X-ray Crystallographic Studies
Suitable crystals were covered in mineral oil (Aldrich) and mounted on a glass fiber or MiTeGen holder. The crystals were transferred directly to the cold stream of a STOE IPDS 2 diffractometer.

All structures were solved by using the program SHELXS/T\(^1\)\(^-\)\(^2\) and Olex2.\(^3\) The remaining non-hydrogen atoms were located from successive difference Fourier map calculations. The refinements were carried out by using full-matrix least-squares techniques on \(F^2\) by using the program SHELXL\(^1\)\(^-\)\(^2\). In each case, the locations of the largest peaks in the final difference Fourier map calculations, as well as the magnitude of the residual electron densities, were of no chemical significance.

Crystallographic data (excluding structure factors) for the structures reported in this paper have been deposited with the Cambridge Crystallographic Data Centre as a supplementary publication no. 1904969-1904970. Copies of the data can be obtained free of charge on application to CCDC, 12 Union Road, Cambridge CB21EZ, UK (fax: (+44)1223-336-033; email: deposit@ccdc.cam.ac.uk).
