Abstract

The incremental updating of lower and upper approximations under the variation of information systems is an important issue in rough set theory. Many incremental updating approaches with respect to different kinds of indiscernibility relations have been proposed. The grade indiscernibility relation is a fuzzification of classical Pawlak’s indiscernibility relation which can characterize the similarity between objects more precisely. Based on fuzzy rough set model, this paper discusses the approaches for dynamically acquiring of the upper and lower approximations with respect to the grade indiscernibility relation when adding and removing an attribute or an object, and changing the attribute value of the object, respectively. Since the approaches are used in succession, they make the approximations can be updated correctly and effectively when any kind of possible change in the information system. Finally, extensive experiments on data sets from University of California, Irvine (UCI) show that the incremental methods effectively reduce the computing time in comparison with the traditional non-incremental method.

Keywords: Rough set, Fuzzy relation, The grade indiscernibility relation, Incremental learning, Approximation operators.

1. Introduction

Rough set theory, a mathematical tool for dealing with vagueness and uncertainty, was introduced by Pawlak in 1982¹. It can be used in attribute value representation models to describe the dependencies among attributes, evaluate the significance of attributes and derive decision rules²³⁴⁵⁶. Rough set-based data analysis starts from a data table, also called an information system, which contains data about objects of interest that are characterized by a finite set of attributes. Objects with the same information are indiscernible and the indiscernibility relation generated in this way forms the mathematical basis for the theory of rough sets. By using the indiscernibility relation, a rough set is characterized by a pair of sets, called the lower and upper approximations. In recent years, classical rough sets have been extended to several general models, such as covering rough set model⁷, fuzzy rough set model⁸, variable precision rough set model⁹, generalized rough set model¹⁰, probabilistic rough set model¹¹, etc.

With the rapid development of modern information technology, different types of data have increased dramatically. In many real-time cases, information systems may evolve over time, in other
words, some new information becomes available continuously while some information is no longer useful. One can retrain the system from scratch whenever adding or removing data (attributes or objects), which is known as a non-incremental approach\textsuperscript{12}. However, the non-incremental approach becomes very costly or even intractable as the number of data grows. Alternatively, one can also apply an incremental learning scheme\textsuperscript{12}. The essence of incremental learning is to allow the learning process to take place in a continuous and progressive manner rather than a one-shot experience\textsuperscript{13}. The research on updating knowledge incrementally has shown its importance in many areas, such as clinical decision making, intrusion detection, stock evaluation, and text categorization\textsuperscript{14}. Some incremental learning methods with respect to rough set theory have been proposed\textsuperscript{14,15,16,17}. Chan firstly put forward an incremental method for updating the approximations of a crisp concept based on the lower and upper boundary sets\textsuperscript{15}. Li et al. presented an incremental method of updating decision rules when multi-attributes are deleted or added simultaneously under rough set based on the characteristic relation\textsuperscript{16}. Zhang et al. investigated the approach for updating approximations under neighborhood rough sets\textsuperscript{17}. Cheng proposed two incremental methods for the fast computing of the rough fuzzy approximations based on the boundary set and the cut sets of a fuzzy set, respectively\textsuperscript{14}. These studies have significantly enriched the theory of rough set and guided a way for dynamic data mining, even big data mining.

The indiscernibility relation is a key notion of rough set theory, which partitions the object set of an information system into a collection of equivalence classes. Zhao proposed the notion of grade indiscernibility relation which is a fuzzy relation for information system to characterize the difference between the grades of discernibility\textsuperscript{18}. Based on fuzzy rough set model\textsuperscript{8}, Qin investigated rough approximation operators based on the grade indiscernibility relation\textsuperscript{19}. For the sake of better applying of the grade indiscernibility relation, Luo extend it to incomplete information system\textsuperscript{20}. The value tolerance relation based rough approximation opera-

2. Preliminaries

In this section, for our further development, we briefly review some basic notions of Pawlak rough set\textsuperscript{1} and the grade indiscernibility relation\textsuperscript{18}. Meanwhile, the traditional non-incremental algorithm of calculating approximations is presented.
2.1. The grade indiscernibility relation

Definition 1 1 An information system is a quadruple $S = (U, A, V, F)$, where

(1) $U = \{x_1, x_2, \ldots, x_n\}$ is a nonempty finite set of objects called the universe of discourse;
(2) $A$ is a nonempty finite set of attributes;
(3) $V = \bigcup_{a \in A} V_a$, is the values domain of $a$;
(4) $f : U \times A \rightarrow V$ is an information function such that $f(x, a) \in V_a$, for any $x \in U, a \in A$.

Definition 2 Let $S = (U, A, V, F)$ be an information system, $B \subseteq A$, the indiscernibility relation $\text{ind}(B)$ induced by $B$ is defined as:
\[
\text{ind}(B) = \{(x, y) \in U \times U; \forall b \in B(f(x, b) = f(y, b))\}.
\]

Clearly, $\text{ind}(B)$ is an equivalence relation. If $(x, y) \in \text{ind}(B)$, then $x$ and $y$ are indiscernible with respect to $B$. It is noticed that, if $x$ and $y$ are discernible with respect to $B$, i.e. $(x, y) \notin \text{ind}(B)$, then there exists at least one attribute $b \in B$ such that $f(x, b) \neq f(y, b)$. Thus the grade of discernibility may be different for different pairs of objects. The difference has not been described in Pawlak's indiscernibility relation. To address this issue, Zhao proposed the grade indiscernibility relation for information system\(^{18}\), which is defined as follows.

Definition 3 18 Let $S = (U, A, V, F)$ be an information system, $B \subseteq A$, the grade indiscernibility relationship $GR_B$ on $B$ is a binary fuzzy relation on $U$, i.e. $GR_B : U \times U \rightarrow [0, 1]$, and for any $x, y \in U$,
\[
GR_B(x, y) = \frac{1}{|B|} |\{b \in B; f(x, b) = f(y, b)\}|.
\]

According to this definition, $GR_B(x, y)$ represents the proportion of indistinguishable attribute of $x$ and $y$ in $B$. Clearly, $(x, y) \in \text{ind}(B)$ if and only if $GR_B(x, y) = 1$. Thus, $GR_B$ is a kind of fuzzification of a indiscernibility relation $\text{ind}(B)$. It is noticed that $GR_B$ is a reflexive and symmetric fuzzy relation, but not necessarily transitive, i.e., $GR_B(x, y) \land GR_B(y, z) \leq GR_B(x, z)$ is not necessarily hold. From the point of fuzzy rough set model\(^{8}\), Qin presented approximation operators based on grade indiscernibility relation\(^{19}\).

Definition 4 19 Let $S = (U, A, V, F)$ be an information system, $B \subseteq A$. For any fuzzy subset $\mu \in F(U)$, the lower approximation $\overline{GR}_B(\mu)$ and the upper approximations $\overline{GR}_B(\mu)$ of $\mu$ are defined as follows:
\[
\forall x \in U, \quad \overline{GR}_B(\mu)(x) = (1 - GR_B(x, y)) \forall y \in U, \quad \overline{GR}_B(\mu)(x) = \vee y \in U \cap \{GR_B(x, y) \land \mu(y)\}.
\]

In this definition, if $X \subseteq P(U)$ is a subset of $U$, then
\[
\overline{GR}_B(X)(x) = \bigwedge_{y \in X} (1 - GR_B(x, y)),
\]
\[
\overline{GR}_B(X)(x) = \bigvee_{y \in X} GR_B(x, y).
\]

Clearly, by the reflexivity of $GR_B(x, y)$, we have $GR_B(X) \subseteq X \subseteq \overline{GR}_B(X)$ for any $X \subseteq U$.

2.2. The non-incremental algorithm of computing approximations

In order to get the approximations based on the grade indiscernibility relation, the non-incremental method will firstly build the relation matrix and then get the approximations from the matrix. The calculation process of the traditional way can be represented as the following Steps in Algorithm 2.1.

Algorithm 2.1 (The traditional non-incremental algorithm of computing approximations)

Step 1: Input $S = (U, A, V, F), X, B$.

Step 2: Build the relation matrix $M_{n \times m}$, where $n = |X|, m = |U - X|$, 
\[
M_{n \times m} = GR_B(x_i, x_j) = \frac{1}{|B|} \left| \{b \in B; f(x_i, b) = f(x_j, b)\} \right|, x_i \in X, x_j \not\in U - X.
\]

Step 3: Calculate the lower approximations
\[
\overline{GR}_B(X)(x_i) = \bigwedge_{y \in U - X} (1 - GR_B(x_i, y) = \bigvee_{y \in U - X} GR_B(x_i, y) \quad \text{and the set} \quad Y_{x_i} = \{y \in U - X; \bigvee_{y \in U - X} GR_B(x_i, y) \}, x_i \in X
\]

Step 4: Calculate the upper approximations
\[
\overline{GR}_B(X)(x_i) = \bigvee_{y \in U - X} GR_B(x_i, y) \quad \text{and the set} \quad Y_{x_i}^\vee = \{y \in U - X; \bigvee_{y \in U - X} GR_B(x_i, y) \}, x_i \in U - X
\]

Step 5: Output the $M_{n \times m}$: $GR_B(X)(x_i)$ and $Y_{x_i}$, $x_i \in X; \overline{GR}_B(X)(x_j)$ and $Y_{x_j}$, $x_j \not\in U - X$; $\overline{GR}_B(X)(x_i) = 0$, $x_i \not\in U - X; \overline{GR}_B(X)(x_j) = 1$, $x_j \not\in X$.

It is easy to see that Algorithm 2.1 has a time complexity of $O(|X| |U - X| |B|)$, which is mainly decided by the time cost of building the relation matrix in Step 2. The following Example 1 shows the
progress of using the Algorithm 2.1 to get the approximations based on the grade indiscernibility relation.

**Example 1** Let \( U = \{x_1, x_2, x_3, x_4, x_5, x_6\} \) be the universal set, \( A = \{b_1, b_2, b_3, b_4, b_5\} \) be the conditional attribute set, \( B = \{b_1, b_2, b_3, b_4\} \), \( X = \{x_2, x_3, x_6\} \) be the decision set. The related information system is given in Table 1.

| \( b_1 \) | \( b_2 \) | \( b_3 \) | \( b_4 \) | \( b_5 \) | \( d \) |
|---|---|---|---|---|---|
| \( x_1 \) | 2 | 2 | 1 | 3 | \( U - X \) |
| \( x_2 \) | 2 | 2 | 1 | 2 | \( X \) |
| \( x_3 \) | 2 | 2 | 2 | 1 | \( X \) |
| \( x_4 \) | 1 | 1 | 1 | 2 | \( U - X \) |
| \( x_5 \) | 1 | 2 | 2 | 3 | \( X \) |
| \( x_6 \) | 1 | 1 | 2 | 2 | \( U - X \) |

Table 1

From the Step 2 of Algorithm 2.1 we have a relation matrix \( M_{3 \times 3} \), where \( GR_B(x, y), x_i \in X, x_j \in U - X \).

\[
M_{3 \times 3} = x_3 \begin{pmatrix}
x_1 & x_4 & x_5 \\
x_2 & 3/4 & 2/4 & 2/4 \\
x_6 & 0 & 3/4 & 3/4 \\
\end{pmatrix}
\]

The first column is the object that \( x_i \in X \). The first row is the object that \( x_j \in U - X \).

From the step 3 of Algorithm 2.1 we have the lower approximations:

\[
GR_B(x_2) = \bigvee_{y \in U-X} (1 - GR_B(x_2, y)) = 1 - \bigvee_{y \in U-X} GR_B(x_2, y) = 1 - GR_B(x_2, y) = 1 - \frac{3}{4} = \frac{1}{4}, \quad \text{and} \quad Y_x^{\downarrow} = \{y; \forall y \in U-X, GR_B(x_2, y) = x_1\}.
\]

\[
GR_B(x_3) = \bigvee_{y \in U-X} (1 - GR_B(x_3, y)) = 1 - \bigvee_{y \in U-X} GR_B(x_3, y) = 1 - GR_B(x_3, y) = 1 - \frac{3}{4} = \frac{1}{4}, \quad \text{and} \quad Y_x^{\downarrow} = \{y; \forall y \in U-X, GR_B(x_3, y) = x_1\}.
\]

\[
GR_B(x_6) = \bigvee_{y \in U-X} (1 - GR_B(x_6, y)) = 1 - \bigvee_{y \in U-X} GR_B(x_6, y) = 1 - GR_B(x_6, y) = \frac{3}{4}, \quad \text{and} \quad Y_x^{\downarrow} = \{y; \forall y \in U-X, GR_B(x_6, y) = x_1\}.
\]

\[
GR_B(x_1) = 0, x_i \in \{x_1, x_4, x_5\}.
\]

From the step 4 of algorithm 2.1 we have the upper approximations:

\[
\overline{GR_B}(X)(x_1) = \bigvee_{y \in X} \overline{GR_B}(x_1, y) = \frac{3}{4}, \quad \text{and} \quad Y_x^{\uparrow} = \{y \in X; \forall y \in X, \overline{GR_B}(x_1, y) = x_1\}.
\]

\[
\overline{GR_B}(X)(x_4) = \bigvee_{y \in X} \overline{GR_B}(x_4, y) = \frac{3}{4}, \quad \text{and} \quad Y_x^{\uparrow} = \{y \in X; \forall y \in X, \overline{GR_B}(x_4, y) = x_4\}.
\]

\[
\overline{GR_B}(X)(x_6) = 0, x_i \in \{x_2, x_3, x_6\}.
\]

3. Incrementally updating approximations while adding or removing an attribute

The traditional non-incrementally update method is based on static information system, which has huge time complexity as the number of data grows. Incremental update method can improve the efficiency by using the existing approximation knowledge.

3.1. Incrementally updating approximations when adding an attribute

**Proposition 1** Let \( S = (U, A, V, F) \) be an information system, \( B \subseteq A \), \( a \in A \) and \( b \in B \). For any \( x, y \in U \),

\[
GR_B(x, y) = \frac{\overline{GR}(x, y) + \overline{GR}(x, y)}{|B| + 1}.
\]

**Proof.** This proof is straightforward. \( \square \)

**Proposition 2** Let \( S = (U, A, V, F) \) be an information system, \( B \subseteq A \), \( a \in A \), \( b \notin B \), \( X \subseteq U \). The lower and upper approximations of \( X \) by adding \( b \) to \( B \) can be updated respectively as follows.

**Lower approximation:** If \( x_i \in U - X \), then

\[
GR_B(x_i) = \overline{GR_B}(X)(x_i) = 0; \quad \text{If} \quad x_i \in X, \quad \text{then} \quad GR_B(x_i) = \overline{GR_B}(X)(x_i).
\]

**Upper approximation:** If \( x_j \in X \), then

\[
GR_B(x_j) = \overline{GR_B}(X)(x_j) = 1; \quad \text{If} \quad x_j \in U - X, \quad \text{then} \quad GR_B(x_j) = \overline{GR_B}(X)(x_j).
\]

215
Proof. Lower approximation: For any \( x_j \in U - X \), it is obviously that \( \overline{GR}_{B|\{b\}}(X)(x_j) = \overline{GR}_{B}(X)(x_j) = 0 \).

For any \( x_j \in X \), if \( \exists y \in Y^\vee_{x_j} \) such that \( f(x_j, b) = f(y, b) \), then \( \overline{GR}_{B|\{b\}}(X)(x_j) = 1 - \overline{GR}_{B}(X)(x_j, y) = 1 - \frac{|BR_{G}(X)(x_j) + 1|}{|B| + 1} \).

If \( f(x_j, b) \neq f(y, b) \) for any \( y \in Y^\vee_{x_j} \), then
\[
\overline{GR}_{B|\{b\}}(X)(x_j) = \bigvee_{y \in X} \bigwedge_{x \in X} \overline{GR}_{B}(x, y) = 1 - \frac{|BR_{G}(X)(x_j) + 1|}{|B| + 1}.
\]

Upper approximation: For any \( x_j \in X \), it is obviously that \( \overline{GR}_{B|\{b\}}(X)(x_j) = \overline{GR}_{B}(X)(x_j) = 1 \).

For any \( x_j \in U - X \), if \( \exists y \in Y^\vee_{x_j} \) such that \( f(x_j, b) = f(y, b) \), then \( \overline{GR}_{B|\{b\}}(X)(x_j) = \overline{GR}_{B}(X)(x_j) = 1 - \frac{|BR_{G}(X)(x_j) + 1|}{|B| + 1} \).

If \( f(x_j, b) \neq f(y, b) \) for any \( y \in Y^\vee_{x_j} \), then \( \overline{GR}_{B|\{b\}}(X)(x_j) = \bigwedge_{y \in Y^\vee} \bigvee_{x \in X} \overline{GR}_{B}(x, y) = 1 - \frac{|BR_{G}(X)(x_j) + 1|}{|B| + 1} \).

Upper approximation: If \( x_j \in X \), then \( \overline{GR}_{B|\{b\}}(X)(x_j) = \overline{GR}_{B}(X)(x_j) = 1 \); if \( x_j \in U - X \), then
\[
\overline{GR}_{B|\{b\}}(X)(x_j) = \bigwedge_{y \in Y^\vee} \bigvee_{x \in X} \overline{GR}_{B}(x, y) = 1 - \frac{|BR_{G}(X)(x_j) + 1|}{|B| + 1}.
\]

Since the incremental update approaches need to use the set of \( Y^\vee_{x_i} \) and \( Y^\vee_{x_j} \), in order to maintain the continuity of the approaches, \( Y^\vee_{x_i} \) and \( Y^\vee_{x_j} \) also need to update.

Proposition 3 The set of \( Y^\vee_{x_i} \) and \( Y^\vee_{x_j} \) by adding \( b \) to \( B \) can be updated respectively as follows.

\[
Y^\vee_{x_i} = \begin{cases}
\{y \in Y^\vee_{x_i} : f(x_i, b) = f(y, b)\}, & \forall y \in Y^\vee_{x_i}, \\
\{y : \forall x \in X \rightarrow f(x_i, b) \neq f(y, b)\}, & \forall y \in Y^\vee_{x_i}.
\end{cases}
\]

\[
Y^\vee_{x_j} = \begin{cases}
\{y : \forall x \in X \rightarrow f(x_j, b) \neq f(y, b)\}, & \forall y \in Y^\vee_{x_j}, \\
\{y : \forall x \in X \rightarrow f(x_j, b) = f(y, b)\}, & \forall y \in Y^\vee_{x_j}.
\end{cases}
\]

Algorithm 3.1 (Incremental algorithm for updating approximations when adding an attribute \( b \))

Step 1: Input the relation matrix \( M_{B|\{b\}} \); \( GR_B(X)(x_j), Y^\vee_{x_i}, x_i \in X \); \( GR_B(X)(x_j), Y^\vee_{x_j}, x_j \in U - X \); the increasing attribute \( b \).

Step 2: We get a new relation matrix \( M^*_B \).

\[
GR_{B|\{b\}}(x_j, y) = \begin{cases}
\frac{|BR_{G}(X)(x_j) + 1|}{|B| + 1}, & f(x_i, b) = f(x_j, b); \\
\frac{|BR_{G}(X)(x_j) + 1|}{|B| + 1}, & f(x_i, b) \neq f(x_j, b).
\end{cases}
\]

\( x_i \in X, x_j \in U - X \); // According to Proposition 1.

Step 3: Calculate the lower approximations \( x_i \in \).

If \( \exists y \in Y^\vee_{x_i} \), such that \( f(x_i, b) = f(y, b) \), then \( GR_{B|\{b\}}(X)(x_i) = \frac{|BR_{G}(X)(x_i) + 1|}{|B| + 1} \) and \( Y^\vee_{x_i} = \{y \in Y^\vee_{x_i} : f(x_i, b) = f(y, b)\} \).

Else \( GR_{B|\{b\}}(X)(x_i) = \frac{|BR_{G}(X)(x_i) + 1|}{|B| + 1} \) and \( Y^\vee_{x_i} = \{y : \forall x \in X \rightarrow GR_{B|\{b\}}(x_i, y)\} \); // According to Proposition 2 and 3.

Step 4: Calculate the upper approximations \( x_j \in U - X \).
If \( \exists y \in Y_{y_{3j}}^{v} \) such that \( f(x_j, b) = f(y, b) \) then \( \overline{GR}_{B \setminus \{b\}}(X)(x_j) = \frac{|GR_{B \setminus \{b\}}(X)(x_j) + 1|}{|B| + 1} \) and \( Y_{y_{3j}}^{v_{3j}} = \{ y \in Y_{y_{3j}}^{v_{3j}} \mid f(x_j, b) = f(y, b) \} \).

Else \( \overline{GR}_{B \setminus \{b\}}(X)(x_j) = \frac{|GR_{B \setminus \{b\}}(X)(x_j) + 1|}{|B| + 1} \) and \( Y_{y_{3j}}^{v_{3j}} = \{ y \in Y_{y_{3j}}^{v_{3j}} \mid \forall x \neq X, GR_{B \setminus \{b\}}(X, y)) \} \).

According to Proposition 2 and 3.

Step 5: Output the relation matrix \( M_{\text{new}}^{*} \):
\[
GR_{B \setminus \{b\}}(X)(x_i), \ Y_{y_{3j}}^{v_{3j}}, \ x_j \in X; \overline{GR}_{B \setminus \{b\}}(X)(x_j), \ Y_{y_{3j}}^{v_{3j}}; \ x_j \in U - X; \ \overline{GR}_{B \setminus \{b\}}(X)(x_j) = 1, x_j \in X.
\]

The time complexity of Algorithm 3.1 is \( O(|X|(|U| - |X|)) \), which is mainly decided by the time cost of building the relation matrix in Step 2. In the following Example 2, we use the results from Example 1 to demonstrate how algorithm 3.1 update the approximations when adding an attribute.

**Example 2** We consider the information system given in Table 1. Let \( U = \{x_1, x_2, x_3, x_4, x_5, x_6\} \) be the universal set, \( B = \{b_1, b_2, b_3, b_4\} \) be the conditional attribute set, \( X = \{x_2, x_3, x_6\} \) be the decision set. Adding an attribute \( b_5 \) to \( B \).

Using the result of Example 1.

\[
M_{3 \times 3}^{\text{v3j}} = x_3
\begin{pmatrix}
3/4 & 2/4 & 2/4 \\
3/4 & 0 & 2/4 \\
0 & 3/4 & 3/4
\end{pmatrix}
\]

\[
GR_B(X)(x_2) = \frac{1}{3}, Y_{y_{32}}^{v_{32}} = \{x_1\}; \overline{GR_B}(X)(x_6) = \frac{1}{3}, Y_{y_{36}}^{v_{36}} = \{x_1, x_3, x_5\}; GR_B(X) = \{x_i \mid 0, x_i \in [x_1, x_4, x_5]\}.
\]

\[
GR_B(X)(x_1) = \frac{1}{2}, Y_{y_{31}}^{v_{31}} = \{x_2, x_3\}; \overline{GR_B}(X)(x_4) = \frac{3}{4}, Y_{y_{34}}^{v_{34}} = \{x_5, x_6\}; \overline{GR_B}(X)(x_5) = \frac{3}{4}, Y_{y_{35}}^{v_{35}} = \{x_6\}; \overline{GR_B}(X)(x_6) = \frac{1}{2}, x_j \in [x_2, x_3, x_6].
\]

From the Step 2 of Algorithm 3.1 we have a new relation matrix \( M_{3 \times 3}^{*} \):

\[
M_{3 \times 3}^{*} = x_3
\begin{pmatrix}
3/5 & 3/5 & 2/5 \\
4/5 & 0 & 3/5 \\
0 & 4/5 & 3/5
\end{pmatrix}
\]

The lower and upper approximations of \( X = \{x_2, x_3, x_6\} \) by adding \( b_5 \) to \( B \) are updated as follows.

From the step 3 of algorithm 3.1 we have the lower approximations:
\[
GR_{B \setminus \{b\}}(X)(x_2): \text{For any } y \in Y_{y_{32}}^{v_{32}}, f(x_2, b_5) = f(y, b_5). \text{ So we have } GR_{B \setminus \{b\}}(X)(x_2) = \frac{1 + 1}{4 + 1} = \frac{2}{5} \text{ and } Y_{y_{32}}^{v_{32}} = \{ y \mid \forall x \neq X, GR_{B \setminus \{b\}}(X, y) = \{x_1, x_4\} \}.
\]

\[
GR_{B \setminus \{b\}}(X)(x_3): \exists x_1 \in Y_{y_{31}}^{v_{31}}, \text{ such that } f(x_3, b_5) = f(x_1, b_5), \text{ then } GR_{B \setminus \{b\}}(X)(x_3) = \frac{3 + 1}{4 + 1} = \frac{4}{5} \text{ and } Y_{y_{31}}^{v_{31}} = \{ y \in Y_{y_{31}}^{v_{31}} \mid f(x, b_5) = f(y, b_5) \} = \{ x_1 \}.
\]

\[
GR_{B \setminus \{b\}}(X)(x_4): \exists x_6 \in Y_{y_{36}}^{v_{36}}, \text{ such that } f(x_4, b_5) = f(x_6, b_5), \text{ then } GR_{B \setminus \{b\}}(X)(x_4) = \frac{3 + 1}{4 + 1} = \frac{4}{5} \text{ and } Y_{y_{36}}^{v_{36}} = \{ y \in Y_{y_{36}}^{v_{36}} \mid f(x, b_5) = f(y, b_5) \} = \{ x_6 \}.
\]

\[
GR_{B \setminus \{b\}}(X)(x_5): \text{For any } y \in Y_{y_{35}}^{v_{35}}, f(x_5, b_5) \neq f(y, b_5), \text{ so we have } GR_{B \setminus \{b\}}(X)(x_5) = \frac{3}{4 + 1} = \frac{3}{5} \text{ and } Y_{y_{35}}^{v_{35}} = \{ y \mid \forall x \neq X, GR_{B \setminus \{b\}}(X, y) = \{x_3, x_6\} \}.
\]

\[
GR_{B \setminus \{b\}}(X)(x_6) = 1, x_j \in [x_2, x_3, x_6].
\]

### 3.2. Incrementally updating approximations when removing an attribute

**Proposition 4** Let \( S = (U, A, V, F) \) be an information system, \( B \subseteq A \), \( b \in B \). For any \( x, y \in U \),
\[
GR_{B \setminus \{b\}}(x, y) = \left\{ \frac{|GR_{B \setminus \{b\}}(x, y) - GR_{B \setminus \{b\}}(x, y)|}{|B| - 1} \right\}
= \begin{cases}
\frac{|GR_{B \setminus \{b\}}(x, y)| + 1}{|B| + 1}, & f(x, b) = f(y, b) \\
\frac{|GR_{B \setminus \{b\}}(x, y)|}{|B| + 1}, & f(x, b) \neq f(y, b).
\end{cases}
\]

**Proof.** This proof is straightforward. \( \square \)

**Proposition 5** Let \( S = (U, A, V, F) \) be an information system, \( B \subseteq A \), \( b \in B \), \( X \subseteq U \). The lower and upper approximations of \( X \) by removing \( b \) from \( B \) can be updated respectively as follows.

**Lower approximation:** If \( x_j \in U - X \), then \( GR_{B \setminus \{b\}}(X)(x_j) = \overline{GR_B}(X)(x_j) = 0 \); If \( x_j \in X \), then \( GR_{B \setminus \{b\}}(X)(x_j) \)
where

\[ Y_{x_i} = \{ y \in X \mid GR_B(X(x_i)) = 1 - GR_B(y) \}. \]

**Proof.** Lower approximation: For any \( x_i \in U - X \), it is obviously that \( GR_B^{-1}(X(x_i)) = \emptyset \).

For any \( x_i \in X \), if \( \exists y \in Y_{x_i} \) such that \( f(x_i, b) \neq f(y, b) \), then \( GR_B^{-1}(X(x_i)) = 1 - GR_B^{-1}(x_i, y) = 1 - \left| \frac{GR_B(X(x_i))}{|B| - 1} \right| = \left| \frac{GR_B(x_i)}{|B| - 1} \right| \).

If \( f(x_i, b) = f(y, b) \) for any \( y \in Y_{x_i} \), then \( GR_B^{-1}(X(x_i)) = 1 - \left| \frac{GR_B(x_i)}{|B| - 1} \right| \).

Upper approximation: For any \( x_i \in X \), it is obviously that \( GR_B^{-1}(X(x_i)) = \emptyset \).

For any \( x_i \in U - X \), if \( \exists y \in Y_{x_i} \) such that \( f(x_i, b) \neq f(y, b) \), then \( GR_B^{-1}(X(x_i)) = 1 - \left| \frac{GR_B(x_i)}{|B| - 1} \right| \).

If \( f(x_i, b) = f(y, b) \) for any \( y \in Y_{x_i} \), then \( GR_B^{-1}(X(x_i)) = 1 - \left| \frac{GR_B(x_i)}{|B| - 1} \right| \).

**Proposition 6** The set of \( Y_{x_i}^\wedge \) and \( Y_{x_i}^\vee \) by removing \( b \) from \( B \) can be updated respectively as follows.

**Algorithm 3.2 (Incremental algorithm for updating approximations when removing an attribute \( b \))**

**Step 1:** Input the relation matrix \( M_{n \times m} \).

**Step 2:** We get a new relation matrix \( M'_{n \times m} = GR_B^{-1}(X(x_i)) \).

**Step 3:** Calculate the lower approximations \( x_i \in X \).

If \( \exists y \in Y_{x_i}^{\wedge} \) such that \( f(x_i, b) \neq f(y, b) \), then \( GR_B^{-1}(X(x_i)) = 1 - \left| \frac{GR_B(x_i)}{|B| - 1} \right| \).

**Proposition 6** The set of \( Y_{x_i}^\wedge \) and \( Y_{x_i}^\vee \) by removing \( b \) from \( B \) can be updated respectively as follows.

**Algorithm 3.2 (Incremental algorithm for updating approximations when removing an attribute \( b \))**

**Step 1:** Input the relation matrix \( M_{n \times m} \).

**Step 2:** We get a new relation matrix \( M'_{n \times m} = GR_B^{-1}(X(x_i)) \).

**Step 3:** Calculate the lower approximations \( x_i \in X \).

If \( \exists y \in Y_{x_i}^{\wedge} \) such that \( f(x_i, b) \neq f(y, b) \), then \( GR_B^{-1}(X(x_i)) = 1 - \left| \frac{GR_B(x_i)}{|B| - 1} \right| \).

**Proposition 6** The set of \( Y_{x_i}^\wedge \) and \( Y_{x_i}^\vee \) by removing \( b \) from \( B \) can be updated respectively as follows.
Step 4: Calculate the upper approximations \( x_j \in U - X \)
If \( \exists y \in Y^y_{x_j}(f(x_j, b) \neq f(y, b)) \), then
\[
\overline{GR}_B(x_j) = \frac{|\overline{GR}_B(X)(x_j)|}{|B| - 1} \quad \text{and} \quad Y^y_{x_j} = \{ y ; y \in Y^y_{x_j} \} \quad \text{where} \quad \overline{GR}_B(X)(x_j) = \frac{|\overline{GR}_B(X)(x_j)|}{|B| - 1}. \]

Else \( \overline{GR}_B(x_j) = \frac{|\overline{GR}_B(X)(x_j)|}{|B| - 1} \) and \( Y^y_{x_j} = \{ y ; y \in Y^y_{x_j} \} \). \quad \text{According to Proposition 5 and 6.}

Step 5: Output the relation matrix \( M'_{3x3} \):
\[
GR_b(X)(x_1) = \frac{4}{5}, Y^y_{x_1} = \{ x_3 \}; \quad GR_b(X)(x_4) = \frac{4}{5}, Y^y_{x_4} = \{ x_6 \}; \quad GR_b(X)(x_5) = \frac{4}{5}, Y^y_{x_5} = \{ x_3, x_6 \}; \quad GR_b(X)(x_6) = 1, x_j \in \{ x_2, x_3, x_6 \}.
\]

From the Step 2 of Algorithm 3.2 we have a new relation matrix \( M'_{3x3} \):
\[
M'_{3x3} = \begin{pmatrix}
  x_1 & x_4 & x_5 \\
  2 & 3/4 & 1/4 \\
  3/4 & 0 & 2/4 \\
  0 & 3/4 & 3/4
\end{pmatrix}
\]

The lower and upper approximations of \( X = \{ x_2, x_3, x_6 \} \) by removing \( b_2 \) from \( B \) are updated as follows.

From the step 3 of Algorithm 3.2 we have the lower approximations:
\[
GR_{B-[b_2]}(X)(x_2): \exists x_4 \in Y^y_{x_2}, \text{such that } f(x_2, b_2) \neq f(x_4, b_2), \text{then } GR_{B-[b_2]}(X)(x_2) = \frac{5}{7} = \frac{5}{4} \quad \text{and} \quad Y^y_{x_2} = \{ y ; y \in Y^y_{x_2} \} \quad \text{where} \quad \overline{GR}_B(X)(x_2) = \frac{|\overline{GR}_B(X)(x_2)|}{|B| - 1}.
\]

For any \( y \in Y^y_{x_2}, \text{ } f(x_2, b_2) = f(y, b_2), \text{ so we have } GR_{B-(b_2)}(X)(x_2) = \frac{4}{5} \quad \text{and} \quad Y^y_{x_2} = \{ y ; y \in U - X \} \quad \text{where} \quad \overline{GR}_B(X)(x_2) = \frac{|\overline{GR}_B(X)(x_2)|}{|B| - 1}.
\]

For any \( y \in Y^y_{x_2}, \text{ } f(x_6, b_2) = f(y, b_2), \text{ so we have } GR_{B-(b_2)}(X)(x_6) = \frac{5}{7} = \frac{5}{4} \quad \text{and} \quad Y^y_{x_6} = \{ y ; y \in U - X \} \quad \text{where} \quad \overline{GR}_B(X)(x_6) = \frac{|\overline{GR}_B(X)(x_6)|}{|B| - 1}.
\]

From the step 4 of Algorithm 3.2 we have the upper approximations:
\[
\overline{GR}_{B-(b_2)}(X)(x_1): \text{For any } y \in Y^y_{x_1}, f(x_1, b_2) = f(y, b_2), \text{ so we have } \overline{GR}_{B-(b_2)}(X)(x_1) = \frac{5}{7} = \frac{5}{4} \quad \text{and} \quad Y^{y*}_{x_1} = \{ y ; y \in \overline{GR}_{B-(b_2)}(X)(x_1) \} \quad \text{where} \quad \overline{GR}_B(X)(x_1) = \frac{|\overline{GR}_B(X)(x_1)|}{|B| - 1}.
\]

\[
\overline{GR}_{B-(b_2)}(X)(x_4): \text{For any } y \in Y^y_{x_4}, f(x_4, b_2) = f(y, b_2), \text{ so we have } \overline{GR}_{B-(b_2)}(X)(x_4) = \frac{5}{7} = \frac{5}{4} \quad \text{and} \quad Y^{y*}_{x_4} = \{ y ; y \in \overline{GR}_{B-(b_2)}(X)(x_4) \} \quad \text{where} \quad \overline{GR}_B(X)(x_4) = \frac{|\overline{GR}_B(X)(x_4)|}{|B| - 1}.
\]

\[
\overline{GR}_{B-(b_2)}(X)(x_5): \exists x_6 \in Y^y_{x_5}, \text{ such that } f(x_5, b_2) \neq f(x_6, b_2), \text{ then } \overline{GR}_{B-(b_2)}(X)(x_5) = \frac{5}{7} = \frac{5}{4} \quad \text{and} \quad Y^{y*}_{x_5} = \{ y ; y \in \overline{GR}_{B-(b_2)}(X)(x_5) \} \quad \text{where} \quad \overline{GR}_B(X)(x_5) = \frac{|\overline{GR}_B(X)(x_5)|}{|B| - 1}.
\]

Using the result of Example 2.
\[
GR_b(X)(x_2) = \frac{2}{5}, \quad Y^y_{x_2} = \{ x_1, x_4 \}; \quad GR_b(X)(x_3) = \frac{1}{2}, \quad Y^y_{x_3} = \{ x_1 \}; \quad GR_b(X)(x_6) = \frac{3}{5}, \quad Y^y_{x_6} = \{ x_4 \}; \quad GR_b(X)(x_5) = \frac{4}{5}, \quad Y^y_{x_5} = \{ x_3, x_6 \}; \quad GR_b(X)(x_6) = 1, x_j \in \{ x_2, x_3, x_6 \}.
\]
4. Incrementally updating approximations while adding or removing an object

In this section, we consider the problem of updating approximations based on the garde indiscernibility relation of a target concept in terms of adding or removing an object.

4.1. Incrementally updating approximations when adding an object

**Proposition 7** Let $S = (U, A, V, F)$ be an information system, $B \subseteq A$, $x^\vee \notin U$, $X \subseteq U$, $U^\vee = U \cup \{x^\vee\}$. The lower and upper approximations of $X$ by adding $x^\vee$ to $U$ can be updated respectively as follows.

The lower approximation: When $x_i \in U^\vee - X$, we have $\overline{GR}_B^\vee(X)(x_i) = 0$. When $x_i \in X$, we have:

If $1 - GR_B(x_i, x^\vee) > GR_B(x_i, x^\vee)$, then $\overline{GR}_B^\vee(X)(x_i) = GR_B(x_i)$(x_i) and $\overline{Y}^\vee_{x_i} = Y^\vee_{x_i}$.

If $1 - GR_B(x_i, x^\vee) = GR_B(x_i)$, then $\overline{GR}_B^\vee(X)(x_i) = GR_B(x_i)$ and $\overline{Y}^\vee_{x_i} = Y^\vee_{x_i} \cup \{x^\vee\}$.

If $1 - GR_B(x_i, x^\vee) < GR_B(x_i)$, then $\overline{GR}_B^\vee(X)(x_i) = 1 - GR_B(x_i)\vee x^\vee$ and $\overline{Y}^\vee_{x_i} = \{x^\vee\}$.

The upper approximation: If $x_j \in X$, $\overline{GR}_B^\vee(x_j) = 1$; if $x_j \in U^\vee - \{x^\vee\} - X$, then $\overline{GR}_B^\vee(x_j) = GR_B(x_j)$ and $\overline{Y}^\vee_{x_j} = Y^\vee_{x_j}$. If $x_j = x^\vee$, then $\overline{GR}_B^\vee(x_j) = \vee_{y \in X} GR_B(x^\vee, y)$ and $\overline{Y}^\vee_{x_j} = \{y; \vee_{y \in X} GR_B(x^\vee, y)\}$.

**Proof.** Lower approximation:

If $x_i \in X$, we have $\overline{GR}_B^\vee(x_i) = \vee_{y \in (U \backslash \{x^\vee\}) \cap X} (1 - GR_B(x_i, y)) = (1 - GR_B(x_i, x^\vee)) \wedge (\wedge_{y \in U \backslash X} (1 - GR_B(x_i, y))) = (1 - GR_B(x_i, x^\vee)) \wedge GR_B(x_i)$. If $x \in U^\vee - X$, it is obviously that $\overline{GR}_B^\vee(X)(x_i) = 0$.

Upper approximation:

If $x_j \in X$, it is obviously that $\overline{GR}_B^\vee(x_j) = GR_B(x_j) = 1$. If $x_j \in U^\vee - \{x^\vee\} - X$, we have $\overline{GR}_B^\vee(x_j) = \vee_\overline{X} GR_B(x_j, y) = GR_B(x_j)$. If $x_j = x^\vee$, we have $\overline{GR}_B^\vee(x_j) = \vee_{y \in X} GR_B(x_j, y)$.

Algorithm 4.1 (Incremental algorithm for updating approximations when adding an object $x^\vee$ to $U - X$):

Step 1: Input the relation matrix $M_{n \times m}$; $GR_B(X)(x_i), Y^\vee_{x_i}, x_i \in X$; $\overline{GR}_B(x_j), x_j \in U - X$; the increasing object $x^\vee$.

Step 2: We get a new relation matrix $M_{n \times (m+1)}^\vee$. Calculate $GR_B(x^\vee, x_i), x_i \in X$.

Step 3: Calculate the lower approximations $x_i \in X$

If $1 - GR_B(x_i, x^\vee) > GR_B(x_i)$, then $GR_B^\vee(x_i) = GR_B(x_i)$ and $Y^\vee_{x_i} = Y^\vee_{x_i}$.

If $1 - GR_B(x_i, x^\vee) < GR_B(x_i)$, then $GR_B^\vee(x_i) = 1 - GR_B(x_i, x^\vee)$ and $Y^\vee_{x_i} = \{x^\vee\}$. According to Proposition 7.

Step 4: Calculate the upper approximations $x_j \in U^\vee - X$

If $x_j \in U^\vee - (x^\vee) - X$, then $\overline{GR}_B^\vee(x_j) = GR_B(x_j)$ and $\overline{Y}^\vee_{x_j} = Y^\vee_{x_j}$.

If $x_j \in U^\vee - (x^\vee) - X$, then $\overline{GR}_B^\vee(x_j) = GR_B(x_j)$ and $\overline{Y}^\vee_{x_j} = \{y; \vee_{y \in X} GR_B(x^\vee, y)\}$. According to Proposition 7.

Step 5: Output the relation matrix $M_{n \times (m+1)}^\vee$; $GR_B^\vee(X)(x_i), Y^\vee_{x_i}, x_i \in X$; $\overline{GR}_B^\vee(x_j), x_j \in U^\vee - X$. $GR_B^\vee(X)(x_i) = 0, x_j \in U^\vee - X, \overline{GR}_B^\vee(x_j) = 1, x_j \in X$.

The time complexity of Algorithm 4.1 is $O(|X||B|)$, which is mainly decided by Step 2. In the following Example 4, We use the results from Example 3 to demonstrate how algorithm 4.1 update the approximations when adding an object to $U - X$.

**Example 4** We consider the information system given in Table 2. Let $U = \{x_1, x_2, x_3, x_4, x_5, x_6\}$ be the universal set, $B = \{b_1, b_2, b_3, b_4\}$ be the conditional attribute set, $X = \{x_2, x_3, x_5\}$ be the decision set. Adding an object $x_7 \in \Psi$ to $U - X$, $U^\vee = U \cup \{x_7\}$.

| $x_i$ | $b_1$ | $b_2$ | $b_3$ | $b_4$ | $d$ |
|-------|-------|-------|-------|-------|-----|
| $x_1$ | 2     | 2     | 1     | 3     | $U^\vee$ |
| $x_2$ | 2     | 2     | 1     | 2     | $X$  |
| $x_3$ | 2     | 2     | 1     | 3     | $X$  |
| $x_4$ | 1     | 1     | 2     | 2     | $\overline{U} - X$ |
| $x_5$ | 1     | 2     | 2     | 3     | $U^\vee$ |
| $x_6$ | 1     | 2     | 2     | 2     | $X$  |
| $x_7$ | 2     | 2     | 1     | 2     | $U^\vee - X$ |
Using the result of Example 3.

\[
\begin{pmatrix}
0 & 0 & 0 \\
3/4 & 0 & 1/4 \\
0 & 3/4 & 3/4
\end{pmatrix}
\]

Proof. This proof is similar to that of Proposition 7.

Algorithm 4.2 (Incremental algorithm for updating approximations when adding an object \(x^v\) to \(X\)).

Step 1: Input the relation matrix \(M_{(m+1)}\).

Step 2: We get a new relation matrix \(M_{(m+1)}\).

Step 3: Calculate the lower approximations \(x_i \in X^v\).

Step 4: Calculate the upper approximations \(x_j \in U^v - X^v\).

Proposition 8 Let \(S = (U, A, V, F)\) be an information system, \(B \subseteq A\), \(x^v \notin U\), \(X \subseteq U\), \(U^v = U \cup \{x^v\}\). The lower and upper approximations of \(X^v = X \cup \{x^v\}\) by adding \(x^v\) to \(X\) can be updated as follows.

Lower approximation: If \(x_i \in U^v - X^v\), then \(GR^v_B(X^v)(x_i) = 0\); if \(x_i \in X\), then \(GR^v_B(X^v)(x_i) = GR_B(X)(x_i)\) and \(Y^v_{x_i} = Y_{x_i}^\wedge\). If \(x_i = x^v\), then \(GR^v_B(X^v)(x_i) = \bigwedge_{y \in U^v - X^v} (1 - GR_B(x^v, y))\) and \(Y^v_{x_i} = \{y; x \in U^v - X^v\} GR_B(x^v, y)\).

Upper approximation: When \(x_j \in X^v\), we have \(GR^v_B(X^v)(x_j) = 1\). When \(x_j \in U^v - X^v\), we have:

If \(GR_B(x_j, x^v) > GR_B(X)(x_j)\), then \(GR^v_B(X^v)(x_j) = GR_B(x_j, x^v)\) and \(Y^v_{x_j} = \{x^v\}\).

If \(GR_B(x_j, x^v) = GR_B(X)(x_j)\), then \(GR^v_B(X^v)(x_j) = GR_B(X)(x_j)\) and \(Y^v_{x_j} = Y^v_{x_j} \cup \{x^v\}\).

If \(GR_B(x_j, x^v) < GR_B(X)(x_j)\), then \(GR^v_B(X^v)(x_j) = GR_B(X)(x_j)\) and \(Y^v_{x_j} = Y^v_{x_j}\).

According to Proposition 8.
Step 5: Output the relation matrix $M^*_x \times_{(m+1)x_m}$; $GR^v_B(\mathbf{X}^v)(x_i)$, $Y^\downarrow x_i$, $x_i \in X^v$; $GR^v_B(\mathbf{X}^v)(x_j)$, $Y^\downarrow x_j$, $x_j \in U^v - X^v$; $GR^v_B(\mathbf{X}^v)(x_i) = 0, x_i \in U^v - X^v, GR^v_B(\mathbf{X}^v)(x_j) = 1, x_j \in X^v$.

The Algorithm 4.2 has a time complexity of $O(|U - X||B|)$, which is mainly decided by Step 2. In the following Example 5, We use the results from Example 4 to demonstrate how algorithm 4.2 update the approximations when adding an object to $X$.

Example 5 We consider the information system given in Table 3. Let $U = \{x_1, x_2, x_3, x_4, x_5, x_6, x_7\}$ be the universal set, $B = \{b_1, b_2, b_3, b_4, b_5\}$ be the conditional attribute set, $X = \{x_2, x_3, x_6\}$ be the decision set. Adding $x_8 \in \Phi$ to $X$, $X^v = X \cup \{x_8\}$.

| Table 4. | $b_1$ | $b_2$ | $b_3$ | $b_4$ | $b_5$ |
|----------|------|------|------|------|------|
| $x_1$   | 2    | 1    | 1    | 3    |      |
| $x_2$   | 2    | 1    | 2    | 2    |      |
| $x_3$   | 2    | 2    | 1    | 3    |      |
| $x_4$   | 1    | 1    | 2    | 2    |      |
| $x_5$   | 1    | 2    | 2    | 3    |      |
| $x_6$   | 1    | 2    | 2    | 2    |      |
| $x_7$   | 1    | 2    | 2    | 1    |      |
| $x_8$   | 2    | 1    | 2    | 2    |      |

Using the result of Example 4.

$$M_{3 \times 4} = x_3 \begin{pmatrix} 2/4 & 3/4 & 0 & 2/4 \\ 3/4 & 0 & 2/4 & 1/4 \\ 0 & 3/4 & 3/4 & 3/4 \end{pmatrix}$$

From the Step 2 of Algorithm 4.2 we have a new relation matrix $M^*_{4 \times 4}$:

$$M^*_{4 \times 4} = x_8 \begin{pmatrix} 2/4 & 3/4 & 1/4 & 1/4 \\ 3/4 & 0 & 2/4 & 1/4 \\ 0 & 3/4 & 3/4 & 3/4 \\ 2/4 & 3/4 & 1/4 & 1/4 \end{pmatrix}$$

The lower and upper approximations of $X^v = \{x_2, x_3, x_6, x_8\}$ by adding $x_8$ to $X$ are updated as follows.

From the step 3 of algorithm 4.2 we have the lower approximations:

$$GR^v_B(\mathbf{X}^v)(x_8) = \bigwedge_{y \in \{x_2, x_3, x_6\}} (1 - GR^v_B(x_8, y)) = \frac{1}{4},$$

and $Y^\downarrow x_8 = \{y; y \in \{x_2, x_3, x_6\}, GR^v_B(x_8, y)\} = \{x_4\}$.

$$GR^v_B(\mathbf{X}^v)(x_i) = GR^v_B(\mathbf{X})(x_i), Y^\downarrow x_i = Y^\downarrow x_i, x_i \in \{x_2, x_3, x_6\}.$$

$$GR^v_B(\mathbf{X}^v)(x_8) = 0, x_i \in \{x_1, x_4, x_5, x_7\}.$$

From the step 4 of algorithm 4.2 we have the upper approximations:

$$GR^v_B(\mathbf{X}^v)(x_1):$$ Since $GR^v_B(x_1, x_8) < GR^v_B(x_1, x)$, then $GR^v_B(\mathbf{X}^v)(x_1) = GR^v_B(\mathbf{X})(x_1) = \frac{3}{4}$ and $Y^\uparrow x_1 = \{x_3\}$.

$$GR^v_B(\mathbf{X}^v)(x_4):$$ Since $GR^v_B(x_4, x_8) < GR^v_B(x_4, x)$, then $GR^v_B(\mathbf{X}^v)(x_4) = GR^v_B(\mathbf{X})(x_4) = \frac{3}{4}$ and $Y^\uparrow x_4 = \{x_4\} \cup \{x_8\} = \{x_2, x_6, x_8\}$.

$$GR^v_B(\mathbf{X}^v)(x_5):$$ Since $GR^v_B(x_5, x_8) < GR^v_B(x_5, x)$, then $GR^v_B(\mathbf{X}^v)(x_5) = GR^v_B(\mathbf{X})(x_5) = \frac{3}{4}$ and $Y^\uparrow x_5 = \{x_5\}$.

$$GR^v_B(\mathbf{X}^v)(x_7):$$ Since $GR^v_B(x_7, x_8) < GR^v_B(x_7, x)$, then $GR^v_B(\mathbf{X}^v)(x_7) = GR^v_B(\mathbf{X})(x_7) = \frac{3}{4}$ and $Y^\uparrow x_7 = \{x_6\}$.

$$GR^v_B(\mathbf{X}^v)(x_j) = 1, x_j \in \{x_2, x_3, x_6, x_8\}.$$

4.2. Incrementally updating approximations when removing an object

Proposition 9 Let $S = (U, A, V, F)$ be an information system, $B \subseteq A$, $x^\downarrow \in U$ and $x^\downarrow \notin X$, $X \subseteq U$, $U^\downarrow = U - \{x^\downarrow\}$. The lower and upper approximations of $X$ by removing $x^\downarrow$ from $U$ can be updated respectively as follows.

$$\begin{pmatrix} x_1 & x_4 & x_5 & x_7 \\ x_2 & 2/4 & 3/4 & 1/4 & 1/4 \\ x_3 & 3/4 & 0 & 2/4 & 1/4 \\ x_6 & 2/4 & 3/4 & 1/4 & 1/4 \end{pmatrix}$$
Lower approximation: If \( x_i \in U^\wedge - X \), then 
\( GR_B(X)(x_i) = GR_B(X)(x_i) = 0 \). If \( x_i \in X \), then we have:

If \( GR_B(X)(x_i) = 1 - GR_B(x_i, x^\wedge) \), then 
\( GR_B(X)(x_i) = \bigwedge_{y \in U^\wedge - X} (1 - GR_B(x_i, y)) \) and \( Y_{x_i}^\mu = \{ y; y \in U^\wedge - X \} \).

If \( \exists y \in Y_{x_i}^\mu \) such that \( GR_B(X)(x_i) = 1 - GR_B(x_i, y) \), then \( GR_B(X)(x_i) = GR_B(X)(x_i) \) and \( Y_{x_i}^\mu = Y_{x_i} - \{ x^\wedge \} \).

Upper approximation: \( GR_B(X)(x_i) = GR_B(X)(x_i) \), \( x_j \in X \), and \( GR_B(X)(x_j) = GR_B(X)(x_j) \), \( Y_{x_j}^\nu = Y_{x_j} \), \( x_j \in U^\wedge - X \).

Algorithm 4.3 (Incremental algorithm for updating approximations when removing an object \( x^\wedge \) from \( U - X \))

Step 1: Input the relation matrix \( M_{n \times n} \);

\( GR_B(X)(x_i), Y_{x_i}^\wedge, x_i \in X; GR_B(X)(x_j), Y_{x_j}^\nu, x_j \in U - X \).

Step 2: We get a new relation matrix \( M^*_n \);

// Delete \( GR_B(x^\wedge, x_i), x_i \in X \) from the relation matrix \( M_{n \times n} \).

Step 3: Calculate the lower approximations \( x_i \in X \)

If \( \exists y \in Y_{x_i}^\mu \), such that \( GR_B(X)(x_i) = 1 - GR_B(x_i, y) \), then \( GR_B(X)(x_i) = GR_B(X)(x_i) \) and \( Y_{x_i}^\mu = Y_{x_i} - \{ x^\wedge \} \).

Else \( GR_B(X)(x_i) = \bigwedge_{y \in U^\wedge - X} (1 - GR_B(x_i, y)) \) and \( Y_{x_i}^\nu = \{ y; \bigvee_{y \in U^\wedge - X} GR_B(x_i, y) \} \). // According to the Proposition 9.

Step 4: Calculate the upper approximations \( x_j \in U^\wedge - X \)

\( GR_B(X)(x_j) = GR_B(X)(x_j), Y_{x_j}^\nu = Y_{x_j} \). // According to the Proposition 9.

Step 5: Output the relation matrix \( M^*_n \);

\( GR_B(X)(x_i), Y_{x_i}^\wedge, x_i \in X; GR_B(X)(x_j), Y_{x_j}^\nu, x_j \in U^\wedge - X; GR_B(X)(x_i) = 0, x_i \in U^\wedge - X \) and \( GR_B(X)(x_j) = 1, x_j \in X \).

The Algorithm 4.3 has a time complexity of \( O(|X|) \), which is mainly decided by Step 2. In the following Example 6, we use the results from Example 5 to demonstrate how algorithm 4.3 update the approximations when removing an object from \( U - X \).

Example 6 We consider the information system given in Table 4. Let \( U = \{ x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8 \} \) be the universal set, \( B = \{ b_1, b_2, b_3, b_4, b_5 \} \) be the condi-
tional attribute set, \( X = \{ x_2, x_3, x_6, x_8 \} \) be the decision set. Removing \( x_4 \in \Psi \) from \( U - X \).

| \( x_1 \) | 2 | 1 | 1 | 3 | \( U - X \) |
| \( x_2 \) | 2 | 1 | 2 | 2 | \( X \) |
| \( x_3 \) | 2 | 2 | 1 | 3 | \( X \) |
| \( x_5 \) | 1 | 2 | 2 | 3 | \( U - X \) |
| \( x_6 \) | 1 | 2 | 2 | 2 | \( X \) |
| \( x_7 \) | 1 | 2 | 2 | 1 | \( U - X \) |
| \( x_8 \) | 2 | 1 | 2 | 2 | \( X \) |

Using the result of Example 5.

| \( x_1 \) | 3/4 | 3/4 | 1/4 | 1/4 |
| \( x_3 \) | 2/4 | 3/4 | 1/4 | 1/4 |
| \( x_5 \) | 3/4 | 0 | 3/4 | 3/4 |
| \( x_8 \) | 2/4 | 3/4 | 1/4 | 1/4 |

\( GR_B(X)(x_2) = \frac{1}{3}, Y_{x_2}^\wedge = \{ x_4 \}; \quad GR_B(X)(x_3) = \frac{1}{4}, Y_{x_3}^\wedge = \{ x_1 \}; \quad GR_B(X)(x_6) = \frac{1}{4}, Y_{x_6}^\wedge = \{ x_4, x_5, x_7 \}; \quad GR_B(X)(x_8) = \frac{1}{4}, Y_{x_8}^\wedge = \{ x_4 \}; \quad GR_B(X)(x_5) = 0, x_i \in \{ x_1, x_4, x_5, x_7 \}. \)

\( GR_B(X)(x_1) = \frac{1}{3}, Y_{x_1}^\wedge = \{ x_3 \}; \quad GR_B(X)(x_4) = \frac{3}{4}, Y_{x_4}^\wedge = \{ x_2, x_6, x_8 \}; \quad GR_B(X)(x_8) = \frac{1}{4}, Y_{x_8}^\wedge = \{ x_6 \}; \quad GR_B(X)(x_7) = \frac{3}{4}, Y_{x_7}^\wedge = \{ x_6 \}; \quad GR_B(X)(x_5) = 1, x_j \in \{ x_2, x_3, x_6, x_8 \}. \)

From the Step 2 of Algorithm 4.3 we have a new relation matrix \( M^*_4 \):

\( M^*_4 = \begin{bmatrix} x_1 & x_5 & x_7 \\ x_2 & 2/4 & 1/4 & 1/4 \\ x_3 & 3/4 & 2/4 & 1/4 \\ x_5 & 2/4 & 1/4 & 1/4 \end{bmatrix} \)

The lower and upper approximations of \( X = \{ x_2, x_3, x_6, x_8 \} \) by removing \( x_4 \) from \( U - X \) be updated as follows:

From the step 3 of Algorithm 4.3 we have the lower approximations:

\( GR_B(X)(x_2): Since \ GR_B(X)(x_2) = 1 - GR_B(x_2, x_4), then \ GR_B(X)(x_2) = \bigwedge_{y \in \{ x_1, x_5, x_7 \}} (1 - GR_B(x_2, y)) = \frac{3}{4} \) and \( Y_{x_2}^\wedge = \{ y; y \in \bigvee_{y \in \{ x_1, x_5, x_7 \}} GR_B(x_2, y) \} = \{ x_1 \} \).
\( GR_{B}^{\alpha}(X)(x_3) \): Since \( Y_{x_3}^{\alpha} = \{x_1\}, GR_{B}^{\alpha}(X)(x_3) = 1 - GR_{B}(x_3,x_1) \), then \( GR_{B}^{\alpha}(X)(x_3) = GR_{B}^{\alpha}(X)(x_1) = \frac{1}{4} \) and \( Y_{x_3}^{\alpha} = Y_{x_1}^{\alpha} = \{x_4\} = \{x_3,x_1\} \).

\( GR_{B}^{\alpha}(X)(x_6) \): Since \( \exists x_3 \in Y_{x_6}^{\alpha}, \) such that \( GR_{B}^{\alpha}(X)(x_3) = 1 - GR_{B}(x_6,x_3), \) then \( GR_{B}^{\alpha}(X)(x_6) = GR_{B}(x_6,x_3) = \frac{1}{4} \) and \( Y_{x_6}^{\alpha} = Y_{x_3}^{\alpha} = \{x_4\} = \{x_3,x_1\} \).

\( GR_{B}(X)(x_8) = \frac{1}{4} \) and \( Y_{x_8}^{\alpha} = \{x_9\} = \{x_5\} \).

\( GR_{B}(x_8,x_4) \), then \( GR_{B}^{\alpha}(X)(x_8) = \wedge_{y \in \{x_1,x_3,x_7\}} (1 - GR_{B}(x_8,y)) = \frac{2}{3} \) and \( Y_{x_8}^{\alpha} = \{y; \vee GR_{B}(x_8,y)\} = \{x_3\} \).

From the step 4 of algorithm 4.3 we have the upper approximations:

\( GR_{B}(X)(x_3) = GR_{B}(x_3,x_1) = 0, x_3 \in \{x_1,x_3,x_7\} \).

The lower approximations of \( X \) are \( X - \{x^6\} \) by removing \( x^6 \) from \( X \) can be respectively updated as follows:

**Proposition 10** Let \( S = (U,A,V,F) \) be an information system, \( B \subseteq A, U^\alpha = U - \{x^\alpha\}, x^\alpha \in X, X \subseteq U \). The lower and upper approximations of \( X^\alpha = X - \{x^\alpha\} \) can be respectively updated as follows:

**Step 4:** Calculate the upper approximations \( x_j \in U^\alpha - X^\alpha \)

If \( \exists y \in Y_{x_j}^{\alpha} \) such that \( y \neq Y_{x_j}^{\alpha} = \{y; \vee GR_{B}(x_j,y)\} \).

The Algorithm 4.4 has a time complexity of \( O(|U| - X) \), which is mainly decided by Step 2. In the following Example 7, We use the results from Example 6 to demonstrate how algorithm 4.4 update the approximations when removing an object from \( X \).

**Example 7** Let \( X = \{x_1,x_2,x_3,x_5,x_6,x_7,x_8\} \) be the universal set, \( B = \{b_1,b_3,b_4,b_5\} \) be the conditional attribute set, \( X = \{x_2,x_3,x_6,x_8\} \) be the decision set. Removing \( x_3 \in X_{\Phi} \) from \( X, X^\alpha = X - \{x_3\} \).

| \( x_1 \) | \( x_2 \) | \( x_3 \) | \( x_4 \) | \( x_5 \) | \( x_6 \) | \( x_7 \) | \( x_8 \) |
|---|---|---|---|---|---|---|---|
| 2 | 1 | 1 | 3 | 2 | 3 | 1 | 2 |

Using the result of Example 6.

**Step 1:** Input the relation matrix \( M_{\text{new}} \); \( GR_{B}(X)(x_1), Y_{x_1}^{\alpha}, x_1 \in X; GR_{B}(X)(x_5), Y_{x_5}^{\alpha}, x_5 \in U - X \).

**Step 2:** We get a new relation matrix \( M_{\text{new}} \).

**Step 3:** Calculate the lower approximations \( x_i \in X^\alpha \)

\( GR_{B}(X)(x_2) = \frac{2}{3}, Y_{x_2}^{\alpha} = \{x_1\} \); \( GR_{B}(x_3) = \frac{1}{4}, Y_{x_3}^{\alpha} = \{x_1\}, GR_{B}(X)(x_6) = \frac{4}{3}, Y_{x_6}^{\alpha} = \{x_5\} \); \( GR_{B}(X)(x_8) = \frac{2}{4}, Y_{x_8}^{\alpha} = \{x_1\}; GR_{B}(X)(x_5) = 0, x_5 \in \{x_1,x_3,x_7\} \).
\[
\overline{GR}_B(X)(x_1) = \frac{3}{4}, Y^\vee_{x_1} = \{x_3\}; \overline{GR}_B(X)(x_5) = \frac{3}{4}, Y^\vee_{x_5} = \{x_6\}; \overline{GR}_B(X)(x_7) = \frac{3}{4}, Y^\vee_{x_7} = \{x_6\}; \overline{GR}_B(X)(x_1) = 1, x_j \in \{x_2, x_3, x_6, x_8\}.
\]

From the Step 2 of Algorithm 4.4 we have a new relation matrix \(M^*_3 \times 3\):

\[
\begin{pmatrix}
    x_1 & x_3 & x_7 \\
    x_2 & 2/4 & 1/4 & 1/4 \\
    x_6 & 0 & 3/4 & 3/4 \\
    x_8 & 2/4 & 1/4 & 1/4 \\
\end{pmatrix}
\]

The lower and upper approximations of \(X^\wedge = \{x_2, x_6, x_8\}\) by removing \(x_3\) from \(X\) be updated as follows:

From the Step 3 of algorithm 4.4 we have the lower approximations:

\[
\overline{GR}^\wedge_3(X')(x_1) = \overline{GR}_B(X)(x_1), \quad Y^\wedge_{x_1} = Y^\wedge_{x_1}, \quad x_1 \in \{x_2, x_6, x_8\}, \text{ and } \overline{GR}^\wedge_3(X')(x_7) = 0, x_7 \in \{x_1, x_3, x_7\}.
\]

From the Step 4 of algorithm 4.4 we have the upper approximations:

\[
\overline{GR}^\vee_3(X')(x_1): \quad \overline{GR}_B(X)(x_1) = \overline{GR}_B(X)(x_1), \quad Y^\vee_{x_1} = Y^\vee_{x_1}, \quad y_{x_1} = \{y; \cup \overline{GR}_B(x_1, y) = 2/4 \text{ and } Y^\wedge_{x_1} = \{x_2, x_6\}, \quad x_3 \in \{x_2, x_6, x_8\}.
\]

\[
\overline{GR}^\vee_3(X')(x_3): \quad \overline{GR}_B(X)(x_3) = \overline{GR}_B(X)(x_3), \quad Y^\vee_{x_3} = Y^\vee_{x_3}, \quad y_{x_3} = \{y; \cup \overline{GR}_B(x_3, y) = 2 \text{ and } Y^\wedge_{x_3} = \{x_6\}.
\]

\[
\overline{GR}^\vee_3(X')(x_7): \quad \overline{GR}_B(X)(x_7) = \overline{GR}_B(X)(x_7), \quad Y^\wedge_{x_7} = \{x_6\}, \quad x_7 \in \{x_2, x_3, x_6, x_7\}.
\]

5. Incrementally updating approximations when changing the attribute value of the object

In practical situation, the attribute values of the object are likely to change, as well. In this section, we discuss the methods of incrementally updating approximations based on the grade indiscernibility relation when changing the decision attribute value and the conditional attribute value of the object, respectively.

5.1. Incrementally updating approximations when changing the decision attribute value of the object

**Proposition 11** Let \(S = (U, A, V, F)\) be an information system, \(B \subseteq A, X \subseteq U, x^\wedge \in U \text{ and } x^\vee \in X\). The lower and upper approximations of \(X^\wedge = X \cup \{x^\wedge\}\) by changing the decision attribute value of \(x^\wedge\) from \(U \text{ to } X\) can be updated respectively as follows.

**Lower approximation:** If \(x_i \in U \text{ to } X\), we have

\[
\overline{GR}_B(X')(x_i) = \overline{GR}_B(X)(x_i) = 0. \quad \text{If } x_i \in X, \text{ we have: if } \exists y \in Y^\wedge_{x_i}, \text{such that } \overline{GR}_B(X)(x_i) = 1 - \overline{GR}_B(x_i, y), \text{ then } \overline{GR}_B(X')(x_i) = \overline{GR}_B(X)(x_i) \text{ and } Y^\wedge_{x_i} = Y^\vee_{x_i} - \{x^\wedge\}.
\]

If \(\overline{GR}_B(X)(x_i) = 1 - \overline{GR}_B(x_i, x^\wedge)\) or \(x_i = x^\wedge\), then

\[
\overline{GR}_B(X')(x_i) = \bigwedge_{y \in U \setminus X}(1 - \overline{GR}_B(x_i, y)) \text{ and } Y^\wedge_{x_i} = \{y; \cup \overline{GR}_B(x_i, y)\}.
\]

**Upper approximation:** If \(x_i \in X\), we have

\[
\overline{GR}_B(X')(x_i) = 1. \quad \text{If } x_i \in U \text{ to } X, \text{ we have: if } \overline{GR}_B(x_i, x^\wedge) > \overline{GR}_B(X)(x_i), \text{ then } \overline{GR}_B(X')(x_i) = \overline{GR}_B(x_i, x^\wedge). \text{ If } \overline{GR}_B(x_i, x^\wedge) = \overline{GR}_B(X)(x_i), \text{ then } \overline{GR}_B(X')(x_i) = \overline{GR}_B(X)(x_i) \text{ and } Y^\wedge_{x_i} = Y^\vee_{x_i} \cup \{x^\wedge\}.
\]

If \(\overline{GR}_B(x_i, x^\wedge) < \overline{GR}_B(X)(x_i), \text{ then } \overline{GR}_B(X')(x_i) = \overline{GR}_B(X)(x_i) \text{ and } Y^\wedge_{x_i} = Y^\vee_{x_i} \text{.}
\]

Algorithm 5.1 (Incremental algorithm for updating approximations when changing the decision attribute value of \(x^\wedge, x^\wedge \in U \text{ to } X\))

1. Step 1: Input the relation matrix \(M_{n \times m}; \quad \text{if } \overline{GR}_B(X)(x_i) = \overline{GR}_B(x_i, y), \text{ then } x_i \in X \text{ from the relation matrix } M_{n \times m} \text{ and calculate } \overline{GR}_B(x^\wedge, x_i), x_i \in U \setminus X^\wedge.
\]

2. Step 2: Calculate the upper approximations \(x_i \in X^\wedge
\]

If \(\exists y \in Y^\wedge_{x_i}, \text{ such that } \overline{GR}_B(x_i, y) \neq 1 - \overline{GR}_B(x_i, x^\wedge)\), then \(\overline{GR}_B(X')(x_i) = \overline{GR}_B(X)(x_i) \text{ and } Y^\wedge_{x_i} = Y^\vee_{x_i} - \{x^\wedge\}.
\]

If \(\overline{GR}_B(x_i, x^\wedge) = \overline{GR}_B(X)(x_i)\), then \(\overline{GR}_B(X')(x_i) = \overline{GR}_B(X)(x_i) \text{ and } Y^\wedge_{x_i} = Y^\vee_{x_i} \text{.}
\]

3. Step 3: Calculate the upper approximations \(x_i \in U \setminus X^\wedge
\]

If \(\exists y \in Y^\wedge_{x_i}, \text{ such that } \overline{GR}_B(x_i, y) = 1 - \overline{GR}_B(x_i, x^\wedge)\), then \(\overline{GR}_B(X')(x_i) = \overline{GR}_B(X)(x_i) \text{ and } Y^\wedge_{x_i} = Y^\vee_{x_i} - \{x^\wedge\}.
\]

4. Step 4: Calculate the upper approximations \(x_i \in U \setminus X^\wedge
\]
If \( GR_B(x_j, x^\wedge) > GR_B(X)(x_j) \), then \( GR_B(X^\wedge)(x_j) = GR_B(x_j, x^\wedge) \) and \( Y^\wedge x_j = x^\wedge \).

If \( GR_B(x_j, x^\vee) = GR_B(X)(x_j) \), then \( GR_B(X^\vee)(x_j) = GR_B(X)(x_j) \) and \( Y^\wedge x_j = Y^\vee x_j \).

If \( GR_B(x_j, x^\vee) < GR_B(X)(x_j) \), then \( GR_B(X^\vee)(x_j) = GR_B(X)(x_j) \) and \( Y^\vee x_j = Y^\vee x_j \). // According to the Proposition 11.

Step 5: Output the relation matrix \( M_{(m+1)\times(m-1)}^* \): 
\[
GR_B(X^\wedge)(x_i), \ Y^\wedge x_i, \ x_i \in X^\wedge; \ GR_B(X^\vee)(x_i), \ Y^\vee x_i, \ x_i \in U - X^\wedge; \ GR_B(X^\vee)(x_i) = 0, \ x_i \in U - X^\vee, \text{ and } \ GR_B(X^\vee)(x_i) = 1, \ x_i \in X^\vee.
\]

The Algorithm 5.1 has a time complexity of \( O((U \times X)|B|) \), which is mainly decided by Step 2. In the following Example 8, We use the results from Example 7 to demonstrate how algorithm 5.1 update the approximations when changing the decision value of the object from \( U - X \) to \( X \).

**Example 8** We consider the information system given in Table 6. Let \( U = \{x_1, x_2, x_5, x_6, x_7, x_8\} \) be the universal set, \( B = \{b_1, b_2, b_4, b_5\} \) be the conditional attribute set, \( X = \{x_2, x_5, x_8\} \) be the decision set. Changing the decision attribute value of \( x_5 \) to \( X \) from \( U - X \), \( X^\vee = X \cup \{x_5\} \).

| \( b_1 \) | \( b_2 \) | \( b_3 \) | \( b_4 \) | \( b_5 \) | \( d \) |
|---|---|---|---|---|---|
| \( x_1 \) | 2 | 1 | 1 | 3 | \( U - X \) |
| \( x_2 \) | 2 | 1 | 2 | 2 | \( X \) |
| \( x_5 \) | 1 | 2 | 2 | 3 | \( X \) |
| \( x_6 \) | 1 | 2 | 2 | 2 | \( X \) |
| \( x_7 \) | 1 | 2 | 1 | \( U - X \) | 2 |
| \( x_8 \) | 2 | 1 | 2 | 2 | \( X \) |

Using the result of Example 7.

\[
GR_B(X)(x_2) = \frac{3}{4}, \ Y^\wedge x_2 = \{x_1\}; \ GR_B(X)(x_6) = \frac{1}{4}, \ Y^\wedge x_6 = \{x_5, x_7\}; \ GR_B(X)(x_8) = \frac{3}{4}, \ Y^\wedge x_8 = \{x_1\}; \ GR_B(X)(x_i) = 0, \ x_i \in \{x_1, x_5, x_7\}.
\]

\[
GR_B(X^\wedge)(x_1) = \frac{5}{4}, \ Y^\wedge x_1 = \{x_2, x_8\}; \ GR_B(X^\wedge)(x_5) = \frac{1}{4}, \ Y^\wedge x_5 = \{x_6\}; \ GR_B(X^\wedge)(x_8) = \frac{1}{4}, \ Y^\wedge x_8 = \{x_6\}; \ GR_B(X^\vee)(x_1) = 1, \ x_j \in \{x_2, x_6, x_8\}.
\]

From the Step 2 of Algorithm 5.1 we have a new relation matrix \( M_{4 \times 2}^* \):

\[
M_{4 \times 2}^* = \begin{pmatrix}
(1, 2) & (1, 3) \\
2 & 1 & 3 & \frac{1}{4} & 1/4 & 1/4 \\
0 & \frac{3}{4} & 3/4 & \\
0 & \frac{1}{4} & 1/4 & 1/4 & \frac{1}{4} & 1/4 & 1/4 \\
(2, 3) & (2, 2) & (2, 1) & (2, 0) & (2, 3) & (2, 2) & (2, 1) & (2, 0) & (2, 3) & (2, 2) & (2, 1) & (2, 0) & (2, 3) & (2, 2) & (2, 1) & (2, 0) & (2, 3) & (2, 2) & (2, 1) & (2, 0)
\end{pmatrix}
\]

The lower and upper approximations of \( X^\wedge = \{x_2, x_5, x_6, x_8\} \) by changing the decision attribute value \( x_5 \in U - X \) to \( x_5 \in X \) are updated as follows:

From the step 3 of algorithm 5.1 we have the lower approximations:

\[
GR_B(X^\wedge)(x_2): \text{ Since } Y^\wedge x_2 = \{x_1\}; \ GR_B(X^\wedge)(x_2) = 1 - GR_B(x_2, x_1), \text{ then } GR_B(X^\wedge)(x_2) = GR_B(X)(x_2) = \frac{2}{4} \text{ and } Y^\wedge x_2 = Y^\wedge x_2 - \{x_5\} = \{1\} .
\]

\[
GR_B(X^\wedge)(x_6): \text{ Since } \exists \in \{y_\in\{x_1, x_7\} \text{ such that } GR_B(X)(x_6) = 1 - GR_B(x_6, x_7), \text{ then } GR_B(X^\wedge)(x_6) = GR_B(X)(x_6) = \frac{1}{4} \text{ and } Y^\wedge x_6 = Y^\wedge x_6 - \{x_5\} = \{x_7\} .
\]

\[
GR_B(X^\wedge)(x_8): \text{ Since } Y^\wedge x_8 = \{x_1\}; \ GR_B(X^\wedge)(x_8) = 1 - GR_B(x_8, x_1), \text{ then } GR_B(X^\wedge)(x_8) = GR_B(X)(x_8) = \frac{3}{4} \text{ and } Y^\wedge x_8 = Y^\wedge x_8 - \{x_5\} = \{x_8\} .
\]

\[
GR_B(X^\wedge)(x_5): \text{ GR}_B(X^\wedge)(x_5) = 1 \wedge \{1 - GR_B(x_5, y)\} = \frac{1}{4} \text{ and } Y^\wedge x_8 = \{y; x_5 \}
\]

From the step 4 of algorithm 5.1 we have the upper approximations:

\[
GR_B(X^\wedge)(x_1): \text{ Since } GR_B(x_1, x_5) < GR_B(X)(x_1), \text{ then } GR_B(X^\wedge)(x_1) = GR_B(X)(x_1) = \frac{1}{4} \text{ and } Y^\wedge x_1 = Y^\wedge x_1 - \{x_5, x_8\} .
\]

\[
GR_B(X^\wedge)(x_7): \text{ Since } GR_B(x_7, x_5) < GR_B(X)(x_7), \text{ then } GR_B(X^\wedge)(x_7) = GR_B(X)(x_7) = \frac{1}{4} \text{ and } Y^\wedge x_7 = Y^\wedge x_7 - \{x_5\} = \{x_5, x_6\} .
\]

\[
GR_B(X^\wedge)(x_8): \text{ GR}_B(X^\wedge)(x_8) = 1, x_j \in \{x_2, x_5, x_6, x_8\} .
\]

**Proposition 12** Let \( S = (U, A, V, F) \) be an information system, \( B \subseteq A, X \subseteq U, x^\wedge \in X \). The lower and upper approximations of \( X^\wedge = X \{x^\wedge\} \) by changing the decision attribute value of \( x^\wedge \) from \( U - X \) to \( U - X \) can be updated respectively as follows.

**Lower approximation:** If \( x_i \in U - X^\wedge \), we have \( GR_B(X^\wedge)(x_i) = 0; \text{ if } x_i \in X^\wedge \), we have:
If \( 1 - GR_B(x_i, x^\wedge) > GR_B(X)(x_i) \), then \( GR_B(X^\wedge)(x_i) = GR_B(X)(x_i) \) and \( Y_{x_i}^\wedge = Y_{x_i}^\wedge \); 
If \( 1 - GR_B(x_i, x^\wedge) < GR_B(X)(x_i) \), then \( GR_B(X^\wedge)(x_i) = GR_B(X)(x_i) \) and \( Y_{x_i}^\wedge = Y_{x_i}^\wedge \cup \{x^\wedge\} \); 
If \( 1 - GR_B(x_i, x^\wedge) = GR_B(X)(x_i) \), then \( GR_B(X^\wedge)(x_i) = 1 - GR_B(x_i, x^\wedge) \) and \( Y_{x_i}^\wedge = \{x^\wedge\} \).

Upper approximation: If \( x_j \in X^\wedge \), we have \( GR_B(X^\wedge)(x_j) = GR_B(X)(x_j) = 1 \); If \( x_j \in U - X^\wedge \), we have:

If \( \exists y \in Y_{x_j}^\wedge \) such that \( GR_B(X)(x_j) = GR_B(x_j, y) \), then \( GR_B(X^\wedge)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^\wedge = Y_{x_j}^\wedge \).

If \( GR_B(X)(x_j) = GR_B(x_j, x^\wedge) \), or \( x_j = x^\wedge \), then \( GR_B(X)(x_j) = \forall y \in X^\wedge \) and \( Y_{x_j}^\wedge = \{y, \forall y \in GR_B(x_j, y)\} \).

Algorithm 5.2 (Incremental algorithm for updating approximations when changing the decision attribute value of \( x^\wedge \), \( x^\wedge \in X \) to \( x^\wedge \in U - X \))

Step 1: Input the relation matrix \( M_{nxm} \);
\( GR_B(X)(x_i), Y_{x_i}^\wedge, x_i \in X; GR_B(X)(x_j, y) \), \( x_j \in U - X \).

Step 2: We get a new relation matrix \( M^\wedge_{nxm} \); // Delete \( x_j \in U - X \) from the relation matrix \( M_{nxm} \) and calculate \( GR_B(x_j, x_j^\wedge), x_j \in X^\wedge \).

Step 3: Calculate the lower approximations \( x_j \in X^\wedge \)

If \( 1 - GR_B(x_j, x_j^\wedge) > GR_B(X)(x_j) \), then \( GR_B(X^\wedge)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^\wedge = Y_{x_j}^\wedge \); 
If \( 1 - GR_B(x_j, x_j^\wedge) < GR_B(X)(x_j) \), then \( GR_B(X^\wedge)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^\wedge = Y_{x_j}^\wedge \cup \{x_j^\wedge\} \); 
If \( 1 - GR_B(x_j, x_j^\wedge) = GR_B(X)(x_j) \), then \( GR_B(X^\wedge)(x_j) = 1 - GR_B(x_j, x_j^\wedge) \) and \( Y_{x_j}^\wedge = \{x_j^\wedge\} \). // According to the Proposition 12.

Step 4: Calculate the upper approximations \( x_j \in U - X^\wedge \)

If \( \exists y \in Y_{x_j}^\wedge \) such that \( GR_B(X)(x_j) = GR_B(x_j, y) \), then \( GR_B(X^\wedge)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^\wedge = Y_{x_j}^\wedge \).
Else \( GR_B(X)(x_j) = \forall x \in X^\wedge \) and \( Y_{x_j}^\wedge = \{y, \forall y \in GR_B(x_j, y)\} \). // According to the Proposition 12.

Step 5: Output the relation matrix \( M^\wedge_{nxm} \);
\( GR_B(X^\wedge)(x_j), Y_{x_j}^\wedge, x_j \in X^\wedge; GR_B(X^\wedge)(x_j) \) and \( Y_{x_j}^\wedge, x_j \in U - X^\wedge; GR_B(X^\wedge)(x_i) = 0, x_i \in U - X^\wedge \), and \( GR_B(X^\wedge)(x_j) = 1, x_j \in X^\wedge \).

The Algorithm 5.2 has a time complexity of \( O(|X||B|) \), which is mainly decided by Step 2. In the following Example 9, We use the results from Example 8 to demonstrate how algorithm 5.2 update the approximations when changing the decision attribute value of the object from \( X \) to \( U - X \).

Example 9 We consider the information system given in Table 7. Let \( U = \{x_1, x_2, x_3, x_6, x_7, x_8\} \) be the universal set, \( B = \{b_1, b_2, b_3, b_5\} \) be the conditional attribute set, \( X = \{x_2, x_3, x_6, x_8\} \) be the decision set. Changing the decision attribute value \( x_8 \) from \( X \) to \( U - X \), \( X^\wedge = \{x_2, x_3, x_6\} \).

| \( b_1 \) | \( b_2 \) | \( b_3 \) | \( b_4 \) | \( b_5 \) | \( d \) |
|---|---|---|---|---|---|
| \( x_1 \) | 2 | 1 | 1 | 3 | \( U - X \) |
| \( x_2 \) | 2 | 1 | 2 | 2 | \( X \) |
| \( x_5 \) | 1 | 2 | 2 | 3 | \( X \) |
| \( x_6 \) | 1 | 2 | 2 | 2 | \( X \) |
| \( x_7 \) | 1 | 2 | 2 | 1 | \( U - X \) |
| \( x_8 \) | 1 | 2 | 2 | 3 | \( U - X \) |

Using the result of Example 8.

\[
M^\wedge_{x_{12}} = \begin{bmatrix} x_1 & x_7 \\ x_2 & 2/4 & 1/4 \\ x_8 & 0 & 3/4 \\ x_5 & 2/4 & 1/4 \\ x_6 & 1/4 & 3/4 \end{bmatrix}
\]

\[
GR_B(X)(x_2) = \frac{3}{4}, Y_{x_2}^\wedge = \{x_1\}; GR_B(X)(x_6) = \frac{1}{4}, Y_{x_6}^\wedge = \{x_7\}; GR_B(X)(x_5) = \frac{1}{4}, Y_{x_5}^\wedge = \{x_7\}; GR_B(X)(x_8) = 0, x_i \in \{x_1, x_7\};
\]
\[
GR_B(X)(x_1) = \frac{3}{4}, Y_{x_1}^\wedge = \{x_2, x_3\}; GR_B(X)(x_7) = \frac{3}{4}, Y_{x_7}^\wedge = \{x_5, x_6\}; GR_B(X)(x_8) = 1, x_j \in \{x_2, x_3, x_6, x_8\}.
\]

From the Step 2 of Algorithm 5.2 we have a new relation matrix \( M^\wedge_{3x3} \):

\[
M^\wedge_{3x3} = \begin{bmatrix} x_1 & x_3 & x_8 \\ x_2 & 2/4 & 1/4 & 4/4 \\ x_5 & 1/4 & 3/4 & 1/4 \end{bmatrix}
\]

The lower and upper approximations of \( X^\wedge = \{x_2, x_3, x_6\} \) by changing the decision attribute value \( x_8 \in X \) to \( x_8 \in U - X \), are updated as follows:
From the step 3 of algorithm 5.2 we have the lower approximations:

\[ GR_B^l(X)(x_2) : \text{ Since } 1 - GR_B(x_2, x_3) < GR_B(X)(x_2), \text{ then } GR_B^l(X)(x_2) = 1 - GR_B(x_2, x_3) = 0 \text{ and } Y_{x_2}^*= \{x_3\}. \]

\[ GR_B^l(X)(x_3) : \text{ Since } 1 - GR_B(x_3, x_6) > GR_B(X)(x_3), \text{ then } GR_B^l(X)(x_3) = GR_B(X)(x_3) = \frac{1}{4} \text{ and } Y_{x_3}^* = Y_{x_3}^* = \{x_7\}. \]

\[ GR_B^l(X)(x_5) : \text{ Since } 1 - GR_B(x_5, x_8) > GR_B(X)(x_5), \text{ then } GR_B^l(X)(x_5) = GR_B(X)(x_5) = \frac{1}{4} \text{ and } Y_{x_5}^* = Y_{x_5}^* = \{x_7\}. \]

\[ GR_B^l(X)(x_8) : \text{ Since } 1 - GR_B(x_8, X) > GR_B(X)(x_8), \text{ then } GR_B^l(X)(x_8) = \bigvee_{x \in [2, 5, X]} GR_B(x, x) = \{x_2\}. \]

\[ GR_B^l(X)(x_j) = GR_B(X)(x_j) = 1, x_j \in [2, 5, X]. \]

5.2. Incremental updating approximations when changing the conditional attribute value of the object

Proposition 13 Let \( S = (U, A, V, F) \) be an information system, \( B \subseteq A, b \in B \), changing the conditional attribute value \( f(x^*, b) \) to \( f^*(x^*, b) \), \( f^*(x^*, b) \neq f(x^*, b), x^* \in U \). For any \( y \in U \),

\[ GR_B^e(x^*, y) = \begin{cases} 
|B|GR_B(x^*, y) + 1, & f^*(x^*, b) = f(y, b), \\
|B|GR_B(x^*, y) - 1, & f^*(x^*, b) \neq f(y, b).
\end{cases} \]

Proposition 14 Let \( S = (U, A, V, F) \) be an information system, \( B \subseteq A, X \subseteq U, x^* \in X \). The lower and upper approximations of \( X \) by changing the conditional attribute value of \( x^* \), \( f(x^*, b) \) to \( f^*(x^*, b) \) can be updated as follows.

**Lower approximation:** If \( x_i \in U - X \), then \( GR_B^e(X)(x_i) = 0 \). If \( x_i \in X \), we have

If \( x_i \in X - \{x^*\} \), then \( GR_B^e(X)(x_i) = GR_B(X)(x_i) \) and \( Y_{x_i}^* = Y_{x_i}^* \).

If \( x_i = x^* \), then \( GR_B^e(X)(x^*) = \bigwedge_{y \in U - X} (1 - GR_B^e(x^*, y)) \) and \( Y_{x_i}^* = \{y; \forall y \in U - X, GR_B^e(x^*, y)\} \).

**Upper approximation:** If \( x_j \in X \), then \( GR_B^e(X)(x_j) = 1 \). If \( x_j \in U - X \), we have:

If \( GR_B(X)(x_j) = GR_B(x_j, x^*) \), then \( GR_B^e(X)(x_j) = \bigvee_{x \in X} GR_B(x_j, y) \) and \( Y_{x_j}^* = \{y; \forall y \in X, GR_B^e(x_j, y)\} \).

If \( \exists y \in Y_{x_j}^* \) such that \( GR_B(X)(x_j) = GR_B(x_j, y) \), we have:

If \( GR_B(X)(x_j) > GR_B^e(x_j, x^*) \), then \( GR_B^e(X)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^* = Y_{x_j}^* - \{x^*\} \).

Algorithm 5.3 (Incremental algorithm for updating approximations when changing the conditional attribute value \( f(x^*, b) \) to \( f^*(x^*, b) \), \( x^* \in X \))

Step 1: Input the relation matrix \( M_{n \times m} \):

\[ GR_B^e(X)(x_i) = GR_B(x_i, x^*), \text{ then } GR_B^e(X)(x_i) = GR_B^e(X)(x_i) \]

\[ GR_B^e(X)(x_j) < GR_B^e(x_j, x^*), \text{ then } GR_B^e(X)(x_j) = GR_B(x_j, x^*) \] and \( Y_{x_j}^* = \{x^*\} \).

Step 2: We get a new relation matrix \( M_{n \times m} \):

Changing the value \( GR_B(x^*, y) \) to \( GR_B^e(x^*, y) \) of the relation matrix \( M_{n \times m} \), \( GR_B^e(x^*, y) = \begin{cases} 
|B|GR_B(x^*, y) + 1, & f^*(x^*, b) = f(y, b), \\
|B|GR_B(x^*, y) - 1, & f^*(x^*, b) \neq f(y, b),
\end{cases} \]

\[ y \in U - X \] if

According to Proposition 13.

Step 3: Calculate the lower approximations \( x_i \in X \)

If \( x_i \in X - \{x^*\} \), then \( GR_B^e(X)(x_i) = GR_B(X)(x_i) \) and \( Y_{x_i}^* = Y_{x_i}^* \).

If \( x_i = x^* \), then \( GR_B^e(X)(x^*) = \bigwedge_{y \in U - X} (1 - GR_B^e(x^*, y)) \) and \( Y_{x_i}^* = \{y; \forall y \in U - X, GR_B^e(x^*, y)\} \).

According to Proposition 14.

Step 4: Calculate the upper approximations \( x_j \in U - X \)

If \( \exists y \in Y_{x_j}^* \) such that \( GR_B(X)(x_j) = GR_B(x_j, y) \), we have:

If \( GR_B(X)(x_j) > GR_B^e(x_j, x^*) \), then \( GR_B^e(X)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^* = Y_{x_j}^* - \{x^*\} \).
We consider the information system $\mathcal{B}$ from Example 10. We use results from Example 9.

Step 5: Output the relation matrix $M':$

$$M'_{3 \times 3} = \begin{pmatrix} x_1 & x_7 & x_8 \\ x_2 & 2/4 & 1/4 & 4/4 \\ x_5 & 1/4 & 3/4 & 1/4 \end{pmatrix}$$

The lower and upper approximations of $X = \{x_2, x_3, x_6\}$ by changing $f(x_5, b_3)$ to $f^*(x_5, b_3)$ are updated as follows.

From the step 3 of algorithm 5.3 we have the lower approximations:

$$\begin{align*}
\overline{GR}_B^*(X(x_1)) &= GR_B^*(X(x_1)), \\
Y^*_x &= Y^*_x \cup \{x_1, x_7, x_8\}, \\
\overline{GR}_B^*(X(x_8)) &= Y^*_x, \\
Y^*_x &= Y^*_x \cup \{x_2, x_3, x_6\}, \\
\overline{GR}_B^*(X(x_5)) &= \bigwedge_{y \in X} \overline{GR}_B^*(x, y) \text{ and } Y^*_y = Y^*_y \cup \{y\}. \\
\overline{GR}_B^*(X(x_2)) &= GR_B^*(X(x_2)), \\
Y^*_x &= Y^*_x \cup \{x_1, x_7, x_8\}, \\
\overline{GR}_B^*(X(x_5)) &= Y^*_x, \\
Y^*_x &= Y^*_x \cup \{x_2, x_3, x_6\}, \\
\overline{GR}_B^*(X(x_8)) &= \bigwedge_{y \in X} \overline{GR}_B^*(x, y) \text{ and } Y^*_y = Y^*_y \cup \{y\}.
\end{align*}$$

**Example 10** We consider the information system given in Table 8. Let $U = \{x_1, x_2, x_5, x_6, x_7, x_8\}$ be the universal set, $B = \{b_1, b_3, b_4, b_5\}$ be the conditional attribute set, $X = \{x_2, x_3, x_6\}$ be the decision set. Changing $f(x_5, b_3) = 2$ to $f^*(x_5, b_3) = 1.$

|   | $b_1$ | $b_3$ | $b_4$ | $b_5$ | $d$ |
|---|------|------|------|------|-----|
| $x_1$ | 2    | 1    | 1    | 3    | $U - X$ |
| $x_2$ | 2    | 1    | 2    | 3    | $X$  |
| $x_5$ | 1    | 1    | 2    | 3    | $X$  |
| $x_6$ | 1    | 2    | 2    | 3    | $X$  |
| $x_7$ | 1    | 2    | 2    | 1    | $U - X$ |
| $x_8$ | 2    | 1    | 2    | 2    | $U - X$ |

Using the result of Example 9.

$$\begin{align*}
GR_B^*(X(x_2)) &= 0, Y^*_x = \{x_8\}; \\
GR_B^*(X(x_6)) &= \frac{1}{4}, Y^*_x = \{x_7\}; \\
GR_B^*(X(x_8)) &= \frac{1}{4}, Y^*_x = \{x_7\}; \\
GR_B^*(X(x_1)) &= 0, x_1 \in \{x_1, x_7, x_8\}. \\
GR_B^*(X(x_5)) &= \frac{2}{4}, Y^*_x = \{x_2\}; \\
GR_B^*(X(x_7)) &= \frac{3}{4}, Y^*_x = \{x_6\}; \\
GR_B^*(X(x_8)) &= \frac{1}{4}, Y^*_x = \{x_2\}; \\
GR_B^*(X(x_5)) &= 1, x_5 \in \{x_2, x_3, x_6\}. \\
\end{align*}$$

From the step 2 of Algorithm 5.3 we have a new relation matrix $M'_{3 \times 3} :$

$$\begin{pmatrix} x_1 & x_7 & x_8 \\ x_2 & 2/4 & 1/4 & 4/4 \\ x_5 & 1/4 & 3/4 & 1/4 \end{pmatrix}$$

**Proposition 14** Let $S = (U, A, V, F)$ be an information system, $B \subseteq A, X \subseteq U, x^* \in U - X.$ The lower and upper approximations of $X$ by changing the conditional attribute value of $x^*$, $f(x^*, b) \to f^*(x^*, b)$ $(f(x^*, b) \neq f^*(x^*, b))$ can be updated respectively as follows.

**Lower approximation:** If $x_i \in U - X$, then $GR_B^*(X(x_i)) = 0.$ If $x_i \in X$, we have

$$\begin{align*}
&\text{If } GR_B^*(X(x_i)) = GR_B^*(X(x_i)), \text{ then } GR_B^*(X(x_i)) = \bigwedge_{y \in U - X} \overline{GR}_B^*(x_i, y) \text{ and } Y^*_x = \bigvee_{y \in U - X} \overline{GR}_B^*(x_i, y). \\
&\text{If } \exists y \in Y^*_y, \text{ such that } GR_B^*(X(x_i)) = GR_B^*(X(x_i)), \text{ we have:} \\
&\text{If } GR_B^*(X(x_i)) > GR_B^*(X(x_i)), \text{ then } GR_B^*(X(x_i)) = GR_B^*(X(x_i)) \text{ and } Y^*_x = Y^*_x \cup \{x_i\}. \\
\end{align*}$$
If \( GR_B(X)(x_j) = GR_B^0(X)(x_i) \), then \( GR_B^0(X)(x_i) = GR_B(X)(x_i) \) and \( Y_{x_j}^\wedge = Y_{x_i}^\wedge \cup \{x\} \);
If \( GR_B(X)(x_j) < GR_B^0(X)(x_i) \), then \( GR_B(X)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^\wedge = \{x\} \).

Upper approximation: If \( x_j \in X \), then \( GR_B(X)(x_j) = 1 \). If \( x_j \in U - X \), we have:
If \( x_j \in U - X - \{x^*\} \), then \( GR_B(X)(x_j) = GR_B(X)(x_j) \) and \( Y_{x_j}^\wedge = Y_{x_j}^\wedge \).
If \( x_j = x^* \), then \( GR_B(X)(x^*) = \forall y \in X \) and \( Y_{x_j}^\wedge = \{y; \forall y \in X \} \).

Algorithm 5.4 (Incremental algorithm for updating approximations when changing the conditional attribute value \( f(x^*, b) \) to \( f(x^*, b') \), \( x^* \in U - X \))

Step 1: Input the relation matrix \( M_{n\times m} \);
\( GR_B(X)(x_j) \), \( Y_{x_j}^\wedge \), \( x_i \in X \); \( GR_B(X)(x_j) \), \( Y_{x_j}^\wedge \), \( x_j \in U - X \); \( GR_B(X)(x_j) = 0 \), \( x_i \in U - X \), and \( GR_B(X)(x_j) = 1 \), \( x_j \in X \).

The time complexity of the Algorithm 5.4 is \( O(|X||B|) \), which is mainly decided by the time cost of building the information system matrix in Step 2. In the following Example 11, We use the results from Example 10 to demonstrate how algorithm 5.4 update the approximations when changing the conditional attribute value \( f(x^*, b) \) to \( f'(x^*, b') \), \( x^* \in U - X \).

Example 11 We consider the information system given in Table 9. Let \( U = \{x_1, x_2, x_5, x_6, x_7, x_8\} \) be the universal set, \( B = \{b_1, b_2, b_3, b_4\} \) be the conditional attribute set, \( X = \{x_2, x_5, x_6\} \) be the decision set. Changing \( f(x_8, b_4) = 2 \) to \( f'(x_8, b_4) = 1 \).

| Table 10. |
|-------------|
| \( b_1 \) | \( b_2 \) | \( b_3 \) | \( b_4 \) | \( d \) |
|-------------|
| \( x_1 \) | 2 | 1 | 1 | 3 | \( U - X \) |
| \( x_2 \) | 2 | 1 | 2 | \( X \) |
| \( x_3 \) | 1 | 1 | 2 | \( X \) |
| \( x_4 \) | 1 | 2 | 2 | \( U - X \) |
| \( x_5 \) | 1 | 2 | 2 | \( U - X \) |
| \( x_6 \) | 2 | 1 | 1 | \( U - X \) |
| \( x_7 \) | 2 | 1 | 1 | \( U - X \) |

Using the result of Example 10.

Step 5: Output the relation matrix \( M'_{n\times m} \):
\( GR_B'(X)(x_j) \), \( Y_{x_j}^\wedge \), \( x_j \in X \); \( GR_B'(X)(x_j) \), \( Y_{x_j}^\wedge \), \( x_j \in U - X \); \( GR_B'(X)(x_j) = 0 \), \( x_i \in U - X \), and \( GR_B'(X)(x_j) = 1 \), \( x_j \in X \).

From the Step 2 of Algorithm 5.4 we have a new relation matrix \( M'_{n\times m} \):
| Table 11. |
|-------------|
| \( x_1 \) | \( x_7 \) | \( x_8 \) |
|-------------|
| \( x_2 \) | 2/4 | 1/4 | 4/4 |
| \( x_3 \) | 2/4 | 0 | 2/4 |
| \( x_4 \) | 2/4 | 2/4 | 2/4 |

For the final result of Example 10:

| Table 12. |
|-------------|
| \( x_1 \) | \( x_7 \) | \( x_8 \) |
|-------------|
| \( x_2 \) | 2/4 | 1/4 | 3/4 |
| \( x_3 \) | 2/4 | 0 | 1/4 |
| \( x_4 \) | 2/4 | 2/4 | 1/4 |

230
The lower and upper approximations of \( X = \{x_2, x_5, x_6\} \) by changing \( f(x_8, b_4) \) to \( f'(x_8, b_4) \) are updated as follows.

From the step 3 of algorithm 5.4 we have the lower approximations:

\[ \overline{GR}_B(X)(x_2) : \text{Since } GR_B(X)(x_2) = GR_B(x_2, x_8), \text{then } \overline{GR}_B^L(X)(x_2) = \bigwedge_{y \in \{x_5, x_7, x_6\}} (1 - GR_B^L(y, x_2, y)) = \frac{3}{4} \text{ and } Y_{\overline{x}_2}^L = \{y ; \bigvee_{y \in \{x_5, x_7, x_6\}} GR_B^L(y, x_2, y)\} = \{x_8\}; \]

\[ \overline{GR}_B(X)(x_6) : \text{Since } \exists x_7 \in Y_{\overline{x}_6}^L, \text{such that } GR_B(X)(x_6) = GR_B(x_6, x_7), \text{and } GR_B(X)(x_6) > GR_B(x_6, x_8) \text{ then } GR_B^L(X)(x_6) = GR_B(X)(x_6) = \frac{1}{4} \text{ and } Y_{\overline{x}_6}^L = Y_{\overline{x}_6} - \{x_8\} = \{x_7\}; \]

\[ \overline{GR}_B(X)(x_5) : \text{Since } \exists x_7 \in Y_{\overline{x}_5}^L, \text{such that } GR_B(X)(x_5) = GR_B(x_5, x_7), \text{and } GR_B(X)(x_5) > GR_B(x_5, x_8) \text{ then } GR_B^L(X)(x_5) = GR_B(X)(x_5) = \frac{3}{4} \text{ and } Y_{\overline{x}_5}^L = Y_{\overline{x}_5} - \{x_8\} = \{x_1, x_7\}. \]

From the step 4 of algorithm 5.4 we have the upper approximations:

\[ \overline{GR}_B(X)(x_j) = \overline{GR}_B(X)(x_j), \text{ } Y_{\overline{x}_j}^V = Y_{\overline{x}_j}^V, \text{ } x_j \in \{x_1, x_7\}, \]

\[ \overline{GR}_B(X)(x_8) = \bigvee_{y \in \{x_5, x_7, x_6\}} GR_B^V(y, x_8, y) = \frac{3}{4} \text{ and } \overline{Y}_{\overline{x}_8}^V = \{y ; \bigvee_{y \in \{x_5, x_7, x_6\}} GR_B^V(y, x_8, y)\} = \{x_1, x_7\}. \]

6. Algorithm analysis

The time complexities of all the incrementally updating algorithms proposed in this paper are list in the Table 11 as follow.

From the Table 11 we can see that the proposed incrementally updating algorithms has lower time complexity for every operation on data. In addition to the time cost, it is obviously that every incrementally updating algorithm will use less memory space to get the information updated, because there is no need to rebuild the whole relation matrix in an incrementally updating algorithm.

The incrementally updating algorithms could be seen as a group of functions to update the existing results to keep the relation matrix, approximation and the set of \( Y_{\overline{x}_j}^V \) and \( Y_{\overline{x}_j}^L \) changing in right way when the information system changed. And we can use different types of the incrementally updating algorithms in any order and with any number of times to adapt to any possible changing in the information system. For example, we can use Algorithm 3.2 once and then use Algorithm 4.1 or 4.2 twice when the basic data need a changing of adding two objects and removing an attribute. And we should note that putting the removing type Algorithm before others will also make the time cost reduced a bit more.

7. Experimental evaluation

In this section, we compare the computational time of the non-incremental algorithm and the proposed incremental algorithms on different data sets shown in Table 12. The three data sets used herein came from the University of California, Irvine (UCI) Machine Learning Repository (www.ics.uci.edu/). In data set Dermatology, we delete some attributes with missing values. Experiments were performed on a 2.40GHz Pentium Server with 8GB of memory, running Windows 10. Algorithms were code in Matlab r2012a.

From the following experimental results, it is clear that the incremental algorithm outperform the traditional non-incremental algorithm in different cases, Table 13 ( Where NIA is the non-incrementally updating algorithm and IA is the incrementally updating algorithm ) shows that the proposed methods can effectively update approximations when the information system changes.

8. Conclusion

This paper discusses the approaches of incrementally updating of the rough approximations based on the grade indiscernibility relation when complete information system is varied. Taking full use of the existing information make the time cost of the approaches reduced a lot especially when dealing with the large-scale data. In the future, we will discuss the methods of dynamic updating of the rough approximations based on the grade indiscernibility relation in incomplete information system. Moreover, the incremental updating approaches of the decision rules with respect to grade indiscernibility relation is another important and interesting issue to be addressed.
Table 11.

| Operation                          | Time Complexity | Algorithm  | Complexity                        | Algorithm  | Complexity                        |
|------------------------------------|-----------------|------------|------------------------------------|------------|------------------------------------|
| Adding an attribute $b$            | Algorithm 2.1   | O($|X||U - X|$) | Algorithm 3.1                      | O($|X||U - X|$) |
| Removing an attribute $b$          |                 |            |                                    |            |                                    |
| Adding an object $x \in U - X$    |                 |            |                                    |            |                                    |
| Adding an object $x \in X$        |                 |            |                                    |            |                                    |
| Removing an object $x \in U - X$  |                 |            |                                    |            |                                    |
| $x \in U - X \rightarrow x \in X$|                 |            |                                    |            |                                    |
| $x \in X \rightarrow x \in U - X$|                 |            |                                    |            |                                    |
| $f(x, b) \rightarrow f^*(x, b), x \in X$ | $O(|X||U - X||B|)$ | Algorithm 4.1 | $O(|X||B|)$ | Algorithm 4.2 | $O(|U - X||B|)$ |
| $f(x, b) \rightarrow f^*(x, b), x \in U - X$ | $O(|X||B|)$ | Algorithm 4.3 | $O(|X|)$ | Algorithm 4.4 | $O(|U - X|)$ |

Table 12.

| ID | Data set | Number of objects | Number of attributes | Decision classes | Missing value |
|----|----------|-------------------|----------------------|------------------|---------------|
| 1  | Zoo      | 101               | 17                   | 7                | No            |
| 2  | Dermatology | 366              | 33                   | 7                | Yes           |
| 3  | Chess    | 3196              | 36                   | 2                | No            |

Table 13. Comparisons of computational time between non-incremental algorithm and incremental simplified algorithm when objects and attributes increase simultaneously(s).

| Operation                          | Zoo       | Dermatology | Chess      |
