General Information

NMR spectra were recorded on a Bruker Ultrashield 300, 400 or 500 MHz spectrometer. The chemical shifts (δ) are reported in ppm downfield of trimethylsilane, and coupling constants (J) are reported in Hertz and rounded to 0.1 Hz. Splitting patterns are abbreviated as follows: singlet (s), doublet (d), triplet (t), quartet (q), septet (sep), multiplet (m), broad (br), or a combination of these. Solvents were used as internal standard when assigning NMR spectra (δ H: CDCl₃ 7.26 ppm, MeOD 3.31 ppm; δ C: CDCl₃ 77.0 ppm, MeOD 49.0 ppm).

Low- and high-resolution mass spectra were recorded by staff at the University of Manchester. EI and CI spectra were recorded on a Micromass Trio 2000; ES and APCI spectra were recorded on a Micromass Platform II; high-resolution mass spectra (HRMS, EI and ES) were recorded on a Thermo Finnigan MAT95XP mass spectrometer. Infrared spectra were recorded on a Perkin Elmer Spectrum RX I FTIR spectrometer as a film on a sodium chloride plate. Absorptions reported are sharp and strong; only absorption maxima of interest are reported. Melting points (mp) were determined on a Gallenkamp apparatus and are uncorrected.

Thin-layer chromatography (TLC) was performed using commercially available precoated plates (Macherey-Nagel alugram Sil G/UV254) and visualised with UV light at 254 nm or phosphomolybdic acid dip (5% in ethanol). Flash chromatography was carried out using Fluorochem Davisil 40–63μ 60 Å.

All reactions were conducted under an atmosphere of dry nitrogen or argon in oven-dried glassware. Tetrahydrofuran (THF) and diethyl ether (Et₂O) were distilled under nitrogen from sodium using benzophenone as indicator. Dichloromethane and toluene were obtained by distillation from calcium hydride under nitrogen. Petrol refers to the fraction of light petroleum ether boiling between 40–65 °C. All other solvents and commercially obtained reagents were used as received or purified using standard procedures.

The organolithium reagents were used directly from commercially available solutions from Sigma-Aldrich: n-BuLi (2.5 M in hexanes), s-BuLi (1.4 M in cyclohexane), t-BuLi (1.7 M in pentane) and iPrLi (0.7 M in pentane).
General procedures

General procedure 1: Carbolithiation of dimethylated ureas 3.
To a solution of urea 3 in dry toluene (0.1 M) cooled at −40 °C, the desired organolithium reagent (2 equiv) is added slowly. After 1 hour, the reaction is quenched slowly with MeOH and NH₄Cl. The crude is extracted with EtOAc, dried with MgSO₄, concentrated under reduced pressure and purified by chromatography on silica gel (PE/EtOAc 9:1).

General procedure 2: Carbolithiation of monomethylated ureas 5.
To a solution of urea 5 in dry tetrahydrofuran (0.1 M) cooled at −40 °C, the desired organolithium reagent (3 equiv) is added slowly. After 1 hour, the reaction is quenched slowly with MeOH and NH₄Cl. The crude is extracted with EtOAc, dried with MgSO₄, and concentrated under reduced pressure. The product was obtained without further purification.

General procedure 3: Carbolithiation of gem disubstituted ene-carbamates 9.
To a solution of carbamate 9 in dry THF (0.1 M), cooled at −78 °C, the desired organolithium reagent (2 equiv) is added slowly. After 1 hour at −78 °C, the reaction is quenched by slow addition of MeOH. The mixture is extracted with EtOAc and washed with NH₄Cl. The organic phase is dried (MgSO₄), filtered and concentrated under reduced pressure. The crude is purified by flash chromatography on silica gel (PE/DCM 1:1).

General procedure 4: Carbolithiation of trisubstituted ene-carbamates 10 followed by deprotection.
Carbamate 10 is solubilised in dry THF (0.1 M) and the mixture is cooled to −40 °C. The desired alkylolithium reagent is added slowly and the reaction is stirred for 1 hour at −40 °C. The reaction is then quenched by slow addition of methanol. The solvent is removed under reduced pressure and the crude is solubilised in TFA. The reaction is stirred for 1 hour at r.t. The reaction mixture is diluted in DCM and washed with NaHCO₃ (1 M). The organic phase is dried (MgSO₄) and filtered, and the solvent is removed under reduce pressure. The corresponding amine is obtained without further purification.
Experimental procedures and characterisation data

Synthesis of the starting materials:

Ureas 1a, 1b, 1c, 3a, 3b, 3c, 3d, 3e, 3f, 3g and 5b were synthesised according to the procedures described [1,2].

Compounds 2a and 4a were previously reported [2]

1,3-Dimethyl-1-(3-methyl-1-phenylbutyl)-3-phenylurea (2c)

To a stirred solution of urea 1a (100 mg; 0.376 mmol) in dry THF (2.5 mL) at −85 °C, iPrLi (1.076 mL; 0.753 mmol; 2 equiv) was added resulting in a red solution. The reaction was stirred at −85 °C for 1 h then quenched with MeOH and NH₄Cl (sat. sol). The crude was extracted with EtOAc, dried with MgSO₄, concentrated under reduced pressure and purified by chromatography on silica gel (petrol/EtOAc 98:2) to afford the desired carbolithiated product 2c (62 mg, 53%) as a colourless oil.

1-(4-Methoxyphenyl)-1,3-dimethyl-3-(1-phenylhexyl)urea (2d)

To a stirred solution of urea 1b (50 mg; 0.168 mmol) in dry THF (2.5 mL) at −78 °C, n-BuLi (135 μL; 0.336 mmol; 2 equiv) was added resulting in a red solution. The reaction was stirred at −78 °C for 1 h then quenched with MeOH and NH₄Cl (sat. sol). The crude was extracted with a mixture 3:1 petrol/Et₂O, dried with MgSO₄, concentrated under reduce pressure and purified by chromatography on silica gel (petrol/EtOAc 98:2) to afford the desired carbolithiated product 2d (36 mg, 61%) as a colourless oil.

1-(4-Chlorophenyl)-1,3-dimethyl-3-(1-phenylhexyl)urea (2e)

To a stirred solution of urea 1c (50 mg; 0.166 mmol) in dry Et₂O (2.5 mL) at −78 °C, n-BuLi (133 μL; 0.332 mmol; 2 equiv) was added resulting in a red solution. The reaction was stirred at −78 °C for 1 h then quenched with MeOH and NH₄Cl (sat. sol). The crude was extracted with a mixture 3:1 petrol/Et₂O, dried with MgSO₄, concentrated under reduce pressure and purified by chromatography on silica gel (petrol/EtOAc 98:2) to afford the desired carbolitiated product 2e (28 mg, 47%) as a colourless oil.

IR νmax (CHCl₃)/cm⁻¹: 2954, 2929, 1651, 1493, 1385, 1330.

1-[(1R*,2R*)-1-(4-Chlorophenyl)-2,3-dimethyl-butyl]-3-(4-methoxyphenyl)-1,3-dimethylurea (4h)

The product was prepared following the general procedure 1 starting from 40 mg of urea E-3g. The desired compound is obtained in 60% yield (30 mg) as an oil.

Alternatively, the compound can be synthesised by treatment of the urea 6c with sodium hydride (2 equiv), in dry THF at 0 °C for 30 min, followed by addition of methyl iodide (2 equiv), at r.t. for 24 h. The reaction was diluted with Et2O and quenched with water. The mixture was extracted with EtOAc, dried (MgSO4), and filtered, and the solvent was removed under reduced pressure. The desired compound was obtained in 60% yield after flash chromatography on silica gel (PE/EtOAc 9:1).

3-phenylpropenal (1.00 g, 7.45 mmol, 1 equiv) was added to a solution of methylamine (8 M in EtOH, 4 equiv) in the presence of molecular sieves (1:1 w/w). The mixture was heated under microwave irradiation for 1 h at 125 °C (or alternatively at 50 °C for 48 h). The crude mixture was filtered through Celite and concentrated under vacuum. The obtained imine was solubilised in toluene (0.5 M) and treated with the 4-methoxyphenyl isocyanate (1 equiv), then stirred for 16 h at r.t. The solvent was evaporated and the crude was purified on silica gel (PE/EtOAc 8:2 + 1% NEt₃). The desired compound was obtained in 40% (0.88 g) as an oil.

The carbamate Z-10 (98 mg, 0.40 mmol) was solubilised in dry toluene and the mixture was cooled to −40 °C. Isopropyllithium was added slowly and the reaction was stirred for 24 h at −40 °C. The reaction was quenched by slow addition of methanol. The solvent was removed under reduced pressure and the crude solubilised in TFA. The reaction was stirred for 1 h at r.t. The reaction mixture was diluted in DCM and washed with NaHCO₃ (1 M). The organic phase was dried (MgSO₄) and filtered, and the solvent was removed under reduced pressure. The desired compound was obtained in 50% yield (40 mg) as an oil.
