ABSTRACT

Dendrons with dodecyl terminal groups joined to benzyloxy moieties were attached to a cyclotriveratrylene core. The dendrimers were used in Bingel cyclopropanation reaction with the fullerene C_{60}. The structure of the synthesized dendrimers was confirmed by ^1H- and ^13C-NMR, MALDI-TOF mass spectrometry and elemental analysis.

Keywords: Cyclotriveratrylene; fullerene C60; cyclopropanation reaction; dendrimers.

1. INTRODUCTION

The cup-shaped cyclotriveratrylene derivatives (CTV) are among the key structures that have been exploited for many years for the design of molecular hosts [1-7]. They are interesting starting compounds for the construction of new macromolecular architectures such as solid inclusion complexes [8], biosensors, bis-cryptophanes to study the guest...
exchange between closely bonded molecular cavities [9], chiral scaffolds for triple helix formation [10], organo- or metallo-gels [11], H₂ storage targets [12] or more recently, coordination polymer networks [13], self- assembled monolayers on gold surface [14] and dendrimers [15-19]. The three or six p-hydroxybenzyl substituents present on the wider rim of cyclotriveratrylenes are able to undergo modification to obtain dendrimers without steric restrictions. Dendrimers with polyamidoamine (PAMAM), Polyarylethyl or polyethers groups have applications in drug delivery [20-23] and dendrimers with polyethers in their structure could be used as biodegradable dendrimers with the appropriate enzyme in the drug delivery systems [24]. Recently, we reported the synthesis of cyclotriveratriyene-dendrimers and their supramolecular complexes with the fullerene C₆₀ [25]. In the present work we report the synthesis of cyclotriveratrylene-dendrimers with three and six fullerenes in the dendritic branches.

2. MATERIALS AND METHODS

2.1 General

Solvents and reagents were purchased as reagent grade and used without further purification. Acetone was distilled over calcium chloride. Tetrahydrofuran was distilled from sodium and benzophenone. Column chromatography was performed on Merck silica gel 60Å (70-230 mesh). ¹H- and ¹³C-NMR were recorded on a Varian-Unity-300 MHz with tetramethylsilane (TMS) as an internal reference. Infrared (IR) spectra were measured on a spectrophotometer Nicolet FT-SSX. Elemental analysis was determined by Galbraith Laboratories Inc. (Knoxville, TN, USA). FAB+ mass spectra were taken on a JEOL JMS AX505 HA instrument. Electrospray mass spectra were taken on a Bruker Daltonic, Esquire 6000. MALDI-TOF mass spectra were taken on a Bruker Omni FLEX.

2.2 Synthesis of Core

2.2.1 (4-(Allyloxy)-3-methoxyphenyl) methanol 1

A mixture of vanillyl alcohol 10 g (65 mmol), allyl bromide (6.3 ml, 73 mmol) and potassium carbonate 10 g (65 mmol) in 100 ml of acetone was refluxed for 12 h with magnetic stirring. Then, after most of the solvent was stripped off, water was added and the organic material was extracted with dichloromethane. This product was recrystallized from 100 ml of diethyl ether to yield 14 g (80%) of a white powder [25].

2.2.2 2,7,12-Trimethoxy-3,8,13-tris (2-propenylxyloxy)-10,15-dihydro -5 Htribenzo [a,d,g] cyclononene 2

p-Toluensulfonic acid 0.49 g (2.57 mmol) was mixed with the phenol protected vanillyl alcohol 0.5 g (2.57 mmol) in solid state and stirred for 20 min. The resulting purple solid was incubated at room temperature for 48 h. The reaction mixture was redissolved by addition of dichloromethane and the organic phase was thoroughly washed with water until neutral pH. The dichloromethane solution was partially dried over sodium sulphate and evaporated under vacuum, after which, ether was added, affording a crystalline residue, which was purified by digestion in 200 ml of ether overnight and finally isolated by suction filtration, to yield 0.22 g (37%) of a white powder [25].
2.2.3 2,7,12-Trihydroxy-3,8,13-trimethoxy-10,15-dihydro-5H-tribenzo[a,d,g]cyclononene (cyclotrifieratrylene) 3

The tris(allyl ether) 2, 1.0 g (1.8 mmol) was dissolved in 10 ml of hot dioxane, and to this solution 11 ml of ethanol, 0.2 g of 10 % palladium on charcoal and (dropwise) 0.2 ml of 70 % perchloric acid were added. This mixture was stirred under nitrogen at 55 – 60°C for 18 h. The catalyst was filtered off and washed, first with 10 ml of dioxane and then with 10 ml of dichloromethane. The organic filtrate was thoroughly washed with water, dried over sodium sulphate and concentrated to 5 ml. The desired triphenol, which was allowed to crystallize overnight, was finally collected by suction filtration, to yield 0.42 g (55 %) of white needles [25].

3. RESULTS AND DISCUSSION

The synthesis of the cyclotrimeratrylene derivatives is depicted in Scheme 1. Precursor CTV (OH)₃ was obtained in three steps from commercially available vanillyl alcohol, according to the subsequent multistep transformations. The (4-(allyloxy)-3-methoxyphenyl) methanol 1 undergoes smooth trimerisation in the presence of p-toluenesulfonic acid in solid state, affording the C3-cyclotrimeratrylene derivative 2 in 24 % yield. The allyl ethers of 2 can then be cleaved back to phenols under mild condition, giving 3 in ca. 47 % [25].

![Scheme 1. Synthesis of cyclotrimeratrylene](image)

Dendrons containing polybenzyl ether groups were prepared starting from the O-alkylation reaction of the commercially available methyl 3,5-dihydroxybenzoate 1 with 1-bromododecane in acetone using potassium carbonate as a catalyst (Scheme 2) in
agreement with the literature data [21-25]. The compound 9 was obtained from the diethyl 5-(hydroxymethyl) isophthalate 7, which first was protected with tert-butylchlorodimethylsilane to obtain the compound 8, followed by the reduction with LiAlH₄ in THF to give the compound 9 (Scheme 2).

\[ \text{Scheme 2. Synthesis of compounds 6 and 9.} \]

Compound 6 was attached to compound 9 to obtain the bismalonate 10 in CH₂Cl₂ with DCC and DMAP. Bismalonate 10 was treated with 1.0 M tetrabutylammonium fluoride to obtain Bismalonate 11 (Scheme 3).

\[ \text{Scheme 3. Synthesis of bismalonate 11} \]

Bismalonate 11 was used to obtain the first generation activated dendron 12 upon treatment with SOCl₂, which when coupled to the 3,5-dihydroxybenzyl alcohol was used to obtain the second generation activated dendron 14 (Scheme 4).
The dendrons of first and second generation 12 and 14, respectively, were attached to the cyclotriveratrylene 3 to obtain the dendrimers 15 and 16 (Scheme 5). The reaction was carried out in DMF and Cs$_2$CO$_3$ at reflux for 2 days, and the dendrimers 15 and 16 were obtained in good yields.

The $^1$H NMR spectra of dendrimers 15 and 16 showed one broad signal at $\delta_H$ 0.87, 1.26, 1.71 and at $d_H$ 3.80, due to the aliphatic chain, at $\delta_H$ 3.45 due to the CO-CH$_2$-CO. The signal at $\delta_H$ 3.84 is assigned to the O-CH$_3$ and signals at $\delta_H$ 4.61, 5.04 and 5.08 are ascribed to the -CH$_2$-O protons. For dendrimers 15 and 16, the aromatic protons give singlets and multiplets at $\delta_H$ 6.46, 7.50, and at 7.70. In both cases, two doublets were observed at $\delta_H$ 3.63, and at $\delta_H$ 4.70 due to the protons at the CH$_2$ groups of the cyclotriveratrylene with a coupling constant $J$= 15.00 Hz.
The functionalization of C$_{60}$ was made using the double Bingel cyclopropanation [26-31]. Treatment of C$_{60}$ with dendrimers 15 or 16, I$_2$, and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in toluene at room temperature gave the fullerene derivatives 17 and 18 in 21 and 18% yield, respectively (Scheme 6). All the spectroscopic studies and elemental analysis results were consistent with the proposed molecular structures assigned to the fullerene derivatives. All the compounds were characterized by $^1$H and $^{13}$C NMR, IR, and mass spectrometry (Electrospray and MALDI-TOF).

Scheme 6. Synthesis of fullerene derivatives 17 and 18

In the $^1$H NMR spectra of compounds 17a and 18b (Fig. 1a and 1b respectively) are observed at $\delta_{\text{H}}$ 0.85-1.70 and 3.80 signals due to the aliphatic chain. Two doublets at $\delta_{\text{H}}$ 3.50 and 4.60 assigned to the $\text{-CH}_2$- groups of the cyclotrimeratrylene. Signals at $\delta_{\text{H}}$ 4.61, 5.04, and at $\delta_{\text{H}}$ 5.08 were ascribed to the $\text{-CH}_2$-O protons. For dendrimers 17 and 18, signals are also observed from the aromatic protons at the macrocycle and of the benzyloxy chains. In the $^{13}$C NMR spectra of the cyclotrimeratrylene-fullerene-dendrimers, 35 signals were ascribed to the fullerene.
Fig. 1. $^1$H NMR spectra of dendrimers a) 17 and b) 18 in CDCl$_3$

In the Fig. 2 the MALDI-TOF mass spectra for dendrimers 17 and 18 contain a peak at m/z= 6295 (M+Na) and 12513 respectively.
4. CONCLUSION

The cyclotrimeracylene dendrimers were obtained from dendrons 12 and 14, and then the fullerene \( \text{C}_{60} \) was introduced in the dendritic branches by a cyclization reaction. Adding the fullerene \( \text{C}_{60} \) in the last step of the synthesis gave good yields. The cycloadditions could occur in different places as shown in Fig. 3. The cis cycloadditions give 30 to 35 signals in the \( ^{13}\text{C} \) NMR spectrum. The trans cycloadditions give more than 35 signals. In our case the \( ^{1}\text{H}, ^{13}\text{C} \) NMR and UV-vis studies showed that the double Bingel cyclopropanation reaction afforded only cis-2 adducts, in agreement with the literature data [32,33].
