Abstract

The main objective of this paper is to develop a new mathematical model to study, analyze, and control the family status in several regions and to discuss the impact of the connectivity of regions and the mobility of residents on the marital status of the family, by adopting a multiregion discrete-time model. The modelling and the control process of the system that describes the case of monogamous marriages in a multiregion framework are considered. Two combined control strategies are proposed, which allow reducing the virgin and divorced individuals and increasing the number of married individuals in a specific region. The first control is considered as the impact of public awareness campaigns to educate virgin men and women about the benefits of marriage for the individual and the society; the second control characterizes the legal procedures, administrative complications, and the heavy financial and social consequences of divorces. The optimal control theory is applied to characterize such optimal strategies and determined numerically using a progressive-regressive discrete scheme to discuss the obtained results.

1. Introduction

Mathematical models are useful tools for understanding the functioning of natural systems and for predicting their evolution. Among these models are those that study the dynamics of populations and ecosystems. Many researchers have studied models of population dynamics: prey and predator dynamics [1–4], epidemic dynamics in a population [5–8], molecular systems [9–11], and so forth.

Civil status is the situation of the person in the family and/or society. A person’s marital status is positioned in one of four categories: virgin, married, divorced, or widowed (VMDW). Several authors have discussed the social functioning, marital status, family stability, and social control of health behavior [12–18]. In [19], the authors have given a discrete mathematical model that describes the marital status of the monogamous marriage case and they also studied the optimal control that reduces the number of unmarried and divorced people and increases the number of married people. In this paper, we generalize the results established in [19] to the case of a multiregion system. We studied the effect of the population travel to different regions for the marriage, divorce, and widow.

Many studies on civil status have given statistics on the family situation of different regions (cities, rural regions, industrial regions, tourist regions, etc.), according to the age group of the population. For example in Morocco, the High Commissioner for Planning (HCP, public institution) [14] gives different statistics according to the age groups of the population; there are 76.2% of single people for the age group of 20 to 24 and 54% for the group of 25 to 29 years old. The percentage of divorce is 30% for couples with less than 5 years of marriage and 3% for married couples who have exceeded 20 years of marriages. 41.4% of married men and
41.8% of married women are identified by the HCP in the urban areas. The percentage of divorce is 0.8% for men and 3.1% for women. The widowed men are 0.6% of the population and women are 7.3% in urban areas. For the rural area, there are 40% of married men and 42.5% of married women; the percentage of divorce is 0.4% for married men and 1.4% for married women. Widowed men are represented by 0.6% of the population and women by 6.8% in rural areas.

In recent years, many attempts have been made to develop control strategies for different systems [5, 20–27]. There are a number of different methods for calculating the optimal control for a specific mathematical model. For example, Pontryagin ef al.’s maximum principle [28] allows the characterization of the optimal control for an ordinary equation model system with a given constraint.

In [29], the authors have described a new modelling approach based on multiregion discrete-time SIR models aiming to describe the spatial-temporal evolution of epidemics that emerge in different geographical regions and to show the influence of one region on another region via infection travel.

In this paper and inspired by [29], we investigate an approach that determines an optimal control relative to a discrete VMDW model in a multiregion framework, which defines the evolution of the marital status of the marriage in a population, enabling decision-makers to develop very useful control strategies to reduce the virgin individuals and to increase the number of married individuals in a specific region.

The first control can be considered as public awareness campaigns showing to individuals the benefits of marriage on the psychic and social stability on persons and the society, or cultural entertained events to give people the chance to meet and to know and to allow themselves to get married. The second control is determined for the persons who have initiated the divorce proceedings; this control is considered as a long and costly legal procedure.

The optimal control problem was the subject of an optimization criterion represented by the minimization of an objective function. The optimality system is solved based on an iterative discrete schema that converges following an appropriate test similar to the one related to the Forward-Backward Sweep Method (FBSM).

The paper is organized as follows: in Section 2, the model VMDW is described for a multiregion discrete model. In Section 3, we give some results concerning the existence of optimal control and we use Pontryagin’s maximum principle to investigate the analysis of control strategies and to determine the necessary condition for optimal control. Numerical simulations are given in Section 4. Finally, we conclude the paper in Section 5.

2. Mathematical Modelling

We consider a discrete-time model VMDW of the marital status of the family dynamic within a domain of interest $\Omega$ which represents a country, a city, a town, or a small domain. We assume that there are $p$ geographical regions (domains) of the domain studied $\Omega$. Let $\Omega = \bigcup_{j=1}^{p} \Omega_j$, and let $N_i(\Omega_k)$ be the population of domain $\Omega_k$ at time $i$; that is, the number of individuals who are residents in $\Omega_k$.

This model classifies the marital status of the family dynamics of a population into eight compartments in each region $\Omega_k$: virgin men $V^M(\Omega_k)$, virgin women $V^W(\Omega_k)$, married men $M^M(\Omega_k)$, married women $M^W(\Omega_k)$, divorced men $D^M(\Omega_k)$, divorced women $D^W(\Omega_k)$, widowed men $W^M(\Omega_k)$, and widowed women $W^W(\Omega_k)$.

The unit of time $i$ can correspond to days, months, or years; it depends on the frequency of the survey and demographic studies as needed. However demographic statistics are generally done annually so the units $i, i+1, \ldots$ can be considered as years. The following system describes a discrete model of the marital status of the monogamous marriage case of a region $\Omega_k$:

\[
V^M_{i+1}(\Omega_k) = \Lambda_{k1} + V^M_i(\Omega_k) - \sum_{j=1}^{p} \alpha_{kj} V^W_i(\Omega_j) + \gamma_{kj} D^W_i(\Omega_j) + \delta_{kj} W^W_i(\Omega_j) + N_i(\Omega_k) + N_i(\Omega_j)
\]

\[
V^W_{i+1}(\Omega_k) = \Lambda_{k2} + V^W_i(\Omega_k) - \sum_{j=1}^{p} \alpha_{jk} V^M_i(\Omega_j) + \beta_{jk} D^M_i(\Omega_j) + \eta_{jk} W^M_i(\Omega_j) + N_i(\Omega_j) + N_i(\Omega_k)
\]

\[
D^M_{i+1}(\Omega_k) = D^M_i(\Omega_k) - \sum_{j=1}^{p} \beta_{kj} V^W_i(\Omega_j) + \mu_{kj} D^W_i(\Omega_j) + \theta_{kj} W^W_i(\Omega_j) + N_i(\Omega_k) + N_i(\Omega_j)
\]

\[
D^W_{i+1}(\Omega_k) = D^W_i(\Omega_k) - \sum_{j=1}^{p} \gamma_{jk} V^M_i(\Omega_j) + \eta_{jk} D^M_i(\Omega_j) + \delta_{jk} W^M_i(\Omega_j) + N_i(\Omega_j) + N_i(\Omega_k)
\]

\[
W^M_{i+1}(\Omega_k) = W^M_i(\Omega_k) - \sum_{j=1}^{p} \beta_{kj} V^W_i(\Omega_j) + \mu_{kj} D^W_i(\Omega_j) + \theta_{kj} W^W_i(\Omega_j) + N_i(\Omega_k) + N_i(\Omega_j)
\]

\[
W^W_{i+1}(\Omega_k) = W^W_i(\Omega_k) - \sum_{j=1}^{p} \gamma_{jk} V^M_i(\Omega_j) + \eta_{jk} D^M_i(\Omega_j) + \delta_{jk} W^M_i(\Omega_j) + N_i(\Omega_j) + N_i(\Omega_k)
\]
\begin{align}
D_{i+1}^W(\Omega_k) & = D_i^W(\Omega_k) - \sum_{j=1}^{p} \frac{\gamma_{jk} V_i^M(\Omega_j) + \mu_{jk} D_i^M(\Omega_j) + \nu_{jk} W_i^W(\Omega_j)}{N_i(\Omega_j) + N_i(\Omega_k)} D_i^W(\Omega_k) \\
& + \sum_{j=1}^{p} \lambda_j^M D_i^W(\Omega_j) - d_k D_i^W(\Omega_k), \\
W_{i+1}^M(\Omega_k) & = W_i^M(\Omega_k) - \sum_{j=1}^{p} \frac{\eta_{jk} V_i^M(\Omega_j) + \nu_{jk} D_i^W(\Omega_j) + \sigma_{jk} W_i^W(\Omega_j)}{N_i(\Omega_j) + N_i(\Omega_k)} W_i^M(\Omega_k) \\
& + \omega_k M_i^W(\Omega_k) - d_k W_i^M(\Omega_k), \\
W_{i+1}^W(\Omega_k) & = W_i^W(\Omega_k) - \sum_{j=1}^{p} \frac{\delta_{jk} V_i^M(\Omega_j) + \theta_{jk} D_i^M(\Omega_j) + \sigma_{jk} W_i^W(\Omega_j)}{N_i(\Omega_j) + N_i(\Omega_k)} W_i^W(\Omega_k) \\
& + \sum_{j=1}^{p} \rho_j^M M_i^W(\Omega_j) - d_k W_i^W(\Omega_k), \\
M_{i+1}^M(\Omega_k) & = M_i^M(\Omega_k) + \sum_{j=1}^{p} \frac{\alpha_{jk} V_i^W(\Omega_j) + \beta_{jk} D_i^W(\Omega_j) + \gamma_{jk} W_i^W(\Omega_j)}{N_i(\Omega_j) + N_i(\Omega_k)} V_i^M(\Omega_k) \\
& + \frac{\alpha_{jk} V_i^M(\Omega_j) + \beta_{jk} D_i^M(\Omega_j) + \gamma_{jk} W_i^W(\Omega_j)}{N_i(\Omega_j) + N_i(\Omega_k)} V_i^W(\Omega_k) - (\lambda_k + \rho_k) M_i^M(\Omega_k), \\
M_{i+1}^W(\Omega_k) & = M_i^W(\Omega_k) + \sum_{j=1}^{p} \frac{\alpha_{jk} V_i^W(\Omega_j) + \beta_{jk} D_i^W(\Omega_j) + \gamma_{jk} W_i^W(\Omega_j)}{N_i(\Omega_j) + N_i(\Omega_k)} V_i^M(\Omega_k) \\
& + \frac{\alpha_{jk} V_i^M(\Omega_j) + \beta_{jk} D_i^M(\Omega_j) + \gamma_{jk} W_i^W(\Omega_j)}{N_i(\Omega_j) + N_i(\Omega_k)} V_i^W(\Omega_k) - (\lambda_k + \omega_k) M_i^W(\Omega_k),
\end{align}
where $V^M_i(\Omega_i)$, $V^W_i(\Omega_i)$, $M^M_i(\Omega_i)$, $M^W_i(\Omega_i)$, $D^M_i(\Omega_i)$, $D^W_i(\Omega_i)$, $W^M_i(\Omega_i)$, and $W^W_i(\Omega_i)$ are the given initial state in the region $\Omega_i$. In equations (1)–(8), all parameters are nonnegative and defined in Table 1.

For equation (1) of the model, virgin men of a region $\Omega_i$ can contact a virgin, divorced, or widowed woman of another region $\Omega_j$, with $a_{ij}$, $\gamma_{ij}$, and $\delta_{ij}$ rates, respectively, and this contact can result in a marriage. The married couple can stay in the region $\Omega_k$ or settle in the conjoin region $\Omega_j$. Thus, the number of virgin men decreases and the number of virgins at the instant $i$ is substituted for the number $a_{ij}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j) + \gamma_{ij}V^M_i(\Omega_i)D^M_j(\Omega_j)/(\Omega_i)/N_i(\Omega_i) + N_j(\Omega_j) + \delta_{ij}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j)$ and a portion of this number $\alpha_{ij}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j) + \gamma_{ij}V^M_i(\Omega_i)D^M_j(\Omega_j)/(\Omega_i)/N_i(\Omega_i) + N_j(\Omega_j) + \delta_{ij}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j)$ that represents the part of married couples who decides to settle in $\Omega_k$ is added at the time $i + 1$ to the number of men marrying in region $\Omega_k$ and the other portion $\alpha_{ij}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j) + \gamma_{ij}V^M_i(\Omega_i)D^M_j(\Omega_j)/(\Omega_i)/N_i(\Omega_i) + N_j(\Omega_j) + \delta_{ij}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j) + \delta_{ij}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j)$ is added to the number of men marrying in region $\Omega_j$. Then, we have $\alpha_{ij} = \alpha_{ij} + \alpha_{ij}$, $\gamma_{ij} = \gamma_{ij} + \gamma_{ij}$, and $\delta_{ij} = \delta_{ij} + \delta_{ij}$.

Similarly in equation (2), the number of virgins in region $\Omega_i$ decreases at the instant $i + 1$ by substituting the number of virgin women at the instant $i$, the number $a_{ji}V^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j) + \beta_{ji}D^M_i(\Omega_i)V^W_j(\Omega_j)/(\Omega_i)/N_i(\Omega_i) + N_j(\Omega_j) + \eta_{ji}W^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j)$ which represents the number of married women after contact with a virgin, divorced, or widowed men in region $\Omega_i$ with $\beta_{ji}$, $\eta_{ji}$ and $\beta_{ji}$ levels, respectively. Also we have $a_{jk} = a_{jk} + a_{jk}$, $\beta_{jk} = \beta_{jk} + \beta_{jk}$ and $\eta_{jk} = \eta_{jk} + \eta_{jk}$.

In equation (3), a divorced man in region $\Omega_k$ can contact a virgin, divorced, or widowed woman of region $\Omega_j$ with $\beta_{kj}$, $\mu_{kj}$, and $\theta_{kj}$ rates, respectively, so this contact can result in divorce. Then the number $\beta_{kj}D^M_i(\Omega_i)V^W_j(\Omega_j)/(\Omega_i)/N_i(\Omega_i) + N_j(\Omega_j) + \mu_{kj}D^M_i(\Omega_i)V^W_j(\Omega_j)/(\Omega_i)/N_i(\Omega_i) + N_j(\Omega_j) + \eta_{ij}W^M_i(\Omega_i)V^W_j(\Omega_j)/N_i(\Omega_i) + N_j(\Omega_j)$ is decreased by the number of married men at the time $i + 1$ and added to the number of married men and we have $\mu_{kj} = \mu_{kj} + \mu_{kj}$ and $\theta_{kj} = \theta_{kj} + \theta_{kj}$.

In the model we propose here, it was considered that a divorced man remains in his region and the divorced woman returns to the region of her parents; this is the case for the majority of regions whether they are conservative or not. And so the number $\lambda_iM^M_i(\Omega_i)$ is added to the number of divorced men and the number $\lambda_iM^W_i(\Omega_i)$ of divorced women is added to the number of divorced women of the region $\Omega_i$ with $\lambda_i$ being the rate that a woman divorces a man from the region $\Omega_k$ and returns to the region $\Omega_i$. Consequently, the total number of $\sum_{i=1}^{\infty} \lambda_iM^M_i(\Omega_i)$ is added to the number of divorced women in the region $\Omega_i$ with the relation $\sum_{i=1}^{\infty} \lambda_i$. The same principle applies to equations (5) and (6) with $\rho_k = \sum_{i=1}^{\infty} p_k$.

For equation (7), the number of married men in the region $\Omega_k$ increases at the instant $i + 1$ by the number of virgin, divorced, and widowed men who are married by contacting virgin, divorced, or widowed women of the region $\Omega_j$ and decreases the natural mortality with a $\rho_k$ and divorce rate with a $\lambda_i$ rate. The same principle can be applied to equation (8).

In equations (7) and (8) from the model, the natural mortality of married men and women was considered. The mortality rate for married men is $\rho_k$ and the mortality rate for married women is $\omega_k$. These rates appear in equations (5) and (6) which correspond to widowed men and women, respectively, so the number of mortalities which is $\rho_kM^M_i(\Omega_k)$ married men and the number $\sum_{i=1}^{\infty} \rho_iM^W_i(\Omega_i)$ are added to the number of widowed women and similarly the number $\omega_kM^W_i(\Omega_k)$ is added to the number of widowed men.

### 3. Methods and Results

#### 3.1. An Optimal Control Approach

An optimal control approach has been applied to models (1)–(8) to reduce the virgin and divorced individuals and increase the number of married individuals along the control strategy period. For this, we introduce a control variable $(u_i, v_i)$ that characterizes the benefits of an awareness campaign to educate virgin men and women about the benefits of marriage for the individual and the society, especially the legal procedures, administrative complications, and the heavy financial and social consequences of divorces, respectively, in the abovementioned models (1)–(8). Then, the model is given by the following equations:

---

**Table 1**: The description of parameters used for the definition of discrete-time systems (1)–(8).

| Parameter  | Description |
|------------|-------------|
| $\Lambda_{i1}$ | Natality of virgin men in region $\Omega_i$ |
| $\Lambda_{i2}$ | Natality of virgin women in region $\Omega_i$ |
| $d_\kappa$ | Natural mortality rate in region $\Omega_k$ |
| $a_{ij}$ | Marriage rate of virgin men of region $\Omega_i$ to virgin women of region $\Omega_j$ |
| $\beta_{ij}$ | Marriage rate of virgin men of region $\Omega_i$ to virgin women of region $\Omega_j$ |
| $\gamma_{ij}$ | Marriage rate of virgin men of region $\Omega_i$ to divorced women of region $\Omega_j$ |
| $\delta_{ij}$ | Marriage rate of virgin men of region $\Omega_i$ to widowed women of region $\Omega_j$ |
| $\eta_{ij}$ | Marriage rate of married men of region $\Omega_i$ to virgin women of region $\Omega_j$ |
| $\mu_{ij}$ | Marriage rate of married men of region $\Omega_i$ to divorced women of region $\Omega_j$ |
| $\theta_{ij}$ | Marriage rate of married men of region $\Omega_i$ to widowed women of region $\Omega_j$ |
| $\lambda_k$ | Divorce rate of married men of region $\Omega_k$ |
| $\omega_k$ | Divorce rate of women of region $\Omega_k$ which return to the region $\Omega_j$ |
| $\rho_k$ | Widow rate of married women of region $\Omega_k$ |
| $\omega_k$ | Widow rate of married men of region $\Omega_k$ |
\[\begin{align*}
V_{i+1}^M(\Omega_k) &= \Lambda_{k1} + V_i^M(\Omega_k) - \sum_{j=1}^P \alpha_{kj} V_j^W(\Omega_j) + \gamma_{kj} D_j^W(\Omega_j) + \delta_{kj} W_j^W(\Omega_j) V_j^M(\Omega_k) \\
&\quad - d_k V_i^M(\Omega_k) - u_i V_i^M(\Omega_k), \\
V_{i+1}^W(\Omega_k) &= \Lambda_{k2} + V_i^W(\Omega_k) - \sum_{j=1}^P \alpha_{jk} V_j^M(\Omega_j) + \beta_{jk} D_j^M(\Omega_j) + \theta_{jk} W_j^W(\Omega_j) V_j^W(\Omega_k) \\
&\quad - d_k V_i^W(\Omega_k) - u_i V_i^W(\Omega_k), \\
D_{i+1}^M(\Omega_k) &= D_i^M(\Omega_k) - \sum_{j=1}^P \beta_{kj} V_j^W(\Omega_j) + \mu_{kj} D_j^M(\Omega_j) + \eta_{kj} W_j^M(\Omega_j) D_j^M(\Omega_k) \\
&\quad + \lambda_k M_i^M(\Omega_k) - d_k D_i^M(\Omega_k) - v_i D_i^M(\Omega_k), \\
D_{i+1}^W(\Omega_k) &= D_i^W(\Omega_k) - \sum_{j=1}^P \gamma_{kj} V_j^M(\Omega_j) + \nu_{kj} D_j^W(\Omega_j) + \sigma_{kj} W_j^W(\Omega_j) D_j^W(\Omega_k) \\
&\quad + \omega_k M_i^W(\Omega_k) - d_k D_i^W(\Omega_k) - v_i D_i^W(\Omega_k), \\
W_{i+1}^M(\Omega_k) &= W_i^M(\Omega_k) - \sum_{j=1}^P \eta_{kj} V_j^W(\Omega_j) + \nu_{kj} D_j^W(\Omega_j) + \theta_{kj} W_j^M(\Omega_j) W_i^M(\Omega_k) \\
&\quad + \omega_k M_i^W(\Omega_k) - d_k W_i^M(\Omega_k), \\
W_{i+1}^W(\Omega_k) &= W_i^W(\Omega_k) - \sum_{j=1}^P \delta_{kj} V_j^M(\Omega_j) + \theta_{kj} D_j^M(\Omega_j) + \sigma_{kj} W_j^W(\Omega_j) W_i^W(\Omega_k) \\
&\quad + \rho_k M_i^W(\Omega_k) - d_k W_i^W(\Omega_k), \\
M_{i+1}^M(\Omega_k) &= M_i^M(\Omega_k) + \sum_{j=1}^P \left[ \frac{\alpha_{kj} V_j^W(\Omega_j) + \gamma_{kj} D_j^W(\Omega_j) + \delta_{kj} W_j^W(\Omega_j) V_j^M(\Omega_k)}{N_i(\Omega_k) + N_i(\Omega_j)} \right] - (\lambda_k + \rho_k) M_i^M(\Omega_k) + u_i V_i^M(\Omega_k) + v_i D_i^M(\Omega_k). 
\end{align*}\]
\[ M_i^W(\Omega_k) = M_i^W(\Omega_k) + \sum_{j=1}^{p} \left[ \begin{array}{c} \alpha_k^{\delta_i} \xi_j^W(\Omega_j) + \gamma_k^{\delta_i} D_j^W(\Omega_j) + \delta_k^{\delta_i} W_j^W(\Omega_j) \\ \lambda_k(\Omega_k) + \nu_k(\Omega_k) \end{array} \right] \]

subject to systems (9)–(16). Here, \( \Omega \) are the positive weight parameters which are associated with the controls \( u_i \) and \( v_j \).

3.2. Characterization of the Optimal Control. For an initial state \( (V_0^W(\Omega_k), V_0^W(\Omega_k), M_0^W(\Omega_k), M_0^W(\Omega_k), D_0^W(\Omega_k), D_0^W(\Omega_k), W_0^W(\Omega_k), W_0^W(\Omega_k)) \), we consider an optimization criterion defined by the following objective function:

\[
J(u, v) = \sum_{i=0}^{N} \left( A_i V_i^W(\Omega_k) + A_2 D_i^W(\Omega_k) - A_3 M_i^W(\Omega_k) \right)
+ \sum_{i=0}^{N-1} \left( \frac{r_1}{2} (u_i)^2 + \frac{r_2}{2} (v_i)^2 \right),
\]

subject to systems (9)–(16). Here, \( A_1, A_2, \) and \( A_3 \) are positive constants to keep a balance in the size of \( V_i^W(\Omega_k), D_i^W(\Omega_k), \) and \( M_i^W(\Omega_k) \), respectively. In the objective functional, \( r_1 \) and \( r_2 \) are the positive weight parameters which are associated with the controls \( u_i \) and \( v_j \).

In other words, we seek the optimal controls \( (u^*, v^*) \) such that

\[
J(u^*, v^*) = \min\{J(u, v) \mid (u, v) \in \mathcal{U}_{ad} \},
\]

where \( \mathcal{U}_{ad} \) is the set of admissible controls defined by

\[
\mathcal{U}_{ad} = \left\{ (u, v) \mid u_{i, \min} \leq u_i \leq u_{i, \max}, v_{i, \min} \leq v_i \leq v_{i, \max}, i \in \{0, \ldots, N - 1\} \right\},
\]

where \( (u_{i, \min}, u_{i, \max}, v_{i, \min}, v_{i, \max}) \in [0, 1]^4 \).

The sufficient condition for existence of an optimal control \( (u^*, v^*) \) for problem (18) follows from standard results of [21]. In order to find an optimal solution, first we find the Hamiltonian for the optimal control problem (18). In fact, the Hamiltonian \( H \) of the optimal problem is given by

\[
H(u, v) = \sum_{i=0}^{N-1} \left( \frac{r_1}{2} (u_i)^2 + \frac{r_2}{2} (v_i)^2 \right) + \sum_{i=0}^{N} \left( A_i V_i^W(\Omega_k) + A_2 D_i^W(\Omega_k) - A_3 M_i^W(\Omega_k) \right) - (\lambda_k + \omega_k) M_i^W(\Omega_k) + u_i V_i^W(\Omega_k) + v_i D_i^W(\Omega_k).
\]
\[
H = A_i V_i^w (\Omega_i) + A_j D_j^w (\Omega_j) - A_l M_l^w (\Omega_l) + \frac{\tau}{2} q_i^2 + \frac{\tau}{2} p_i^2
\]

\[+ \zeta_{i,i,i} \left[ A_{i,i} + V_i^M (\Omega_i) - \sum_{j=1}^p \frac{\beta_{i,j} V_i^w (\Omega_i) + \theta_{i,j} W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} V_j^M (\Omega_j) - d_i V_i^w (\Omega_i) - u_i V_i^w (\Omega_i) \right]\]

\[+ \zeta_{i,j,i} \left[ A_{i,j} + V_i^w (\Omega_i) - \sum_{j=1}^p \frac{\beta_{i,j} V_i^w (\Omega_i) + \theta_{i,j} W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} V_j^M (\Omega_j) - d_i V_i^w (\Omega_i) - u_i V_i^w (\Omega_i) \right]\]

\[+ \zeta_{i,j,i} \left[ D_i^w (\Omega_i) - \sum_{j=1}^p \frac{\beta_{i,j} V_i^w (\Omega_i) + \theta_{i,j} W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} V_j^M (\Omega_j) + \lambda_i M_i^w (\Omega_i) + d_i M_i^w (\Omega_i) - v_i D_i^w (\Omega_i) \right]\]

\[+ \zeta_{i,j,i} \left[ D_i^w (\Omega_i) - \sum_{j=1}^p \frac{\beta_{i,j} V_i^w (\Omega_i) + \theta_{i,j} W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} V_j^M (\Omega_j) + \lambda_i M_i^w (\Omega_i) + d_i M_i^w (\Omega_i) - v_i D_i^w (\Omega_i) \right]\]

\[+ \zeta_{i,j,i} \left[ W_i^w (\Omega_i) - \sum_{j=1}^p \frac{\beta_{i,j} V_i^w (\Omega_i) + \theta_{i,j} W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} V_j^M (\Omega_j) + \omega_i M_i^w (\Omega_i) - d_i W_i^w (\Omega_i) \right]\]

\[+ \zeta_{i,j,i} \left[ W_i^w (\Omega_i) - \sum_{j=1}^p \frac{\beta_{i,j} V_i^w (\Omega_i) + \theta_{i,j} W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} V_j^M (\Omega_j) + \omega_i M_i^w (\Omega_i) - d_i W_i^w (\Omega_i) \right]\]

\[
\begin{bmatrix}
\frac{\alpha_i V_i^w (\Omega_i) + \gamma_i D_i^w (\Omega_i) + \delta_i W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} \\
\frac{\beta_i V_i^w (\Omega_i) + \sigma_i D_i^w (\Omega_i) + \theta_i W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} \\
\frac{\rho_i V_i^w (\Omega_i) + \eta_i D_i^w (\Omega_i) + \phi_i W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} \\
\frac{\lambda_i V_i^w (\Omega_i) + \omega_i D_i^w (\Omega_i) + \psi_i W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)}
\end{bmatrix}
\]

\[+ \zeta_{i,j,i} \left[ M_i^w (\Omega_i) + \sum_{j=1}^p \frac{\beta_{i,j} V_i^w (\Omega_i) + \theta_{i,j} W_i^w (\Omega_i)}{N_i (\Omega_i) + N_i (\Omega_i)} V_j^M (\Omega_j) - d_i V_i^w (\Omega_i) - u_i V_i^w (\Omega_i) \right] - (\lambda_i + \rho_{i,j}) M_i^w (\Omega_i) + u_i V_i^w (\Omega_i) + v_i D_i^w (\Omega_i)
\]
where $\zeta^k_1, \zeta^k_2, \ldots, \zeta^k_8$ are the adjoint functions to be determined suitably.

At the same time by using Pontryagin et al.'s maximum principle [28], we derive necessary conditions for our optimal control. We obtain the following theorem.

**Theorem 1.** Let $V^M(\Omega_k), V^W(\Omega_k), M^M(\Omega_k), M^W(\Omega_k), D^M(\Omega_k), D^W(\Omega_k)$, and $W^M(\Omega_k)$ be optimal state solutions with associated optimal control ($u^*, v^*$) for the optimal control problem (18). Then, there exist adjoint variables $\zeta^k_1, \zeta^k_2, \ldots, \zeta^k_8$ that satisfy

$$
\Delta \zeta^k_{ij} = -\zeta^k_{ij} \left( 1 - \sum_{j=1}^8 \alpha^j_k V^W_i(\Omega_j) + \gamma^j_k D^W_i(\Omega_j) + \delta^j_k W^W_i(\Omega_j) - d_k - u_i \right) + \delta^k_{2,j+1} \alpha^k_k V^W_i(\Omega_k) + \gamma^k_k D^W_i(\Omega_k) + \delta^k_k W^W_i(\Omega_k) - d_k - u_i
$$

$$
\Delta \zeta^k_{2j} = -A_1 - \zeta^k_{2j} \left( 1 - \sum_{j=1}^8 \alpha^j_k V^M_i(\Omega_j) + \beta^j_k D^M_i(\Omega_j) + \eta^j_k W^M_i(\Omega_j) - d_k - v_i \right) + \delta^k_{2,j+1} \alpha^k_k V^M_i(\Omega_k) + \gamma^k_k D^M_i(\Omega_k) + \delta^k_k W^M_i(\Omega_k) - d_k - v_i
$$

$$
\Delta \zeta^k_{3j} = -\zeta^k_{3j} \left( 1 - \sum_{j=1}^8 \beta^j_k V^W_i(\Omega_j) + \alpha^j_k D^W_i(\Omega_j) + \theta^j_k W^W_i(\Omega_j) - d_k - v_i \right) + \delta^k_{2,j+1} \alpha^k_k V^W_i(\Omega_k) + \gamma^k_k D^W_i(\Omega_k) + \delta^k_k W^W_i(\Omega_k) - d_k - v_i
$$

$$
\Delta \zeta^k_{4j} = -A_2 - \zeta^k_{4j} \left( 1 - \sum_{j=1}^8 \gamma^j_k V^M_i(\Omega_j) + \mu^j_k D^M_i(\Omega_j) + \nu^j_k W^M_i(\Omega_j) - d_k - v_i \right) + \delta^k_{2,j+1} \alpha^k_k V^M_i(\Omega_k) + \gamma^k_k D^M_i(\Omega_k) + \delta^k_k W^M_i(\Omega_k) - d_k - v_i
$$
\[
\Delta \xi_{S,j} = -\xi_{S,j+1}^k \left( 1 - \frac{\sum_{j=1}^{\rho} \eta_k \nu_j^{V_i^W} (\Omega_j) + \nu_j^{D_i^W} (\Omega_j) + \sigma_j^{W_i^W} (\Omega_j)}{N_i(\Omega_k) + N_i(\Omega_j)} - d_k \right) + \xi_{S,j+1}^k \eta_k \nu_j^{V_i^W} (\Omega_k) + \nu_j^{D_i^W} (\Omega_k) + \sigma_j^{W_i^W} (\Omega_k) \\
- (\xi_{S,j+1}^k + \zeta_{S,j+1}^k) \left( \sum_{j=1}^{\rho} \eta_k \nu_j^{V_i^W} (\Omega_j) + \nu_j^{D_i^W} (\Omega_j) + \sigma_j^{W_i^W} (\Omega_j) \right) + \eta_k \nu_j^{V_i^W} (\Omega_k) + \nu_j^{D_i^W} (\Omega_k) + \sigma_j^{W_i^W} (\Omega_k) 
\]

\[
\Delta \xi_{D,j} = -\xi_{D,j+1}^k \left( 1 - \frac{\sum_{j=1}^{\rho} \delta_k \nu_j^{M_i^W} (\Omega_j) + \theta_k \nu_j^{D_i^M} (\Omega_j) + \theta_k \nu_j^{W_i^M} (\Omega_j)}{N_i(\Omega_k) + N_i(\Omega_j)} - d_k \right) + \xi_{D,j+1}^k \delta_k \nu_j^{M_i^W} (\Omega_k) + \theta_k \nu_j^{D_i^M} (\Omega_k) + \theta_k \nu_j^{W_i^M} (\Omega_k) \\
- (\xi_{D,j+1}^k + \zeta_{D,j+1}^k) \left( \sum_{j=1}^{\rho} \delta_k \nu_j^{M_i^W} (\Omega_j) + \theta_k \nu_j^{D_i^M} (\Omega_j) + \theta_k \nu_j^{W_i^M} (\Omega_j) \right) + \delta_k \nu_j^{M_i^W} (\Omega_k) + \theta_k \nu_j^{D_i^M} (\Omega_k) + \theta_k \nu_j^{W_i^M} (\Omega_k) 
\]

\[
\Delta \xi_{O,j} = -\xi_{O,j+1}^k \lambda_k - \xi_{O,j+1}^k \rho_k - \xi_{O,j+1}^k \left( 1 - \lambda_k - \rho_k \right), \\
\Delta \xi_{S,j} = A_3 - \xi_{S,j+1}^k \lambda_k - \xi_{S,j+1}^k \omega_k - \xi_{S,j+1}^k \left( 1 - \lambda_k - \omega_k \right), \\
\]

with transversality conditions

\[
\begin{align*}
\zeta_{1,N} &= 0, \\
\zeta_{2,N} &= A_1, \\
\zeta_{3,N} &= 0, \\
\zeta_{4,N} &= A_2, \\
\zeta_{5,N} &= 0, \\
\zeta_{6,N} &= 0, \\
\zeta_{7,N} &= 0, \\
\zeta_{8,N} &= -A_3.
\end{align*}
\]

Furthermore, the optimal control \((u_i^*, v_i^*)\) is given by

\[
u_i^* = \min \left\{ \max \left\{ \frac{V_i^M (\Omega_k) (\xi_{i,j+1} - \xi_{i,j+1}) + V_i^W (\Omega_k) (\xi_{i,j+1} - \xi_{i,j+1})}{\tau_1}, u_{min}, u_{max} \right\}, u_{max} \right\}, \\
v_i^* = \min \left\{ \max \left\{ \frac{D_i^M (\Omega_k) (\xi_{i,j+1} - \xi_{i,j+1}) + D_i^W (\Omega_k) (\xi_{i,j+1} - \xi_{i,j+1})}{\tau_2}, v_{min}, v_{max} \right\}, v_{max} \right\},
\]

for \(i = 0, \ldots, N - 1\).

\textbf{Proof.} Using Pontryagin et al.\’s maximum principle [28] and setting \(V_i^{M*} (\Omega_k), V_i^{W*} (\Omega_k), M_i^{M*} (\Omega_k), M_i^{W*} (\Omega_k), D_i^{M*} (\Omega_k), D_i^{W*} (\Omega_k), W_i^{M*} (\Omega_k), W_i^{W*} (\Omega_k),\) and \((u^*, v^*)\), we obtain the following adjoint equations:
\[ \Delta \zeta_{1,i}^k = -\frac{\partial H}{\partial V_i^M(\Omega_k)} \left( 1 - \sum_{j=1}^p \frac{\alpha_{ij} V_i^M(\Omega_j) + \gamma_{ij} D_i^M(\Omega_j) + \delta_{ij} W_i^M(\Omega_j)}{N_i(\Omega_k) + N_j(\Omega_j)} - d_k - u_i \right) \]

\[ = -\zeta_{1,i}^k + \sum_{j=1}^p \left( \frac{\alpha_{ij} V_i^M(\Omega_j) + \gamma_{ij} D_i^M(\Omega_j) + \delta_{ij} W_i^M(\Omega_j)}{N_i(\Omega_k) + N_j(\Omega_j)} \right) - \zeta_{1,i}^k u_i \]

\[ \Delta \zeta_{2,j} = -\frac{\partial H}{\partial V_i^M(\Omega_k)} \left( 1 - \sum_{i=1}^p \frac{\alpha_{jk} V_i^M(\Omega_j) + \beta_{jk} D_i^M(\Omega_j) + \eta_{jk} W_i^M(\Omega_j)}{N_i(\Omega_k) + N_j(\Omega_j)} - d_k - u_i \right) \]

\[ = -\zeta_{2,j}^k + \sum_{i=1}^p \left( \frac{\alpha_{jk} V_i^M(\Omega_j) + \beta_{jk} D_i^M(\Omega_j) + \eta_{jk} W_i^M(\Omega_j)}{N_i(\Omega_k) + N_j(\Omega_j)} \right) - \zeta_{2,j}^k u_i \]
\[
\Delta r_{3j}^k = \frac{\partial H}{\partial D^W_{ij}(\Omega_k)} = \left[ -\zeta_{3j+1}^k \frac{\beta_{ij}}{2N_i(\Omega_k)} V^W_{ij}(\Omega_k) + \zeta_{3j+1}^k \left( 1 - \sum_{j=1}^{p} \frac{\beta_{ij} V^M_{ij}(\Omega_j)}{N_i(\Omega_k) + N_i(\Omega_j)} \right) - d_k - v_i \right]
\]

\[
= -\left[ -\zeta_{4j+1}^k \frac{\beta_{ij}}{2N_i(\Omega_k)} V^W_{ij}(\Omega_k) + \sum_{j=1}^{p} \frac{\beta_{ij} V^M_{ij}(\Omega_j)}{N_i(\Omega_k) + N_i(\Omega_j)} \right]
\]

\[
\Delta \xi_{4j}^k = \frac{\partial H}{\partial D^W_{ij}(\Omega_k)} = \left[ A_2 - \zeta_{4j+1}^k \frac{\gamma_{ik} V^M_{ik}(\Omega_k)}{2N_i(\Omega_k)} + \zeta_{4j+1}^k \left( 1 - \sum_{j=1}^{p} \frac{\gamma_{ik} V^M_{ij}(\Omega_j) + \mu_{ik} D^M_{ij}(\Omega_j) + \nu_{ik} W^M_{ij}(\Omega_j)}{N_i(\Omega_k) + N_i(\Omega_j)} \right) - d_k - v_i \right]
\]

\[
= -\left[ -\zeta_{5j+1}^k \frac{\gamma_{ik} V^M_{ik}(\Omega_k)}{2N_i(\Omega_k)} + \sum_{j=1}^{p} \frac{\gamma_{ik} V^M_{ij}(\Omega_j) + \mu_{ik} D^M_{ij}(\Omega_j) + \nu_{ik} W^M_{ij}(\Omega_j)}{N_i(\Omega_k) + N_i(\Omega_j)} \right]
\]
\begin{align*}
\Delta \zeta_{5,i}^k &= \frac{\partial H}{\partial W_i^M(\Omega_k)} \\
&= -\c^k_{5,i} \left[ \eta_{ij} V_i^W(\Omega_k) - \xi_{5,i} \frac{\delta_{ij}}{2N_i(\Omega_k)} D_i^W(\Omega_k) + \xi_{5,i} \left( 1 - \sum_{j} \frac{\eta_{ij} V_i^W(\Omega_k) + \delta_{ij} D_i^W(\Omega_k) + \sigma_{ij} W_i^M(\Omega_k)}{N(\Omega_k) + N(\Omega_j)} \right) \right] \\
&= -\c^k_{5,i+1} \left[ \eta_{ij} V_i^W(\Omega_k) + \xi_{5,i+1} \left( 1 - \sum_{j} \frac{\eta_{ij} V_i^W(\Omega_k) + \delta_{ij} D_i^W(\Omega_k) + \sigma_{ij} W_i^M(\Omega_k)}{N(\Omega_k) + N(\Omega_j)} \right) \right] \\
&= -\xi_{5,i+1} \left( 1 - \sum_{j} \frac{\eta_{ij} V_i^W(\Omega_k) + \delta_{ij} D_i^W(\Omega_k) + \sigma_{ij} W_i^M(\Omega_k)}{N(\Omega_k) + N(\Omega_j)} \right) - \xi_{5,i+1} \left( 1 - \sum_{j} \frac{\eta_{ij} V_i^W(\Omega_k) + \delta_{ij} D_i^W(\Omega_k) + \sigma_{ij} W_i^M(\Omega_k)}{N(\Omega_k) + N(\Omega_j)} \right) \\
\Delta \zeta_{6,i}^k &= \frac{\partial H}{\partial W_i^M(\Omega_k)} \\
&= -\c^k_{6,i+1} \left[ \eta_{ij} V_i^M(\Omega_k) - \xi_{6,i+1} \frac{\delta_{ij}}{2N_i(\Omega_k)} D_i^M(\Omega_k) - \xi_{6,i+1} \frac{\delta_{ij}}{2N_i(\Omega_k)} W_i^M(\Omega_k) + \xi_{6,i+1} \left( 1 - \sum_{j} \frac{\eta_{ij} V_i^M(\Omega_k) + \delta_{ij} D_i^M(\Omega_k) + \sigma_{ij} W_i^M(\Omega_k)}{N(\Omega_k) + N(\Omega_j)} \right) \right] \\
&= -\xi_{6,i+1} \left( 1 - \sum_{j} \frac{\eta_{ij} V_i^M(\Omega_k) + \delta_{ij} D_i^M(\Omega_k) + \sigma_{ij} W_i^M(\Omega_k)}{N(\Omega_k) + N(\Omega_j)} \right) - \xi_{6,i+1} \left( 1 - \sum_{j} \frac{\eta_{ij} V_i^M(\Omega_k) + \delta_{ij} D_i^M(\Omega_k) + \sigma_{ij} W_i^M(\Omega_k)}{N(\Omega_k) + N(\Omega_j)} \right) \\
\Delta \zeta_{7,i}^k &= \frac{\partial H}{\partial W_i^M(\Omega_k)} = -\left[ \xi_{3,5,i+1} \lambda_k + \xi_{3,5,i+1} \rho_k + \xi_{7,i+1} \left( 1 - \left( \lambda_k + \rho_k \right) \right) \right] \\
\Delta \zeta_{8,i}^k &= \frac{\partial H}{\partial W_i^M(\Omega_k)} = -\left[ -A_3 + \xi_{4,7,i+1} \lambda_k + \xi_{5,5,i+1} \omega_k + \xi_{8,i+1} \left( 1 - \left( \lambda_k + \omega_k \right) \right) \right].
\end{align*}
with transversality conditions:
\[
\begin{align*}
\zeta_{1,N} & = 0, \\
\zeta_{2,N} & = A_1, \\
\zeta_{3,N} & = 0, \\
\zeta_{4,N} & = A_2, \\
\zeta_{5,N} & = 0, \\
\zeta_{6,N} & = 0, \\
\zeta_{7,N} & = 0, \\
\zeta_{8,N} & = -A_3. \\
\end{align*}
\]

To obtain the optimality conditions, we take the variation with respect to control \((u^*_i, v^*_i)\) and set it equal to zero:
\[
\begin{align*}
\frac{\partial H}{\partial u_i} &= \tau_1 u_i - \zeta_{1,i+1} V^M_i(\Omega_k) - \zeta_{2,i+1} V^W_i(\Omega_k) + \zeta_{7,i+1} V^M_i(\Omega_k) \\
&\quad + \zeta_{8,i+1} V^W_i(\Omega_k) = 0, \\
\frac{\partial H}{\partial v_i} &= \tau_2 u_i - \zeta_{3,i+1} D^M_i(\Omega_k) - \zeta_{4,i+1} D^W_i(\Omega_k) + \zeta_{7,i+1} D^M_i(\Omega_k) \\
&\quad + \zeta_{8,i+1} D^W_i(\Omega_k) = 0.
\end{align*}
\]

(40)

Then, we obtain the optimal control:
\[
\begin{align*}
u_i^* &= V^M_i(\Omega_k)(\zeta_{1,i+1} - \zeta_{7,i+1}) + V^W_i(\Omega_k)(\zeta_{2,i+1} - \zeta_{8,i+1}) \\
&\quad \tau_1, \\
v_i^* &= D^M_i(\Omega_k)(\zeta_{3,i+1} - \zeta_{7,i+1}) + D^W_i(\Omega_k)(\zeta_{4,i+1} - \zeta_{8,i+1}) \\
&\quad \tau_2.
\end{align*}
\]

(42)

By the bounds in \(\mathcal{U}_{ad}\), it is easy to obtain \((u^*_i, v^*_i)\) in the following form:
\[
\begin{align*}
u_i^* &= \min \left\{ \max \left\{ V^M_i(\Omega_k)(\zeta_{1,i+1} - \zeta_{7,i+1}) + V^W_i(\Omega_k)(\zeta_{2,i+1} - \zeta_{8,i+1}), u_{\min}\right\}, u_{\max} \right\}, \\
v_i^* &= \min \left\{ \max \left\{ D^M_i(\Omega_k)(\zeta_{3,i+1} - \zeta_{7,i+1}) + D^W_i(\Omega_k)(\zeta_{4,i+1} - \zeta_{8,i+1}), u_{\min}\right\}, u_{\max} \right\},
\end{align*}
\]

(43)

for \(i = 0, \ldots, N - 1\).

\[\Box\]

4. Discussion

In this section, we provide numerical simulations to demonstrate our theoretical results in the case when the studied domain represents the assembly of \(p\) regions (cities, towns, etc.). The code is written and compiled in MATLAB using the data cited in Table 2. The optimality systems are solved using an iterative method where, at instant \(i\), the states \(V^M_i, V^W_i, \ldots, M^W_i\) with an initial guess are obtained based on a progressive scheme in time, and their adjoint variables \(\zeta_{1,i+1}, i = 1, 2, \ldots, 8\) are obtained based on a regressive scheme in time because of the transversality conditions. Afterward, we update the optimal control values (30) and (31) using the values of state and costate variables obtained in the previous steps. Finally, we execute the previous steps until a tolerance criterion is reached. In order to show the importance of our work and without loss of generality, we consider here that \(p = 4\). An area with 4 regions was considered: two regions \(\Omega_1\) and \(\Omega_2\) represent two urban areas and the regions \(\Omega_3\) and \(\Omega_4\) represent the two rural areas. The High Commissioner for Planning (HCP, public establishment) [14] gave various population statistics according to the regions (urban and rural). The values defined in Table 2 are inspired by data mentioned on page 2. Generally, the HCP gives the average sum of marriage, divorce, and widow rates between different population areas \(\alpha_{hj}, \beta_{hj}, \ldots, \omega_h\). And, precisely, one of the main objects of our work is to estimate as close as possible the values of the parameters \(\alpha_{hj}, \ldots, \omega_h\) defined in Table 2.

4.1. Simulations without Controls. In this section, Figure 1 depicts dynamics of the states \(V^M_i, V^W_i, \ldots, M^W_i\) in regions \(\Omega_1, \Omega_2, \Omega_3, \) and \(\Omega_4\), respectively, in the case when there is yet no control strategy, and we note that in all these figures presented here, simulations give us an idea about the evolution of marital status in each region whether rural or urban and the impact of flows of populations between regions on the dynamics of the marital status of each one.

The study of the evolution of the dynamics of the marital status was spread out over a period of 20 years. In Figure 1, we note that the evolution of the population in regions \(\Omega_1\) and \(\Omega_4\) is almost the same and similarly for regions \(\Omega_2\) and \(\Omega_3\).
### Table 2: Parameters values associated with discrete-time systems (9)–(16) and with optimal control problem (18).

|                        | $V^M = 4500, V^W = 4600, D^M = 400$ | $V^M = 1050, V^W = 1060, D^M = 90$ |

**Figure 1:** Time evolution of marital status of family dynamics VMDW without controls.

**Figure 2:** Continued.
In the urban area $\Omega_1$, the number of single men is 4500 at time $i = 0$, and the number of married men is about 2000 and 400 cases of divorce for men and the same numbers for women, with a birth rate of 250 per year and 0.03% mortality. The number of virgins declined a little and stabilized after 10 years to 3750. By cons, for the number of married men and women, there is a slight evolution that reaches after 12 years the number of 3200 married people and finally, for the number of divorces, it remains almost stable throughout the period and remains around 600 divorces.
In rural $\Omega_2$, the number of unmarried men at time $t = 0$ is 1050, the number of married men is about 500 and 100 divorces for men and the same numbers for women, with a birth rate of 60 per year and 0.03% mortality. These numbers will be evolved, so the number of virgins has decreased to reach about 700 virgins. The number of married women will experience considerable growth to reach around 1400 for men and 1100 for women. The number of women divorces will witness a slight growth of about 300 divorces and stability for men of almost 100.

**4.2. Simulations with Controls.** Considering the critical level of control, we give optimal control sufficient to reduce the number of virgin and divorced individuals and to increase the married individuals in $\Omega_1$ and we also studied the effect of controls on other neighboring regions $\Omega_3, \Omega_3$, and $\Omega_4$.

In the following, we can see that the optimal control function has a very desirable effect upon the population of virgin and divorced people which decreases while the married population increases in a consistent way during the length of the process. The time evolution of the respective populations with control is displayed in Figure 2.

Figures 3–5 allow us to compare changes in the number of virgins, divorced, and married individuals before and after the introduction of control.

In a population of virgin men of 4500 individuals (Figure 3(a)) by applying the control law, this number
decreases rapidly to reach after 3 years the number of 1700 virgins and then goes back up to reach out at the end of the companion awareness 3000 virgin men. This result is similar to virgin women as shown in Figure 3(b).

Figure 3(c) also shows the effect of applying the control law by indicating that the number of divorced men decreases more rapidly at the beginning of treatment to reach 100 male divorces. Then, we notice that the number increases and we can justify it by the fact that the number of divorced people is proportional to the number of married people. Since the number of married individuals increases along the course of treatment, it has been assumed that divorced men remain in $\Omega_1$. Unlike divorced women who can return to their region of origin, therefore the number of divorced women that was 600 women decreases rapidly to reach 150 divorces after 4 years and then increases to 280 divorced women at the end of the companion as shown in Figure 3(d).

Figures 4(c) and 4(d) show that the number of married men and women grows after 2 years and reaches a maximum value of about 2500 for married men and 2000 for married women; then it declines to 3800 for men and 4250 for women at the end of companion. This decline is due to the fact that the number of divorced men and women increases, but it is still quite high as far as the uncontrolled number of married men and women. In Figures 4(a) and 4(b), we show the evolution of widowed men and women; the number increases slightly concerning the number of widowed individuals in a dynamics of the marital system without control strategies.

We also note in Figures 1 and 2 and contrary to the evolution of the dynamics of marital status in $\Omega_1$ that the number of virgin and divorced people slightly increases in the regions $\Omega_2$, $\Omega_3$, and $\Omega_4$ and the number of married people decreases slightly.

Finally, Figure 5 displays the time evolution of the optimal control ($u^*, v^*$).

5. Conclusions

In this paper, we consider a discrete-time marital status model; we treat the modelling and control of a system that described the case of a multiregion model. Optimal control is investigated to reduce the number of virgins and the divorced population and to increase the married ones. The first control introduced is supposing the benefits of an awareness campaign to educate virgin men and women about the benefits of marriage for individuals and the society, and the second control characterizes the legal procedures, administrative complications, and the heavy financial and social consequences of divorces. A discrete version of Pontryagin et al.’s maximum principle is done to analyze the optimal control problem and numerical simulation is given to illustrate the obtained results.

Data Availability

The disciplinary data used to support the findings of this study have been deposited in the Network Repository (http://www.networkrepository.com).
