ABSTRACT

Objective: The objective of this study is to identify the effect of red betel (Piper crocatum Ruiz and Pav.) leaves ethanolic extract on hepatoprotecive effect on CCl₄-induced liver damage in rats.

Methods: Standard phytochemical screening method was done for preliminary phytochemical screening. Hepatotoxic rats were induced with CCl₄ and treated with ethanolic extract of red betel leaves. The hepatoprotective test was divided into two groups (curative and preventive test). In the curative test, the rats which have been induced with CCl₄ were given ethanol extract 600 mg/kg bw each day for 15 days. In the preventive test, the induced rats were given ethanol extract 600 mg/kg bw each day and CCl₄ each 4 h for 45 days. Alanine aminotransferase (ALT), aspartate aminotransferase (AST), and alkaline phosphatase (ALP) parameters were also measured.

Result: The phytochemical screening showed an ethanolic extract of red betel leaves which contain a lot of phytochemical compounds. The result of hepatoprotective study showed that the ALT, AST, and ALP registered a significant (p<0.05) alteration in CCl₄ treated rats.

Conclusion: The ethanolic extract of red betel leaves had the curative and preventive test.

Keywords: Red betel, Hepatotoxic, Hepatoprotective, CCl₄

INTRODUCTION

The liver is one of the largest organs in the human body and performs many vital functions related to digestion, metabolism, immunity, and storage of nutrients within the body [1]. The liver as a vital organ in the body is primarily responsible for the metabolism of endogenous and exogenous agents. It plays an important role in drug elimination and detoxification, and liver damage may be caused by xenobiotics, alcohol consumption, malnutrition, infection, anemia, and medications [2].

Liver disease is a big problem in the health system, and the use of conventional medicine for the treatment of liver diseases is sometimes inadequate and causes serious side effects [3]. Based on the WHO (2004), the prevalence of liver cirrhosis is 1.3%, and it is the 18th leading cause of death with 800,000 cases. In the United States in 2009, chronic liver disease and cirrhosis were responsible for about 30,444 cases of deaths [4]. Hepatotoxicity is defined as injury to the liver that is associated with impaired liver function caused by exposure to a drug or another non-infectious agent [5]. Hepatotoxic agents can react with the basic cellular components and consequently induce almost all types of liver lesions.

Nature is always a golden sign to show the prominent phenomena of coexistence. Natural products from plants, animals, and minerals are the basis for treating human diseases [6,7]. One of the medicinal plants commonly used by people is red betel (Piper crocatum Ruiz and Pav) plant. Betel plant has been known as an antiseptic since 600 BC. The types of betel generally used as medicine in Indonesia are green betel (Piper betel) and black betel. However, there is another type gaining popularity, i.e., red betel. Red betel is the type of betel often used as an ornamental plant in the 1990s, but now it has shifted to medicinal function [8]. The present study investigates the hepatoprotective potential of red betel ethanolic extract treatment against CCl₄-induced liver toxicity in rats.

METHODS

Collection of plant material
Fresh red betel leaves were collected in January 2016 from the local area of Berastagi and authenticated by Indonesian Institute of Sciences: Research Center for Biology. A voucher specimen was deposited in the Pharmacognosy Laboratory, Faculty of Pharmacy, University of Sumatera Utara.

Plant extraction preparation
Extraction was done by a maceration method. 900 g of powdered red betel leaves were macerated in advance with the solvent of ethanol for 5 days, then filtered, and do it continuously until the filtrate obtained is clear and colorless [9].

Phytochemical screening of various lotus leaf extract
Phytochemical screening carried out on various lotus leaf extracts which are hexane, ethyl acetate, and ethanol includes examining the secondary chemical metabolites of alkaloids, flavonoids, glycosides, saponins, tannins, triterpenoids, and steroids [10-12].

Preparation of animals
Healthy adult Wistar albino rats (150–200 g body weight) from animal house of the Faculty of Pharmacy, University of Sumatera Utara, were used for the study. Rats were housed in a polycarbonate cages in a room with 12 h day-night circle. They were fed on a standard pellet diet and water ad libitum. The study was approved by the Animal Research Ethics Committees (AREC) of University of Sumatera Utara, and the experiments were conducted according to the ethical norms and AREC guidelines (AREC registration number: 385/KEPH-FMIPA/2015).
Experimental design
Curative hepatoprotective test
In the curative test, rats were divided into three groups. The first group served as the baseline. Necrosis rats in the second group received Na CMC 0.5% suspension as a negative control. Group III necrosis rats were treated with an ethanol extract of red betel at a dose of 600 mg/kg BW. Alanine aminotransferase (ALT), aspartate aminotransferase (AST), and Alkaline phosphatase (ALP) were observed on days 5, 10, and 15.

Preventive hepatoprotective test
Measurement of ALT, AST, and ALP before the treatment is the initial value. In the preventive test, rats were divided into three groups. Group I was healthy rats which were given CCl4 every 4 days with a dose of 1 ml/kg BW for 45 days as a control hepatotoxic. Group II is healthy rats which were given daily Na, CMC and CCl4 every 4 days with a dose of 1 ml/kg BW for 45 days as a negative control. Group III is healthy rats which were given a daily dose of red betel ethanol extract at a dose of 600 mg/kg BW and CCl4 4 days with a dose of 1 ml/kg BW for 45 days. Rats’ serum was taken for testing the activity of ALT, AST, and ALP on days 15, 30, and 45.

Statistical analysis
All the data were expressed an mean ± standard deviation. The significant difference between different groups was compared by ANOVA followed by Duncan’s test.

RESULTS
Phytochemical screening
Screening results of the various extract of Lotus leaf extract showed different chemical compounds in different extracts (Table 1).

Table 1: Phytochemical screening result of red betel leaves ethanolic extract

| No  | Screening          | Ethanol Extract |
|-----|--------------------|-----------------|
| 1   | Alkaloids          | Positive        |
| 2   | Flavonoids         | Positive        |
| 3   | Glycosides         | Positive        |
| 4   | Saponins           | Positive        |
| 5   | Tannins            | Positive        |
| 6   | Triterpenoid/Steroids | Positive    |

Curative hepatoprotective test
In the curative test, the ethanol extract was given after induction with CCl4 1 ml/kg BW every 4 h for 45 days. The measurement of the activity of ALT, AST, and ALP test can be seen in Table 2.

Preventive hepatoprotective test
In the preventive test, the ethanol extract of red betel dose of 600 mg/kg BW given every day and CCl4 was given then on the 4th day 2 h before the extract. Results of preventive tests can be seen in Table 3.

DISCUSSION
The hepatoprotective activity may be attributed to classes of compounds present in it, such as flavonoids, alkaloids, and saponins [13]. Red betel contains flavonoids. Flavonoid compounds suspected of being able to repair damaged liver cells. These compounds react to restore the damaged liver cells. The mechanism of hepatoprotective is by detoxifying toxic compounds, increasing the regeneration of liver cells, anti-inflammatory and as an immunomodulator [14]. Flavonoids can control liver diseases [13]. As the anti-inflammatory agent, flavonoids can restore the permeability and increase the resistance of the capillary of blood vessels [15].

Based on Table 2, the activity of ALT, AST, and ALP in Group III with extract dose is 600 mg/kg BW which did not differ significantly in the normal group (p>0.05) and significantly different from the negative group (p<0.05). CCl4 may cause significant changes in serum liver enzymes [16]. This shows the effect of a decrease in ALT, AST, and ALP from the application of the extract. ALT is more accurate for liver enzymes [16]. This shows the effect of a decrease in ALT, AST, and ALP from the application of the extract. ALT is more accurate for liver function test than AST because ALT formed in the liver. Increased ALT enzymes in liver toxicity were caused by the loss of structural integrity of the liver [17].

Group III (dose 600 mg/kg/BW) showed a significant difference with the negative control and the hepatotoxic control. Decreasing in liver serum level suggesting that the possibility of the extracts ability to protect the hepatocytes which caused by CCl4 [16]. This proves that extract may protect liver cells from damage caused by CCl4. Flavonoids are supposed to reduce the liver damage by binding free radicals so, the impact will be reduced. Free radicals will disrupt the membrane integrity of hepatocytes, thus removing various enzymes from hepatocytes, such as AST and ALT [18-20].

Table 2: Measurement ALT, AST, and ALP activity in the curative test

| Group                  | ALT                              | AST                              | ALP                              |
|------------------------|----------------------------------|----------------------------------|----------------------------------|
| Normal                 | 102.515±5.336                    | 179.26±10.85                     | 28.5±0.50                       |
| Negative control       | 59.13±40.60                      | 72.75±10.064                     | 27.5±0.831                      |
| Extract control (600 mg/kg BW) | 134.94±13.883 | 337.45±57.835                   | 5.09±0.00                       |

Table 3: Measurement of ALT, AST, and ALP in preventive test

| Group                  | ALT                              | AST                              | ALP                              |
|------------------------|----------------------------------|----------------------------------|----------------------------------|
| Hepatotoxic control    | 102.515±5.336                    | 179.26±10.85                     | 28.5±0.50                       |
| Negative control       | 59.13±40.60                      | 72.75±10.064                     | 27.5±0.831                      |
| Extract control (600 mg/kg BW) | 134.94±13.883 | 337.45±57.835                   | 5.09±0.00                       |

Note: p<0.05 indicates a significant difference with the normal group.
CONCLUSIONS
The result of this study demonstrates that red betel leaves ethanolic extract was effective for the curative and preventive of CCl₄-induced hepatic damage in rats. However, the protective, curative, and preventive effect of red betel leaves needs to be confirmed by characterizing the active compounds of this plant as well as its mechanisms of action.
