**ABSTRACT**

Fluoride, as the super reactive element fluorine, is found naturally throughout earth’s crust. It has been identified as a strong, persistent powerful cumulative toxic agent, commonly distributed in the rivers, lakes, seas of earth. It is highly mobile and biologically active element in aquatic systems. Fish are considered as the excellent and valuable bioindicator of ecosystem pollution. The present study was designed to estimate acute fluoride toxicity on enzyme activity of liver of freshwater fish *Tilapia mossambica*. The major enzymes of Carbohydrate-Protein Metabolic pathways are Alkaline phosphatase (ALP), Alanine transaminase (ALT), Aspartate transaminase (AST) in association with carbohydrate, protein, lipid in the liver of *Tilapia mossambica*, from Kalri Lake (Keenjhar Lake), Sindh, Pakistan at low amount of fluoride (sub-lethal) was estimated by using UV- Visible Spectrophotometer. Results showed ALP, AST and ALT enzymes present in the liver tissue were significantly changed (p < 0.001). Finally, it is concluded that fluoride produces the adverse poisonous effect on liver functioning which may be associated with altered or elevated enzyme activity of protein-carbohydrate metabolism.

**INTRODUCTION**

The liver is a chief central metabolic organ, essential for life in vertebrates and invertebrates. The liver plays a main role in the metabolism of carbohydrate, protein, amino acid, and lipid. It acts as a detoxifying organ which may accumulate bio-transform and excretes a variety of toxicants or their by-products. Toxicants can produce disorders in the physiology of animal in association with altered enzyme activity. Several studies reported the changes in enzyme activity in the freshwater fish when exposed to various pollutants. Fluoride is highly mobile and biologically active element in aquatic systems. Fish are considered as an excellent and valuable bioindicator of ecosystem pollution. A number of cellular and biological processes including enzymatic reactions, cessation of protein secretion and synthesis, production of reactive oxygen species (ROS), and variation of gene expression can be affected by fluoride. Fluoride as an anabolic agent or toxicant promotes cell proliferation and acts as an enzyme inhibitor for lipases, phosphatases and esterases, ATP production cycle and cellular respiration at the sublethal concentrations. Fluoride showed a significant alteration in enzymes activities of Alkaline phosphatase (ALP), Alanine transaminase (ALT), Aspartate transaminase (AST) in fish gills at the sublethal concentration of fluoride.
MATERIAL AND METHODS
Normal alive *Tilapia mossambica* (weight 90.2g and length 8.7cm) were collected from the Keenjhar Lake, with the help of local fisherman. Fish were divided into two groups under normal condition. Group I was considered as control (non-treated) while group II marked as experimental treated with 1.5 gm NaF / 70 L of water. Each group contains twelve fishes and acclimated in a glass aquarium, filled with tap water. Aquarium was aerated by using air pumps and filters. The Commercial pellet as the fish food was used for both groups (I and II) per a day. Aquarium water was changed after 2 or 3 days. Chemical study of water was performed according to approved procedures of APHA11.

Study of biochemical constituents and enzymatic assays
Fishes of both groups (control and treated) were dissected and livers of all fishes were removed and cleaned with water. A glass homogenizer was used to homogenized tissues in cold solution of saline (0.89% NaCl) and centrifuged in a refrigerated laboratory centrifuge. A clear supernatant was used for Alkaline phosphatase (ALP) estimation by p-nitro phenol method. However Aspartate transaminase (AST), Alanine transaminase (ALT) were measured by Randox Kit methods. Estimation of glucose was done by GOP-PAP method and protein by Lowry *et al.* method12,13. Estimation of total lipid by sulphophospho-vanilline (SPV) method14. Data were represented as Mean ± S.E.M. A paired student t-test at 95% confidence interval of the difference was applied to find out the level of significance. P value < 0.05 was considered significant.

RESULTS AND DISCUSSION
The effect of fluoride on important and essential enzymes of Carbohydrate - Protein metabolism were measured in the liver of *Tilapia mossambica*, at 1st, 2nd, 3rd and 4th week upon exposure to fluoride. Aminotransferases are important group of enzymes participating in the shifting of the amino group from alpha-amino acids to the alpha-keto acid without the liberation of ammonia. The alpha-keto acid enters into the citric acid cycle for the release of energy. In this process alpha-keto acids changed into amino acids might be used in protein synthesis and take part in carbohydrate-protein metabolism regulation10,15,16. Alkaline phosphatase (ALP) removing phosphate groups from nucleotides, proteins, and alkaloids, a process called dephosphorylation. The results showed significant increase in the enzymatic action of Alkaline phosphatase (ALP), Alanine transaminase (ALT), Aspartate aminotransferase (AST) (Table 1, Fig. 1) in treated liver under fluoride when compare to control fish (p < 0.001) due to utilization of glucose and amino acid in carbohydrate-protein metabolism (Table 2)10,17-21. High levels of AST, ALT, ALP upon long-term exposure (4th week) to fluoride might be due to altered liver function or liver dysfunction under stress22,23.

Table 1: Enzymatic activity of AST, ALT, ALP in the liver of *Tilapia mossambica* at 1st, 2nd, 3rd and 4th week upon exposure to fluoride (1.5g/70L).

| Biochemical parameter (U/L) | Control Fish | Treated Fish 1st week | Treated Fish 2nd week | Treated Fish 3rd week | Treated Fish 4th week |
|----------------------------|--------------|-----------------------|-----------------------|-----------------------|----------------------|
| AST                        | 633.65±0.077 | 823.54±0.009          | 876.42±0.013          | 856.14±0.008          | 734.12±0.051         |
| ALT                        | 755.6±0.068  | 890.4±0.073           | 974.6±0.005           | 1005.6±0.009          | 798.34±0.034         |
| ALP                        | 308.4±0.090  | 677.13±0.007          | 790.85±0.007          | 859.26±0.007          | 467.47±0.074         |

Values expressed as Mean ± S.E.M; *: Significant at P< 0.05; **: Highly significant at P<0.01; ***: Very highly significant (p<0.001) compared with control.

Values expressed as Mean ± S.E.M; **: Highly significant at P<0.01; ***: Very highly significant (p<0.001) compared with control

Fig. 2: Fluoride Effect (1.5g/70L) on Protein, Lipid, Cholesterol Glucose in the liver of *Tilapia mossambica* at 1st, 2nd, 3rd and 4th week.
Quantitative measurements of biochemical constituents in the liver of freshwater fish *Tilapia mossambica* at 1st, 2nd, 3rd and 4th week are presented in Table 2 and Fig. 2. Results showed decreased in protein-carbohydrate and lipid contents due to changes in carbohydrate–protein metabolism ($p < 0.001$). This condition might be due to the decrease in the oxidation of glucose while decreased in protein might be associated with energy production. The whole process is needed to overcome the lethal stress caused by fluoride in freshwater fish *Tilapia mossambica*. The present study demonstrates the disorder of biochemical processes occurring in the fish body caused by fluoride, the mobile persistent toxic agent producing the adverse effect on fish health, growth and number in the freshwater reservoir.

## Conclusion

The liver is a fundamental organ of various metabolism and different process in fishes. This study has revealed that the liver of *Tilapia mossambica* upon exposure to fluoride may result in the alteration in the enzyme activities might be due to a defensive mechanism to overcome the lethal stress caused by Fluoride in freshwater fish *Tilapia mossambica*. The present study demonstrates the disorder of biochemical processes occurring in the fish body caused by the fluoride, the mobile persistent toxic agent producing the adverse effect on fish health, growth and number in the freshwater reservoir.
