A rare case of huge intrahepatic portal vein aneurysm

Muharrem Battal, Mustafa Ozer Ulukan, Burhan Akdana, Rabia Karasu, Uğur Temel

ABSTRACT

Introduction: Our case was incidentally diagnosed large aneurysm of the main portal vein. The incidence of intrahepatic and extrahepatic portal vein aneurysms (PVAs) is not clear. Portal vein aneurysm usually occurs at the junction of the superior mesenteric vein and splenic veins or at the hepatic hilus at the bifurcation of the right and left portal veins [1].

Case Report: Color Doppler and contrast-enhanced dynamic computed tomography scan and computed tomography angiography clearly showed a well-circumscribed, 44x34 mm intrahepatic portal vein aneurysm.

Conclusion: The aim of this study is to evaluate the imaging features of portal vein aneurysm.

INTRODUCTION

Portal vein aneurysm usually occurs at the junction of the superior mesenteric vein and splenic veins or at the hepatic hilus at the bifurcation of the right and left portal veins [1]. It is very rarely diagnosed disorder that has been observed by ultrasonography in 0.067% of the patients [2]. In our case dilatation was at intrahepatic portion of portal vein and it is very rare. Whereas small aneurysms tend to be asymptomatic, large extrahepatic aneurysms may give rise to various complications including right upper quadrant pain, jaundice due to compression of adjacent organs such as the duodenum and the bile duct, rupture, or complete occlusion of the portal vein by thrombosis [3, 4].

CASE REPORT

A 54-year-old female was presented with non-specific upper quadrant pain and dyspepsia. The laboratory tests of the patient were normal. She was evaluated with ultrasonography and intrahepatic cystic lesion was detected. This lesion was evaluated by magnetic resonance imaging (MRI) scanner and 44x34 mm diameter intrahepatic portal vein dilatation was found (Figure 1). The diagnosis of intrahepatic portal vein aneurysm was corrected on color Doppler ultrasonography. Color Doppler ultrasonography showed color flow in the lesion (Figure 2) and duplex Doppler ultrasonography showed the characteristic monophasic waveform. On computed tomography (CT) scan, portal vein aneurysm was seen as a well-circumscribed enhanced mass communicating with the portal vein (Figure 3A–B). Three-dimensional and volume rendered contrast-enhanced dynamic computed tomography and angiography images clearly showed aneurysmal dilatation of the umbilical portion of the portal vein and the relation between the aneurysm and portal vein branches (Figure 4).
DISCUSSION

Portal vein aneurysms are most often diagnosed sporadically, and the incidence is ambiguous because most patients are asymptomatic. The reported frequency in the ultrasonography is 0.067% [2]. Although the cause of portal vein aneurysm is unknown, two origins, congenital and acquired, have been proposed. Hepatocellular disease and portal hypertension are etiologies of acquired origin portal vein aneurysm. A portal venous system aneurysm may be congenital or may be acquired as a result of weakening of the vascular wall [5]. Congenital factors include an abnormality of the internal walls of the vessel, incomplete regression of the distal right primitive vitellin vein or a variant branching pattern of the portal vein [6]. Portal vein aneurysms may lead urgent surgical operations if they make complications as thrombosis, portal hypertension, rupture, embolism, and compression of the duodenum and inferior vena cava [7]. In this case, the hypothesis of a congenital origin can be suggested because no other cause was found.

Figure 1: Portal vein aneurysm was seen as a well-circumscribed enhanced mass on magnetic resonance imaging scanner.

Figure 2: Portal vein aneurysm. Color Doppler ultrasonography showing color flow in the lesion.

Figure 3: (A) Portal vein aneurysm was seen as a well-circumscribed enhanced mass on computed tomography scan, (B) Aneurysm was seen in axial section of computed tomography scan.

Figure 4: Computed tomography angiography images clearly showing aneurismal dilatation of the umbilical portion of the portal vein.
diagnosis is generally based on color Doppler ultrasound. Color Doppler sonography showed a constant hepatopetal flow along the aneurysmal wall, which immediately led to the diagnosis. We stress the usefulness of color Doppler sonography for studying the hemodynamics of this vascular anomaly and contrast-enhanced dynamic computed tomography and angiography clearly showed a well-circumscribed, 44x34 mm portal vein aneurysm. Large aneurysms may give rise to various complications including right upper quadrant pain, jaundice due to compression of adjacent organs such as the duodenum and the bile duct, rupture, or complete occlusion of the portal vein by thrombosis [3, 4]. Operative treatment is required in these complications. The prognosis depends on complications and underlying liver disease. Therefore, this patient requires careful follow-up.

**CONCLUSION**

As having complications such as thrombosis, portal hypertension, rupture, embolism, and compression of the duodenum and inferior vena cava, these aneurysms should be appreciated in emergency situations.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Mentored Review Articles (MRA)
Our academic program “Mentored Review Article” (MRA) gives you a unique opportunity to publish papers under mentorship of international faculty. These articles are published free of charges.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
