A large set of economic and financial indicators suggests a negligible risk of unexpectedly low real GDP growth but a modest risk of unexpectedly low inflation.

We use a large set of economic and financial indicators to assess tail risks of the three macroeconomic variables: real GDP, unemployment, and inflation. When applied to U.S. data, we find evidence that a dense model using principal components (PC) as predictors might be misspecified by imposing the “common slope” assumption on the set of predictors across multiple quantiles. The common slope assumption ignores the heterogeneous informativeness of individual predictors on different quantiles. However, the parsimony of the PC-based approach improves the accuracy of out-of-sample forecasts when combined with a sparse model using the dynamic model averaging method. Out-of-sample analysis of U.S. data suggests that the downside risk for real macro variables spiked to by the end of the Great Recession but subsequently declined to a negligible level. On the other hand, the downside tail risk for inflation fluctuated around a non-negligible level even after the end of the Great Recession. The disconnect between the downside risk of inflation and that of real activities can be in line with the evidence for the reduced role of the output gap for inflation during the recent period.

Authors

Thomas R. Cook
Data Scientist

Tom Cook is a Data Scientist in the Economic Research Department of the Federal Reserve Bank of Kansas City. He joined the bank in August 2016 after completing his PhD in Political Science at the University of Colorado. He also holds an MPA from DePaul University, and a BA in Philosophy and Political Science from the University of Iowa. His substantive research interests are the roles of time and information transmission in political and economic strategic behavior. Methodologically, his research at the bank focuses on the development of machine learning, neural networks, and advanced statistical models for use in economic research.

Taeyoung Doh
Senior Economist

Taeyoung Doh is a Senior Economist in the Economic Research Department of the Federal Reserve Bank of Kansas City. He joined the department in July 2007. He received a bachelor's degree in economics from Seoul National University in 1996, an M.A. degree from Seoul National University in 1998 and a Ph.D. in economics from the University of Pennsylvania in 2007. His current research interest include monetary policy and term structure of interest rates, estimation of dynamic stochastic general equilibrium models, and asset pricing based on long run macroeconomic risks.
