Abstract: A concise synthetic route leading to highly functional erythrina alkaloid skeletons has been developed. The key process is an oxidative carbon-carbon coupling followed by a conjugated addition. Based on this new strategy, a formal synthesis of demethoxyerythratidinone was completed in only 6 steps from 4-aminophenol.

Keywords: erythrina alkaloid, oxidative dearomation, demethoxyerythratidinone, formal synthesis

Introduction

The genus *Erythrina* is widely distributed in tropical and subtropical regions and has been used in indigenous medicine.1 Erythrina alkaloids are common constitutes isolated from this species. Representative structures of the erythrina alkaloid family are characterized by a tetracyclic ring system and featured with an 1-azaspiro[5.5]undecane unit (Figure 1). A variety of biological effects are associated with the erythrina skeleton including sedative, hypotensive, neuromuscular blocking and CNS activity.1,2 Because of its typical structure and interesting bioactivities, there has been much interest in the synthesis of these alkaloids and derivatives over the years.3 An impressive strategy towards erythrina skeleton is biomimetic approach through an oxidative carbon-carbon bond formation.4 Although numerous imaginative synthetic routes have been developed based on the oxidative coupling,5 few meet adequate measures of flexibility and efficiency in terms of diversity oriented synthesis.

We recently initiated a research program towards the synthesis of structurally diverse compounds by using oxidative formation of carbon-carbon bond as the key reaction. The spiro cyclohexyldienonyl β-lactams, oxindoles and structural unit for erythrina alkaloids were synthesized from the amide derivatives of 4-aminophenol.6 In this paper, we reported the results towards the synthesis of analogues of erythrina alkaloids.

Results and Discussion

The retrosynthetic analysis is showed in Scheme 1. Starting from the commercially available 4-aminophenol (1kg/157USD), we speculated that a highly functional erythrina skeleton could be reached by a sequential oxidative dearomatization and a Michael addition.

We began our research by an amidation of 4-aminophenol (1) with homoveratroyl chloride (2).7 The product, amide (3), was then converted to amine by a reduction with lithium aluminium hydride in THF (83%). By treatment of amine (4) with ethyl 3-chloro-3-oxopropanoate in dichloromethane, we obtained 71% yield over three steps. Other amides (10 and 11), aiming at the synthesis of erythraline and its analogues, were prepared in three or four steps by the same procedure as shown in Scheme 2.

Figure 1. Representative erythrina alkaloids.

![Figure 1](image_url)
The key oxidative coupling process was attempted by treatment of amide (5) with iodobenzene diacetate (IBD) in methanol, a well-established dearomatization procedure. To our disappointment, this oxidative condition only led to cyclohexyldienone (12). We then tried the oxidation with (bis(trifluoroacetoxy)iodo) benzene (PIFA) in trifluoroethanol at −40°C. To our delight, this oxidation provided the desired azaspiro cyclohexyldienone (13), after treatment with DBU in dichloromethane, the desired intermediate (14) with a highly functional erythrina skeleton was obtained in 72% yield. This two steps procedure was soon optimized to be an efficient "one-pot" reaction: after the oxidative coupling, potassium carbonate was directly introduced to the reaction mixture at room temperature, and compound 14 was obtained in 83% isolated yield. Although oxidative coupling of amides 10 and 11 proceeded under the same reaction condition, the yield (70% and 72% for 15 and 16) was relatively lower than that of amide 5, possibly due to the poor electron donating ability imposed by stereoelectronic effect of the methylenedioxy substituent. This one-pot cyclization furnished the highly functional erythrina skeletons in an efficient way (4 steps for erythrina derivative 14 and 4–5 steps for erythrina derivatives 15 and 16).

Having successfully constructed the azaspiro cyclohexyldienone, we turned our attention next to convert compound 14 to the natural product, namely 3-demethoxyerythratidinone. Compound 14 was further manipulated, hydrogenation followed by decarboxylation, to a known intermediate for the synthesis of demethoxyerythratidinone (Scheme 4), thus furnished a formal synthesis of this natural erythrina alkaloid.

In conclusion, we have developed a practical and efficient method for the synthesis of erythrina skeletons. Based on this methodology, a formal synthesis of demethoxyerythratidinone was also completed. The highly functional erythrina derivatives could be used not only as intermediates for the synthesis of natural erythrina alkaloids but also be used as building blocks for the synthesis of erythrina alkaloid-like compounds.
Experimental Section

General Experimental Procedures. Melting points were obtained on a XT-4 melting-point apparatus and were uncorrected. Proton nuclear magnetic resonance (1H NMR) spectra were recorded on a Bruker Avance 300 spectrometer at 300 MHz. Carbon-13 nuclear magnetic resonance (13C NMR) was recorded on Bruker Avance 300 spectrometer at 75 MHz. Chemical shifts are reported as δ values in parts per million (ppm) relative to tetramethylsilane (TMS) for all recorded NMR spectra. Low-resolution mass spectra were recorded on a VG Auto Spec-3000 magnetic sector MS spectrometer. High resolution mass spectra were taken on AB QSTAR Pulsar mass spectrometer. Silica gel (200–300 mesh) for column chromatography and silica GF254 for TLC were produced by Qingdao Marine Chemical Company (China). All air- or moisture-sensitive reactions were conducted under an argon atmosphere. Starting materials and reagents used in reactions were obtained commercially from Acros, Aldrich, Fluka and were used without purification, unless otherwise indicated.

Synthesis of Compound 3. To a solution of 4-aminophenol (1, 546 mg, 5 mmol) in CH2Cl2 (20 mL) and pyridine (2.02 mL, 25 mmol, 5.0 eq.) at 0°C, homoveratroyl chloride (2, 5.5 mmol, 1.1 eq.) in dichloromethane (5 mL) was added dropwise. The resulting mixture was then stirred at room temperature for 3–4 h. The reaction mixture was diluted with EtOAc (10 mL). The aqueous phase was separated and the organic phase was washed with water (2 × 15 mL). After dried over anhydrous Na2SO4 and filtration, the residue (1.43 g) in CH2Cl2 (3 mL) was added dropwise. The mixture was diluted with water (2 × 15 mL). After dried over anhydrous Na2SO4 and filtration, the residue was removed under reduced pressure and the residue (1.43 g) was used in next step without further purification.

Synthesis of Compound 4. To a solution of 3 (1.43 g) in anhydrous THF (50 mL) at 0°C, LiAlH4 (380 mg, 10 mmol, 2.0 eq.) was added in one portion. The resulting mixture was gradually warmed up to room temperature then stirred at 75°C overnight. The reaction mixture was cooled to 0°C and an aqueous solution of saturated K2CO3 (5 mL) was added dropwise. The mixture was diluted with water (50 mL) and extracted with EtOAc (3 × 15 mL). The organic phases were combined and washed with water (2 × 15 mL) and brine (15 mL). After dried over anhydrous Na2SO4 and filtration, the solvent was removed under reduced pressure and the residue was chromatographed on silica gel (CH2Cl2 : EtOAc = 15:1) to afford amine 4 (984 mg, 72% over two steps). Pale yellow syrup, 1H NMR (300 MHz, CDCl3, CD3OD): δ: 6.82 (1H, d, J = 8.1 Hz), 6.80–6.63 (4H, m), 6.54 (2H, d, J = 8.4 Hz), 3.85 (3H, s), 3.84 (3H, s), 3.32 (1H, t, J = 6.6 Hz), 2.83 (1H, t, J = 6.6 Hz). 13C NMR (75 MHz, CDCl3) δ: 148.98, 148.71, 147.60, 141.46, 131.86, 120.78, 116.36, 115.43, 112.16, 111.52, 55.96, 55.87, 46.61, 34.93. HRESIMS m/z found: 274.1437, calcd. for C13H18O5N [M + H]+: 274.1443.

Synthesis of Compound 5. To a solution of 4 (820 mg, 3 mmol) in CH2Cl2 (30 mL) and pyridine (1.21 mL, 15 mmol, 5.0 eq.) at 0°C, ethyl 3-chloro-3-oxopropanoate (496 mg, 3.3 mmol, 1.1 eq.) in CH2Cl2 (3 mL) was added dropwise. The resulting mixture was then stirred at room temperature for 2–3 h. The reaction mixture was then treated with 2N HCl (10 mL) for 10 min and diluted with CH2Cl2 (20 mL). The aqueous phase was separated and the organic phase was washed with water (2 × 3 mL). The organic phases were combined and back extracted with EtOAc (10 mL). The combined organic phases were dried over anhydrous Na2SO4 and filtration. After removal of the solvent under reduced pressure, the residue was chromatographed on silica gel (Hexane : EtOAc = 4:1–2:1) to give amine 5 (815 mg, 70%). Pale yellow powder, m.p.: 138–139°C. 1H NMR (300 MHz, CDCl3) δ: 6.93 (2H, d, J = 8.7 Hz), 6.90 (2H, d, J = 8.7 Hz), 6.75 (1H, d, J = 7.8 Hz), 6.74 (1H, d, J = 1.5 Hz), 6.68 (1H, dd, J = 7.8, 1.5 Hz), 4.10 (2H, q, J = 7.2 Hz), 3.89 (2H, t, J = 7.9 Hz), 3.81 (6H, s), 3.20 (2H, s), 2.83 (2H, t, J = 7.9 Hz), 1.20 (3H, t, J = 7.2 Hz). 13C NMR (75 MHz, CDCl3) δ: 167.97, 167.14, 157.11, 148.97, 147.64, 133.75, 131.09, 129.17, 120.87, 116.73, 112.22, 111.42, 61.51, 55.98, 55.92, 51.50, 41.90, 33.37, 14.09. HRESIMS m/z found: 388.1759, calcd. for C21H30N2O6 [M + H]+: 388.1760.

Synthesis of Compounds 8 and 9. The procedures were same as compounds 3 and 4. Compound 8 (52%): Pale yellow syrup. 1H NMR (300 MHz, CDCl3, CD3OD): δ: 6.59 (1H, d, J = 8.1 Hz), 6.55–6.51 (4H, m), 6.34 (2H, d, J = 8.4 Hz), 5.76 (2H, s), 3.12 (1H, t, J = 6.9 Hz), 2.64 (1H, t, J = 6.9 Hz), 0.83 (9H, s), 0.00 (9H, s). 13C NMR (75 MHz, CDCl3, CD3OD): δ: 147.82, 1447.54, 1466.12, 1452.64, 133.19, 121.66, 120.71, 114.20, 109.12, 108.32, 100.87, 46.11, 35.37, 25.79, 18.20, 4.50. HRESIMS m/z found: 371.1925, calcd. for C21H25N2O8Si [M]+: 371.1917. Compound 9 (33%): Pale yellow syrup, 1H NMR (300 MHz, CDCl3, CD3OD): δ: 6.75 (1H, d, J = 7.8 Hz), 6.70–6.63 (4H, m), 6.53 (2H, d, J = 8.7 Hz), 5.93 (2H, s), 3.29 (1H, t, J = 6.9 Hz), 2.80 (1H, t, J = 6.9 Hz). 13C NMR (75 MHz, CDCl3, CD3OD): δ: 147.97, 148.80, 146.11, 142.05, 133.08, 121.65, 116.25, 114.77, 109.09, 108.32, 100.86, 46.35, 35.25. HRESIMS m/z found: 257.1057, calcd. for C11H16N2O2 [M + H]+: 257.1052.

Synthesis of Compound 10. To a solution of 8 (557 mg, 1.5 mmol) in CH2Cl2 (20 mL) and pyridine (0.6 mL, 7.5 mmol, 5.0 eq.) at 0°C, ethyl 3-chloro-3-oxopropanoate (248 mg, 1.65 mmol, 1.1 eq.) in CH2Cl2 (3 mL) was added dropwise. The
The procedures were same as compound 14. **Compound 15 (70%):** Pale yellow syrup. 1H NMR (300 MHz, CDCl3) δ: 6.69 (1H, dd, J = 10.2, 1.8 Hz), 6.67 (1H, s), 6.66 (1H, s), 6.17 (1H, d, J = 10.2 Hz), 5.96 (2H, s), 4.40 (1H, dd, J = 12.0, 3.9 Hz), 4.31–4.20 (2H, m), 3.38 (1H, d, J = 11.7 Hz), 3.21 (1H, m), 3.13–2.89 (3H, m), 2.70 (1H, d, J = 12.9 Hz), 2.65 (1H, d, J = 12.9 Hz), 1.31 (3H, t, J = 7.2 Hz). 13C NMR (75 MHz, CDCl3) δ: 194.82, 168.17, 166.51, 147.64, 147.17, 145.38, 127.81, 126.64, 127.31, 109.85, 105.57, 101.47, 62.07, 59.63, 53.89, 44.39, 36.34, 35.54, 29.46, 14.15. HRESIMS m/z found: 369.1220, calcd. for C9H9NO4 [M+H]+: 369.1220. 

**Synthesis of Compound 16**. To a solution of 13 (385.4 mg, 1.0 mmol) in anhydrous EtOH (20 mL) was added a powder of 10% Pd/C (38 mg). The resulting mixture was then stirred at room temperature under a balloon of hydrogen overnight. After filtration and washed with CH2Cl2 (5 mL), the filtrate was concentrated and the residue was chromatographed on silica gel (CH2Cl2: EtOAc = 5:1–3:1) to afford ketone 17 (368 mg, 95%). White plates, m.p.: 182–183°C. 1H NMR (300 MHz, CDCl3) δ: 6.68 (1H, s), 6.56 (1H, s), 4.34 (1H, dd, J = 13.2, 5.4 Hz), 4.15 (2H, q, J = 7.2 Hz), 3.86 (3H, s), 3.84 (3H, s), 3.44–3.34 (1H, m), 3.18 (1H, d, J = 8.1 Hz), 3.15–2.90 (2H, m), 2.65 (1H, d, J = 16.8 Hz), 2.64 (1H, d, J = 16.8 Hz), 2.49–2.20 (4H, m), 1.22 (3H, t, J = 7.2 Hz). 13C NMR (75 MHz, CDCl3) δ: 209.23, 169.01, 167.18, 148.71, 148.54, 133.87, 125.48, 111.94, 107.36, 62.16, 61.47, 54.66, 50.63, 55.21, 42.55, 40.02, 35.62, 35.44, 33.50, 27.82, 14.14. HRESIMS m/z found: 388.1751, calcd. for C12H12NO4 [M+H]+: 388.1760.

**Synthesis of Compound 17**. A mixture of 17 (193 mg, 0.5 mmol), LiCl (21 mg, 0.5 mmol, 1.0 eq.) and H2O (27 mg, 1.5 mmol, 3 eq.) in DMSO (15 mL) was stirred at 158°C under N2 overnight (ca. 15–17 h). The resulting mixture was then stirred at room temperature under a balloon of hydrogen overnight. After filtration and washed with CH2Cl2 (5 mL), the filtrate was concentrated and the residue was chromatographed on silica gel (CH2Cl2: EtOAc = 5:1–3:1) to afford 18 (118 mg, 75%). Pale yellow powder, m.p.: 164–165°C. 1H NMR (300 MHz, CDCl3) δ: 6.68 (1H, s), 6.56 (1H, s), 4.37 (1H, dd, J = 12.0, 5.4 Hz), 3.86 (3H, s), 3.84 (3H, s), 3.15–2.90 (4H, m), 2.78–2.53 (3H, m), 2.49–2.20 (4H, m), 2.11 (1H, dd, J = 17.8, 7.5 Hz). 13C NMR (75 MHz, CDCl3) δ: 210.13, 172.19, 148.60, 148.43, 134.48, 125.65, 111.91, 107.45, 62.56, 56.45, 56.03, 43.38, 37.90, 37.59, 35.35, 34.84, 33.64, 27.67. HRESIMS m/z found: 316.1556, calcd. for C8H12NO4 [M+H]+: 316.1548.
