(Received 14 November 2021; accepted 3 February 2022)

We obtain a measure representation for a functional arising in the context of optimal design problems under linear growth conditions. The functional in question corresponds to the relaxation with respect to a pair $(\chi, u)$, where $\chi$ is the characteristic function of a set of finite perimeter and $u$ is a function of bounded deformation, of an energy with a bulk term depending on the symmetrized gradient as well as a perimeter term.

Keywords: (Special) fields of bounded deformation; optimal design; sets of finite perimeter; symmetric quasiconvexity

2020 Mathematics subject classification: 49J45; 49Q10

1. Introduction

In optimal design one aims to find an optimal shape which minimizes a cost functional. The optimal shape is a subset $E$ of a bounded, open set $\Omega \subset \mathbb{R}^N$ which is described by its characteristic function $\chi : \Omega \to \{0, 1\}$, $E = \{\chi = 1\}$, and, in the linear elasticity framework, the cost functional is usually a quadratic energy, so we are lead to the problem

$$\min_{(\chi,u)} \int_\Omega \chi(x)W_1(\mathcal{E}u(x)) + (1 - \chi(x))W_0(\mathcal{E}u(x)) \, dx,$$

where \( W_0 \) and \( W_1 \) are two elastic densities, with \( W_0 \geq W_1 \), and \( \mathcal{E}u \) denotes the symmetrized gradient of the displacement \( u \). We refer to the seminal papers \([1, 35–37, 43]\), among a wide literature (see, for instance, the recent contributions \([7, 8]\)).

However, as soon as plasticity comes into play, the observed stress–strain relation is no longer linear and, due to the linear growth of the stored elastic energy and to the lack of reflexivity of the space \( L^1 \), a suitable functional space is necessary to account for fields \( u \) whose strains are measures. The space of special fields with bounded deformation, \( BD(\Omega) \), was first proposed in \([36, 37, 47–50]\) and starting from these pioneering papers a vast literature developed.

Indeed, already in the case where \( \chi \equiv \chi_{\Omega} \), the search for equilibria in the context of perfect plasticity leads naturally to the study of lower semicontinuity properties, and eventually relaxation, for energies of the type

\[
\int_{\Omega} f(\mathcal{E}u(x)) \, dx \tag{1.2}
\]

where \( f \) is the volume energy density. As mentioned above, \( u \) belongs to the space \( BD(\Omega) \) of functions of bounded deformation composed of integrable vector-valued functions for which all components \( E_{ij} \), \( i, j = 1, \ldots, N \), of the deformation tensor \( E_u := (Du + Du^T)/2 \) are bounded Radon measures and \( \mathcal{E}u \) stands for the absolutely continuous part, with respect to the Lebesgue measure, of the symmetrized distributional derivative \( E_u \).

Lower semicontinuity for \((1.2)\) was established in \([16]\) under convexity assumptions on \( f \) and in \([27]\) for symmetric quasiconvex integrands, under linear growth conditions and for \( u \in LD(\Omega) \), the subspace of \( BD(\Omega) \) comprised of functions for which the singular part \( E^s u \) of the measure \( E u \) vanishes. For a symmetric quasiconvex density \( f \) with an explicit dependence on the position in the body and satisfying superlinear growth assumptions, lower semicontinuity properties were established in \([28]\) for \( u \in SBD(\Omega) \).

In the case where the energy density takes the form \( \|\mathcal{E}u\|^2 \) or \( \|\mathcal{E}^D u\|^2 + (\text{div } u)^2 \) (where \( A^D \) stands for the deviator of the \( N \times N \) matrix \( A \) given by \( A^D := A - (1/N)\text{tr}(A)I \), and the total energy also includes a surface term, a first relaxation result was proved in \([18]\). We also refer to \([39]\) for the relaxation in the case where there is no surface energy and to \([33, 40, 42]\) for related models concerning evolutions and homogenization, among a wider list of contributions.

For general energy densities \( f \), Barroso, Fonseca and Toader \([12]\) studied the relaxation of \((1.2)\) for \( u \in SBD(\Omega) \) under linear growth conditions but placing no convexity assumptions on \( f \). They showed that the relaxed functional admits an integral representation where a surface energy term arises naturally. The global method for relaxation due to Bouchitté, Fonseca and Mascarenhas \([17]\) was used to characterize the density of this term, whereas the identification of the relaxed bulk energy term relied on the blow-up method \([31]\) together with a Poincaré-type inequality.

Ebobisse and Toader \([29]\) obtained an integral representation result for general local functionals defined in \( SBD(\Omega) \) which are lower semicontinuous with respect to the \( L^1 \) topology and satisfy linear growth and coercivity conditions. The functionals under consideration are restrictions of Radon measures and are assumed to
be invariant with respect to rigid motions. Their work was extended to the space $SBD^p(\Omega)$, $p > 1$, which arises in connection with the study of fracture and damage models, by Conti, Focardi and Iurlano [24] in the two-dimensional setting. A crucial and novel ingredient of their proof is the construction of a $W^{1,p}$ approximation of an $SBD^p$ function $u$ using finite-elements on a countable mesh which is chosen according to $u$ (recall that $SBD^p$ denotes the space of fields with bounded deformation such that the symmetrized gradient is the sum of an $L^p$ field and a measure supported on a set of finite $\mathcal{H}^{N-1}$ measure).

The analysis of an integral representation for a variational functional satisfying lower semicontinuity, linear growth conditions and the usual measure theoretical properties, was extended to the full space $BD(\Omega)$ by Caroccia, Focardi and Van Goethem [23]. In this work, the invariance of the studied functional with respect to rigid motions, required in [29], is replaced by a weaker condition stating continuity with respect to infinitesimal rigid motions. Their result relies, as in papers mentioned above, on the global method for relaxation, as well as on the characterization of the Cantor part of the measure $Eu$, due to De Philippis and Rindler [25], which extends to the $BD$ case the result of Alberti’s rank-one theorem in $BV$.

In the study of the minimization problem (1.1) one usually prescribes the volume fraction of the optimal shape, leading to a constraint of the form
\[
\frac{1}{\mathcal{L}^N(\Omega)} \int_\Omega \chi(x) \, dx = \theta, \quad \theta \in (0, 1).
\]
It is sometimes convenient to replace this constraint by inserting, instead, a Lagrange multiplier in the modelling functional which, in the optimal design context, becomes
\[
F(\chi, u; \Omega) := \int_\Omega \chi(x) W_1(\mathcal{E}u(x)) + (1 - \chi(x)) W_0(\mathcal{E}u(x)) + \int_\Omega k(x) \, dx. \tag{1.3}
\]

Despite the fact that we have compactness for $u$ in $BD(\Omega)$ for functionals of the form (1.3), it is well known that the problem of minimizing (1.3) with respect to $(\chi, u)$, adding suitable forces and/or boundary conditions, is ill-posed, in the sense that minimizing sequences $\chi_n \in L^\infty(\Omega; \{0, 1\})$ tend to highly oscillate and develop microstructure, so that in the limit we may no longer obtain a characteristic function. To avoid this phenomenon, as in [2, 34], we add a perimeter penalization along the interface between the two zones $\{\chi = 0\}$ and $\{\chi = 1\}$ (see [21] for the analogous analysis performed in $BV$, and [14, 15, 20] for the Sobolev settings, also in the presence of a gap in the growth exponents).

Thus, with an abuse of notation (i.e. denoting $W_1 + k$, in (1.3), still by $W_1$), our aim in this paper is to study the energy functional given by
\[
F(\chi, u; \Omega) := \int_\Omega \chi(x) W_1(\mathcal{E}u(x)) + (1 - \chi(x)) W_0(\mathcal{E}u(x)) + |D\chi|(\Omega), \tag{1.4}
\]
where $u \in BD(\Omega)$, $\chi \in BV(\Omega; \{0, 1\})$ and the densities $W_i$, $i = 0, 1$, are continuous functions satisfying the following linear growth conditions from above and below:
\[
\exists \alpha, \beta > 0 \text{ such that } \alpha |\xi| \leq W_i(\xi) \leq \beta (1 + |\xi|), \quad \forall \xi \in \mathbb{R}^N.
\]
We point out that no convexity assumptions are placed on $W_i$, $i = 0, 1$. 
To simplify the notation, in the sequel, we let $f : \{0,1\} \times \mathbb{R}^N \to [0, +\infty)$ be defined as

$$f(q, \xi) := qW_1(\xi) + (1 - q)W_0(\xi),$$

and for a fixed $q \in \{0,1\}$, we recall that the recession function of $f$, in its second argument, is given by

$$f^\infty(q, \xi) := \limsup_{t \to +\infty} \frac{f(q,t\xi)}{t}. \quad (1.7)$$

Since we place no convexity assumptions on $W_i$, we consider the relaxed localized functionals arising from the energy (1.4), defined, for an open subset $A \subset \Omega$, by

$$F(\chi, u; A) := \inf \left\{ \liminf_{n \to +\infty} F(\chi_n, u_n; A) : u_n \in W^{1,1}(A; \mathbb{R}^N), \chi_n \in BV(A; \{0,1\}) \right\},$$

$$u_n \to u \text{ in } L^1(A; \mathbb{R}^N), \chi_n \to \chi \text{ in } L^1(A; \{0,1\}) \right\}, \quad (1.8)$$

and

$$F_{LD}(\chi, u; A) := \inf \left\{ \liminf_{n \to +\infty} F(\chi_n, u_n; A) : u_n \in LD(A), \chi_n \in BV(A; \{0,1\}), \right\}.$$

where $LD(\Omega) := \{u \in BD(\Omega) : E^*u = 0\}.

Due to the expression of (1.4), and to the fact that $\chi_n \overset{*}{\rightharpoonup} \chi$ in $BV \text{ if and only if } \{\chi_n\} \text{ is uniformly bounded in } BV \text{ and } \chi_n \to \chi$ in $L^1$, it is equivalent to take $\chi_n \overset{*}{\rightharpoonup} \chi$ in $BV \text{ or } \chi_n \to \chi$ in $L^1$, in the definitions of the functionals (1.8) and (1.9), obtaining for each of them the same infimum regardless of the considered convergence.

As a simple consequence of the density of smooth functions in $LD(\Omega)$ we show in remark 3.5 that, under the above growth conditions on $W_0, W_1$,

$$F(\chi, u; A) = F_{LD}(\chi, u; A), \text{ for every } \chi \in BV(A; \{0,1\}), u \in BD(\Omega), A \in \mathcal{O}(\Omega).$$

We prove in proposition 3.8 that $F(\chi, u; \cdot)$ is the restriction to the open subsets of $\Omega$ of a Radon measure, the main result of our paper concerns the characterization of this measure.

**Theorem 1.1.** Let $f : \{0,1\} \times \mathbb{R}^N \to [0, +\infty)$ be a continuous function as in (1.6), where $W_0$ and $W_1$ satisfy (1.5), and consider $F : BV(\Omega; \{0,1\}) \times BD(\Omega) \times ...
\( \mathcal{O}(\Omega) \) defined in (1.4). Then

\[
\mathcal{F}(\chi, u; A) = \int_A SQf(\chi(x), \mathcal{E}u(x)) \, dx
+ \int_{A \cap (J_\chi \cup J_u)} g(x, \chi^+(x), \chi^-(x), u^+(x), u^-(x), \nu(x)) \, d\mathcal{H}^{N-1}(x)
+ \int_A (SQf)^\infty(\chi(x), \chi^+(x), \chi^-(x), u^+(x), u^-(x), \nu(x)) \, dx
\]

(1.10)

where \( SQf \) is the symmetric quasiconvex envelope of \( f \) and \((SQf)^\infty\) is its recession function (cf. §2.3 and (1.7), respectively). The relaxed surface energy density is given by

\[
g(x_0, a, b, c, d, \nu) := \limsup_{\varepsilon \to 0^+} \frac{m(\chi_{a,b,\nu}(\cdot-x_0), u_{c,d,\nu}(\cdot-x_0); Q_\nu(x_0, \varepsilon))}{\varepsilon^{N-1}}
\]

where \( Q_\nu(x_0, \varepsilon) \) stands for an open cube with centre \( x_0 \), sidelength \( \varepsilon \) and two of its faces parallel to the unit vector \( \nu \),

\[
m(\chi, u; V) := \inf \{ \mathcal{F}(\theta, v; V) : \theta \in BV(\Omega; \{0,1\}), v \in BD(\Omega),
\theta = \chi \text{ on } \partial V, v = u \text{ on } \partial V \},
\]

for any \( V \) open subset of \( \Omega \) with Lipschitz boundary, and, for \( (a, b, c, d, \nu) \in \{0,1\} \times \{0,1\} \times \mathbb{R}^N \times \mathbb{R}^N \times S^{N-1} \), the functions \( \chi_{a,b,\nu} \) and \( u_{c,d,\nu} \) are defined as

\[
\chi_{a,b,\nu}(y) := \begin{cases}
  a, & \text{if } y \cdot \nu > 0 \\
  b, & \text{if } y \cdot \nu < 0
\end{cases}
\quad \text{and} \quad
u_{c,d,\nu}(y) := \begin{cases}
  c, & \text{if } y \cdot \nu > 0 \\
  d, & \text{if } y \cdot \nu < 0
\end{cases}
\]

For the notation regarding the jump sets \( J_\chi, J_u \) and the corresponding vectors \( \chi^+(x), \chi^-(x), \nu_\chi(x), u^+(x), u^-(x) \) and \( \nu_u(x) \) we refer to §2.1, 2.2 and 4.3.

The above expression for the relaxed surface energy density arises as an application of the global method for relaxation [17]. However, as we will see in §4.3, in the case where \( f \) satisfies the additional hypothesis (3.9), this density can be described more explicitly, leading to an integral representation for (1.8), in the \( BD \) setting, entirely similar to the one in \( BV \), obtained in [21], when \( W_0 \) and \( W_1 \) depend on the whole gradient \( \nabla u \). Indeed, under this assumption, we show that

\[
g(x_0, a, b, c, d, \nu) = K(a, b, c, d, \nu)
\]

where

\[
K(a, b, c, d, \nu)
:= \inf \left\{ \int_{Q_\nu} (SQf)^\infty(\chi(x), \mathcal{E}u(x)) \, dx + |D\chi|(Q_\nu) : (\chi, u) \in \mathcal{A}(a, b, c, d, \nu) \right\},
\]

(1.11)
and, for \((a, b, c, d, \nu) \in \{0, 1\} \times \{0, 1\} \times \mathbb{R}^N \times \mathbb{R}^N \times S^{N-1}\), the set of admissible functions is
\[
A(a, b, c, d, \nu) := \left\{ (\chi, u) \in BV_{\text{loc}} (S_{\nu}; \{0, 1\}) \times W^{1,1}_{\text{loc}} (S_{\nu}; \mathbb{R}^N) : \right.
\]
\[
(\chi(y), u(y)) = (a, c) \text{ if } y \cdot \nu = \frac{1}{2}, \quad (\chi(y), u(y)) = (b, d) \text{ if } y \cdot \nu = -\frac{1}{2},
\]
\[
(\chi, u) \text{ are 1-periodic in the directions of } \nu_1, \ldots, \nu_{N-1}\},
\]
\[
\{\nu_1, \nu_2, \ldots, \nu_{N-1}, \nu\} \text{ is an orthonormal basis of } \mathbb{R}^N \text{ and } S_{\nu} \text{ is the strip given by}
\]
\[
S_{\nu} = \left\{ x \in \mathbb{R}^N : |x \cdot \nu| < \frac{1}{2} \right\}.
\]

As an application of the result of Caroccia, Focardi and Van Goethem, obtained in the abstract variational functional setting in [23], the authors proved an integral representation for the relaxed functional, defined in \(BD(\Omega) \times \mathcal{O}(\Omega)\),
\[
\mathcal{F}_0(u; A) := \inf \left\{ \liminf_{n \to +\infty} F_0(u_n; A) : u_n \in W^{1,1}(A; \mathbb{R}^N), u_n \to u \text{ in } L^1(A; \mathbb{R}^N) \right\},
\]
where
\[
F_0(u; A) := \begin{cases} 
\int_A f_0(x, u(x), \mathcal{E} u(x)) \, dx, & \text{if } u \in W^{1,1}(\Omega; \mathbb{R}^N) \\
+\infty, & \text{otherwise}
\end{cases}
\]
and the density \(f_0\) satisfies linear growth conditions from above and below
\[
\frac{1}{C} |A| \leq f_0(x, u, A) \leq C \left(1 + |A|\right), \quad \forall (x, u, A) \in \Omega \times \mathbb{R}^N \times \mathbb{R}_+^N \times \mathbb{R}^N,
\]
as well as a continuity condition with respect to \((x, u)\). This generalizes to the full space \(BD(\Omega)\), and to the case of densities \(f_0\) depending explicitly on \((x, u)\), the results obtained in [12]. We will make use of their work in § 4.2 to prove both lower and upper bounds for the density of the Cantor part of the measure \(\mathcal{F}(\chi, u; \cdot)\), by means of an argument based on Chacon’s biting lemma which allows us to fix \(\chi\) at an appropriately chosen point \(x_0\), as in [41].

The contents of this paper are organized as follows. In § 2 we fix our notation and provide some results pertaining to \(BV\) and \(BD\) functions and notions of quasiconvexity which will be used in the sequel. Section 3 contains some auxiliary results which are needed to prove our main theorem. In particular, in proposition 3.8 we show that \(\mathcal{F}(\chi, u; \cdot)\) is the restriction to the open subsets of \(\Omega\) of a Radon measure \(\mu\). Section 4 is dedicated to the proof of our main theorem, which characterizes this measure. In each of § 4.1, 4.2 and 4.3 we prove lower and upper bounds of the densities of \(\mu\) with respect to the bulk and Cantor parts of \(E u\), as well as with respect to a surface measure which is concentrated on the union of the jump sets of \(\chi\) and \(u\).

The fact that our functionals have an explicit dependence on the \(\chi\) field prevented us from applying existing results (such as [5, 19]) directly and required us to obtain direct proofs.
2. Preliminaries

In this section we fix notations and quote some definitions and results that will be used in the sequel.

Throughout the text $\Omega \subset \mathbb{R}^N$ will denote an open, bounded set with Lipschitz boundary.

We will use the following notations:

- $\mathcal{B}(\Omega)$, $\mathcal{O}(\Omega)$ and $\mathcal{O}_\infty(\Omega)$ represent the families of all Borel, open and open subsets of $\Omega$ with Lipschitz boundary, respectively;
- $\mathcal{M}(\Omega)$ is the set of finite Radon measures on $\Omega$;
- $|\mu|$ stands for the total variation of a measure $\mu \in \mathcal{M}(\Omega)$;
- $\mathcal{L}^N$ and $\mathcal{H}^{N-1}$ stand for the $N$-dimensional Lebesgue measure and the $(N-1)$-dimensional Hausdorff measure in $\mathbb{R}^N$, respectively;
- the symbol $\text{d}x$ will also be used to denote integration with respect to $\mathcal{L}^N$;
- the set of symmetric $N \times N$ matrices is denoted by $\mathbb{R}^{N \times N}$;
- given two vectors $a, b \in \mathbb{R}^N$, $a \odot b$ is the symmetric $N \times N$ matrix defined by $a \odot b := \frac{a \otimes b + b \otimes a}{2}$, where $\otimes$ indicates tensor product;
- $B(x, \varepsilon)$ is the open ball in $\mathbb{R}^N$ with centre $x$ and radius $\varepsilon$, $Q(x, \varepsilon)$ is the open cube in $\mathbb{R}^N$ with two of its faces parallel to the unit vector $e_N$, centre $x$ and sidelength $\varepsilon$, whereas $Q_\nu(x, \varepsilon)$ stands for a cube with two of its faces parallel to the unit vector $\nu$; when $x = 0$ and $\varepsilon = 1$, $\nu = e_N$ we simply write $B$ and $Q$;
- $S^{N-1} := \partial B$ is the unit sphere in $\mathbb{R}^N$;
- $C_c^\infty(\Omega; \mathbb{R}^N)$ and $C_{\text{per}}(Q; \mathbb{R}^N)$ are the spaces of $\mathbb{R}^N$-valued smooth functions with compact support in $\Omega$ and smooth and $Q$-periodic functions from $Q$ to $\mathbb{R}^N$, respectively;
- by limit we mean $\lim_{\delta \to 0^+} \lim_{n \to +\infty}$, $\lim_{k \to +\infty} \lim_{n \to +\infty}$;
- $C$ represents a generic positive constant that may change from line to line.

2.1. BV functions and sets of finite perimeter

In the following we give some preliminary notions regarding functions of bounded variation and sets of finite perimeter. For a detailed treatment we refer to [4].

Given $u \in L^1(\Omega; \mathbb{R}^d)$ we let $\Omega_u$ be the set of Lebesgue points of $u$, i.e. $x \in \Omega_u$ if there exists $\tilde{u}(x) \in \mathbb{R}^d$ such that

$$\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{B(x, \varepsilon)} |u(y) - \tilde{u}(x)| \, dy = 0,$$
\( \tilde{u}(x) \) is called the approximate limit of \( u \) at \( x \). The Lebesgue discontinuity set \( S_u \) of \( u \) is defined as \( S_u := \Omega \setminus \Omega_u \). It is known that \( \mathcal{L}^N(S_u) = 0 \) and the function \( x \in \Omega \mapsto \tilde{u}(x) \), which coincides with \( u \ \mathcal{L}^N \text{-a.e. in } \Omega_u \), is called the Lebesgue representative of \( u \).

The jump set of the function \( u \), denoted by \( J_u \), is the set of points \( x \in \Omega \setminus \Omega_u \) for which there exist \( a, b \in \mathbb{R}^d \) and a unit vector \( \nu \in S^{N-1} \), normal to \( J_u \) at \( x \), such that \( a \neq b \) and

\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{\{y \in B(x, \varepsilon) : (y-x) \cdot \nu > 0\}} |u(y) - a| \, dy = 0,
\]

\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{\{y \in B(x, \varepsilon) : (y-x) \cdot \nu < 0\}} |u(y) - b| \, dy = 0.
\]

The triple \((a, b, \nu)\) is uniquely determined by the conditions above, up to a permutation of \((a, b)\) and a change of sign of \( \nu \), and is denoted by \((u^+(x), u^-(x), \nu_u(x))\). The jump of \( u \) at \( x \) is defined by \([u](x) := u^+(x) - u^-(x)\).

We recall that a function \( u \in L^1(\Omega; \mathbb{R}^d) \) is said to be of bounded variation, and we write \( u \in BV(\Omega; \mathbb{R}^d) \), if all its first-order distributional derivatives \( D_j u_i \) belong to \( \mathcal{M}(\Omega) \) for \( 1 \leq i \leq d \) and \( 1 \leq j \leq N \).

The matrix-valued measure whose entries are \( D_j u_i \) is denoted by \( Du \) and \(|Du|\) stands for its total variation. The space \( BV(\Omega; \mathbb{R}^d) \) is a Banach space when endowed with the norm

\[
\|u\|_{BV(\Omega; \mathbb{R}^d)} = \|u\|_{L^1(\Omega; \mathbb{R}^d)} + |Du|(\Omega)
\]

and we observe that if \( u \in BV(\Omega; \mathbb{R}^d) \) then \( u \mapsto |Du|(\Omega) \) is lower semicontinuous in \( BV(\Omega; \mathbb{R}^d) \) with respect to the \( L^1_{\text{loc}}(\Omega; \mathbb{R}^d) \) topology.

By the Lebesgue decomposition theorem, \( Du \) can be split into the sum of two mutually singular measures \( D^a u \) and \( D^s u \), the absolutely continuous part and the singular part, respectively, of \( Du \) with respect to the Lebesgue measure \( \mathcal{L}^N \). By \( \nabla u \) we denote the Radon–Nikodym derivative of \( D^a u \) with respect to \( \mathcal{L}^N \), so that we can write

\[
Du = \nabla u \mathcal{L}^N |\Omega + D^s u.
\]

If \( u \in BV(\Omega) \) it is well known that \( S_u \) is countably \((N-1)\)-rectifiable, see [4], and the following decomposition holds

\[
Du = \nabla u \mathcal{L}^N |\Omega + [u] \otimes \nu_u \mathcal{H}^{N-1} |S_u + D^c u,
\]

where \( D^c u \) is the Cantor part of the measure \( Du \).

If \( \Omega \) is an open and bounded set with Lipschitz boundary then the outer unit normal to \( \partial \Omega \) (denoted by \( \nu \)) exists \( \mathcal{H}^{N-1} \text{-a.e. and the trace for functions in } BV(\Omega; \mathbb{R}^d) \) is defined.

**Theorem 2.1** (Approximate differentiability). If \( u \in BV(\Omega; \mathbb{R}^d) \), then for \( \mathcal{L}^N \text{-a.e. } x \in \Omega \)

\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N+1} \int_{Q(x, \varepsilon)} |u(y) - u(x) - \nabla u(x) \cdot (y-x)| \, dy = 0.
\]
**Definition 2.2.** Let $E$ be an $\mathcal{L}^N$-measurable subset of $\mathbb{R}^N$. For any open set $\Omega \subset \mathbb{R}^N$ the perimeter of $E$ in $\Omega$, denoted by $P(E; \Omega)$, is given by

$$P(E; \Omega) := \sup \left\{ \int_E \text{div} \varphi(x) \, dx : \varphi \in C^1_c(\Omega; \mathbb{R}^N), \|\varphi\|_{L^\infty} \leq 1 \right\}. \quad (2.2)$$

We say that $E$ is a set of finite perimeter in $\Omega$ if $P(E; \Omega) < +\infty$.

Recalling that if $\mathcal{L}^N(E \cap \Omega)$ is finite, then $\chi_E \in L^1(\Omega)$, by [4, proposition 3.6], it follows that $E$ has finite perimeter in $\Omega$ if and only if $\chi_E \in BV(\Omega)$ and $P(E; \Omega)$ coincides with $|D\chi_E|(\Omega)$, the total variation in $\Omega$ of the distributional derivative of $\chi_E$. Moreover, a generalized Gauss–Green formula holds:

$$\int_E \text{div} \varphi(x) \, dx = \int_\Omega \langle \nu_{E}(x), \varphi(x) \rangle \, d|D\chi_E|, \quad \forall \varphi \in C^1_c(\Omega; \mathbb{R}^N),$$

where $D\chi_E = \nu_{E}|D\chi_E|$ is the polar decomposition of $D\chi_E$.

The following approximation result can be found in [9].

**Lemma 2.3.** Let $E$ be a set of finite perimeter in $\Omega$. Then, there exists a sequence of polyhedra $E_n$, with characteristic functions $\chi_n$, such that $\chi_n \to \chi$ in $L^1(\Omega; \{0,1\})$ and $P(E_n; \Omega) \to P(E; \Omega)$.

### 2.2. BD and LD functions

We now recall some facts about functions of bounded deformation. More details can be found in [3, 12, 16, 51, 52].

A function $u \in L^1(\Omega; \mathbb{R}^N)$ is said to be of bounded deformation, and we write $u \in BD(\Omega)$, if the symmetric part of its distributional derivative $Du$, $Eu := (Du + Du^T)/2$, is a matrix-valued bounded Radon measure. The space $BD(\Omega)$ is a Banach space when endowed with the norm

$$\|u\|_{BD(\Omega)} = \|u\|_{L^1(\Omega; \mathbb{R}^N)} + |Eu|(\Omega).$$

We denote by $LD(\Omega)$ the subspace of $BD(\Omega)$ comprised of functions $u$ such that $Eu \in L^1(\Omega; \mathbb{R}^{N \times N})$, a counterexample due to [44] shows that $W^{1,1}(\Omega; \mathbb{R}^N) \subseteq LD(\Omega)$.

The intermediate topology in the space $BD(\Omega)$ is the one determined by the distance

$$d(u,v) := \|u - v\|_{L^1(\Omega; \mathbb{R}^N)} + |Eu|(\Omega) - |Ev|(\Omega), \quad u,v \in BD(\Omega).$$

Hence, a sequence $\{u_n\} \subset BD(\Omega)$ converges to a function $u \in BD(\Omega)$ with respect to this topology, written $u_n \overset{\infty}{\rightharpoonup} u$, if and only if, $u_n \to u$ in $L^1(\Omega; \mathbb{R}^N)$, $Eu_n \overset{\infty}{\rightharpoonup} Eu$ in the sense of measures and $|Eu_n|(\Omega) \to |Eu|(\Omega)$.

Recall that if $u_n \to u$ in $L^1(\Omega; \mathbb{R}^N)$ and there exists $C > 0$ such that $|Eu_n|(\Omega) \leq C, \forall n \in \mathbb{N}$, then $u \in BD(\Omega)$ and

$$|Eu|(\Omega) \leq \liminf_{n \to +\infty} |Eu_n|(\Omega). \quad (2.3)$$

By the Lebesgue decomposition theorem, $Eu$ can be split into the sum of two mutually singular measures $E^a u$ and $E^s u$, the absolutely continuous part and the
singular part, respectively, of $E u$ with respect to the Lebesgue measure $\mathcal{L}^N$. The Radon–Nikodym derivative of $E^a u$ with respect to $\mathcal{L}^N$, is denoted by $\mathcal{E} u$ so we have

$$E u = \mathcal{E} u \mathcal{L}^N[\Omega + E^a u].$$

With these notations we may write

$$LD(\Omega) := \{ u \in BD(\Omega) : E^a u = 0 \}$$

and (cf. [51]) $LD(\Omega)$ is a Banach space when endowed with the norm

$$\| u \|_{LD(\Omega)} := \| u \|_{L^1(\Omega; \mathbb{R}^N)} + \| \mathcal{E} u \|_{L^1(\Omega; \mathbb{R}^N)}.$$

If $\Omega$ is a bounded, open subset of $\mathbb{R}^N$ with Lipschitz boundary $\Gamma$, then there exists a linear, surjective and continuous, both with respect to the norm and to the intermediate topologies, trace operator

$$tr : BD(\Omega) \rightarrow L^1(\Omega; \mathbb{R}^N)$$

such that $tr \ u = u$ if $u \in BD(\Omega) \cap C(\overline{\Omega}; \mathbb{R}^N)$. Furthermore, the following Gauss–Green formula holds

$$\int_{\Omega} (u \circ D\varphi)(x) \, dx + \int_{\Omega} \varphi(x) \, dE u(x) = \int_{\Gamma} \varphi(x)(tr u \circ \nu)(x) \, d\mathcal{H}^{N-1}(x), \quad (2.4)$$

for every $\varphi \in C^1(\overline{\Omega})$ (cf. [3, 51]).

The following lemma is proved in [12].

**Lemma 2.4.** Let $u \in BD(\Omega)$ and let $\rho \in C_0^\infty(\mathbb{R}^N)$ be a non-negative function such that $\text{supp}(\rho) \subset B(0, 1)$, $\rho(-x) = \rho(x)$ for every $x \in \mathbb{R}^N$ and $\int_{\mathbb{R}^N} \rho(x) \, dx = 1$. For any $n \in \mathbb{N}$ set $\rho_n(x) := n^N \rho(nx)$ and

$$u_n(x) := (u * \rho_n)(x) = \int_{\Omega} u(y) \rho_n(x - y) \, dy, \quad \text{for } x \in \left\{ y \in \Omega : \text{dist}(y, \partial \Omega) > \frac{1}{n} \right\}.$$

Then $u_n \in C^\infty(\Omega \setminus \left\{ y \in \Omega : \text{dist}(y, \partial \Omega) > \frac{1}{n} \right\}; \mathbb{R}^N)$ and

(i) for any non-negative Borel function $h : \Omega \rightarrow \mathbb{R}$

$$\int_{B(x_0, \varepsilon)} h(x) |E u_n(x)| \, dx \leq \int_{B(x_0, \varepsilon + 1/n)} (h * \rho_n)(x) \, d|E u|(x),$$

whenever $\varepsilon + \frac{1}{n} < \text{dist}(x_0, \partial \Omega)$;

(ii) for any positively homogeneous of degree one, convex function $\theta : \mathbb{R}^N_{\text{sym}} \rightarrow [0, +\infty]$ and any $\varepsilon \in [0, \text{dist}(x_0, \partial \Omega)]$ such that $|E u|(|\partial B(x_0, \varepsilon)|) = 0$,

$$\lim_{n \rightarrow +\infty} \int_{B(x_0, \varepsilon)} \theta(|E u_n(x)|) \, dx = \int_{B(x_0, \varepsilon)} \theta \left( \frac{dE u}{d|E u|} \right) \, d|E u|,$$

(iii) $\lim_{n \rightarrow +\infty} u_n(x) = \tilde{u}(x)$ and $\lim_{n \rightarrow +\infty} (|u_n - u * \rho_n|(x) = 0$ for every $x \in \Omega \setminus S_u$, whenever $u \in L^\infty(\Omega; \mathbb{R}^N)$.
The following result, proved in [51], see also [12, theorem 2.6], shows that it is possible to approximate any \( BD(\Omega) \) function \( u \) by a sequence of smooth functions which preserve the trace of \( u \).

**Theorem 2.5.** Let \( \Omega \) be a bounded, connected, open set with Lipschitz boundary. For every \( u \in BD(\Omega) \), there exists a sequence of smooth functions \( \{u_n\} \subset C^\infty(\Omega; \mathbb{R}^N) \cap W^{1,1}(\Omega; \mathbb{R}^N) \) such that \( u_n \rightharpoonup u \) and \( tr \, u_n = tr \, u \). If, in addition, \( u \in LD(\Omega) \), then \( \mathcal{E}u_n \to \mathcal{E}u \) in \( L^1(\Omega; \mathbb{R}^{N \times N}) \).

It is also shown in [51] that if \( \Omega \) is an open, bounded subset of \( \mathbb{R}^N \), with Lipschitz boundary, then \( BD(\Omega) \) is compactly embedded in \( L^q(\Omega; \mathbb{R}^N) \), for every \( 1 \leq q < N/(N - 1) \). In particular, the following result holds.

**Theorem 2.6.** Let \( \Omega \) be an open, bounded subset of \( \mathbb{R}^N \), with Lipschitz boundary and let \( 1 \leq q < N/(N - 1) \). If \( \{u_n\} \) is bounded in \( BD(\Omega) \), then there exist \( u \in BD(\Omega) \) and a subsequence \( \{u_{n_k}\} \) of \( \{u_n\} \) such that \( u_{n_k} \to u \) in \( L^q(\Omega; \mathbb{R}^N) \).

If \( u \in BD(\Omega) \) then \( J_u \) is countably \((N - 1)\)-rectifiable, see [3], and the following decomposition holds

\[
Eu = \mathcal{E}u \mathcal{L}^N[\Omega + [u] \circ \nu_u \mathcal{H}^{N-1}[J_u + E^c u],
\]

where \([u] = u^+ - u^-\), \( u^\pm \) are the traces of \( u \) on the sides of \( J_u \) determined by the unit normal \( \nu_u \) to \( J_u \) and \( E^c u \) is the Cantor part of the measure \( Eu \) which vanishes on Borel sets \( B \) with \( \mathcal{H}^{N-1}(B) < +\infty \).

We end this subsection by pointing out that the equivalent of (2.1), with \( \mathcal{E}u(x) \) replacing \( \nabla u(x) \), is false (see [3]). However the following result holds (cf. [3, theorem 4.3] and [28, theorem 2.5]).

**Theorem 2.7 (Approximate symmetric differentiability).** If \( u \in BD(\Omega) \), then, for \( \mathcal{L}^N\)-a.e. \( x \in \Omega \), there exists an \( N \times N \) matrix \( \nabla u(x) \) such that

\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^{N+1}} \int_{B_\varepsilon(x)} |u(y) - u(x) - \nabla u(x)(y - x)| \, dy = 0, \tag{2.5}
\]

\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{B_\varepsilon(x)} \frac{|(u(y) - u(x) - \mathcal{E}u(x)(y - x), y - x)|}{|y - x|^2} \, dy = 0, \tag{2.6}
\]

for \( \mathcal{L}^N\)-a.e. \( x \in \Omega \). Furthermore

\[
\mathcal{L}^N(\{x \in \Omega : |\nabla u(x)| > t\}) \leq \frac{C(N, \Omega)}{t} ||u||_{BD(\Omega)}, \quad \forall \, t > 0,
\]

with \( C(N, \Omega) > 0 \) depending only on \( N \) and \( \Omega \).

From (2.5) and (2.6) it follows that \( \mathcal{E}u = (\nabla u + \nabla u^T)/2 \).

We denote by \( \mathcal{R} \) the kernel of the linear operator \( E \) consisting of the class of rigid motions in \( \mathbb{R}^N \), i.e. affine maps of the form \( Mx + b \) where \( M \) is a skew-symmetric \( N \times N \) matrix and \( b \in \mathbb{R}^N \). \( \mathcal{R} \) is therefore closed and finite-dimensional
so it is possible to define the orthogonal projection $P : BD(\Omega) \to \mathcal{R}$. This operator belongs to the class considered in the following Poincaré–Friedrichs type inequality for $BD$ functions (see [3, 38, 51]).

**Theorem 2.8.** Let $\Omega$ be a bounded, connected, open subset of $\mathbb{R}^N$, with Lipschitz boundary, and let $R : BD(\Omega) \to \mathcal{R}$ be a continuous linear map which leaves the elements of $\mathcal{R}$ fixed. Then there exists a constant $C(\Omega, R)$ such that

$$
\int_{\Omega} |u(x) - R(u)(x)| \, dx \leq C(\Omega, R) |Eu|(\Omega), \text{ for every } u \in BD(\Omega).
$$

**2.3. Notions of quasiconvexity**

**Definition 2.9 ([12], definition 3.1).** A Borel measurable function $f : \mathbb{R}_s^{N \times N} \to \mathbb{R}$ is said to be symmetric quasiconvex if

$$
f(\xi) \leq \int_{Q} f(\xi + \mathcal{E}\varphi(x)) \, dx,
$$

for every $\xi \in \mathbb{R}_s^{N \times N}$ and for every $\varphi \in C^\infty_{\text{per}}(Q; \mathbb{R}^N)$.

**Remark 2.10.** The above property (2.7) is independent of the size, orientation and centre of the cube over which the integration is performed. Also, if $f$ is upper semi-continuous and locally bounded from above, using Fatou’s lemma and the density of smooth functions in $LD(Q)$, it follows that in (2.7) $C^\infty_{\text{per}}(Q; \mathbb{R}^N)$ may be replaced by $LD_{\text{per}}(Q)$.

Given $f : \mathbb{R}_s^{N \times N} \to \mathbb{R}$, the symmetric quasiconvex envelope of $f$, $SQf$, is defined by

$$
SQf(\xi) := \inf \left\{ \int_{Q} f(\xi + \mathcal{E}\varphi(x)) \, dx : \varphi \in C^\infty_{\text{per}}(Q; \mathbb{R}^N) \right\}, \quad (2.8)
$$

It is possible to show that $SQf$ is the greatest symmetric quasiconvex function that is less than or equal to $f$. Moreover, definition (2.8) is independent of the domain, i.e.

$$
SQf(\xi) := \inf \left\{ \frac{1}{\mathcal{L}^N(D)} \int_{D} f(\xi + \mathcal{E}\varphi(x)) \, dx : \varphi \in C^\infty_0(D; \mathbb{R}^N) \right\}, \quad (2.9)
$$

whenever $D \subset \mathbb{R}^N$ is an open, bounded set with $\mathcal{L}^N(\partial D) = 0$.

In [27], a Borel measurable function $f : \mathbb{R}_s^{N \times N} \to \mathbb{R}$ is said to be symmetric quasiconvex if and only if

$$
f(\xi) \leq \frac{1}{\mathcal{L}^N(D)} \int_{D} f(\xi + \mathcal{E}\varphi(x)) \, dx \quad \text{for all } \varphi \in W^{1,\infty}_0(D; \mathbb{R}^N), \quad (2.10)
$$

and it is stated that $f$ is symmetric quasiconvex if and only if $f \circ \pi$ is quasiconvex in the sense of Morrey, where $\pi$ is the projection of $\mathbb{R}^{N \times N}$ onto $\mathbb{R}_s^{N \times N}$. 
Let us show that these two notions coincide. Observe first that, for any \( \varphi \in C_0^\infty(D;\mathbb{R}^N) \),
\[
\SQ f(\xi) \leq \frac{1}{\mathcal{L}^N(D)} \int_D SQ f(\xi + \varphi(x)) \, dx = \frac{1}{\mathcal{L}^N(D)} \int_D (SQ f \circ \pi)(\xi + \nabla \varphi(x)) \, dx.
\]
(2.11)

If \( f \) is upper semicontinuous and satisfies a growth condition from above as in (1.5), then \( SQ f \) in (2.9) is symmetric quasiconvex also in the sense of [27]. Indeed, \( SQ f \) satisfies the same growth condition (1.5) and a density argument as in [10] shows that \( SQ f \circ \pi \) is \( W^{1,1} \)-quasiconvex, hence \( W^{1,\infty} \)-quasiconvex, i.e. \( \varphi \) can be chosen in \( W_0^{1,\infty}(D;\mathbb{R}^N) \). Thus,
\[
\SQ f(\xi) \leq \frac{1}{\mathcal{L}^N(D)} \int_D SQ f(\xi + \varphi(x)) \, dx \leq \frac{1}{\mathcal{L}^N(D)} \int_D f(\xi + \varphi(x)) \, dx,
\]
for every \( \varphi \in W_0^{1,\infty}(D;\mathbb{R}^N) \). Therefore, denoting by \( SQ f_E \) the symmetric quasi-
convexification
\[
SQ f_E(\xi) := \inf \left\{ \frac{1}{\mathcal{L}^N(D)} \int_D f(\xi + \varphi(x)) \, dx : \varphi \in W_0^{1,\infty}(D;\mathbb{R}^N) \right\},
\]
and by \( SQ f \) the symmetric quasiconvexification defined through (2.9), trivially \( SQ f_E \leq SQ f \) and by (2.12) we have equality.

Actually, under linear growth conditions and upper semicontinuity of \( f \), we may also conclude that
\[
SQ f_E(\xi) := \inf \left\{ \frac{1}{\mathcal{L}^N(D)} \int_D f(\xi + \varphi(x)) \, dx : \varphi \in W_0^{1,1}(D;\mathbb{R}^N) \right\}.
\]

3. Auxiliary results

We recall that for \( u \in BD(\Omega) \) and \( \chi \in BV(\Omega;\{0,1\}) \) the energy under consider-
ation is
\[
F(\chi, u; \Omega) := \int_\Omega \chi(x)W_1(\mathcal{E}u(x)) + (1 - \chi(x))W_0(\mathcal{E}u(x)) \, dx + |D\chi|(\Omega),
\]
(3.1)
and our aim is to obtain an integral representation for the localized relaxed functionals, defined for \( A \in \mathcal{O}(\Omega) \), by
\[
\mathcal{F}(\chi, u; A) := \inf \left\{ \liminf_{n \to +\infty} F(\chi_n, u_n; A) : u_n \in W^{1,1}(A;\mathbb{R}^N), \chi_n \in BV(A;\{0,1\}) \right\},
\]
(3.2)
\[
\mathcal{F}_{LD}(\chi, u; A) := \inf \left\{ \liminf_{n \to +\infty} F(\chi_n, u_n; A) : u_n \in LD(A), \chi_n \in BV(A;\{0,1\}) \right\},
\]
(3.3)
where the densities \( W_i, i = 0, 1 \), are continuous functions such that

\[
\exists \alpha, \beta > 0 \text{ such that } \alpha |\xi| \leq W_i(\xi) \leq \beta (1 + |\xi|), \; \forall \xi \in \mathbb{R}^{N \times N}, \tag{3.4}
\]

and where, for purposes of notation, we let \( f : \{0, 1\} \times \mathbb{R}^{N \times N}_s \rightarrow [0, +\infty) \) be defined as

\[
f(q, \xi) := qW_1(\xi) + (1 - q)W_0(\xi). \tag{3.5}
\]

It follows from the definition of the recession function (1.7) and from the growth conditions (3.4) that for every \( q \in \{0, 1\} \) and every \( \xi \in \mathbb{R}^{N \times N}_s \)

\[
\alpha |\xi| \leq f^\infty(q, \xi) \leq \beta |\xi|. \tag{3.6}
\]

It is an immediate consequence of (3.4) that

\[
|f(q_1, \xi) - f(q_2, \xi)| \leq \beta |q_1 - q_2|(1 + |\xi|), \; \forall q_1, q_2 \in \{0, 1\}, \forall \xi \in \mathbb{R}^{N \times N}_s, \tag{3.7}
\]

from which it follows that

\[
|f^\infty(q_1, \xi) - f^\infty(q_2, \xi)| \leq \beta |q_1 - q_2| |\xi|, \; \forall q_1, q_2 \in \{0, 1\}, \forall \xi \in \mathbb{R}^{N \times N}_s. \tag{3.8}
\]

The following additional hypothesis will be used to write the density of the jump term in the form given in (1.11)

\[
\exists 0 < \gamma \leq 1, \exists C, L > 0 : t |\xi| > L \Rightarrow \left| f^\infty(q, \xi) - \frac{f(q, t\xi)}{t} \right| \leq C \frac{|\xi|^{1-\gamma}}{t^\gamma}, \tag{3.9}
\]

for every \( q \in \{0, 1\} \) and every \( \xi \in \mathbb{R}^{N \times N}_s \). As pointed out in [32], this can be stated equivalently as

\[
\exists 0 < \gamma \leq 1, \exists C > 0 \text{ such that } |f^\infty(q, \xi) - f(q, \xi)| \leq C (1 + |\xi|^{1-\gamma}), \tag{3.10}
\]

for every \( q \in \{0, 1\} \) and every \( \xi \in \mathbb{R}^{N \times N}_s \).

Under our assumed growth conditions (3.4), we observe that if \( f \) satisfies (3.9), or equivalently (3.10), then the same holds for its symmetric quasiconvex envelope \( SQf \). To this end, we recall that, under the hypothesis (3.4), the recession function of a symmetric quasiconvex function is still symmetric quasiconvex (see [46, remarks 8 and 9]) and we begin by stating the following results (cf. [21, (iv) and (v) in remark 3.2] and [45, propositions 2.6 and 2.7] for the quasiconvex counterpart).

**Proposition 3.1.** Let \( f : \{0, 1\} \times \mathbb{R}^{N \times N}_s \rightarrow [0, +\infty) \) be a continuous function as in (3.5) and satisfying (3.4) and (3.9). Let \( f^\infty \) and \( SQf \) be its recession function and its symmetric quasiconvex envelope, defined by (1.7) and (2.8), respectively. Then

\[
SQ(f^\infty)(q, \xi) = (SQf)^\infty(q, \xi) \quad \text{for every } (q, \xi) \in \{0, 1\} \times \mathbb{R}^{N \times N}_s. \tag{3.11}
\]

**Proposition 3.2.** Let \( f : \{0, 1\} \times \mathbb{R}^{N \times N}_s \rightarrow [0, +\infty) \) be a continuous function as in (3.5), satisfying (3.4) and (3.9). Then, there exist \( \gamma \in [0, 1) \) and \( C > 0 \) such that

\[
|(SQf)^\infty(q, \xi) - SQf(q, \xi)| \leq C (1 + |\xi|^{1-\gamma}), \; \forall (q, \xi) \in \{0, 1\} \times \mathbb{R}^{N \times N}_s.
\]
The growth conditions (3.4), as well as standard diagonalization arguments, allow us to prove the following properties of the functional \( \mathcal{F}(\chi, u; A) \) defined in (3.2).

**Proposition 3.3.** Let \( A \in \mathcal{O}(\Omega), \ u \in BD(A), \ \chi \in BV(A; \{0,1\}) \) and \( \mathcal{F}(\chi, u; A) \) be given by (3.1). If \( W_i, i = 0,1 \), satisfy (3.4), then

(i) there exists \( C > 0 \) such that

\[
C \left( |Eu|(A) + |D\chi|(A) \right) \leq \mathcal{F}(\chi, u; A) \leq C \left( \mathcal{L}^N(A) + |Eu|(A) + |D\chi|(A) \right);
\]

(ii) \( \mathcal{F}(\chi, u; A) \) is always attained, that is, there exist sequences \( \{u_n\} \subset W^{1,1}(A; \mathbb{R}^N) \) and \( \{\chi_n\} \subset BV(A; \{0,1\}) \) such that \( u_n \to u \) in \( L^1(A; \mathbb{R}^N) \), \( \chi_n \to \chi \) in \( L^1(A; \{0,1\}) \) and

\[
\mathcal{F}(\chi, u; A) = \lim_{n \to \infty} \mathcal{F}(\chi_n, u_n; A);
\]

(iii) if \( \{u_n\} \subset W^{1,1}(A; \mathbb{R}^N) \) and \( \{\chi_n\} \subset BV(A; \{0,1\}) \) are such that \( u_n \to u \) in \( L^1(A; \mathbb{R}^N) \) and \( \chi_n \to \chi \) in \( L^1(A; \{0,1\}) \), then

\[
\mathcal{F}(\chi, u; A) \leq \liminf_{n \to +\infty} \mathcal{F}(\chi_n, u_n; A).
\]

**Proof.** (i) The upper bound follows from the growth condition from above of \( W_i, i = 0,1 \) and by fixing \( \chi_n = \chi \) as a test sequence for \( \mathcal{F}(\chi, u; A) \), whereas the lower bound is a consequence of the inequality from below in (3.4) and (2.3) and the lower semicontinuity of the total variation of Radon measures.

The conclusions in (ii) and (iii) follow by standard diagonalization arguments.

\[\square\]

**Remark 3.4.** Analogous conclusions also hold for the functional \( \mathcal{F}_{LD}(\chi, u; A) \).

**Remark 3.5.** Assuming that the continuous functions \( W_0 \) and \( W_1 \) satisfy the growth hypothesis (3.4), it follows from the density of smooth functions in \( LD(\Omega) \) and a diagonalization argument that

\[
\mathcal{F}(\chi, u; A) = \mathcal{F}_{LD}(\chi, u; A), \quad \text{for every } \chi \in BV(A; \{0,1\}), u \in BD(\Omega), A \in \mathcal{O}(\Omega).
\]

**Proof.** As \( W^{1,1}(A; \mathbb{R}^N) \subset LD(A) \), one inequality is trivial. In order to show the reverse one, let \( \{u_n\} \subset LD(A), \ \{\chi_n\} \subset BV(A; \{0,1\}) \) be such that \( u_n \to u \) in \( L^1(A; \mathbb{R}^N) \), \( \chi_n \to \chi \) in \( L^1(A; \{0,1\}) \) and

\[
\mathcal{F}_{LD}(\chi, u; A) = \lim_n \left[ \int_A \chi_n(x)W_1(\mathcal{E}u_n(x)) + (1 - \chi_n(x))W_0(\mathcal{E}u_n(x)) \, dx + |D\chi_n|(A) \right].
\]

By theorem 2.5, for each \( n \in \mathbb{N} \), let \( v_{n,k} \in W^{1,1}(A; \mathbb{R}^N) \) be such that \( v_{n,k} \to u_n \) in \( L^1(A; \mathbb{R}^N) \), as \( k \to +\infty \), and \( \mathcal{E}v_{n,k} \to \mathcal{E}u_n \) in \( L^1(A; \mathbb{R}^N) \), as \( k \to +\infty \). By passing
to a subsequence, if necessary, assume also that \( \lim_{k \to +\infty} \mathcal{E}v_{n,k}(x) = \mathcal{E}u_n(x) \), for a.e. \( x \in A \). By (3.4) and Fatou’s lemma we obtain

\[
\int_A \chi_n(x) [C(1 + |\mathcal{E}u_n(x)|) - W_1(\mathcal{E}u_n(x))] \, dx \\
\leq \liminf_{k \to +\infty} \int_A \chi_n(x) [C(1 + |\mathcal{E}v_{n,k}(x)|) - W_1(\mathcal{E}v_{n,k}(x))] \, dx
\]

so that

\[
\int_A \chi_n(x) W_1(\mathcal{E}u_n(x)) \, dx \geq \limsup_{k \to +\infty} \int_A \chi_n(x) W_1(\mathcal{E}v_{n,k}(x)) \, dx,
\]

and likewise for the term involving \( (1 - \chi_n)W_0 \). From the previous inequalities we conclude that

\[
F(\chi_n, u_n; A) \geq \limsup_{k \to +\infty} F(\chi_n, v_{n,k}; A).
\]

Since \( v_{n,k} \to u_n \) in \( L^1(A; \mathbb{R}^N) \), as \( k \to +\infty \), and \( u_n \to u \) in \( L^1(A; \mathbb{R}^N) \), by a diagonalization argument there exists a sequence \( k_n \to +\infty \) such that \( v_{n,k_n} \to u \) in \( L^1(A; \mathbb{R}^N) \) and

\[
F(\chi_n, v_{n,k_n}; A) \leq F(\chi_n, u_n; A) + \frac{1}{k_n}.
\]

As \( \{\chi_n\}, \{v_{n,k_n}\} \) are admissible for \( \mathcal{F} (\chi; u; A) \) it follows that

\[
\mathcal{F} (\chi, u; A) \leq \liminf_{n \to +\infty} F(\chi_n, v_{n,k_n}; A)
\]

\[
\leq \limsup_{n \to +\infty} \left( F(\chi_n, u_n; A) + \frac{1}{k_n} \right) = \mathcal{F}_{LD} (\chi, u; A). \tag*{\square}
\]

A straightforward adaptation of the proof of [12, proposition 3.7] yields the following result which enables us to prove the nested subadditivity property of the functional \( \mathcal{F} (\chi, u; \cdot) \).

**Proposition 3.6.** Let \( A \in \mathcal{O}(\Omega) \) and assume that \( W_0, W_1 \) satisfy the growth condition (3.4). Let \( \{\chi_n\} \subset BV(A; \{0, 1\}) \) and \( \{u_n\}, \{v_n\} \subset BD(A; \mathbb{R}^N) \) be sequences satisfying \( u_n - v_n \to 0 \) in \( L^1(A; \mathbb{R}^N) \), \( \sup_n |\mathcal{E}u_n|(A) < +\infty \), \( |\mathcal{E}v_n| \overset{*}{\to} \mu \) and \( |\mathcal{E}v_n| \to \mu(A) \). Then there exist subsequences \( \{v_{n_k}\} \) of \( \{v_n\} \), \( \{\chi_{n_k}\} \) of \( \{\chi_n\} \) and there exists a sequence \( \{w_k\} \subset BD(A) \) such that \( w_k = v_{n_k} \) near \( \partial A \), \( w_k - v_{n_k} \to 0 \) in \( L^1(A; \mathbb{R}^N) \) and

\[
\limsup_{k \to +\infty} F(\chi_{n_k}, w_k; A) \leq \liminf_{n \to +\infty} F(\chi_n, u_n; A).
\]

It is clear from the proof that if the original sequences \( \{u_n\}, \{v_n\} \) belong to \( W^{1,1}(A; \mathbb{R}^N) \) then the sequence \( \{w_k\} \) will also be in this space.
Proposition 3.7. Assume that $W_0$ and $W_1$ are continuous functions satisfying (3.4). Let $u \in BD(\Omega)$, $\chi \in BV(\Omega; \{0, 1\})$ and $S, U, V \in \mathcal{O}(\Omega)$ be such that $S \subset \subset V \subset U$. Then

$$F(\chi, u; U) \leq F(\chi, u; V) + F(\chi, u; U \setminus \overline{S}).$$

Proof. By proposition 3.3, (ii), let $\{v_n\} \subset W^{1,1} (V; \mathbb{R}^N)$, $\{w_n\} \subset W^{1,1} (U \setminus \overline{S}; \mathbb{R}^N)$, $\{\chi_n\} \subset BV (V; \{0, 1\})$ and $\{\theta_n\} \subset BV (U \setminus \overline{S}; \{0, 1\})$ be such that $v_n \to u$ in $L^1 (V; \mathbb{R}^N)$, $w_n \to u$ in $L^1 (U \setminus \overline{S}; \mathbb{R}^N)$, $\chi_n \to \chi$ in $L^1 (V; \{0, 1\})$, $\theta_n \to \chi$ in $L^1 (U \setminus \overline{S}; \{0, 1\})$ and

$$F(\chi, u; V) = \lim_{n \to +\infty} F(\chi_n, v_n; V) \quad (3.12)$$

$$F(\chi, u; U \setminus \overline{S}) = \lim_{n \to +\infty} F(\theta_n, w_n; U \setminus \overline{S}). \quad (3.13)$$

Let $V_0 \in \mathcal{O}_x (\Omega)$ satisfy $S \subset \subset V_0 \subset \subset V$ and $|E_u| (\partial V_0) = 0$, $|D\chi| (\partial V_0) = 0$. Applying proposition 3.6 to $\{v_n\}$ and $u$ in $V_0$, we obtain a subsequence $\{\overline{\chi}_n\}$ of $\{\chi_n\}$ and a sequence $\{\overline{v}_n\} \subset W^{1,1} (V_0; \mathbb{R}^N)$ such that $\overline{v}_n \to u$ near $\partial V_0$, $\overline{v}_n \to u$ in $L^1 (V_0; \mathbb{R}^N)$ and

$$\limsup_{n \to +\infty} F(\overline{\chi}_n, \overline{v}_n; V_0) \leq \liminf_{n \to +\infty} F(\chi_n, v_n; V_0). \quad (3.14)$$

A further application of proposition 3.6, this time to $\{w_n\}$ and $u$ in $U \setminus \overline{V_0}$, yields a subsequence $\{\overline{\theta}_n\}$ of $\{\theta_n\}$ and a sequence $\{\overline{w}_n\} \subset W^{1,1} (U \setminus \overline{V_0}; \mathbb{R}^N)$ such that $\overline{w}_n \to u$ near $\partial V_0$, $\overline{w}_n \to u$ in $L^1 (U \setminus \overline{V_0}; \mathbb{R}^N)$ and

$$\limsup_{n \to +\infty} F(\overline{\theta}_n, \overline{w}_n; U \setminus \overline{V_0}) \leq \liminf_{n \to +\infty} F(\theta_n, w_n; U \setminus \overline{V_0}). \quad (3.15)$$

Define

$$z_n := \begin{cases} \overline{v}_n, & \text{in } V_0 \\ \overline{w}_n, & \text{in } U \setminus \overline{V_0}, \end{cases}$$

note that, by the properties of $\{\overline{v}_n\}$ and $\{\overline{w}_n\}$, $\{z_n\} \subset W^{1,1} (U; \mathbb{R}^N)$ and $z_n \to u$ in $L^1 (U; \mathbb{R}^N)$.

We must now build a transition sequence $\{\eta_n\}$ between $\{\overline{\chi}_n\}$ and $\{\overline{\theta}_n\}$, in such a way that an upper bound for the total variation of $\eta_n$ is obtained. In order to connect these functions without adding more interfaces, we argue as in [13] (see also [14]). For $\delta > 0$ consider

$$V_\delta := \{x \in V : \text{dist} (x, V_0) < \delta\},$$

where $\delta$ is small enough so that $\overline{w}_n = u$ in $V_\delta \setminus \overline{V_0}$ and

$$\int_{V_\delta \setminus \overline{V_0}} C (1 + |u(x)|) \, dx = O(\delta). \quad (3.16)$$

Given $x \in V$, let $d(x) := \text{dist} (x; V_0)$. Since the distance function to a fixed set is Lipschitz continuous, applying the change of variables formula (see theorem 2, § 3.4.3
in [30]) yields

\[
\int_{V_o} |\overline{\chi}_n(x) - \overline{\theta}_n(x)||\det \nabla d(x)| \, dx = \int_0^\delta \left[ \int_{d^{-1}(y)} |\overline{\chi}_n(x) - \overline{\theta}_n(x)| \, dH^{N-1}(x) \right] \, dy
\]

and, as \(|\det \nabla d(x)|\) is bounded and \(\overline{\chi}_n - \overline{\theta}_n \to 0\) in \(L^1(V \cap (U \backslash S); \{0, 1\})\), it follows that, for almost every \(\rho \in [0; \delta]\), we have

\[
\lim_{n \to +\infty} \int_{d^{-1}(\rho)} |\overline{\chi}_n(x) - \overline{\theta}_n(x)| \, dH^{N-1}(x) = 0. \tag{3.17}
\]

Fix \(\rho_0 \in [0; \delta]\) such that \(|D\chi|/|\partial V_{\rho_0}| = 0\) and (3.17) holds. We observe that \(V_{\rho_0}\) is a set with locally Lipschitz boundary since it is a level set of a Lipschitz function (see, e.g. [30]). Hence, for every \(n\), we can consider \(\overline{\chi}_n, \overline{\theta}_n\) on \(\partial V_{\rho_0}\) in the sense of traces and define

\[
\eta_n := \begin{cases} \overline{\chi}_n, & \text{in } V_{\rho_0} \\ \overline{\theta}_n, & \text{in } U \backslash V_{\rho_0}. \end{cases}
\]

Then \(\{\eta_n\} \subset BV(U; \{0, 1\})\), \(\eta_n \to \chi\) in \(L^1(U; \{0, 1\})\) and so \(\{\eta_n\}\) and \(\{z_n\}\) are admissible for \(F(\chi, u; U)\). Therefore, by (3.17), (3.4), (3.14), (3.15), (3.16), (3.12) and (3.13),

\[
F(\chi, u; U) \leq \liminf_{n \to +\infty} F(\eta_n, z_n; U)
\]

\[
\leq \liminf_{n \to +\infty} \left[ F(\overline{\chi}_n, \overline{\nabla}; V_0) + \int_{V_{\rho_0} \backslash V_0} \overline{\chi}_n(x) W_1(Eu(x)) \right.
\]

\[
+ (1 - \overline{\chi}_n(x)) W_0(Eu(x)) \, dx + |D\overline{\chi}_n|(V_{\rho_0} \backslash V_0) + F(\overline{\theta}_n, \overline{\nabla}; U \backslash V_{\rho_0})
\]

\[
+ \int_{\partial V_{\rho_0}} |\overline{\chi}_n(x) - \overline{\theta}_n(x)| \, dH^{N-1}(x)
\]

\[
\leq \limsup_{n \to +\infty} F(\overline{\chi}_n, \overline{\nabla}; V_0) + \limsup_{n \to +\infty} F(\overline{\theta}_n, \overline{\nabla}; U \backslash V_0)
\]

\[
+ \int_{V_{\rho_0} \backslash V_0} C (1 + |Eu(x)|) \, dx + \limsup_{n \to +\infty} |D\chi_n|(V_{\rho_0} \backslash V_0)
\]

\[
\leq \liminf_{n \to +\infty} F(\chi_n, v_n; V_0) + \liminf_{n \to +\infty} F(\theta_n, w_n; U \backslash V_0)
\]

\[
+ O(\delta) + \limsup_{n \to +\infty} |D\chi_n|(V_{\rho_0} \backslash V_0)
\]

\[
\leq \limsup_{n \to +\infty} F(\chi_n, v_n; V) + \limsup_{n \to +\infty} F(\theta_n, w_n; U \backslash \overline{S}) + O(\delta)
\]

\[
= F(\chi, u; V) + F(\chi, u; U \backslash \overline{S}) + O(\delta)
\]

so the result follows by letting \(\delta \to 0^+\). \qed
PROPOSITION 3.8. Let $W_0$ and $W_1$ be continuous functions satisfying (3.4). For every $u \in BD(\Omega)$, $\chi \in BV(\Omega; \{0, 1\})$, $\mathcal{F}(\chi, u; \cdot)$ is the restriction to $O(\Omega)$ of a Radon measure.

Proof. By proposition 3.3 (ii), let $\{u_n\} \subset W^{1,1}(\Omega; \mathbb{R}^N)$, $\{\chi_n\} \subset BV(\Omega; \{0, 1\})$, be such that $u_n \to u$ in $L^1(\Omega; \mathbb{R}^N)$, $\chi_n \to \chi$ in $L^1(\Omega; \{0, 1\})$ and

$$\mathcal{F}(\chi, u; \Omega) = \lim_{n \to +\infty} F(\chi_n, u_n; \Omega).$$

Let $\mu_n = f(\chi_n(\cdot), \mathcal{E}u_n(\cdot))L^N|\Omega + |D\chi_n|$ and extend this sequence of measures outside of $\Omega$ by setting, for any Borel set $E \subset \mathbb{R}^N$,

$$\lambda_n(E) = \mu_n(E \cap \Omega).$$

Passing, if necessary, to a subsequence, we can assume that there exists a non-negative Radon measure $\mu$ (depending on $\chi$ and $u$) on $\overline{\Omega}$ such that $\lambda_n \rightharpoonup \mu$ in the sense of measures in $\overline{\Omega}$. Let $\varphi_k \in C_0(\overline{\Omega})$ be an increasing sequence of functions such that $0 \leq \varphi_k \leq 1$ and $\varphi_k(x) \to 1$ a.e. in $\overline{\Omega}$. Then, by Fatou's lemma and by the choice of $\{u_n\}, \{\chi_n\}$, we have

$$\mu(\overline{\Omega}) = \int_{\Omega} \liminf_{k \to +\infty} \varphi_k(x) \, d\mu \leq \liminf_{k \to +\infty} \int_{\Omega} \varphi_k(x) \, d\mu$$

$$= \liminf_{k \to +\infty} \lim_{n \to +\infty} \left( \int_{\Omega} \varphi_k(x)f(\chi_n(x), \mathcal{E}u_n(x)) \, dx + \int_{\Omega} \varphi_k(x) \, d|D\chi_n| \right)$$

$$\leq \lim_{n \to +\infty} \left( \int_{\Omega} f(\chi_n(x), \mathcal{E}u_n(x)) \, dx + |D\chi_n| (\Omega) \right) = \mathcal{F}(\chi, u; \Omega),$$

so that

$$\mu(\overline{\Omega}) \leq \mathcal{F}(\chi, u; \Omega). \quad (3.18)$$

On the other hand, by the upper semicontinuity of weak * convergence of measures on compact sets, for every open set $V \subset \Omega$, it follows that

$$\mathcal{F}(\chi, u; V) \leq \liminf_{n \to +\infty} F(\chi_n, u_n; V) = \liminf_{n \to +\infty} \mu_n(V) \leq \limsup_{n \to +\infty} \mu_n(V) = \mu(V). \quad (3.19)$$

Now let $V \in O(\Omega)$ and $\varepsilon > 0$ be fixed and consider an open set $S \subset V$ such that $\mu(V \setminus S) < \varepsilon$. Then

$$\mu(V) \leq \mu(S) + \varepsilon = \mu(\overline{\Omega}) - \mu(\overline{\Omega} \setminus S) + \varepsilon, \quad (3.20)$$

and so, by (3.20), (3.18), (3.19) and proposition 3.7 we have

$$\mu(V) \leq \mu(\overline{\Omega}) - \mu(\overline{\Omega} \setminus S) + \varepsilon \leq \mathcal{F}(\chi, u; \Omega) - \mathcal{F}(\chi, u; \overline{S}) + \varepsilon \leq \mathcal{F}(\chi, u; V) + \varepsilon.$$

Letting $\varepsilon \to 0^+$, we obtain

$$\mu(V) \leq \mathcal{F}(\chi, u; V),$$
whenever \( V \) is an open set such that \( V \subset \subset \Omega \). For a general open subset \( V \subset \Omega \) we have

\[
\mu(V) = \sup \{ \mu(O) : O \subset \subset V \} \leq \sup \{ \mathcal{F}(\chi, u; O) : O \subset \subset V \} \leq \mathcal{F}(\chi, u; V).
\]

It remains to show that \( \mathcal{F}(\chi, u; U) \leq \mu(U) \), \( \forall U \in \mathcal{O}(\Omega) \). Fix \( \varepsilon > 0 \) and choose \( V, S \in \mathcal{O}(\Omega) \) such that \( S \subset \subset V \subset \subset U \) and \( \mathcal{L}^N(U \setminus \overline{S}) + |Eu|(U \setminus \overline{S}) + |D\chi|(U \setminus \overline{S}) < \varepsilon \). By proposition 3.3 (i), (3.19) and the nested subadditivity result, it follows that

\[
\mathcal{F}(\chi, u; U) \leq \mathcal{F}(\chi, u; V) + \mathcal{F}(\chi, u; U \setminus \overline{S}) \\
\leq \mu(V) + C(\mathcal{L}^N(U \setminus \overline{S}) + |Eu|(U \setminus \overline{S}) + |D\chi|(U \setminus \overline{S})) \leq \mu(U) + C\varepsilon,
\]

so it suffices to let \( \varepsilon \rightarrow 0^+ \) to conclude the proof. \( \square \)

Combining the arguments given in the proofs of propositions 3.6 and 3.7 it is possible to obtain the following refined version of proposition 3.6.

Proposition 3.9. Let \( A \in \mathcal{O}(\Omega) \) and assume that \( W_0, W_1 \) satisfy the growth condition (3.4). Let \( \{u_n\}, \{v_n\} \subset BD(A; \mathbb{R}^N) \) and \( \{\chi_n\}, \{\theta_n\} \subset BV(A; \{0, 1\}) \) be sequences satisfying \( u_n - v_n \rightarrow 0 \) in \( L^1(A; \mathbb{R}^N) \), \( \chi_n - \theta_n \rightarrow 0 \) in \( L^1(A; \{0, 1\}) \), sup \( n |E^\varepsilon u_n|(A) < +\infty \), sup \( n |E_\varepsilon v_n| \rightarrow \mu(A) \), sup \( n |D\chi_n|(A) < +\infty \) and sup \( n |D\theta_n|(A) < +\infty \). Then there exist subsequences \( \{v_{n_k}\} \) of \( \{v_n\} \), \( \{\theta_{n_k}\} \) of \( \{\theta_n\} \) and there exist sequences \( \{w_k\} \subset BD(A), \{\eta_k\} \subset BV(A; \{0, 1\}) \) such that \( w_k = v_{n_k} \) near \( \partial A \), \( \eta_k = \theta_{n_k} \) near \( \partial A \), \( w_k - v_{n_k} \rightarrow 0 \) in \( L^1(A; \mathbb{R}^N) \), \( \eta_k - \theta_{n_k} \rightarrow 0 \) in \( L^1(A; \{0, 1\}) \) and

\[
\lim_{k \rightarrow +\infty} \sup_{n \rightarrow +\infty} F(\eta_k, w_k; A) \leq \lim_{n \rightarrow +\infty} \inf F(\chi_n, u_n; A).
\]

As in proposition 3.6, the new sequence \( \{w_k\} \) has the same regularity as the original sequences \( \{u_n\}, \{v_n\} \) as it is obtained through a convex combination of these ones using smooth cut-off functions.

The following proposition, whose proof is standard (cf. for instance [45, lemma 3.1] or [22, proposition 2.14]), allows us to assume without loss of generality that \( f \) is symmetric quasiconvex.

Proposition 3.10. Let \( W_0 \) and \( W_1 \) be continuous functions satisfying (3.4) and consider the functional \( F : BV(\Omega; \{0, 1\}) \times BD(\Omega) \times \mathcal{O}(\Omega) \) defined in (3.1). Consider furthermore the relaxed functionals given in (3.2) and

\[
\mathcal{F}_{SQf}(\chi, u; A) := \inf \left\{ \liminf_{n \rightarrow +\infty} \int_A SQf(\chi_n(x), E u_n(x)) \, dx + |D\chi_n|(A) : \right. \\
(\chi_n, u_n) \in BV(A; \{0, 1\}) \times LD(A), u_n \rightharpoonup u \text{ in } L^1(A; \mathbb{R}^N), \\
\chi_n \rightarrow \chi \text{ in } L^1(A; \{0, 1\}) \left. \right\}.
\]

Then, \( \mathcal{F}(\cdot, \cdot, \cdot) \) coincides with \( \mathcal{F}_{SQf}(\cdot, \cdot, \cdot) \) in \( BV(\Omega; \{0, 1\}) \times BD(\Omega) \times \mathcal{O}(\Omega) \).
In the sequel we rely on the result of proposition 3.10 and assume that \( f \) is symmetric quasiconvex. Together with (3.4), this entails the Lipschitz continuity of \( f \) with respect to the second variable (see [26]). Under this quasiconvexity hypothesis, assuming in addition that (3.9) holds and taking also into account proposition 3.2, we recall (cf. (1.11)) that our relaxed surface energy density is given by

\[
K(a, b, c, d, \nu) := \inf \left\{ \int_{Q_\nu} f^\infty(\chi(x), E(u(x)) \, dx + |D\chi| (Q_\nu) : (\chi, u) \in \mathcal{A}(a, b, c, d, \nu) \right\}.
\]

(3.22)

where, for \((a, b, c, d, \nu) \in \{0, 1\} \times \{0, 1\} \times \mathbb{R}^N \times \mathbb{R}^N \times S^{N-1}\), the set of admissible functions is

\[
\mathcal{A}(a, b, c, d, \nu) := \{ (\chi, u) \in BV_{\text{loc}}(S_\nu; \{0, 1\}) \times W^{1,1}_{\text{loc}}(S_\nu; \mathbb{R}^N) : \\
(\chi(y), u(y)) = (a, c) \text{ if } y \cdot \nu = -\frac{1}{2}, \quad (\chi(y), u(y)) = (b, d) \text{ if } y \cdot \nu = \frac{1}{2}, \\
(\chi, u) \text{ are } 1\text{-periodic in the directions of } \nu_1, \ldots, \nu_{N-1}\}.
\]

(3.23)

\(\{\nu_1, \nu_2, \ldots, \nu_{N-1}\}\) is an orthonormal basis of \(\mathbb{R}^N\) and \(S_\nu\) is the strip given by

\[
S_\nu = \left\{ x \in \mathbb{R}^N : |x \cdot \nu| < \frac{1}{2} \right\}.
\]

The following result provides an alternative characterization of \(K(a, b, c, d, \nu)\) which will be useful to obtain the surface term of the relaxed energy, under hypothesis (3.9). To this end, given \((a, b, c, d, \nu) \in \{0, 1\} \times \{0, 1\} \times \mathbb{R}^N \times \mathbb{R}^N \times S^{N-1}\), we consider the functions

\[
\chi_{a, b, \nu}(y) := \begin{cases} 
  a, & \text{if } y \cdot \nu > 0 \\
  b, & \text{if } y \cdot \nu < 0
\end{cases}
\]

and

\[
u_{c, d, \nu}(y) := \begin{cases} 
  c, & \text{if } y \cdot \nu > 0 \\
  d, & \text{if } y \cdot \nu < 0
\end{cases}
\]

(3.24)

**Proposition 3.11.** For every \((a, b, c, d, \nu) \in \{0, 1\} \times \{0, 1\} \times \mathbb{R}^N \times \mathbb{R}^N \times S^{N-1}\) we have

\[
K(a, b, c, d, \nu) = \tilde{K}(a, b, c, d, \nu)
\]

where

\[
\tilde{K}(a, b, c, d, \nu) := \inf \left\{ \liminf_{n \to +\infty} \left[ \int_{Q_\nu} f^\infty(\chi_n(x), E(u_n(x)) \, dx + |D\chi_n| (Q_\nu) \right] : \\
\chi_n \in BV(Q_\nu; \{0, 1\}), u_n \in W^{1,1}(Q_\nu; \mathbb{R}^N), \chi_n \to \chi_{a, b, \nu} \text{ in } L^1(Q_\nu; \{0, 1\}), \\
u_n \to \nu_{c, d, \nu} \text{ in } L^1(Q_\nu; \mathbb{R}^N) \right\}.
\]

(3.25)

**Proof.** The conclusion follows as in [11, proposition 3.5], by proving a double inequality.
To show that $K(a, b, c, d, \nu) \leq \tilde{K}(a, b, c, d, \nu)$ we take sequences $\{\chi_n\}, \{u_n\}$ as in the definition of $\tilde{K}(a, b, c, d, \nu)$ and use proposition 3.9, applied to $\{\chi_n\}, \{\chi_{a,b,\nu}\}, \{u_n\}$ and $\{v_n\}$, where $v_n$ is a regularization of $u_{c,d,\nu}$ which preserves its boundary values (cf. theorem 2.5).

The reverse inequality is based on the periodicity of the admissible functions for $K(a, b, c, d, \nu)$, together with the Riemann–Lebesgue lemma. □

4. Proof of the main theorem

Given $\chi \in BV(\Omega; \{0, 1\})$ and $u \in BD(\Omega)$, by proposition 3.8 we know that $F(\chi, u, ; \cdot)$ is the restriction to $\mathcal{O}(\Omega)$ of a Radon measure $\mu$. By proposition 3.3 (i) we may decompose $\mu$ as

$$\mu = \mu^a \mathcal{L}^N + \mu^j + \mu^c,$$

with $\mu^j \ll |E^j u| + |D\chi|$.

Our aim in this section is to characterize the density $\mu^a$ and the measures $\mu^j$ and $\mu^c$.

We point out that the measure $\mu^j$ is given by $\sigma^j \mathcal{H}^{N-1}(J_\chi \cup J_u)$, for a certain density $\sigma^j$. Indeed, due to the fact that, for BV functions, $\mathcal{H}^{N-1}(S_u \setminus J_u) = 0$, the measure $|D\chi|$ is concentrated on $J_\chi$ apart from an $\mathcal{H}^{N-1}$-negligible set, whereas, by [3, remark 4.2 and proposition 4.4], $|E^j u|$ is concentrated on $J_u$ and it is the only part of the measure $Eu$ that is concentrated on $(n - 1)$-dimensional sets.

4.1. The bulk term

**Proposition 4.1.** Let $u \in BD(\Omega), \chi \in BV(\Omega; \{0, 1\})$ and let $W_0$ and $W_1$ be continuous functions satisfying (3.4). Assume that $f$ given by (3.5) is symmetric quasiconvex. Then, for $\mathcal{L}^N$ a.e. $x_0 \in \Omega$,

$$\mu^a(x_0) = \frac{d\mathcal{F}(\chi, u, ; \cdot)}{d\mathcal{L}^N}(x_0) \geq f(\chi(x_0), Eu(x_0)).$$

**Proof.** Let $x_0 \in \Omega$ be a point satisfying

$$\mu^a(x_0) = \frac{d\mu}{d\mathcal{L}^N}(x_0) = \lim_{\varepsilon \to 0^+} \frac{\mu(Q(x_0, \varepsilon))}{\varepsilon} \text{ exists and is finite } (4.1)$$

and

$$\frac{d|E^s u|}{d\mathcal{L}^N}(x_0) = 0, \quad \frac{d|D\chi|}{d\mathcal{L}^N}(x_0) = 0. \quad (4.2)$$

Furthermore, we choose $x_0$ to be a point of approximate continuity for $u$, for $Eu$ and for $\chi$, namely we assume that

$$\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{Q(x_0, \varepsilon)} |u(x) - u(x_0)| \, dx = 0, \quad (4.3)$$

$$\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{Q(x_0, \varepsilon)} |Eu(x) - Eu(x_0)| \, dx = 0 \quad (4.4)$$
and

$$\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon N} \int_{Q(x_0, \varepsilon)} |\chi(x) - \chi(x_0)| \, dx = 0. \tag{4.5}$$

We observe that the above properties hold for $\mathcal{L}^N$ a.e. $x_0 \in \Omega$ (applying, for instance, [3, equation (2.5)] to $u$, $\mathcal{E}u$ and $\chi$).

Assuming that the sequence $\varepsilon_k \to 0^+$ is chosen in such a way that $\mu(\partial Q(x_0, \varepsilon_k)) = 0$, we have

$$\mu^*(x_0) = \lim_{\varepsilon_k \to 0^+} \frac{\mu(Q(x_0, \varepsilon_k))}{\varepsilon_k^N} = \lim_{\varepsilon_k, \varepsilon \to 0^+} \frac{1}{\varepsilon_k^N} \int_{Q(x_0, \varepsilon_k)} f(\chi_n(x), \mathcal{E}u_n(x)) \, dx + |D\chi_n|(Q(x_0, \varepsilon_k)) \gtrless \lim_{\varepsilon_k, \varepsilon \to 0^+} \int_Q f(\chi_n(x + \varepsilon_k y), \mathcal{E}u_n(x + \varepsilon_k y)) \, dy,$$

where $\chi_n \in BV(Q(x_0, \varepsilon_k); \{0, 1\})$, $\chi_n \to \chi$ in $L^1(Q(x_0, \varepsilon_k); \{0, 1\})$ and $u_n \in W^{1,1}(Q(x_0, \varepsilon_k); \mathbb{R}^N)$, $u_n \to u$ in $L^1(Q(x_0, \varepsilon_k); \mathbb{R}^N)$.

Defining

$$\chi_{n, \varepsilon_k}(y) := \chi_n(x_0 + \varepsilon_k y) - \chi(x_0),$$

it follows by (4.5) that

$$\lim_{\varepsilon_k, \varepsilon \to 0^+} \|\chi_{n, \varepsilon_k}\|_{L^1(Q)} = \lim_{\varepsilon_k, \varepsilon \to 0^+} \int_Q |\chi_n(x_0 + \varepsilon_k y) - \chi(x_0)| \, dy$$

$$= \lim_{\varepsilon_k, \varepsilon \to 0^+} \frac{1}{\varepsilon_k^N} \int_{Q(x_0, \varepsilon_k)} |\chi_n(x) - \chi(x_0)| \, dx$$

$$= \lim_{\varepsilon_k \to 0^+} \frac{1}{\varepsilon_k^N} \int_{Q(x_0, \varepsilon_k)} |\chi(x) - \chi(x_0)| \, dx = 0. \tag{4.6}$$

Analogously, letting

$$u_{n, \varepsilon_k}(y) := \frac{u_n(x_0 + \varepsilon_k y) - u(x_0)}{\varepsilon_k},$$

then $\mathcal{E}u_{n, \varepsilon_k}(y) = \mathcal{E}u_n(x_0 + \varepsilon_k y)$ and, since $u_{n, \varepsilon_k} \in W^{1,1}(\Omega; \mathbb{R}^N)$, $Eu_{n, \varepsilon_k} = \mathcal{E}u_{n, \varepsilon_k} \mathcal{L}^N$.

Moreover, arguing as in the proof of [12, proposition 4.1], exploiting the coercivity of $f$ in the second variable and theorems 2.8 and 2.6, we conclude that there exists a function $v \in BD(\Omega)$, such that

$$\lim_{\varepsilon_k, \varepsilon \to 0} \|u_{n, \varepsilon_k} - P(u_{n, \varepsilon_k}) - v\|_{L^1(Q; \mathbb{R}^N)} = 0,$$

where $P$ is the projection of $BD(\Omega)$ onto the kernel of the operator $E$. Furthermore, given that the point $x_0$ was chosen to satisfy (4.2) and (4.4), it was shown in [12,
Therefore, a diagonalization argument allows us to extract subsequences \( u_k := u_{n_k, e_k} - P(u_{n_k, e_k}) \) and \( \chi_k := \chi_{n_k, e_k} \), such that
\[
\lim_{k \to +\infty} \| \chi_k \|_{L^1(Q)} = 0,
\]
\[
\lim_{k \to +\infty} \| u_k - v \|_{L^1(Q; \mathbb{R}^N)} = 0
\]
and
\[
\mu^a(x_0) = \frac{d\mu}{d\mathcal{L}^N}(x_0) \geq \lim_{k \to +\infty} \int_Q f(\chi(x_0) + \chi_k(y), \mathcal{E}u_k(y)) \, dy.
\]

Our next step is to fix \( \chi(x_0) \) in the first argument of \( f \) in the previous integral. To this end we make use of Chacon’s biting lemma (see \([4, \text{lemma 5.32}]\)). Indeed, by the coercivity hypothesis (3.4) and (4.9), the sequence \( \{\mathcal{E}u_k\} \) is bounded in \( L^1(Q; \mathbb{R}^N \times N) \) so the biting lemma guarantees the existence of a (not relabelled) subsequence of \( \{u_k\} \) and of a decreasing sequence of Borel sets \( D_r \), such that
\[
\lim_{r \to +\infty} \mathcal{L}^N(D_r) = 0
\]
and the sequence \( \{\mathcal{E}u_k\} \) is equiintegrable in \( Q \setminus D_r \), for any \( r \in \mathbb{N} \).

Since \( f \geq 0 \), by (3.7) and (4.9), we have
\[
\mu^a(x_0) \geq \lim_{k \to +\infty} \int_{Q \setminus D_r} f(\chi(x_0) + \chi_k(y), \mathcal{E}u_k(y)) \, dy
\]
\[
\geq \lim_{k \to +\infty} \left\{ \int_{Q \setminus D_r} f(\chi(x_0), \mathcal{E}u_k(y)) \, dy - \int_{Q \setminus D_r} C |\chi_k(y)| \cdot (1 + |\mathcal{E}u_k(y)|) \, dy \right\}
\]
\[
\geq \lim_{k \to +\infty} \int_{Q \setminus D_r} f(\chi(x_0), \mathcal{E}u_k(y)) \, dy - \limsup_{k \to +\infty} \int_{Q \setminus D_r} C |\chi_k(y)| \cdot |\mathcal{E}u_k(y)| \, dy,
\]
where we used (4.6).

We claim that for each \( j \in \mathbb{N} \), there exist \( k = k(j) \) and \( r_j \in \mathbb{N} \), such that
\[
\int_{Q \setminus D_{r_j}} f(\chi(x_0), \mathcal{E}u_{k(j)}(y)) \, dy \geq \int_{Q} f(\chi(x_0), \mathcal{E}u_{k(j)}(y)) \, dy - \frac{C}{j}.
\]

In light of (3.4), in order to guarantee that (4.11) holds, it suffices to show that for each \( j \in \mathbb{N} \), there exist \( k = k(j) \) and \( r_j \in \mathbb{N} \), such that
\[
\int_{D_{r_j}} 1 + |\mathcal{E}u_{k(j)}(y)| \, dy \leq \frac{1}{j}.
\]

Suppose not. Then, there exists \( j_0 \in \mathbb{N} \) such that, for all \( r, k \in \mathbb{N} \),
\[
\int_{D_r} 1 + |\mathcal{E}u_k(y)| \, dy > \frac{1}{j_0}
\]
which contradicts the equiintegrability of the constant sequence \( \{1 + |\mathcal{E}u_k|\} \), for \( k \) fixed, and the fact that \( \lim_{r \to +\infty} \mathcal{L}^N(D_r) = 0 \).
For this choice of $k(j)$ and $r_j$, we now estimate the last term in (4.10). Since $|\chi_{k(j)}| \to 0$, as $j \to +\infty$, in $L^1(Q)$, this sequence also converges to zero in measure. Thus, denoting by

$$A_{k(j)} := \{x \in Q \setminus D_{r_j} : |\chi_{k(j)}(x)| = 1\},$$

it follows that for every $\delta > 0$, there exists $j_0 \in \mathbb{N}$ such that $\mathcal{L}^n(A_{k(j)}) < \delta$, for all $j > j_0$.

On the other hand, because the sequence $\{\mathcal{E} u_{k(j)}\}$ is equiintegrable in $Q \setminus D_{r_j}$, we know that for every $\varepsilon > 0$, there exists $\delta = \delta(\varepsilon) > 0$ such that for any measurable set $A \subset Q \setminus D_{r_j}$ with $\mathcal{L}^n(A) < \delta(\varepsilon)$ we have $\int_A |\mathcal{E} u_{k(j)}(y)| \, dy < \varepsilon$. Choosing $j$ large enough so that $\mathcal{L}^n(A_{k(j)}) < \delta(\varepsilon)$ we obtain $\int_{A_{k(j)}} |\mathcal{E} u_{k(j)}(y)| \, dy < \varepsilon$ and hence

$$\int_{Q \setminus D_{r_j}} |\chi_{k(j)}(y)| \cdot |\mathcal{E} u_{k(j)}(y)| \, dy < \varepsilon, \quad (4.14)$$

for every sufficiently large $j$.

Therefore, up to the extraction of a further subsequence, and denoting in what follows $\chi_j := \chi_{k(j)}$, $v_j := u_{k(j)}$ and $D_j := D_{r_j}$, (4.10), (4.11) and (4.14) yield

$$\mu^a(x_0) = \frac{d\mu}{d\mathcal{L}^n}(x_0) \geq \liminf_{j \to +\infty} \left( \int_{Q} f(\chi(x_0), \mathcal{E} v_j(y)) \, dy - \frac{C}{j} \right)$$

$$- \limsup_{j \to +\infty} \int_{Q \setminus D_j} C|\chi_j(y)| \cdot |\mathcal{E} v_j(y)| \, dy$$

$$\geq \liminf_{j \to +\infty} \int_{Q} f(\chi(x_0), \mathcal{E} v_j(y)) \, dy - \varepsilon.$$

Since $v_j \to v$ in $L^1(Q; \mathbb{R}^N)$, proposition 3.6 allows us to assume, without loss of generality, that $v_j = v$ on $\partial Q$. Hence, using the symmetric quasiconvexity of $f$ in the second variable, which also holds for test functions in $LD_{\text{per}}(Q)$ (cf. remark 2.10), and (4.7), we obtain

$$\mu^a(x_0) \geq \liminf_{j \to +\infty} \int_{Q} f(\chi(x_0), \mathcal{E} v_j(y)) \, dy - \varepsilon$$

$$\geq \liminf_{j \to +\infty} \int_{Q} f(\chi(x_0), \mathcal{E} u(x_0) + \mathcal{E}(v_j - v)(y)) \, dy - \varepsilon$$

$$\geq f(\chi(x_0), \mathcal{E} u(x_0)) - \varepsilon,$$

so to conclude it suffices to let $\varepsilon \to 0^+$.

\begin{proposition}
Let $u \in BD(\Omega)$, $\chi \in BV(\Omega; \{0, 1\})$ and let $W_0$ and $W_1$ be continuous functions satisfying (3.4). Let $f$ be given by (3.5) and assume that $f$ is symmetric quasiconvex. Then, for $\mathcal{L}^n$ a.e. $x_0 \in \Omega$,

$$\mu^a(x_0) = \frac{d\mathcal{F}(\chi, u; \cdot)}{d\mathcal{L}^n}(x_0) \leq f(\chi(x_0), \mathcal{E} u(x_0)).
$$
\end{proposition}
Proof. Choose a point $x_0 \in \Omega$ such that (4.3), (4.4) and (4.5) hold,

$$\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} |E^su(Q(x_0, \varepsilon))| = 0,$$

(4.15)

$$\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} |D\chi|(Q(x_0, \varepsilon)) = 0,$$

(4.16)

and, furthermore, such that

$$\mu^a(x_0) = \lim_{\varepsilon \to 0^+} \frac{\mathcal{F}(\chi, u; Q(x_0, \varepsilon))}{\varepsilon^N} \text{ exists and is finite},$$

(4.17)

where the sequence of $\varepsilon \to 0^+$ is chosen so that $|Eu|(\partial Q(x_0, \varepsilon)) = 0$. Notice that $\mathcal{L}^N$ almost every point $x_0 \in \Omega$ satisfies the above properties.

For the purposes of this proof we assume that $\chi(x_0) = 1$, the case $\chi(x_0) = 0$ is treated in a similar fashion. Thus, it follows from (4.5) that

$$\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \mathcal{L}^N(Q(x_0, \varepsilon) \cap \{\chi = 0\}) = 0.$$ 

(4.18)

Using the symmetric quasiconvexity of $f$, fix $\delta > 0$ and let $\phi \in C_{\text{per}}^\infty(Q; \mathbb{R}^N)$ be such that

$$\int_Q f(\chi(x_0), \mathcal{E}u(x_0) + \mathcal{E}\phi(x)) \, dx \leq f(\chi(x_0), \mathcal{E}u(x_0)) + \delta.$$ 

(4.19)

We extend $\phi$ to $\mathbb{R}^N$ by periodicity, define $\phi_n(x) := \frac{1}{n} \phi(nx)$ and consider the sequence of functions in $W^{1,1}(Q(x_0, \varepsilon); \mathbb{R}^N)$ given by

$$u_n,\varepsilon(x) := (\rho_n \ast u)(x) + \varepsilon\phi_n\left(\frac{x - x_0}{\varepsilon}\right).$$

The periodicity of $\phi$ ensures that, as $n \to +\infty$, $u_n,\varepsilon \to u$ in $L^1(Q(x_0, \varepsilon); \mathbb{R}^N)$ and so, letting $\chi_n = \chi$, $\forall n \in \mathbb{N}$, the sequences $\{u_n,\varepsilon\}_n$ and $\{\chi_n\}_n$ are admissible for $\mathcal{F}(\chi, u; Q(x_0, \varepsilon))$. Hence, by (4.16), we have

$$\mu^a(x_0) = \lim_{\varepsilon \to 0^+} \frac{\mathcal{F}(\chi, u; Q(x_0, \varepsilon))}{\varepsilon^N} \leq \liminf_{\varepsilon \to 0^+} \liminf_{n \to +\infty} \frac{1}{\varepsilon^N} \left( \int_{Q(x_0, \varepsilon)} f(\chi(x), \mathcal{E}u_{n,\varepsilon}(x)) \, dx + |D\chi|(Q(x_0, \varepsilon)) \right)$$

$$= \liminf_{\varepsilon \to 0^+} \liminf_{n \to +\infty} \frac{1}{\varepsilon^N} \int_{Q(x_0, \varepsilon)} f(\chi(x), \mathcal{E}u_{n,\varepsilon}(x)) \, dx.$$
\[ \leq \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{1}{\varepsilon^N} \int_{Q(x_0, \varepsilon)} f \left( \chi(x_0), \mathcal{E}u(x_0) + \mathcal{E}\phi_n \left( \frac{x-x_0}{\varepsilon} \right) \right) \, dx \]

\[ + \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{1}{\varepsilon^N} \int_{Q(x_0, \varepsilon)} f \left( \chi(x), \mathcal{E}u_{n, \varepsilon}(x) \right) - f \left( \chi(x_0), \mathcal{E}u_{n, \varepsilon}(x) \right) \, dx \]

\[ + \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{1}{\varepsilon^N} \int_{Q(x_0, \varepsilon)} f \left( \chi(x_0), \mathcal{E}u_{n, \varepsilon}(x) \right) \]

\[ - f \left( \chi(x_0), \mathcal{E}u(x_0) + \mathcal{E}\phi_n \left( \frac{x-x_0}{\varepsilon} \right) \right) \, dx \]

\[ =: I_1 + I_2 + I_3. \]

By changing variables, using the periodicity of \( \phi \) and (4.19), it follows that

\[ I_1 = \limsup_{n \to +\infty} \int_Q f \left( \chi(x_0), \mathcal{E}u(x_0) + \mathcal{E}\phi_n(y) \right) \, dy \]

\[ = \limsup_{n \to +\infty} \int_Q f \left( \chi(x_0), \mathcal{E}u(x_0) + \mathcal{E}\phi(ny) \right) \, dy \]

\[ = \limsup_{n \to +\infty} \int_Q f \left( \chi(x_0), \mathcal{E}u(x_0) + \mathcal{E}\phi(x) \right) \, dx \leq f \left( \chi(x_0), \mathcal{E}u(x_0) \right) + \delta. \]

Consequently, to complete the proof it remains to show that \( I_2 = I_3 = 0 \) and finally to let \( \delta \to 0^+ \). To conclude that \( I_3 = 0 \) we reason exactly as in [12, proposition 4.2] since \( \chi(x_0) \) is fixed in both terms of the integrand. For \( I_2 \), since \( \chi(x_0) = 1 \), we have by (3.7),

\[ I_2 = \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{1}{\varepsilon^N} \int_{Q(x_0, \varepsilon) \cap \{ \chi = 0 \}} f \left( 0, \mathcal{E}u_{n, \varepsilon}(x) \right) - f \left( 1, \mathcal{E}u_{n, \varepsilon}(x) \right) \, dx \]

\[ \leq \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{C}{\varepsilon^N} \int_{Q(x_0, \varepsilon) \cap \{ \chi = 0 \}} 1 + \left| \mathcal{E}(u \ast \rho_n)(x) + \mathcal{E}\phi_n \left( \frac{x-x_0}{\varepsilon} \right) \right| \, dx, \]

where, by periodicity and the Riemann–Lebesgue lemma,

\[ \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{C}{\varepsilon^N} \int_{Q(x_0, \varepsilon) \cap \{ \chi = 0 \}} \left| \mathcal{E}\phi_n \left( \frac{x-x_0}{\varepsilon} \right) \right| \, dx \]

\[ = \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{C}{\varepsilon^N} \int_{Q \cap \{ y: \chi(x_0 + \varepsilon y) = 0 \}} \left| \mathcal{E}\phi(ny) \right| \, dy \]

\[ = \limsup_{\varepsilon \to 0^+} \frac{C}{\varepsilon^N} \int_{Q \cap \{ y: \chi(x_0 + \varepsilon y) = 0 \}} \left( \int_Q \left| \mathcal{E}\phi(x) \right| \, dx \right) \, dy \]

\[ = \limsup_{\varepsilon \to 0^+} \frac{C}{\varepsilon^N} \int_{Q(x_0, \varepsilon) \cap \{ \chi = 0 \}} \int_Q \left| \mathcal{E}\phi(x) \right| \, dx = 0 \]
by (4.18). On the other hand, since $|Eu|$ does not charge the boundary of $Q(x_0, \varepsilon)$, using lemma 2.4, (4.15), (4.4) and (4.18), it follows that

$$\limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{C}{\varepsilon^N} \int_{Q(x_0, \varepsilon) \cap \{\chi = 0\}} |E(u \ast \rho_n)(x)| \, dx$$

$$\leq \limsup_{\varepsilon \to 0^+} \limsup_{n \to +\infty} \frac{C}{\varepsilon^N} \int_{Q(x_0, \varepsilon + 1/n) \cap \{\chi = 0\}} |E u(x)| \, dx$$

$$= \limsup_{\varepsilon \to 0^+} \frac{C}{\varepsilon^N} \int_{Q(x_0, \varepsilon) \cap \{\chi = 0\}} |E u(x)| \, dx$$

$$\leq \limsup_{\varepsilon \to 0^+} \frac{C}{\varepsilon^N} \int_{Q(x_0, \varepsilon)} |E u(x) - E u(x_0)| \, dx$$

$$+ \limsup_{\varepsilon \to 0^+} \frac{C |E u(x_0)|}{\varepsilon^N} \mathcal{L}^N (Q(x_0, \varepsilon) \cap \{\chi = 0\}) = 0.$$ 

Therefore, a final application of (4.18) allows us to conclude that $I_2 = 0$. \[\square\]

**Remark 4.3.** We stress that the symmetric quasiconvexity hypothesis on $f$ in proposition 4.2 is not a restriction for the proof of theorem 1.1, in view of proposition 3.10.

### 4.2. The Cantor term

This section is devoted to the identification of the density of $F$ in (1.8) with respect to $|E^c u|$. To this end, we start by observing that, by virtue of proposition 3.10, there is no loss of generality in assuming that $f$ is symmetric quasiconvex. If this symmetric quasiconvexity hypothesis on $f$ is omitted, the result of the next proposition holds provided we replace $f$ by $(SQf)\infty$, whereas, due to the inequality $(SQf)\infty \leq f\infty$, (4.30) holds as stated.

**Proposition 4.4.** Let $u \in BD(\Omega)$, $\chi \in BV(\Omega; \{0, 1\})$ and let $W_0$ and $W_1$ be continuous functions satisfying (3.4). Assume that $f$ given by (3.5) is symmetric quasiconvex. Then, for $|E^c u|$ a.e. $x_0 \in \Omega$,

$$\mu^c(x_0) = \frac{dF(\chi, u; \cdot)}{d|E^c u|}(x_0) \geq f^\infty \left( \chi(x_0), \frac{dE^c u}{d|E^c u|}(x_0) \right).$$

**Proof.** Let $x_0 \in \Omega$ be a point satisfying (4.3), (4.5) and

$$\mu^c(x_0) = \frac{dF(\chi, u; \cdot)}{d|E^c u|}(x_0) = \frac{d\mu}{d|E^c u|}(x_0)$$

$$= \lim_{\varepsilon \to 0^+} \frac{\mu(Q(x_0, \varepsilon))}{|E^c u|(Q(x_0, \varepsilon))} \text{ exists and is finite},$$

these properties hold for $|E^c u|$ a.e. $x_0 \in \Omega$. Indeed, by [3, theorem 6.1], $|Eu|(S_u \setminus J_u) = 0$, thus $|E^c u|(S_u \setminus J_u) = 0$. Hence, by [3, propositions 3.5 and 4.4],
we have
\[ |E^x u|(S_u) = |E^x u|(J_u) + |E^x u|(S_u \setminus J_u) = 0, \]
which justifies the validity of (4.3). As for (4.5), this is a well-known property of BV functions (cf. [4]).

We define
\[ f_0(\xi) = f(0, \xi) \text{ and } f_1(\xi) = f(1, \xi), \forall \xi \in \mathbb{R}^{N \times N}, \]
and we consider the auxiliary functionals
\[
\mathcal{F}_i(u; A) := \inf \left\{ \liminf_{n \to +\infty} \int_A f_i(\mathcal{E} u_n(x)) \, dx : u_n \in W^{1,1}(A; \mathbb{R}^N), \right. \\
\left. u_n \to u \text{ in } L^1(A; \mathbb{R}^N) \right\}, \quad i = 0, 1.
\]
(4.21)

Referring to theorem 6.1, remark 6.4 and corollary 6.8 in [23], \( \mathcal{F}_i(u; \cdot), i = 0, 1, \) are the restriction to \( \mathcal{O}(\Omega) \) of Radon measures whose densities with respect to \( |E^x u| \) are given by
\[
\frac{d\mathcal{F}_i(u; \cdot)}{d|E^x u|}(x_0) = f_i^\infty \left( \frac{dE^x u}{d|E^x u|}(x_0) \right) = f^\infty \left( i, \frac{dE^x u}{d|E^x u|}(x_0) \right)
\]
(4.22)
for \( |E^x u| \) a.e. \( x_0 \in \Omega \). Choose \( x_0 \) so that it also satisfies (4.22), \( i = 0, 1 \).

In what follows we assume, without loss of generality, that \( \chi(x_0) = 1 \), the case \( \chi(x_0) = 0 \) can be treated similarly. Bearing this choice in mind we work with the functional (4.21) and we will make use of (4.22), with \( i = 1 \). Selecting the sequence \( \varepsilon_k \to 0^+ \) in such a way that \( \mu(\partial Q(x_0, \varepsilon_k)) = 0 \) and \( Q(x_0, \varepsilon_k) \subset \Omega \), we have
\[
\mu^c(x_0) = \lim_{k \to +\infty} \frac{\mu(Q(x_0, \varepsilon_k))}{|E^x u|(Q(x_0, \varepsilon_k))} \\
= \lim_{k, n} \frac{1}{|E^x u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f(\chi_n(x), \mathcal{E} u_n(x)) \, dx + |D\chi_n|(Q(x_0, \varepsilon_k))
\]
where \( \chi_n \in BV(Q(x_0, \varepsilon_k); \{0, 1\}), \chi_n \rightharpoonup \chi \text{ in } L^1(Q(x_0, \varepsilon_k); \{0, 1\}), \ u_n \in W^{1,1}(Q(x_0, \varepsilon_k); \mathbb{R}^N), \ u_n \to u \text{ in } L^1(Q(x_0, \varepsilon_k); \mathbb{R}^N). \) Taking into account that we are searching for a lower bound for \( \mu^c(x_0) \), we neglect the perimeter term \( |D\chi_n|(Q(x_0, \varepsilon_k)) \) and obtain
\[
\mu^c(x_0) \geq \lim \inf_{k, n} \frac{1}{|E^x u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f(\chi_n(x), \mathcal{E} u_n(x)) \, dx
\]
(4.23)
\[
\geq \lim \inf_{k, n} \frac{1}{|E^x u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f_1(\mathcal{E} u_n(x)) \, dx \\
+ \lim \inf_{k, n} \frac{1}{|E^x u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f(\chi_n(x), \mathcal{E} u_n(x)) - f(1, \mathcal{E} u_n(x)) \, dx
\]
By (4.5) it follows that
\[ \liminf_{k} \frac{\mathcal{F}_1(u; Q(x_0, \epsilon_k))}{|E^c u| |Q(x_0, \epsilon_k)|} + \liminf_{k,n} I_{k,n} \]
\[ \geq \frac{d\mathcal{F}_1(u; \cdot)}{d|E^c u|}(x_0) + \liminf_{k,n} I_{k,n} \]
\[ \geq f^\infty \left( 1, \frac{dE^c u}{d|E^c u|}(x_0) \right) + \liminf_{k,n} I_{k,n} \tag{4.24} \]
where
\[ I_{k,n} = \frac{1}{|E^c u|(Q(x_0, \epsilon_k))} \int_{Q(x_0, \epsilon_k)} f(\chi_n(x), u_n(x)) - f(1, E u_n(x)) \, dx. \]

It remains to estimate this term. Changing variables we get
\[ |I_{k,n}| = \left| \frac{\epsilon_k^N}{|E^c u|(Q(x_0, \epsilon_k))} \int_{Q} f(\chi_n(x_0 + \epsilon_k y), E u_n(x_0 + \epsilon_k y)) - f(1, E u_n(x_0 + \epsilon_k y)) \, dy \right| \]
\[ = \left| \delta_k \int_{Q} f(\chi_{n,k}(y) + 1, E u_{n,k}(y)) - f(1, E u_{n,k}(y)) \, dy \right| \tag{4.25} \]
where
\[ \delta_k := \frac{\epsilon_k^N}{|E^c u|(Q(x_0, \epsilon_k))}, \quad \chi_{n,k}(y) := \chi_n(x_0 + \epsilon_k y) - 1, \]
\[ u_{n,k}(y) := \frac{u_n(x_0 + \epsilon_k y) - u(x_0)}{\epsilon_k}. \]

By (4.5) it follows that \( \lim_{k,n} \| \chi_{n,k} \|_{L^1(Q)} = 0 \) [see (4.6)] and \( \lim_{k} \delta_k = 0. \) Thus, using also (3.7), we have from (4.25)
\[ \liminf_{k,n} |I_{k,n}| \leq \limsup_{k,n} \delta_k \int_{Q} |f(\chi_{n,k}(y) + 1, E u_{n,k}(y)) - f(1, E u_{n,k}(y))| \, dy \]
\[ \leq \limsup_{k,n} C \delta_k \int_{Q} |\chi_{n,k}(y)| (1 + |E u_{n,k}(y)|) \, dy \]
\[ = \limsup_{k,n} C \delta_k \int_{Q} |\chi_{n,k}(y)| |E u_{n,k}(y)| \, dy. \tag{4.26} \]

From the growth condition from below on \( f, \) (4.23) and (4.20) we conclude that
\[ \limsup_{k,n} C \delta_k \int_{Q} |\chi_{n,k}(y)| |E u_{n,k}(y)| \, dy \]
\[ \leq \limsup_{k,n} \frac{C}{|E^c u|(Q(x_0, \epsilon_k))} \int_{Q(x_0, \epsilon_k)} |E u_n(x)| \, dx \]
\[ \leq \limsup_{k,n} \frac{C}{|E^c u|(Q(x_0, \epsilon_k))} \int_{Q(x_0, \epsilon_k)} f(\chi_n(x), E u_n(x)) \, dx \]
\[ \leq C \mu^c(x_0) < +\infty. \]
Using a diagonalization argument, let \( \chi_k := \chi_{n(k),k}, u_k := u_{n(k),k} \) be such that \( \chi_k \to 0 \) in \( L^1(Q) \) and

\[
\limsup_{k,n} C \delta_k \int_Q |\chi_{n,k}(y)| |\mathcal{E}u_{n,k}(y)| \, dy = \lim_k C \delta_k \int_Q |\chi_k(y)| |\mathcal{E}u_k(y)| \, dy < +\infty.
\]

(4.27)

Therefore, the sequence \( \{\delta_k \chi_k \mathcal{E}u_k\} \) is bounded in \( L^1(Q; \mathbb{R}^{N \times N}_s) \) so, by the biting lemma, there exists a subsequence (not relabelled) and there exist sets \( D_r \subset Q \) such that \( \lim_{r \to +\infty} L^N(D_r) = 0 \) and the sequence \( \{\delta_k \chi_k \mathcal{E}u_k\} \) is equiintegrable in \( Q\setminus D_r \), for any \( r \in \mathbb{N} \). Following the reasoning in the proof of proposition 4.1 [see (4.12)], for any \( j \in \mathbb{N} \) there exist \( k(j), r(j) \in \mathbb{N} \) such that

\[
\delta_k(j) \int_{D_{r(j)}} |\chi_{k(j)}(y)| |\mathcal{E}u_{k(j)}(y)| \, dy \leq \frac{1}{j}.
\]

(4.28)

The fact that \( \chi_k(j) \to 0 \), as \( j \to +\infty \), in \( L^1(Q) \) and the equiintegrability of \( \{\delta_{k(j)} \chi_{k(j)} \mathcal{E}u_{k(j)}\} \) in \( Q\setminus D_{r(j)} \) ensures that, for any \( \varepsilon > 0 \),

\[
\delta_k(j) \int_{Q\setminus D_{r(j)}} |\chi_{k(j)}(y)| |\mathcal{E}u_{k(j)}(y)| \, dy < \varepsilon,
\]

(4.29)

provided \( j \) is large enough [see the argument used to obtain (4.14)]. Hence, from (4.24), (4.26), (4.27), (4.28) and (4.29) we conclude that

\[
\mu^c(x_0) \geq f^\infty \left( 1, \frac{dE^c u}{d|E^c u|}(x_0) \right),
\]

which completes the proof. \( \square \)

**Proposition 4.5.** Let \( u \in BD(\Omega), \chi \in BV(\Omega; \{0,1\}) \) and let \( W_0 \) and \( W_1 \) be continuous functions satisfying (3.4). Assume that \( f \) given by (3.5) is symmetric quasiconvex. Then, for \( |E^c u| \) a.e. \( x_0 \in \Omega \),

\[
\mu^c(x_0) = \frac{dF(\chi,u;\cdot)}{d|E^c u|}(x_0) \leq f^\infty \left( \chi(x_0), \frac{dE^c u}{d|E^c u|}(x_0) \right).
\]

(4.30)

**Proof.** Let \( x_0 \in \Omega \) be a point satisfying (4.20), (4.3) and (4.5) (which hold for \( |E^c u| \) a.e. \( x \in \Omega \), as observed in the proof of proposition 4.4) and, in addition,

\[
\lim_{\varepsilon \to 0^+} \frac{|D\chi|(Q(x_0,\varepsilon))}{|E^c u|(Q(x_0,\varepsilon))} = 0.
\]

(4.31)

Assuming, once again, that \( \chi(x_0) = 1 \), we also require that \( x_0 \) satisfies (4.22). Choosing the sequence \( \varepsilon_k \to 0^+ \) in such a way that \( \mu(\partial Q(x_0,\varepsilon_k)) = 0 \) and \( Q(x_0,\varepsilon_k) \subset \Omega \), let \( u_n \in W^{1,1}(Q(x_0,\varepsilon_k); \mathbb{R}^N) \) be such that \( u_n \to u \) in
\[ L^1(Q(x_0, \varepsilon_k); \mathbb{R}^N) \text{ and} \]
\[
\frac{d\mathcal{F}_1(u, \cdot)}{d|E^c u|}(x_0) = \lim_{k \to +\infty} \frac{\mathcal{F}_1(u; Q(x_0, \varepsilon_k))}{|E^c u|(Q(x_0, \varepsilon_k))} \\
= \lim_{k,n} \frac{1}{|E^c u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f_1(Eu_n(x)) \, dx. \tag{4.32}
\]

Then, as the constant sequence \( \chi_n = \chi \) is admissible for \( \mathcal{F}(\chi, u; Q(x_0, \varepsilon_k)) \), from (4.31), (4.32) and (4.22) with \( i = 1 \), it follows that

\[
\mu^c(x_0) = \lim_{k \to +\infty} \frac{\mathcal{F}(\chi, u; Q(x_0, \varepsilon_k))}{|E^c u|(Q(x_0, \varepsilon_k))} \\
\leq \liminf_{k,n} \left[ \frac{1}{|E^c u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f(\chi(x), Eu_n(x)) \, dx + |D\chi|(Q(x_0, \varepsilon_k)) \right] \\
\leq \lim_{k,n} \frac{1}{|E^c u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f(1, Eu_n(x)) \, dx + \limsup_{k,n} \frac{1}{|E^c u|(Q(x_0, \varepsilon_k))} \\
\times \int_{Q(x_0, \varepsilon_k)} f(\chi(x), Eu_n(x)) - f(1, Eu_n(x)) \, dx.
\]

The same argument used in the proof of proposition 4.4, now applied to the sequences

\[
\chi_k(y) = \chi(x_0 + \varepsilon_k y) - 1, \quad u_{n,k}(y) := \frac{u_n(x_0 + \varepsilon_k y) - u(x_0)}{\varepsilon_k},
\]

yields

\[
\limsup_{k,n} \frac{1}{|E^c u|(Q(x_0, \varepsilon_k))} \int_{Q(x_0, \varepsilon_k)} f(\chi(x), Eu_n(x)) - f(1, Eu_n(x)) \, dx = 0
\]

from which the conclusion follows. \( \square \)

### 4.3. The surface term

Given \( x_0 \in J_\chi \cup J_u \) we denote by \( \nu(x_0) \) the vector \( \nu_u(x_0) \), if \( x_0 \in J_u \setminus J_\chi \), whereas \( \nu(x_0) := \nu_\chi(x_0) \) if \( x_0 \in J_\chi \setminus J_u \), these vectors are well defined as Borel measurable functions for \( \mathcal{H}^{N-1} \) a.e. \( x_0 \in J_\chi \cup J_u \). Due to the rectifiability of both \( J_\chi \) and \( J_u \) (cf. [4, theorems 3.77 and 3.78] and [3, proposition 3.5 and remark 3.6]), for \( \mathcal{H}^{N-1} \) a.e. \( x_0 \in J_\chi \cap J_u \) we may select \( \nu(x_0) := \nu_\chi(x_0) = \nu_u(x_0) \) where the orientation of \( \nu_\chi(x_0) \) is chosen so that \( \chi^+(x_0) = 1, \chi^-(x_0) = 0 \) and then \( u^+(x_0) \) and \( u^-(x_0) \) are selected according to this orientation.

Thus, in the sequel for \( \mathcal{H}^{N-1} \) a.e. \( x_0 \in J_\chi \cup J_u \), the vector \( \nu(x_0) \) is defined according to the above considerations.
Given that $\mathcal{H}^{N-1}(S_\chi \setminus J_\chi) = 0$ and that all points in $\Omega \setminus S_\chi$ are Lebesgue points of $\chi$, in what follows we take $\chi^+(x_0) = \chi^-(x_0) = \bar{\chi}(x_0)$ for $\mathcal{H}^{N-1}$-a.e. $x_0 \in J_u \setminus J_\chi$, where $\bar{v}$ denotes the precise representative of a field $v$ in $BV$, cf. §2.1. On the other hand, for a $BD$ function $u$ it is not known whether $\mathcal{H}^{N-1}(S_u \setminus J_u) = 0$. However, given that all points in $\Omega \setminus S_u$ are Lebesgue points of $u$ and that, by [3, remark 6.3] and the $\mathcal{H}^{N-1}$ rectifiability of $J_\chi$, $\mathcal{H}^{N-1}(S_u \setminus J_u) \cap J_\chi = 0$, we may consider $u^+(x_0) = u^-(x_0) = \bar{u}(x_0)$ for $\mathcal{H}^{N-1}$ a.e. $x_0 \in J_\chi \setminus J_u$, where $\bar{v}$ denotes the Lebesgue representative of a field $v$ in $BD$ (cf. [3, p. 206]), see also [6].

In order to describe $\mu^j$ we will follow the ideas of the global method for relaxation introduced in [17] (see also [12, 23]), the sequential characterization of $K(a, b, c, d, \nu)$, obtained in proposition 3.11, will also be used.

Given $u \in BD(\Omega)$, $\chi \in BV(\Omega; \{0, 1\})$ and $V \in \mathcal{O}_\infty(\Omega)$ we define

$$m(\chi, u; V) := \inf \{ \mathcal{F}(\theta, v; V) : \theta \in BV(\Omega; \{0, 1\}), v \in BD(\Omega),$$

$$\theta = \chi \text{ on } \partial V, v = u \text{ on } \partial V \},$$

(4.33)

Our goal is to show the following result.

**Proposition 4.6.** Let $f$ be given by (3.5), where $W_0$ and $W_1$ are continuous functions satisfying (3.4). Given $u \in SBD(\Omega)$ and $\chi \in BV(\Omega; \{0, 1\})$, we have

$$\mathcal{F}(\chi, u; V \cap (J_\chi \cup J_u))$$

$$= \int_{V \cap (J_\chi \cup J_u)} g(x, \chi^+(x), \chi^-(x), u^+(x), u^-(x), \nu(x)) \, d\mathcal{H}^{N-1}(x),$$

where

$$g(x_0, a, b, c, d, \nu) := \lim_{\varepsilon \to 0^+} \frac{m(\chi_{a,b,\nu}(-x_0), u_{c,d,\nu}(-x_0); Q_{\nu}(x_0, \varepsilon))}{\varepsilon^{N-1}}$$

(4.34)

and $\chi_{a,b,\nu}$, $u_{c,d,\nu}$ were defined in (3.24).

The proof of the above proposition relies on a series of auxiliary results, based on lemmas 3.1, 3.3 and 3.5 in [17] and which were adapted to the $BD$ case in [12, lemmas 3.10–3.12]. The properties of $\mathcal{F}(\chi, u; A)$ established in proposition 3.3, and the fact that $\mathcal{F}(\chi, u; \cdot)$ is a Radon measure, ensure that we can apply the reasoning given in their respective proofs.

**Lemma 4.7.** Let $f$ be given by (3.5), where $W_0$ and $W_1$ are continuous functions satisfying (3.4). Then there exists a positive constant $C$ such that

$$|m(\chi_1, u_1; V) - m(\chi_2, u_2; V)|$$

$$\leq C \left[ \int_{\partial V} |\text{tr } \chi_1(x) - \text{tr } \chi_2(x)| + |\text{tr } u_1(x) - \text{tr } u_2(x)| \, d\mathcal{H}^{N-1}(x) \right],$$

for every $\chi_1, \chi_2 \in BV(\Omega; \{0, 1\})$, $u_1, u_2 \in BD(\Omega)$ and any $V \in \mathcal{O}_\infty(\Omega)$. 
Proof. The proof follows that of lemma 3.10 in [12]. Given \( \delta > 0 \) let \( V_\delta := \{ x \in V : \text{dist}(x, \partial V) > \delta \} \) and select \( \theta \in BV(\Omega; \{0, 1\}) \) and \( v \in BD(\Omega) \) such that \( \theta = \chi_2 \) and \( v = u_2 \) on \( \partial V \). Now define \( \theta_\delta \in BV(\Omega; \{0, 1\}) \) and \( v_\delta \in BD(\Omega) \) by
\[
\theta_\delta := \begin{cases} 
\theta, & \text{in } V_\delta \\
\chi_1, & \text{in } \Omega \setminus V_\delta 
\end{cases} 
\quad \text{and} \quad
v_\delta := \begin{cases} 
v, & \text{in } V_\delta \\
u_1, & \text{in } \Omega \setminus V_\delta. 
\end{cases}
\]
The definition of \( m(\cdot, \cdot; \cdot) \) and the additivity and locality of \( F(\cdot, \cdot; \cdot) \), as well as the inequality from above in proposition 3.3 (i), lead to the conclusion.

Fixing \( \chi \in BV(\Omega; \{0, 1\}) \), \( u \in BD(\Omega) \) and \( \nu \in S^{N-1} \), we define \( \lambda := \mathcal{L}^N + |E^* u| + |D\chi| \) and, following [17], we let
\[
\mathcal{O}^* := \{ Q_\nu(x, \varepsilon) : x \in \Omega, \varepsilon > 0 \}
\]
and, for \( \delta > 0 \) and \( V \in \mathcal{O}(\Omega) \), set
\[
m_\delta(\chi, u; V) := \inf \left\{ \sum_{i=1}^{+\infty} m(\chi, u; Q_i) : Q_i \in \mathcal{O}^*, Q_i \cap Q_j = \emptyset \text{ if } i \neq j, \right. 
\]
\[
Q_i \subset V, \text{diam } Q_i < \delta, \lambda \left( V \setminus \bigcup_{i=1}^{+\infty} Q_i \right) = 0 \right\}.
\]
Clearly, \( \delta \mapsto m_\delta(\chi, u; V) \) is a decreasing function, so we define
\[
m^*(\chi, u; V) := \sup \left\{ m_\delta(\chi, u; V) : \delta > 0 \right\} = \lim_{\delta \to 0^+} m_\delta(\chi, u; V).
\]

**Lemma 4.8.** Let \( f \) be given by (3.5), where \( W_0 \) and \( W_1 \) are continuous functions satisfying (3.4). Given \( \chi \in BV(\Omega; \{0, 1\}) \), \( u \in BD(\Omega) \), we have
\[
F(\chi, u; V) = m^*(\chi, u; V), \text{ for every } V \in \mathcal{O}(\Omega).
\]

**Proof.** The inequality
\[
m^*(\chi, u; V) \leq F(\chi, u; V)
\]
is an immediate consequence of the fact that \( m(\chi, u; Q_i) \leq F(\chi, u; Q_i) \) and that \( F(\chi, u; \cdot) \) is a Radon measure.

The proof of the reverse inequality relies on the lower semicontinuity of \( F(\cdot, \cdot; V) \) obtained in proposition 3.3 (iv) and on the definitions of \( m_\delta(\chi, u; V) \), \( m(\chi, u; V) \) and \( m^*(\chi, u; V) \). Indeed, fixing \( \delta > 0 \), we consider \( \{ Q_i^\delta \} \) an admissible family for
Relaxation for an optimal design problem

$m^\delta(\chi, u; V)$ such that, letting $N^\delta := V \setminus \bigcup_{i=1}^{+\infty} Q_i^\delta$,

$$\sum_{i=1}^{+\infty} m(\chi, u; Q_i^\delta) < m^\delta(\chi, u; V) + \delta \text{ and } \lambda(N^\delta) = 0,$$

and we now let $\theta_i^\delta \in BV(\Omega; \{0, 1\})$ and $v_i^\delta \in BD(\Omega)$ be such that $\theta_i^\delta = \chi$ on $\partial Q_i^\delta$, $v_i^\delta = u$ on $\partial Q_i^\delta$ and

$$\mathcal{F}(\theta_i^\delta, v_i^\delta; Q_i^\delta) \leq m(\chi, u; Q_i^\delta) + \delta \mathcal{L}^N(Q_i^\delta).$$

Setting $N_0^\delta := \Omega \setminus \bigcup_{i=1}^{+\infty} Q_i^\delta$, we define

$$\theta^\delta := \sum_{i=1}^{+\infty} \theta_i^\delta \chi_{Q_i^\delta} + \chi_{N_0^\delta} \text{ and } v^\delta := \sum_{i=1}^{+\infty} v_i^\delta \chi_{Q_i^\delta} + u \chi_{N_0^\delta}.$$

Following the computations in the proof of [12, lemma 3.11], we may show that $\theta^\delta \in BV(\Omega; \{0, 1\})$, $v^\delta \in BD(\Omega)$, $\theta^\delta \to \chi$ in $L^1(V; \{0, 1\})$ and $v^\delta \rightharpoonup u$ in $L^1(V; \mathbb{R}^N)$, as $\delta \to 0^+$, and also

$$\mathcal{F}(\theta^\delta, v^\delta; N^\delta) \leq C \lambda(N^\delta) = 0.$$

Using the additivity of $\mathcal{F}(\theta^\delta, v^\delta; \cdot)$ we have

$$\mathcal{F}(\theta^\delta, v^\delta; V) = \sum_{i=1}^{+\infty} \mathcal{F}(\theta_i^\delta, v_i^\delta; Q_i^\delta) + \mathcal{F}(\theta^\delta, v^\delta; N^\delta) \leq \sum_{i=1}^{+\infty} m(\chi, u; Q_i^\delta) + \delta \mathcal{L}^N(V) \leq m^\delta(\chi, u; V) + \delta + \delta \mathcal{L}^N(V),$$

so that the lower semicontinuity of $\mathcal{F}(\cdot, \cdot; V)$ yields

$$\mathcal{F}(\chi, u; V) \leq \liminf_{\delta \to 0^+} \mathcal{F}(\theta^\delta, v^\delta; V) \leq \liminf_{\delta \to 0^+} \left( m^\delta(\chi, u; V) + \delta + \delta \mathcal{L}^N(V) \right) = m^*(\chi, u; V)$$

and this completes the proof. \square

Finally, a straightforward adaptation of [17, lemma 3.5] leads to the following result.

**Lemma 4.9.** Let $f$ be given by (3.5), where $W_0$ and $W_1$ are continuous functions satisfying (3.4). Given $\chi \in BV(\Omega; \{0, 1\})$, $u \in BD(\Omega)$, we have

$$\lim_{\varepsilon \to 0^+} \frac{\mathcal{F}(\chi, u; Q_{\nu}(x_0, \varepsilon))}{\lambda(Q_{\nu}(x_0, \varepsilon))} = \lim_{\varepsilon \to 0^+} \frac{m(\chi, u; Q_{\nu}(x_0, \varepsilon))}{\lambda(Q_{\nu}(x_0, \varepsilon))},$$

for $\lambda$ a.e. $x_0 \in \Omega$ and for every $\nu \in S^{N-1}$.

We now proceed with the proof of proposition 4.6.
Proof of proposition 4.6. In the sequel, for simplicity of notation, we will write \( \nu = \nu(x_0) \).

Let \( x_0 \in \Omega \cap (J_\chi \cup J_u) \) be a point satisfying

\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{Q_\nu(x_0,\varepsilon)} |\chi(x) - \tilde{\chi}(x_0)| \, dx = 0, \quad \text{if } x_0 \in \Omega \setminus J_\chi, \tag{4.35}
\]

where \( \chi \) is defined by (3.24) with \( m_0 = \nu(x_0) \) and \( a = \chi^+(x_0), \ b = \chi^-(x_0), \ c = u^+(x_0) \) and \( \rho = u^-(x_0) \). Letting \( \sigma := \mathcal{H}^{N-1}(J_{\chi} \cup J_u) \), by lemma 4.9 it follows that, for \( \sigma \) a.e. \( x_0 \in \Omega \),

\[
\frac{d\mathcal{F}(\chi, u; \cdot)}{d\sigma}(x_0) = \lim_{\varepsilon \to 0^+} \frac{\mathcal{F}(\chi, u; Q_\nu(x_0, \varepsilon))}{\sigma(Q_\nu(x_0, \varepsilon))} \quad \text{exists and is finite.} \tag{4.42}
\]

where we are denoting by \( \chi_0 \) and \( \nu_0 \) the functions given by (3.24) with \( \nu = \nu(x_0) \) and \( a = \chi^+(x_0), \ b = \chi^-(x_0), \ c = u^+(x_0) \) and \( \rho = u^-(x_0) \). Letting \( \sigma := \mathcal{H}^{N-1}(J_{\chi} \cup J_u) \), by lemma 4.9 it follows that, for \( \sigma \) a.e. \( x_0 \in \Omega \),

\[
\frac{d\mathcal{F}(\chi, u; \cdot)}{d\sigma}(x_0) = \lim_{\varepsilon \to 0^+} \frac{\mathcal{F}(\chi, u; \nu_0(x_0, \varepsilon))}{\sigma(\nu_0(x_0, \varepsilon))} \quad \text{exists and is finite.} \tag{4.42}
\]

In view of the considerations made at the beginning of this subsection, these properties hold for \( \mathcal{H}^{N-1} \) a.e. \( x_0 \in \Omega \cap (J_{\chi} \cup J_u) \). Furthermore, we require that \( x_0 \) also satisfies

\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^N} \int_{Q_\nu(x_0,\varepsilon)} |u(x) - \tilde{u}(x_0)| \, dx = 0, \quad \text{if } x_0 \in \Omega \setminus J_\chi, \tag{4.36}
\]

where

\[
\nu(x_0, \varepsilon) = \{ x \in Q_\nu(x_0, \varepsilon) \colon (x - x_0) \cdot (\pm \nu) > 0 \},
\]

and

\[
\mu^j(x_0) = \lim_{\varepsilon \to 0^+} \mathcal{F}(\chi, u; Q_\nu(x_0, \varepsilon)) \mathcal{H}^{N-1}(J_{\chi} \cup J_u)(Q_\nu(x_0, \varepsilon)) \tag{4.38}
\]

where

\[
\nu_0(x_0, \varepsilon) = \{ x \in Q_\nu(x_0, \varepsilon) \colon (x - x_0) \cdot (\pm \nu) > 0 \},
\]

and

\[
\mu^j(x_0) = \lim_{\varepsilon \to 0^+} \mathcal{F}(\chi, u; Q_\nu(x_0, \varepsilon)) \mathcal{H}^{N-1}(J_{\chi} \cup J_u)(Q_\nu(x_0, \varepsilon)) \tag{4.38}
\]

where we are denoting by \( \chi_0 \) and \( \nu_0 \) the functions given by (3.24) with \( \nu = \nu(x_0) \) and \( a = \chi^+(x_0), \ b = \chi^-(x_0), \ c = u^+(x_0) \) and \( \rho = u^-(x_0) \). Letting \( \sigma := \mathcal{H}^{N-1}(J_{\chi} \cup J_u) \), by lemma 4.9 it follows that, for \( \sigma \) a.e. \( x_0 \in \Omega \),

\[
\frac{d\mathcal{F}(\chi, u; \cdot)}{d\sigma}(x_0) = \lim_{\varepsilon \to 0^+} \frac{\mathcal{F}(\chi, u; Q_\nu(x_0, \varepsilon))}{\sigma(Q_\nu(x_0, \varepsilon))} \quad \text{exists and is finite.} \tag{4.42}
\]
that \( \chi_{\varepsilon} \to \chi_0 \) in \( L^1(Q_\nu; \{0, 1\}) \) and \( u_{\varepsilon} \to u_0 \) in \( L^1(Q_\nu; \mathbb{R}^N) \). On the other hand, by (4.40) and (4.41) we have
\[
\lim_{\varepsilon \to 0^+} |E_{u_{\varepsilon}}|(Q_\nu) = \lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^{N-1}} |E_{u}|(Q_\nu(x_0, \varepsilon)) = \frac{1}{\varepsilon^{N-1}} |(u \otimes \nu)(x)| = |E_{u_0}|(Q_\nu)
\]
and
\[
\lim_{\varepsilon \to 0^+} |D\chi_{\varepsilon}|(Q_\nu) = \lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^{N-1}} |D\chi|(Q_\nu(x_0, \varepsilon)) = |D\chi_0|(Q_\nu).
\]
Due to the continuity of the trace operator with respect to the intermediate topology we conclude that
\[
\lim_{\varepsilon \to 0^+} \frac{1}{\varepsilon^{N-1}} \int_{\partial Q_\nu(x_0, \varepsilon)} |\text{tr} \chi(x) - \text{tr} \chi_0(x-x_0)| + |\text{tr} u(x) - \text{tr} u_0(x-x_0)| \, d\mathcal{H}^{N-1}(x)
= \lim_{\varepsilon \to 0^+} \int_{\partial Q_\nu} |\text{tr} \chi_{\varepsilon}(y) - \text{tr} \chi_0(y)| + |\text{tr} u_{\varepsilon}(y) - \text{tr} u_0(y)| \, d\mathcal{H}^{N-1}(y) = 0. \quad (4.43)
\]
Hence, from (4.42), (4.39), lemma 4.7 and (4.43), we obtain
\[
\frac{d\mathcal{F}(\chi, u; \cdot)}{d\sigma}(x_0) = \lim_{\varepsilon \to 0^+} \frac{m(\chi, u; Q_\nu(x_0, \varepsilon))}{\sigma(Q_\nu(x_0, \varepsilon))}
\]
\[
= \lim_{\varepsilon \to 0^+} \frac{m(\chi u; Q_\nu(x_0, \varepsilon)) - m(\chi_0(-x_0), u_0(-x_0); Q_\nu(x_0, \varepsilon)) + m(\chi_0(-x_0), u_0(-x_0); Q_\nu(x_0, \varepsilon))}{\varepsilon^{N-1}}
\]
\[
= \lim_{\varepsilon \to 0^+} \frac{m(\chi_0(-x_0), u_0(-x_0); Q_\nu(x_0, \varepsilon))}{\varepsilon^{N-1}}
\]
and, therefore,
\[
\mathcal{F}(\chi, u; V \cap (J_\chi \cup J_u))
= \int_{V \cap (J_\chi \cup J_u)} \frac{d\mathcal{F}(\chi, u; \cdot)}{d\sigma}(x) \, d\sigma(x)
= \int_{V \cap (J_\chi \cup J_u)} g(x, \chi^+(x), \chi^-(x), u^+(x), u^-(x), \nu(x)) \, d\mathcal{H}^{N-1}(x). \quad \Box
\]

In the final two propositions we will show that, under assumption (3.9), the surface energy density \( g(x, a, b, c, d, \nu) \) may be more explicitly characterized. For this purpose we need an additional lemma which states that more regular functions can be considered in the definition of the Dirichlet functional \( m(\chi, u; V) \) in (4.33).

In what follows, for \( u \in BD(\Omega), \chi \in BV(\Omega; \{0, 1\}) \) and \( V \in \mathcal{O}_\infty(\Omega) \) we define
\[
m_0(\chi, u; V) := \inf\{ F(\theta, v; V) : \theta \in BV(\Omega; \{0, 1\}), v \in W^{1,1}(\Omega; \mathbb{R}^N), \theta = \chi \text{ on } \partial V, v = u \text{ on } \partial V\}.
\]
LEMMA 4.10. Let $f$ be given by (3.5), where $W_0$ and $W_1$ are continuous functions satisfying (3.4). Given $\chi \in BV(\Omega; \{0,1\})$, $u \in BD(\Omega)$, we have

$$m(\chi; u; V) = m_0(\chi; u; V), \text{ for every } V \in \mathcal{O}_\infty(\Omega).$$

Proof. The inequality $m(\chi; u; V) \leq m_0(\chi; u; V)$ is clear since, given any $\theta \in BV(\Omega; \{0,1\})$ such that $\theta = \chi$ on $\partial V$ and any $v \in W^{1,1}(\Omega; \mathbb{R}^N)$ such that $v = u$ on $\partial V$, we have

$$m(\chi; u; V) \leq \mathcal{F}(\theta; v; V) \leq F(\theta; v; V).$$

To show the reverse inequality, we fix $\varepsilon > 0$ and let $\theta \in BV(\Omega; \{0,1\})$, $v \in BD(\Omega)$ be such that $\theta = \chi$ on $\partial V$, $v = u$ on $\partial V$ and

$$m(\chi; u; V) + \varepsilon \geq \mathcal{F}(\theta; v; V).$$

By proposition 3.3 (ii), let $\chi_n \in BV(\Omega; \{0,1\})$, $u_n \in W^{1,1}(\Omega; \mathbb{R}^N)$ satisfy $\chi_n \to \theta$ in $L^1(\Omega; \mathbb{R}^N)$, $u_n \to v$ in $L^1(\Omega; \mathbb{R}^N)$ and

$$\mathcal{F}(\theta; v; V) = \lim_{n \to +\infty} F(\chi_n, u_n; V).$$

Theorem 2.5 ensures the existence of a sequence $v_n \in W^{1,1}(\Omega; \mathbb{R}^N)$ such that $v_n \to v$ in $L^1(\Omega; \mathbb{R}^N)$, $v_n = v = u$ on $\partial V$ and $|Ev_n|(V) \to |Ev|(V)$. We now apply proposition 3.9 to conclude that there exists a subsequence $\{v_{n_k}\}$ of $\{v_n\}$ and there exist sequences $w_k \in W^{1,1}(\Omega; \mathbb{R}^N)$, $\eta_k \in BV(\Omega; \{0,1\})$ verifying $w_k = v_{n_k} = u$ on $\partial V$, $\eta_k = \theta = \chi$ on $\partial V$ and

$$\limsup_{k \to +\infty} F(\eta_k, w_k; V) \leq \liminf_{n \to +\infty} F(\chi_n, u_n; V).$$

Therefore,

$$m_0(\chi; u; V) \leq \limsup_{k \to +\infty} F(\eta_k, w_k; V) \leq \liminf_{n \to +\infty} F(\chi_n, u_n; V)$$

$$= \mathcal{F}(\theta; v; V) \leq m(\chi; u; V) + \varepsilon,$$

so the desired inequality follows by letting $\varepsilon \to 0^+$. \qed

PROPOSITION 4.11. Let $f$ be given by (3.5), where $W_0$ and $W_1$ are continuous functions satisfying (3.4). Assume that $f$ is symmetric quasiconvex and that (3.9) holds. Given $u \in BD(\Omega)$ and $\chi \in BV(\Omega; \{0,1\})$, for $\mathcal{H}^{N-1}$ a.e. $x_0 \in \Omega \cap (J_\chi \cup J_u)$, we have

$$g(x_0, \chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0))$$

$$\geq K(\chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)),$$

where $\chi^+(x_0) = \chi^-(x_0) = \tilde{\chi}(x_0)$ if $x_0 \in J_u \backslash J_\chi$ and $u^+(x_0) = u^-(x_0) = \tilde{u}(x_0)$ if $x_0 \in J_\chi \backslash J_u$, and $K$ is given by (3.22).

Proof. As before, for simplicity of notation, we write $\nu = \nu(x_0)$. 

By lemma 4.10 we have

\[
g(x_0, \chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0))
\]

\[
= \limsup_{\varepsilon \to 0^+} \frac{1}{\varepsilon N - 1} \inf \left\{ \int_{Q_\nu(x_0, \varepsilon)} f(\theta, \nu; Q_\nu(x_0, \varepsilon)) : \theta \in BV(\Omega; \{0, 1\}), \nu \in W^{1,1}(\Omega; \mathbb{R}^N), \theta = \chi_0(-x) \text{ on } \partial Q_\nu(x_0, \varepsilon), \nu = u_0(-x) \text{ on } \partial Q_\nu(x_0, \varepsilon) \right\},
\]

where \( \chi_0 \) and \( u_0 \) are given by (3.24) with \( \nu = \nu(x_0) \) and \( a = \chi^+(x_0), b = \chi^-(x_0), c = u^+(x_0) \) and \( d = u^-(x_0), \) respectively. Thus, for every \( n \in \mathbb{N}, \) there exist \( \theta_{n, \varepsilon} \in BV(\Omega; \{0, 1\}), v_{n, \varepsilon} \in W^{1,1}(\Omega; \mathbb{R}^N) \) such that \( \theta_{n, \varepsilon} = \chi_0(-x) \) on \( \partial Q_\nu(x_0, \varepsilon), \) \( v_{n, \varepsilon} = u_0(-x) \) on \( \partial Q_\nu(x_0, \varepsilon) \) and

\[
g(x_0, \chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)) + \frac{1}{n}
\]

\[
\geq \limsup_{\varepsilon \to 0^+} \frac{1}{\varepsilon N - 1} \left[ \int_{Q_\nu(x_0, \varepsilon)} f(\theta_{n, \varepsilon}(x), \mathcal{E}v_{n, \varepsilon}(x)) \, dx + |D\theta_{n, \varepsilon}|(Q_\nu(x_0, \varepsilon)) \right]
\]

\[
= \limsup_{\varepsilon \to 0^+} \left[ \int_{Q_\nu} \varepsilon f(\theta_{n, \varepsilon}(x + \varepsilon y), \mathcal{E}v_{n, \varepsilon}(x + \varepsilon y)) \, dy \right]
\]

\[
+ \int_{Q_\nu \cap (1/\varepsilon)(J_{\theta_{n, \varepsilon} - x_0})} d\mathcal{H}^{N-1}(y)
\]

\[
= \liminf_{\varepsilon \to 0^+} \left[ \int_{Q_\nu} \varepsilon f(\chi_{n, \varepsilon}(y), \frac{1}{\varepsilon} \mathcal{E}u_{n, \varepsilon}(y)) \, dy + |D\chi_{n, \varepsilon}|(Q_\nu) \right]
\]

\[
\geq \liminf_{\varepsilon \to 0^+} \left[ \int_{Q_\nu} f^\infty(\chi_{n, \varepsilon}(y), \mathcal{E}u_{n, \varepsilon}(y)) \, dy + |D\chi_{n, \varepsilon}|(Q_\nu) \right]
\]

\[
+ \liminf_{\varepsilon \to 0^+} \int_{Q_\nu} \left[ \varepsilon f(\chi_{n, \varepsilon}(y), \frac{1}{\varepsilon} \mathcal{E}u_{n, \varepsilon}(y)) - f^\infty(\chi_{n, \varepsilon}(y), \mathcal{E}u_{n, \varepsilon}(y)) \right] \, dy,
\]

(4.44)

where \( \chi_{n, \varepsilon}(y) = \theta_{n, \varepsilon}(x_0 + \varepsilon y) \) and \( u_{n, \varepsilon}(y) = v_{n, \varepsilon}(x_0 + \varepsilon y). \) We claim that

\[
\liminf_{\varepsilon \to 0^+} \int_{Q_\nu} \left[ \varepsilon f(\chi_{n, \varepsilon}(y), \frac{1}{\varepsilon} \mathcal{E}u_{n, \varepsilon}(y)) - f^\infty(\chi_{n, \varepsilon}(y), \mathcal{E}u_{n, \varepsilon}(y)) \right] \, dy = 0.
\]

(4.45)

If so, noting that \( (\chi_{n, \varepsilon}, u_{n, \varepsilon}) \in A(\chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)) \), we have from (4.44), (4.45) and the definition of \( K(a, b, c, d, \nu), \)

\[
g(x_0, \chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)) + \frac{1}{n}
\]

\[
\geq \liminf_{\varepsilon \to 0^+} \left[ \int_{Q_\nu} f^\infty(\chi_{n, \varepsilon}(y), \mathcal{E}u_{n, \varepsilon}(y)) \, dy + |D\chi_{n, \varepsilon}|(Q_\nu) \right]
\]

\[
\geq K(\chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)),
\]

hence the result follows by letting \( n \to +\infty. \)
It remains to prove (4.45). We write

\[
\int_{Q_\nu} \varepsilon f(\chi_{n,\varepsilon}(y), \frac{1}{\varepsilon} E u_{n,\varepsilon}(y)) - f^\infty(\chi_{n,\varepsilon}(y), E u_{n,\varepsilon}(y)) \, dy \\
= \int_{Q_\nu \cap \{(1/\varepsilon)|E u_{n,\varepsilon}(y)| \leq L\}} \varepsilon f(\chi_{n,\varepsilon}(y), \frac{1}{\varepsilon} E u_{n,\varepsilon}(y)) - f^\infty(\chi_{n,\varepsilon}(y), E u_{n,\varepsilon}(y)) \, dy \\
+ \int_{Q_\nu \cap \{(1/\varepsilon)|E u_{n,\varepsilon}(y)| > L\}} \varepsilon f(\chi_{n,\varepsilon}(y), \\
\times \frac{1}{\varepsilon} E u_{n,\varepsilon}(y)) - f^\infty(\chi_{n,\varepsilon}(y), E u_{n,\varepsilon}(y)) \, dy =: I_1 + I_2.
\]

By the growth hypotheses (3.4) and (3.6) we have

\[
|I_1| \leq \int_{Q_\nu \cap \{|E u_{n,\varepsilon}(y)| \leq L\}} \varepsilon C \left(1 + \frac{1}{\varepsilon} |E u_{n,\varepsilon}(y)|\right) + C|E u_{n,\varepsilon}(y)| \, dy \\
\leq \int_{Q_\nu} \varepsilon C \, dy = O(\varepsilon)
\]

and, by hypothesis (3.9) with \( t = \frac{1}{\varepsilon} \), Hölder’s inequality and (3.4),

\[
|I_2| \leq \int_{Q_\nu \cap \{(1/\varepsilon)|E u_{n,\varepsilon}(y)| > L\}} \left| \varepsilon f(\chi_{n,\varepsilon}(y), \frac{1}{\varepsilon} E u_{n,\varepsilon}(y)) - f^\infty(\chi_{n,\varepsilon}(y), E u_{n,\varepsilon}(y)) \right| \, dy \\
\leq \int_{Q_\nu \cap \{(1/\varepsilon)|E u_{n,\varepsilon}(y)| > L\}} C \varepsilon^\gamma |E u_{n,\varepsilon}(y)|^{1-\gamma} \, dy \\
\leq C \varepsilon^\gamma \left( \int_{Q_\nu} |E u_{n,\varepsilon}(y)| \, dy \right)^{1-\gamma} \\
\leq C \varepsilon^\gamma \left( \int_{Q_\nu} \varepsilon f(\chi_{n,\varepsilon}(y), \frac{1}{\varepsilon} E u_{n,\varepsilon}(y)) \, dy \right)^{1-\gamma} = O(\varepsilon^\gamma),
\]

since the integral in the last expression is uniformly bounded by (4.44). The above estimates yield (4.45) and complete the proof.

\[\square\]

**Proposition 4.12.** Let \( f \) be given by (3.5), where \( W_0 \) and \( W_1 \) are continuous functions satisfying (3.4), and assume that \( f \) is symmetric quasiconvex and that (3.9) holds. Given \( u \in BD(\Omega) \) and \( \chi \in BV(\Omega; \{0, 1\}) \), for \( \mathcal{H}^{N-1} \) a.e. \( x_0 \in \Omega \cap (J_\chi \cup J_u) \) we have

\[
g(x_0, \chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)) \\
\leq K(\chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)).
\]

**Proof.** Using the sequential characterization of \( K \) given in proposition 3.11, let \( \chi_n \in BV(Q_\nu; \{0, 1\}) \), \( u_n \in W^{1,1}(Q_\nu; \mathbb{R}^N) \) be such that \( \chi_n \rightharpoonup \chi_0 \) in \( L^1(Q_\nu; \{0, 1\}) \),
Relaxation for an optimal design problem

Given that $\chi_n, u_0$ are as in the proof of proposition 4.6.

For $x \in Q_\nu(x_0, \varepsilon)$, set $\theta_n(x) := \chi_n((x - x_0) / \varepsilon)$ and $v_n(x) := u_n((x - x_0) / \varepsilon)$. Then, changing variables and using the positive homogeneity of $f^\infty(q, \cdot)$, we have

$$K(\chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0))$$

$$= \lim_{n \to +\infty} \left[ \int_{Q_\nu} f^\infty(\chi_n(y), \mathcal{E}u_n(y)) \, dy + |D\chi_n|(Q_\nu) \right],$$

where $\chi_0, u_0$ are as in the proof of hypothesis (3.9) allow us to conclude that

$$u_n \to u_0 \text{ in } L^1(Q_\nu; \mathbb{R}^N) \text{ and}$$

$$K(\chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0))$$

$$= \lim_{n \to +\infty} \left[ \int_{Q_\nu} f^\infty(\chi_n(y), \mathcal{E}u_n(y)) \, dy + |D\chi_n|(Q_\nu) \right].$$

$$= \frac{1}{\varepsilon^{N-1}} \lim_{n \to +\infty} \left[ \int_{Q_\nu(x_0, \varepsilon)} f^\infty(\theta_n(x), \mathcal{E}v_n(x)) \, dx + |D\theta_n|(Q_\nu(x_0, \varepsilon)) \right]$$

$$\geq \frac{1}{\varepsilon^{N-1}} \liminf_{n \to +\infty} \left[ \int_{Q_\nu(x_0, \varepsilon)} f(\theta_n(x), \mathcal{E}v_n(x)) \, dx + |D\theta_n|(Q_\nu(x_0, \varepsilon)) \right]$$

$$+ \frac{1}{\varepsilon^{N-1}} \liminf_{n \to +\infty} \int_{Q_\nu(x_0, \varepsilon)} (f^\infty(\theta_n(x), \mathcal{E}v_n(x)) - f(\theta_n(x), \mathcal{E}v_n(x))) \, dx$$

$$=: I_1 + I_2. \quad (4.46)$$

Given that $\chi_n \to \chi_0$ in $L^1(Q_\nu; \{0, 1\})$ and $u_n \to u_0$ in $L^1(Q_\nu; \mathbb{R}^N)$, it follows that $\theta_n \to \chi_0(\cdot - x_0)$ in $L^1(Q_\nu(x_0, \varepsilon); \{0, 1\})$ and $v_n \to u_0(\cdot - x_0)$ in $L^1(Q_\nu(x_0, \varepsilon); \mathbb{R}^N)$. Thus,

$$I_1 \geq \frac{1}{\varepsilon^{N-1}} \mathcal{F}(\chi_0(\cdot - x_0), u_0(\cdot - x_0); Q_\nu(x_0, \varepsilon))$$

$$\geq \frac{1}{\varepsilon^{N-1}} m(\chi_0(\cdot - x_0), u_0(\cdot - x_0); Q_\nu(x_0, \varepsilon)). \quad (4.47)$$

On the other hand, the same calculations that were used to prove (4.45) by means of hypothesis (3.9) allow us to conclude that

$$\limsup_{\varepsilon \to 0^+} I_2 = 0. \quad (4.48)$$

Hence, from (4.46), (4.47) and (4.48) we obtain

$$K(\chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0))$$

$$\geq g(x_0, \chi^+(x_0), \chi^-(x_0), u^+(x_0), u^-(x_0), \nu(x_0)). \quad \square$$
