Abstract  We consider traveling fronts to the nonlocal bistable equation

$$u_t = \mu * u - u + f(u),$$

where $\mu$ is a Borel-measure on $\mathbb{R}$ with $\mu(\mathbb{R}) = 1$ and $f$ satisfies $f(0) = f(1) = 0$, $f < 0$ in $(0, \alpha)$ and $f > 0$ in $(\alpha, 1)$ for some constant $\alpha \in (0, 1)$. We do not assume that $\mu$ is absolutely continuous with respect to the Lebesgue measure. We show that there are a constant $c$ and a monotone function $\phi$ with $\phi(-\infty) = 0$ and $\phi(+\infty) = 1$ such that $u(t, x) := \phi(x + ct)$ is a solution to the equation, provided $f'(\alpha) > 0$. In order to prove this result, we would develop a recursive method for abstract monotone dynamical systems and apply it to the equation.

Keywords: nonlocal phase transition, Ising model, convolution model, integro-differential equation, discrete bistable equation, nonlocal evolution equation.

A proposed running title: Traveling Waves in Nonlocal Systems III.
1 Introduction

We would consider the following nonlocal analogue of bistable reaction-diffusion equations:

\begin{equation}
    u_t = \mu \ast u - u + f(u).
\end{equation}

Here, \( \mu \) is a Borel-measure on \( \mathbb{R} \) with \( \mu(\mathbb{R}) = 1 \) and the convolution is defined by

\[(\mu \ast u)(x) = \int_{y \in \mathbb{R}} u(x - y) d\mu(y)\]

for a bounded and Borel-measurable function \( u \) on \( \mathbb{R} \). The nonlinearity \( f \) is a Lipschitz continuous function on \( \mathbb{R} \) and satisfies \( f(0) = f(\alpha) = f(1) = 0 \), \( f < 0 \) in \((0, \alpha)\) and \( f > 0 \) in \((\alpha, 1)\) for some constant \( \alpha \in (0, 1) \). Then, \( G(u) := \mu \ast u - u + f(u) \) is a map from the Banach space \( L^\infty(\mathbb{R}) \) into \( L^\infty(\mathbb{R}) \) and it is Lipschitz continuous. (We note that \( u(x - y) \) is a Borel-measurable function on \( \mathbb{R}^2 \), and \( \|u\|_{L^\infty(\mathbb{R})} = 0 \) implies \( \|\mu \ast u\|_{L^1(\mathbb{R})} \leq \int_{y \in \mathbb{R}} (\int_{x \in \mathbb{R}} |u(x - y)| dx) d\mu(y) = 0 \).) So, because the standard theory of ordinary differential equations works, we have well-posedness of the equation (1.1) and it generates a flow in \( L^\infty(\mathbb{R}) \).

In this paper, we would show that there exists a traveling wave solution. The main result is the following:

**Theorem 1** Suppose the bistable nonlinearity \( f \in C^1(\mathbb{R}) \) satisfies

\[f'(\alpha) > 0,\]

where \( \alpha \) is the unique zero of \( f \) in \((0, 1)\). Then, there exist a constant \( c \) and a monotone function \( \phi \) on \( \mathbb{R} \) with \( \phi(-\infty) = 0 \) and \( \phi(+\infty) = 1 \) such that \( u(t, x) := \phi(x + ct) \) is a solution to (1.1).

In this result, we do not assume that the measure \( \mu \) is absolutely continuous with respect to the Lebesgue measure. For example, Theorem 1 can be applied to not only the integro-differential equation

\[\frac{\partial u}{\partial t}(t, x) = \int_0^1 u(t, x - y) dy - u(t, x) - \lambda u(t, x)(u(t, x) - \alpha)(u(t, x) - 1)\]

but also the discrete equation

\[\frac{\partial u}{\partial t}(t, x) = u(t, x - 1) - u(t, x) - \lambda u(t, x)(u(t, x) - \alpha)(u(t, x) - 1)\]
for all positive constants $\lambda$. In order to prove Theorem 1, we would develop a recursive method for abstract monotone dynamical systems and apply it to the semiflow generated by (1.1). It might be a generalization of the method of Remark 5.2 (4) in Chen [5].

For the nonlocal bistable equation (1.1), Bates, Fife, Ren and Wang [4] obtained existence of traveling wave solutions, when the measure $\mu$ has a density function $J \in C^1(\mathbb{R})$ with $J(y) = J(-y)$ and other little conditions for $\mu$ and $f$ hold. Chen [5] showed existence of traveling wave solutions, when it has a density function $J \in C^1(\mathbb{R})$ and $f'(u) < 1$ and other little conditions hold. Recently, Coville [11] proved existence of traveling wave solutions, when it has a density function $J \in C(\mathbb{R})$ and other little conditions hold.

Bates, Fife, Ren and Wang [4] and Chen [5] studied uniqueness and stability of traveling wave solutions. Coville studied uniqueness and monotonicity of profiles of traveling waves in [10] and uniqueness of speeds [11]. Further, we note that the studies of [10, 11] are not limited when the nonlinearity is bistable but reach ignition, while our study is limited to bistable. In fact, his method of [11] is rather different from ours. See [9] on traveling wave solutions in bistable maps, [2] time-periodic nonlocal bistable equations, [1] time-periodic bistable reaction-diffusion equations, e.g., [3, 6, 8, 14] discrete bistable equations, [7] nonlocal Burgers equations and [12, 13, 15] multistable reaction-diffusion equations.

In Section 2, we give abstract conditions and state that there exists a traveling wave solution provided the conditions. This result might generalize the method of Remark 5.2 (4) in Chen [5]. In Section 3, we prove abstract theorems mentioned in Section 2. In Section 4, we show that the semiflow generated by (1.1) satisfies the conditions given in Section 2 when $f'(\alpha) > 0$ and $\mu(\{0\}) \neq 1$ hold to prove Theorem 1. In Section 5, we recall some known results from [17]. The known results are used in Section 3.

2 Abstract theorems for monotone semiflows

In this section, we would state some abstract results for existence of traveling waves in monotone semiflows. The results might generalize the method of Remark 5.2 (4) in Chen [5]. In the abstract, we would treat a bistable evolution system. Put a set of functions on $\mathbb{R}$;

$$\mathcal{M} := \{u \mid u \text{ is a monotone nondecreasing} \}$$
and left continuous function on $\mathbb{R}$ with $0 \leq u \leq 1$.

The followings are our basic conditions for discrete dynamical systems:

**Hypotheses 2** Let $Q_0$ be a map from $\mathcal{M}$ into $\mathcal{M}$.

(i) $Q_0$ is continuous in the following sense: If a sequence $\{u_k\}_{k \in \mathbb{N}} \subset \mathcal{M}$ converges to $u \in \mathcal{M}$ uniformly on every bounded interval, then the sequence $\{Q_0[u_k]\}_{k \in \mathbb{N}}$ converges to $Q_0[u]$ almost everywhere.

(ii) $Q_0$ is order preserving; i.e.,

$$u_1 \leq u_2 \implies Q_0[u_1] \leq Q_0[u_2]$$

for all $u_1$ and $u_2 \in \mathcal{M}$. Here, $u \leq v$ means that $u(x) \leq v(x)$ holds for all $x \in \mathbb{R}$.

(iii) $Q_0$ is translation invariant; i.e.,

$$T_{x_0}Q_0 = Q_0T_{x_0}$$

for all $x_0 \in \mathbb{R}$. Here, $T_{x_0}$ is the translation operator defined by $(T_{x_0}[u])(\cdot) := u(\cdot - x_0)$.

(iv) $Q_0$ is bistable; i.e., there exists $\alpha \in (0, 1)$ with $Q_0[\alpha] = \alpha$ such that

$$0 < \gamma < \alpha \implies Q_0[\gamma] < \gamma$$

and

$$\alpha < \gamma < 1 \implies \gamma < Q_0[\gamma]$$

hold for all constant functions $\gamma$.

**Remark** If $Q_0$ satisfies Hypothesis 1 (iii), then $Q_0$ maps constant functions to constant functions.

The following condition for discrete dynamical systems might be a little generalization of the condition in Remark 5.2 (4) of Chen [5]:

**Hypothesis 3** Let $Q_0$ be a map from $\mathcal{M}$ into $\mathcal{M}$. If two constants $c_-$ and $c_+$ and two functions $\phi_-$ and $\phi_+ \in \mathcal{M}$ satisfy $(Q_0[\phi_-])(x - c_-) \equiv \phi_-(x)$, $\phi_-(\infty) = 0$, $\phi_-(\infty) = \alpha$, $(Q_0[\phi_+])(x - c_+) \equiv \phi_+(x)$, $\phi_+(-\infty) = \alpha$ and $\phi_+(\infty) = 1$, then the inequality $c_- < c_+$ holds.

The following states that existence of suitable sub and super-solutions implies existence of traveling wave solutions with an estimate of the speeds in the discrete dynamical systems on $\mathcal{M}$:
Theorem 4 Let a map \( Q_0 : M \to M \) satisfy Hypotheses 2 and 3. Suppose a constant \( c \) and a function \( \psi \in M \) with \( \psi(0) = 0 \) and \( \psi(+\infty) \in (\alpha, 1] \) satisfy \( \psi(x) \leq (Q_0[\psi])(x - c) \). Suppose a constant \( \tau \) and a function \( \overline{\psi} \in M \) with \( \overline{\psi}(-\infty) \in [0, \alpha) \) and \( \overline{\psi}(0) = 1 \) satisfy \( (Q_0[\overline{\psi}])(x - \tau) \leq \overline{\psi}(x) \). Then, there exist \( c \in [c, \tau] \) and \( \phi \in M \) with \( \phi(-\infty) = 0 \) and \( \phi(+\infty) = 1 \) such that \( (Q_0[\phi])(x - c) \equiv \phi(x) \) holds.

Corollary 5 Let a map \( Q_0 : M \to M \) satisfy Hypotheses 2 and 3. Then, there exist \( c \in \mathbb{R} \) and \( \phi \in M \) with \( \phi(-\infty) = 0 \) and \( \phi(+\infty) = 1 \) such that \( (Q_0[\phi])(x - c) \equiv \phi(x) \) holds.

We add the following conditions to Hypotheses 2 for continuous dynamical systems on \( M \):

Hypotheses 6 Let \( Q := \{Q^t\}_{t \in [0, +\infty)} \) be a family of maps from \( M \) to \( M \).

(i) \( Q \) is a semigroup; i.e., \( Q^t \circ Q^s = Q^{t+s} \) for all \( t \) and \( s \in [0, +\infty) \).

(ii) \( Q \) is continuous in the following sense: Suppose a sequence \( \{t_k\}_{k \in \mathbb{N}} \subset [0, +\infty) \) converges to 0, and \( u \in M \). Then, the sequence \( \{Q^{t_k}[u]\}_{k \in \mathbb{N}} \) converges to \( u \) almost everywhere.

Instead of Hypothesis 3, we consider the following condition for continuous dynamical systems. It might also be a little generalization of the condition in Remark 5.2 (4) of Chen [5]:

Hypothesis 7 Let \( Q := \{Q^t\}_{t \in [0, +\infty)} \) be a family of maps from \( M \) to \( M \). If two constants \( c_- \) and \( c_+ \) and two functions \( \phi_- \) and \( \phi_+ \in M \) with \( \phi_-(-\infty) = 0 \), \( \phi_-(+\infty) = \alpha \), \( \phi_+(+\infty) = 0 \), and \( \phi_-(+\infty) = \alpha \) and \( \phi_+(+\infty) = 1 \) satisfy \( (Q^t[\phi_-])(x - c_- t) \equiv \phi_-(x) \) and \( (Q^t[\phi_+])(x - c_+ t) \equiv \phi_+(x) \) for all \( t \in [0, +\infty) \), then the inequality \( c_- < c_+ \) holds.

Remark We could found similar hypotheses as Hypothesis 7 for existence of traveling waves to reaction-diffusion equations with triple stable equilibria in [12, 13, 15].

As we would have Theorem 4 for the discrete dynamical systems, we would have the following for the continuous dynamical systems:

Theorem 8 Let \( Q^t \) be a map from \( M \) to \( M \) for \( t \in [0, +\infty) \). Suppose the map \( Q^t \) satisfies Hypotheses 2 for all \( t \in (0, +\infty) \), and the family \( Q := \{Q^t\}_{t \in [0, +\infty)} \) Hypotheses 6 and 7. Then, the following holds:

5
Suppose a constant \( c \) and a function \( \psi \in \mathcal{M} \) with \( \psi(0) = 0 \) and \( \psi(\infty) \in (\alpha, 1] \) satisfy \( \psi(x) \leq (Q^t[\psi])(x - ct) \) for all \( t \in [0, +\infty) \). Suppose a constant \( \tau \) and a function \( \psi \in \mathcal{M} \) with \( \psi(-\infty) \in [0, \alpha) \) and \( \psi(0) = 1 \) satisfy \( (Q^t[\psi])(x - \tau t) \leq \psi(x) \) for all \( t \in [0, +\infty) \). Then, there exist \( c \in [c, \tau] \) and \( \phi \in \mathcal{M} \) with \( \phi(-\infty) = 0 \) and \( \phi(\infty) = 1 \) such that \( (Q^t[\phi])(x - ct) \equiv \phi(x) \) holds for all \( t \in [0, +\infty) \).

3 Proof of the abstract theorems

In this section, we prove the theorems stated in Section 2 by using known results recalled from [17] in Section 5.

Proof of Theorem 4. [Step 0] In this step, we would give an intuitive explanation of our ideas. If you want to advance to exact proof at once, the step is recommended to be skipped.

Because the map \( Q_0 : \mathcal{M} \to \mathcal{M} \) is translation invariant, it is difficult to construct traveling sub and super-solutions with the same speed directly. So, we introduce a sequence of perturbed maps \( Q_n : \mathcal{M} \to \mathcal{M} \) to break the translation invariance but to preserve the order. Then, we might construct sub and super-solutions \( \psi_n \) and \( \psi_n \) to the perturbed problem \( Q_n[u] = u \) and also obtain a solution \( \phi_n \) (i.e., \( Q_n[\phi_n] = \phi_n, \phi_n(-\infty) = 0 \) and \( \phi_n(+\infty) = 1 \)) by order preserving property. In virtue of Hypothesis 3, we expect that the limit of a suitable subsequence of \( (T_{-x_n}[\phi_n])(\cdot) := \phi_n(\cdot + x_n) \) solves the original problem.

We shall explain more in detail but extremely inexactly. Let \( n \in \mathbb{N} \). We put \( \rho_n(x) := \frac{n + \frac{\tau}{n}}{n}(x - \frac{c + \tau}{2}) \). Then, the map \( u \mapsto Q_n[u] := Q_0[u \circ \rho_n] \) breaks the translation invariance but preserves the order. So, we may have a solution \( \phi_n \) to \( Q_n[\phi_n] = \phi_n, \phi_n(-\infty) = 0 \) and \( \phi_n(+\infty) = 1 \). We take \( y_n \) and \( z_n \) such that \( y_n \leq z_n \) and \( 0 < \phi_n(y_n) < \alpha < \phi_n(z_n) < 1 \) hold.

When a constant \( c \) and a sequence \( x_n \) satisfy \( c = \frac{\frac{\tau + c}{2} - \frac{\tau - c}{2}(\lim_{n \to \infty} \frac{x_n}{n})}{2} \), we see

\[
\lim_{n \to \infty} (\rho_n(x + x_n) - x_n) = x - c
\]

and, so,

\[
\lim_{n \to \infty} (T_{-x_n} \circ Q_n \circ T_{x_n})[u] = \lim_{n \to \infty} T_{-x_n}[Q_0[(T_{x_n}[u]) \circ \rho_n]]
\]
\[ \lim_{n \to \infty} Q_0[T_{-x_n}((T_{x_n}[u]) \circ \rho_n)] = Q_0[\lim_{n \to \infty} (T_{x_n}[u]) \circ \rho_n] = Q_0[T_c[u]] = (Q_0 \circ T_c)[u], \]

where \( (T_x[u])(\cdot) := u(\cdot - x) \). We might take a subsequence \( n(k) \) such that there exist the limits \( \phi_- := \lim_{k \to \infty} T_{-y_n}[\phi_n], \phi_+ := \lim_{k \to \infty} T_{-z_n}[\phi_n], c_- := \psi(-\frac{c+\bar{c}}{2}x) \) (\( \lim_{k \to \infty} \frac{\phi_n}{\phi_n} \)) and \( c_+ := \psi(-\frac{c+\bar{c}}{2}x) \) (\( \lim_{k \to \infty} \frac{\phi_n}{\phi_n} \)).

Therefore, we could expect that the two equalities

\[ (Q_0 \circ T_{c_-})[\phi_-] = \lim_{n \to \infty} (T_{-y_n} \circ Q_n \circ T_{y_n})[\phi_-] = \lim_{k \to \infty} (T_{-y_n} \circ Q_n)[\phi_n] \]

and

\[ (Q_0 \circ T_{c_+})[\phi_+] = \phi_+ \]

hold. In virtue of Hypothesis 3, the pair \( (\phi_-, c_-) \) or \( (\phi_+, c_+) \) might solve the original problem, as we obtain \( c_+ \leq c_- \) and \( 0 < \phi_-(0) < \alpha < \phi_+(0) < 1 \).

[Step 1] We show the inequality:

\[ (3.1) \]

Suppose \( \bar{c} < \underline{c} \). Then, there exists \( N \in \mathbb{N} \) such that \( \psi(-\frac{c+\bar{c}}{2}N) < \alpha < \psi(\frac{\bar{c}+\bar{c}}{2}N) \) holds. Hence, because \( (Q_0^N[\psi])(x - \overline{\bar{c}}N) \leq \psi(x) \) and \( \overline{\psi}(x) \leq (Q_0^N[\psi])(x - \underline{c}N) \) hold by Hypotheses 2 (ii) and (iii), we have \( (Q_0^N[\psi])(-\frac{\bar{c}+\bar{c}}{2}N) < \alpha < (Q_0^N[\psi])(-\frac{\bar{c}+\bar{c}}{2}N) \). It is a contradiction with Hypothesis 2 (ii). Therefore, (3.1) holds.

[Step 2] We put a sequence \( \{\rho_n\}_{n \in \mathbb{N}} \) of affine functions on \( \mathbb{R} \) defined by

\[ (3.2) \]

We define two sequences \( \{A_n\}_{n \in \mathbb{N}} \) and \( \{Q_n\}_{n \in \mathbb{N}} \) of maps from \( \mathcal{M} \) to \( \mathcal{M} \) by

\[ A_n[u] := u \circ \rho_n \]

and

\[ Q_n := Q_0 \circ A_n. \]

Then, the map \( Q_n \) satisfies Hypothesis 2 (ii) for all \( n \in \mathbb{N} \).
[Step 3] We show the following: Suppose a sequence \( \{u_k\}_{k \in \mathbb{N}} \subset \mathcal{M} \) converges to \( u \in \mathcal{M} \) almost everywhere. Then, \( \lim_{k \to \infty} (Q_n[u_k])(x) = (Q_n[u])(x) \) holds for all \( n \in \mathbb{N} \) and continuous points \( x \in \mathbb{R} \) of \( Q_n[u] \).

Let \( n \in \mathbb{N} \). Then, the sequence \( \{A_n[u_k]\}_{k \in \mathbb{N}} \subset \mathcal{M} \) converges to \( A_n[u] \in \mathcal{M} \) almost everywhere. Hence, by Proposition 13, we have \( \lim_{k \to \infty} (Q_0[A_n[u_k]])(x) = (Q_0[A_n[u]])(x) \) for all continuous points \( x \in \mathbb{R} \) of \( Q_0[A_n[u]] \).

[Step 4] We take two sequences \( \{\psi_n\}_{n \in \mathbb{N}} \) and \( \{\overline{\psi}_n\}_{n \in \mathbb{N}} \subset \mathcal{M} \) as

\[
\psi_n(x) := \psi(x - (n + \frac{c - \bar{c}}{2}))
\]

and

\[
\overline{\psi}_n(x) := \overline{\psi}(x + (n + \frac{c - \bar{c}}{2})).
\]

Then, we show \( \psi_n \leq Q_n^k[\psi_n] \leq Q_n^{k+1}[\psi_n] \leq Q_n^{k+1}[\overline{\psi}_n] \leq Q_n^k[\overline{\psi}_n] \leq \overline{\psi}_n \) for all \( k = 0, 1, 2, \ldots \). Because \( +n \leq x - \frac{c + \bar{c}}{2} \) implies \( x - \bar{c} \leq \rho_n(x) \) by (3.1),

\[
(3.3) \quad \psi_n(x - c) \leq (A_n[\overline{\psi}_n])(x)
\]

holds. Because \( x - \frac{c + \bar{c}}{2} \leq -n \) implies \( \rho_n(x) \leq x - \bar{c} \) by (3.1),

\[
(3.4) \quad (A_n[\overline{\psi}_n])(x) \leq \overline{\psi}_n(x - \bar{c})
\]

holds. From (3.3), (3.4) and \( \psi_n \leq \overline{\psi}_n \), we have \( \psi_n(x) \leq (Q_0[\overline{\psi}_n])(x - c) \leq (Q_n[\overline{\psi}_n])(x) \leq (Q_0[\overline{\psi}_n])(x - c) \leq \overline{\psi}_n(x) \). As \( \psi_n \leq Q_n^k[\psi_n] \leq Q_n^{k+1}[\psi_n] \leq Q_n^{k+1}[\overline{\psi}_n] \leq \overline{\psi}_n \) holds, \( \psi_n \leq Q_n[\psi_n] \leq Q_n^{k+1}[\psi_n] \leq Q_n^{k+2}[\psi_n] \leq Q_n^{k+2}[\overline{\psi}_n] \leq Q_n^{k+1}[\overline{\psi}_n] \leq Q_n[\overline{\psi}_n] \leq \overline{\psi}_n \) also holds. So, we have

\[
\psi_n \leq Q_n^k[\psi_n] \leq Q_n^{k+1}[\psi_n] \leq Q_n^{k+1}[\overline{\psi}_n] \leq Q_n^k[\overline{\psi}_n] \leq \overline{\psi}_n
\]

for all \( n \in \mathbb{N} \) and \( k = 0, 1, 2, \ldots \). We put \( \phi_n := \lim_{k \to \infty} Q_n^k[\psi_n] \in \mathcal{M} \). Then,

\[
(3.5) \quad \psi_n \leq \phi_n \leq \overline{\psi}_n
\]

holds for all \( n \in \mathbb{N} \). By Step 3, we also have

\[
(3.6) \quad Q_n[\phi_n] = \phi_n
\]

for all \( n \in \mathbb{N} \).
We take $N_0 \in \mathbb{N}$ such that

$$(3.7) \quad 0 \leq \bar{\psi}(-N_0) < \alpha < \underline{\psi}(+N_0) \leq 1$$

holds. Then, because $\phi_n(-(n + \frac{c-2}{2} + N_0)) \leq \bar{\psi}(-N_0)$ and $\underline{\psi}(+N_0) \leq \phi_n(+n + \frac{c-2}{2} + N_0))$ hold from (3.5), for any $n \in \mathbb{N}$, there exist constants $y_n$ and $z_n$ such that

$$\phi_n(y_n) \leq \frac{\bar{\psi}(-N_0) + \alpha}{2} \leq \lim_{h \uparrow 0+} \phi_n(y_n + h),$$

and

$$\phi_n(z_n) \leq \frac{\alpha + \underline{\psi}(+N_0)}{2} \leq \lim_{h \uparrow 0+} \phi_n(z_n + h)$$

and

$$(3.8) \quad -(n + \frac{c-2}{2} + N_0) \leq y_n \leq z_n \leq +(n + \frac{c-2}{2} + N_0)$$

hold. As we put functions

$$\phi_{-,n}(\cdot) := \phi_n(\cdot + y_n) \in \mathcal{M}$$

and

$$\phi_{+,n}(\cdot) := \phi_n(\cdot + z_n) \in \mathcal{M},$$

we have

$$(3.9) \quad \phi_{-,n}(0) \leq \frac{\bar{\psi}(-N_0) + \alpha}{2} \leq \lim_{h \uparrow 0+} \phi_{-,n}(h)$$

and

$$(3.10) \quad \phi_{+,n}(0) \leq \frac{\alpha + \underline{\psi}(+N_0)}{2} \leq \lim_{h \uparrow 0+} \phi_{+,n}(h).$$

By Helly’s theorem and (3.8), there exist a subsequence $\{n(k)\}_{k \in \mathbb{N}} \subset \mathbb{N}$, two functions $\phi_-, \phi_+$, two constants $\xi_-$ and $\xi_+$ such that the two equalities

$$(3.11) \quad \phi_-(x) = \lim_{k \to \infty} \phi_{-,n(k)}(x) \in \mathcal{M}$$

and

$$\phi_+(x) = \lim_{k \to \infty} \phi_{+,n(k)}(x) \in \mathcal{M}$$
hold almost everywhere in $x$ and the two equalities

(3.12) \[ \xi_- = \lim_{k \to \infty} \frac{y_n(k)}{n(k)} \in [-1, +1] \]

and

(3.13) \[ \xi_+ = \lim_{k \to \infty} \frac{z_n(k)}{n(k)} \in [-1, +1] \]

hold. From (3.9), (3.10) and (3.8), we have

(3.14) \[ \phi_-(0) \leq \frac{\psi(-N_0) + \alpha}{2} \leq \lim_{h \downarrow +0} \phi_-(h), \]

(3.15) \[ \phi_+(0) \leq \frac{\alpha + \psi(+N_0)}{2} \leq \lim_{h \downarrow +0} \phi_+(h) \]

and

(3.16) \[ -1 \leq \xi_- \leq \xi_+ \leq +1. \]

[Step 6] We show the following: The two equalities

(3.17) \[ (Q_0[\phi_-])(x - c_-) \equiv \phi_-(x) \]

and

(3.18) \[ (Q_0[\phi_+])(x - c_+) \equiv \phi_+(x) \]

hold, where $c_-$ and $c_+$ are the constants defined by

(3.19) \[ c_- := \frac{c + \overline{c}}{2} - \frac{\overline{c} - c}{2} \xi_- \]

and

(3.20) \[ c_+ := \frac{c + \overline{c}}{2} - \frac{\overline{c} - c}{2} \xi_. \]

Further, the inequality

(3.21) \[ c \leq c_+ \leq c_- \leq \overline{c} \]

holds.
From (3.2) and (3.12), we see
\[
\lim_{k \to \infty} (\rho_n(k)(x + y_n) - y_n(k)) = x - c_-
\]
for all \( x \in \mathbb{R} \). Hence, by Lemma 14, (3.11) and \((A_n[\phi_n])(x + y_n) = \phi_n(\rho_n(x + y_n))\) = \(\phi_-(\rho_n(x + y_n) - y_n)\), we have
\[
\lim_{k \to \infty} (A_n(k)[\phi_n(k)])(x + y_n(k)) = \phi_-(x - c_-)
\]
for all continuous points \( x \in \mathbb{R} \) of \( \phi_-(x - c_-) \). From (3.6),
\[
(3.20) \quad \phi_-(x) = \phi_n(x + y_n) = (Q_n[\phi_n])(x + y_n)
\]
holds for all \( n \in \mathbb{N} \) and \( x \in \mathbb{R} \). By Proposition 13, (3.19), (3.20) and (3.11), we obtain
\[
(Q_0[\phi_-])(x - c_-) = (Q_0[\phi_-(-c_-)])(x) = \lim_{k \to \infty} (Q_0[(A_n[\phi_n(k)])(\cdot + y_n(k))])(x) = \lim_{k \to \infty} \phi_-(k)(x) = \phi_-(x).
\]
Almost similarly as (3.16), we also obtain (3.17). Further, (3.18) follows from (3.1) and (3.15).

[Step 7] By Proposition 13 and (3.16), we have
\[
Q_0[\phi_-(-\infty)] = (Q_0[\phi_-(-\infty)])(0) = \lim_{k \to \infty} (Q_0[\phi_-(\cdot - k)])(0) = \lim_{k \to \infty} (Q_0[\phi_-])(-k) = (Q_0[\phi_-])(-\infty) = \phi_-(-\infty).
\]
Almost similarly, we also have \(Q_0[\phi_-(+\infty)] = \phi_-(+\infty)\), \(Q_0[\phi_+(-\infty)] = \phi_+(-\infty)\) and \(Q_0[\phi_+(+\infty)] = \phi_+(+\infty)\) by Proposition 13, (3.16) and (3.17). From (3.7), (3.13) and (3.14), we see \(0 \leq \phi_-(-\infty) < \alpha, 0 < \phi_-(-\infty) \leq 1, 0 \leq \phi_+(-\infty) < 1\) and \(a < \phi_+(+\infty) \leq 1\). Therefore, from Hypothesis 2 (iv), we obtain
\[
(3.21) \quad \phi_-(-\infty) = 0,
\]
\[
(3.22) \quad \phi_-(+\infty) = \alpha \text{ or } 1,
\]
\[(3.23) \quad \phi_+(-\infty) = 0 \text{ or } \alpha \]

and

\[(3.24) \quad \phi_+ (+\infty) = 1.\]

[Step 8] We show that \(\phi_-(+\infty) \neq \alpha\) or \(\phi_+(-\infty) \neq \alpha\) holds. Suppose that \(\phi_-(+\infty) = \alpha\) and \(\phi_+(-\infty) = \alpha\) hold. Then, from Hypothesis 3, (3.16), (3.17), (3.21) and (3.24), we have \(c_- < c_+\). It is a contradiction with (3.18). So, we see that \(\phi_-(+\infty) \neq \alpha\) or \(\phi_+(-\infty) \neq \alpha\) holds. Hence, from (3.22) and (3.23), we also see that

\[
\phi_-(+\infty) = 1 \quad \text{or} \quad \phi_+(-\infty) = 0
\]

holds. When \(\phi_-(+\infty) = 1\), we obtain the conclusion of Theorem 4 with \(c := c_-\) and \(\phi := \phi_-\) because of (3.18), (3.21) and (3.16). When \(\phi_+(-\infty) = 0\), we obtain it with \(c := c_+\) and \(\phi := \phi_+\) because of (3.18), (3.24) and (3.17).

\[\blacksquare\]

**Proof of Corollary 5.**

We put functions \(\overline{\psi}\) and \(\underline{\psi} \in \mathcal{M}\) as

\[
\underline{\psi}(x) = 0 \quad (x \leq 0), \quad \overline{\psi}(x) = \frac{\alpha + 1}{2} \quad (0 < x)
\]

and

\[
\underline{\psi}(x) = \frac{\alpha}{2} \quad (x \leq -1), \quad \overline{\psi}(x) = 1 \quad (-1 < x).
\]

Then, by Proposition 13 and Hypothesis 2 (iv), we have

\[
(Q_0[\underline{\psi}]) (+\infty) = \lim_{k \to \infty} (Q_0[\underline{\psi}]) (k) = \lim_{k \to \infty} (Q_0[\underline{\psi} (+\infty)]) (0) = (Q_0[\underline{\psi} (+\infty)]) (0) = Q_0[\underline{\psi} (+\infty)] > \psi (+\infty).
\]

Almost similarly, we also have \((Q_0[\overline{\psi}]) (-\infty) < \overline{\psi} (-\infty)\). Hence, there exist constants \(\underline{\overline{c}}\) and \(\overline{\overline{c}}\) such that \(\underline{\psi} (+\infty) \leq (Q_0[\underline{\psi}]) (-\underline{\overline{c}})\) and \((Q_0[\overline{\psi}]) (-1 - \overline{\overline{c}}) \leq \overline{\psi} (-\infty)\) hold. So, because \(\underline{\psi}(x) \leq (Q_0[\underline{\psi}]) (x - \underline{\overline{c}})\) and \((Q_0[\overline{\psi}]) (x - \overline{\overline{c}}) \leq \overline{\psi}(x)\) also hold for all \(x \in \mathbb{R}\), in virtue of Theorem 4, we obtain the conclusion of Corollary 5. \[\blacksquare\]
Proof of Theorem 8.  

[Step 1] By Lemma 17, the map $Q^t$ satisfies Hypothesis 3 for all $t \in (0, +\infty)$. So, by Theorem 4, for any $n \in \mathbb{N}$, there exist $c_n \in [\underline{c}, \bar{c}]$ and $\phi_n \in \mathcal{M}$ with $\phi_n(-\infty) = 0$ and $\phi_n(+\infty) = 1$ such that $(Q^{\frac{1}{t^2}}[\phi_n])(x - \frac{c_n}{t^2}) \equiv \phi_n(x)$ holds. Then, for any $n \in \mathbb{N}$, there exist constants $y_n$ and $z_n$ such that

$$\phi_n(y_n) \leq \frac{\alpha}{2} \leq \lim_{h \downarrow +0} \phi_n(y_n + h)$$

and

$$\phi_n(z_n) \leq \frac{\alpha + 1}{2} \leq \lim_{h \downarrow +0} \phi_n(z_n + h)$$

hold. As we put functions

$$\phi_{-,n}(\cdot) := \phi_n(\cdot + y_n) \in \mathcal{M}$$

and

$$\phi_{+,n}(\cdot) := \phi_n(\cdot + z_n) \in \mathcal{M},$$

we have

$$(3.25) \quad (Q^{\frac{1}{t^2}}[\phi_{-,n}])(x - \frac{c_n}{2^t}) \equiv \phi_{-,n}(x),$$

$$(Q^{\frac{1}{t^2}}[\phi_{+,n}])(x - \frac{c_n}{2^t}) \equiv \phi_{+,n}(x),$$

$$(3.26) \quad \phi_{-,n}(0) \leq \frac{\alpha}{2} \leq \lim_{h \downarrow +0} \phi_{-,n}(h)$$

and

$$(3.27) \quad \phi_{+,n}(0) \leq \frac{\alpha + 1}{2} \leq \lim_{h \downarrow +0} \phi_{+,n}(h).$$

By Helly’s theorem, there exist a subsequence $\{n(k)\}_{k \in \mathbb{N}} \subset \mathbb{N}$, two functions $\phi_{-,} \phi_{+}$ and a constant $c$ such that the two equalities

$$(3.28) \quad \phi_{-}(x) = \lim_{k \to \infty} \phi_{-,n(k)}(x) \in \mathcal{M}$$

and

$$\phi_{+}(x) = \lim_{k \to \infty} \phi_{+,n(k)}(x) \in \mathcal{M}$$
hold almost everywhere in \( x \) and the equality
\[
(3.29) \quad c = \lim_{k \to \infty} c_{\alpha(k)} \in [c, \bar{c}]
\]
holds. From (3.26) and (3.27), we have
\[
(3.30) \quad \phi_-(0) \leq \frac{\alpha}{2} \leq \lim_{h \to 0^+} \phi_-(h)
\]
and
\[
(3.31) \quad \phi_+(0) \leq \frac{\alpha + 1}{2} \leq \lim_{h \to 0^+} \phi_+(h).
\]

[Step 2] We show the following: The two equalities
\[
(3.32) \quad (Q^t_\alpha[x]) (x - ct) \equiv \phi_-(x)
\]
and
\[
(3.33) \quad (Q^t_\alpha[x]) (x - ct) \equiv \phi_+(x)
\]
hold for all \( t \in [0, +\infty) \).

Let \( n_0 \in \mathbb{N} \) and \( m_0 \in \mathbb{N} \). As \( k \in \mathbb{N} \) is sufficiently large,
\[
(3.34) \quad (Q^\frac{m_0}{2n_0}[\phi_-]) (x - c_{\alpha(k)} \frac{m_0}{2n_0}) = \phi_-(x)
\]
for all \( n_0 \in \mathbb{N} \) and \( m_0 \in \mathbb{N} \).

Let \( t \in [0, +\infty) \). Then, by (3.34), there exists a sequence \( \{t_k\}_{k \in \mathbb{N}} \subset [0, +\infty) \) with \( \lim_{k \to \infty} t_k = 0 \) such that \( (Q^{t+t_k}_\alpha(\phi_-)) (x - c(t+t_k)) = \phi_-(x) \) holds for all \( k \in \mathbb{N} \). So, by \( (Q^t_\alpha(\phi_-)(\cdot - ct)) (x - ct_k) = (Q^{t+t_k}_\alpha(\phi_-)(x - c(t+t_k)) \) and Lemma 15, we obtain \( (Q^t_\alpha(\phi_-)(x - ct) = \phi_-(x) \).

Almost similarly as (3.32), we also obtain (3.33).
[Step 3] By Proposition 13 and (3.32), we have
\begin{align*}
Q^t[\phi_-(\infty)] &= (Q^t[\phi_-(\infty)])(0) = \lim_{k \to \infty} (Q^t[\phi_-(\cdot - k)])(0) \\
&= \lim_{k \to \infty} (Q^t[\phi_-](-k)) = (Q^t[\phi_-])(-\infty) = \phi_-(\infty).
\end{align*}
Almost similarly, we also have
\begin{align*}
Q^t[\phi_-] &= \phi_-(\infty), \quad Q^t[\phi_+] = \phi_+(-\infty) \quad \text{and} \\
Q^t[\phi_+ \cdot +] &= \phi_+(\infty)
\end{align*}
by Proposition 13, (3.32) and (3.33).
From (3.30) and (3.31), we see $0 \leq \phi_-(\infty) < \alpha$, $0 < \phi_-(\infty) \leq 1$, $0 \leq \phi_+(\infty) < 1$ and $\alpha < \phi_+(\infty) \leq 1$. Therefore, from Hypothesis 2 (iv), we obtain
\begin{align}
\tag{3.35} &\phi_-(\infty) = 0, \\
\tag{3.36} &\phi_-(\infty) = \alpha \text{ or } 1, \\
\tag{3.37} &\phi_+(\infty) = 0 \text{ or } \alpha
\end{align}
and
\begin{align}
\tag{3.38} &\phi_+(\infty) = 1.
\end{align}

[Step 4] We show that $\phi_- \neq \alpha$ if $\phi_+ \neq \alpha$ holds. Suppose that $\phi_- = \alpha$ and $\phi_+ = \alpha$ hold. Then, from Hypothesis 3, (3.32), (3.33), (3.35) and (3.38), we have the contradiction $c < c$. So, we see that $\phi_- \neq \alpha$ if $\phi_+ \neq \alpha$ holds. Hence, from (3.36) and (3.37), we also see that
\begin{align*}
\phi_- = 1 \quad \text{or} \quad \phi_+ = 0
\end{align*}
holds. When $\phi_- = 1$, we obtain the conclusion of Theorem 8 with $\phi := \phi_-$. When $\phi_+ = 0$, we obtain it with $\phi := \phi_+$.

\section{Proof of Theorem 1}

We recall that $\mu$ is a Borel-measure on $\mathbb{R}$ with $\mu(\mathbb{R}) = 1$, $f$ is a Lipschitz continuous function on $\mathbb{R}$ and satisfies $f(0) = f(\alpha) = f(1) = 0$, $f < 0$ in $(0, \alpha)$ and $f > 0$ in $(\alpha, 1)$ for some constant $\alpha \in (0, 1)$ and the set $M$ has been defined at the beginning of Section 2. Then, in virtue of Lemma 7 of
Lemma 8 of [18] and Proposition 10 of [18], \( Q^t (t \in (0, +\infty)) \) satisfies Hypotheses 2 and \( Q \) Hypotheses 6 for the semiflow \( Q = \{Q^t\}_{t \in [0, +\infty)} \) on \( M \) generated by (1.1). So, if we would confirm that this semiflow on \( M \) satisfies Hypothesis 7, then we could make Theorem 8 of Section 2 work. In this section, we confirm it when \( f'(\alpha) > 0 \) and \( \mu(\{0\}) \neq 1 \) hold and construct sub and super-solutions to prove Theorem 1.

First, we consider the linear equation

\[
(4.1) \quad v_t = \hat{\mu} \ast v.
\]

It generates a flow on the Banach space \( BC(\mathbb{R}) \) when \( \hat{\mu}(\mathbb{R}) < +\infty \). Here, \( BC(\mathbb{R}) \) denote the set of bounded and continuous functions on \( \mathbb{R} \). We have the following for this flow on \( BC(\mathbb{R}) \):

**Proposition 9** Let \( \hat{\mu} \) be a Borel-measure on \( \mathbb{R} \) with \( \hat{\mu}(\mathbb{R}) < +\infty \). Let \( \hat{P} : BC(\mathbb{R}) \to BC(\mathbb{R}) \) be the time 1 map of the flow on \( BC(\mathbb{R}) \) generated by the linear equation (4.1). Then, there exists a Borel-measure \( \hat{\nu} \) on \( \mathbb{R} \) with \( \hat{\nu}(\mathbb{R}) < +\infty \) such that

\[
\hat{P}[v] = \hat{\nu} \ast v
\]

holds for all \( v \in BC(\mathbb{R}) \). Further, the equality

\[
(4.2) \quad \log \int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\nu}(y) = \int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\mu}(y)
\]

holds for all \( \lambda \in \mathbb{R} \).

**Proof.** From Lemma 16 of [18], there exists a Borel-measure \( \hat{\nu} \) on \( \mathbb{R} \) with \( \hat{\nu}(\mathbb{R}) < +\infty \) such that

\[
(4.3) \quad \hat{P}[v] = \hat{\nu} \ast v
\]

holds for all \( v \in BC(\mathbb{R}) \). Further, from Lemma 16 of [18], if \( v \) is a nonnegative, bounded and continuous function on \( \mathbb{R} \), then the inequality

\[
\hat{\mu} \ast v \leq \hat{\nu} \ast v
\]

holds. So, because

\[
\int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\mu}(y) = \lim_{n \to \infty} \int_{y \in \mathbb{R}} \min\{e^{\lambda y}, n\} d\hat{\mu}(y) = \lim_{n \to \infty} (\hat{\mu} \ast \min\{e^{-\lambda x}, n\})(0)
\]
\[
\lim_{n \to \infty} (\hat{\nu} \ast \min\{e^{-\lambda x}, n\})(0) = \lim_{n \to \infty} \int_{y \in \mathbb{R}} \min\{e^{\lambda y}, n\} d\hat{\nu}(y) = \int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\nu}(y)
\]
holds, \(\int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\mu}(y) = +\infty\) implies \(\int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\nu}(y) = +\infty\). Therefore, it is sufficient if we show that the equality (4.2) holds when

\[
\int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\mu}(y) < +\infty.
\]

Let \(\lambda \in \mathbb{R}\). Suppose (4.4).

Let \(X_\lambda\) denote the set of continuous functions \(u\) on \(\mathbb{R}\) with \(\sup_{x \in \mathbb{R}} \frac{|u(x)|}{1 + e^{-\lambda x}} < +\infty\). Then, \(X_\lambda\) is a Banach space with the norm \(\|u\|_{X_\lambda} := \sup_{x \in \mathbb{R}} \frac{|u(x)|}{1 + e^{-\lambda x}}\).

Let \(u \in X_\lambda\). Then, for any \(x\) and \(y\) \(\in \mathbb{R}\), we have

\[
\sup_{h \in [-1, 1]} |u((x + h) - y) - u(x - y)| \leq \|u\|_{X_\lambda} \sup_{h \in [-1, 1]} ((1 + e^{-\lambda(x+h)-y}) + (1 + e^{-\lambda(x-y)}))
\]

\[
\leq \|u\|_{X_\lambda} ((1 + e^{-\lambda x+h}) + (1 + e^{-\lambda x}))(1 + e^{\lambda y}).
\]

Hence, from (4.4), the function \(\hat{\mu} \ast u\) is continuous. Because

\[
\sup_{x \in \mathbb{R}} \frac{|(\hat{\mu} \ast u)(x)|}{1 + e^{-\lambda x}} \leq \sup_{x \in \mathbb{R}} \int_{y \in \mathbb{R}} \frac{|u(x - y)|}{1 + e^{-\lambda(x-y)}}(1 + e^{\lambda y}) d\hat{\mu}(y)
\]

\[
\leq \left( \int_{y \in \mathbb{R}} (1 + e^{\lambda y}) d\hat{\mu}(y) \right) \|u\|_{X_\lambda}
\]
also holds, the map \(u \mapsto \hat{\mu} \ast u\) is a bounded and linear operator in the Banach space \(X_\lambda\). Let \(\hat{P}_\lambda : X_\lambda \to X_\lambda\) be the time 1 map of the flow on \(X_\lambda\) generated by the linear equation (4.1).

Suppose \(\lambda > 0\). Let \(\hat{\lambda} \in (0, \lambda)\). Then, we see

\[
(4.5) \quad \lim_{n \to \infty} \|\min\{e^{-\hat{\lambda} x}, n\} - e^{-\hat{\lambda} x}\|_{X_\lambda}
\]

\[
\leq \lim_{n \to \infty} \sup_{x \in (-\infty, -\frac{1}{\hat{\lambda}} \log n)} \frac{e^{-\hat{\lambda} x}}{1 + e^{-\lambda x}}
\]

\[
\leq \lim_{n \to \infty} \sup_{x \in (-\infty, -\frac{1}{\hat{\lambda}} \log n)} e^{(\lambda-\hat{\lambda})x} = 0.
\]
The function \( v(t, x) := e^{(\int_{y \in \mathbb{R}} e^{\lambda y} \hat{d} \mu(y))t - \bar{\lambda}x} \) is a solution to (4.1) in the phase space \( X_\lambda \). Hence, by (4.3) and (4.5),

\[
\int_{y \in \mathbb{R}} e^{\lambda y} \hat{d} \nu(y) = \lim_{n \to \infty} \int_{y \in \mathbb{R}} \min\{e^{\lambda y}, n\} \hat{d} \nu(y)
\]

holds for all \( \bar{\lambda} \in (0, \lambda) \). So, we have

\[
\int_{y \in \mathbb{R}} e^{\lambda y} \hat{d} \nu(y) = \lim_{\lambda \uparrow \lambda} \int_{y \in \mathbb{R}} e^{\lambda y} \hat{d} \nu(y) = \lim_{\lambda \uparrow \lambda} e^{\int_{y \in \mathbb{R}} e^{\lambda y} \hat{d} \mu(y)} = e^{\int_{y \in \mathbb{R}} e^{\lambda y} \hat{d} \mu(y)}.
\]

When \( \lambda < 0 \), we could also prove it almost similarly as \( \lambda > 0 \).

Because \( e^{(\int_{y \in \mathbb{R}} 1 \hat{d} \mu(y))t} \) is a solution to (4.1), from (4.3), we see

\[
\int_{y \in \mathbb{R}} 1 \hat{d} \nu(y) = (\hat{\nu} * 1)(0) = (\hat{P}[1])(0) = e^{\int_{y \in \mathbb{R}} 1 \hat{d} \mu(y)}.
\]

So, the equality (4.2) also holds when \( \lambda = 0 \). \( \blacksquare \)

In [18], the author has recalled a method to estimate the spreading speeds in monostable systems by Weinberger [16]. Combining Proposition 9 with the method, we have the following:

**Lemma 10** Suppose a constant \( \sigma \) satisfies \( 0 < \sigma < f'(\alpha) \). Then, the following two hold:

(i) Let \( c_\infty \in \mathbb{R} \). Let \( \phi_- \) be a monotone function on \( \mathbb{R} \) with \( \phi_-(-\infty) = 0 \) and \( \phi_-(+\infty) = \alpha \). Suppose \( u_-(t, x) := \phi_-(x + c_-t) \) is a solution to (1.1). Then,

\[
\inf_{\lambda_- > 0} \int_{y \in \mathbb{R}} e^{\lambda_- y} d\mu(y) - 1 + \sigma \leq -c_-
\]

holds.

(ii) Let \( c_\infty \in \mathbb{R} \). Let \( \phi_+ \) be a monotone function on \( \mathbb{R} \) with \( \phi_+(\infty) = \alpha \) and \( \phi_+(\infty) = 1 \). Suppose \( u_+(t, x) := \phi_+(x + c_+t) \) is a solution to (1.1). Then,

\[
\inf_{\lambda_+ > 0} \int_{y \in \mathbb{R}} e^{-\lambda_+ y} d\mu(y) - 1 + \sigma \leq c_+
\]

holds.
Proof. [Step 1] In this step, we show (i).

We put a Borel-measure $\hat{\mu} := \mu$ and a Lipschitz continuous function $\hat{f}(u) := -\frac{1}{\alpha}f(-\alpha(u - 1))$. Then, we see $\hat{f}(0) = \hat{f}(1) = 0$, $f > 0$ in $(0, 1)$ and

\begin{equation}
0 < \sigma < f'(\alpha) = \hat{f}'(0).
\end{equation}

Further, we put a monotone function $\hat{\phi}(z) := -\frac{1}{\sigma}\phi(z) + 1$ with $\hat{\phi}(-\infty) = 1$ and $\hat{\phi}(+\infty) = 0$. Then, the function $u(t, x) := \hat{\phi}(x + c_-t)$ is a solution to

\begin{equation}
u_t = \hat{\mu} * u - u + \hat{f}(u).
\end{equation}

Let $\hat{P} : BC(\mathbb{R}) \to BC(\mathbb{R})$ be the time 1 map of the flow on $BC(\mathbb{R})$ generated by the linear equation (4.1). Then, by Proposition 9, there exists a Borel-measure $\hat{\nu}$ on $\mathbb{R}$ with $\hat{\nu}(\mathbb{R}) < +\infty$ such that

\begin{equation}
\hat{P}[v] = \hat{\nu} * v
\end{equation}

holds for all $v \in BC(\mathbb{R})$. Further, the equality

\begin{equation}
\log \int_{y \in \mathbb{R}} e^{\lambda y}d\hat{\nu}(y) = \int_{y \in \mathbb{R}} e^{\lambda y}d\hat{\mu}(y)
\end{equation}

holds for all $\lambda \in \mathbb{R}$. Let $\hat{P} : BC(\mathbb{R}) \to BC(\mathbb{R})$ be the time 1 map of the flow on $BC(\mathbb{R})$ generated by the linear equation

\begin{equation}
v_t = \hat{\mu} * v - v + \sigma v.
\end{equation}

Then, from (4.8) and (4.9), as $\hat{\nu}$ is the Borel-measure on $\mathbb{R}$ defined by

\begin{equation}
\hat{\nu} := e^{-1+\sigma}\hat{\nu},
\end{equation}

\begin{equation}
\hat{P}[v] = \hat{\nu} * v
\end{equation}

holds for all $v \in BC(\mathbb{R})$ and

\begin{equation}
\log \int_{y \in \mathbb{R}} e^{\lambda y}d\hat{\nu}(y) = \int_{y \in \mathbb{R}} e^{\lambda y}d\hat{\mu}(y) - 1 + \sigma
\end{equation}

holds for all $\lambda \in \mathbb{R}$. Because $\hat{\nu}(\mathbb{R}) = (\hat{\nu} * 1)(0) = (\hat{P}[1])(0) = e^\sigma$ holds from (4.10) and $\hat{\mu}(\mathbb{R}) = 1$, we also have

\begin{equation}
1 < \hat{\nu}(\mathbb{R}) < +\infty.
\end{equation}
Let $\tilde{Q}_0 : \mathcal{B} \to \mathcal{B}$ be the time 1 map of the semiflow on $\mathcal{B}$ generated by the equation (4.7), where $\mathcal{B}$ is the set defined by

$$
\mathcal{B} := \{ u | u \text{ is a continuous function on } \mathbb{R} \text{ with } 0 \leq u \leq 1 \}.
$$

Then, from Lemma 17 of [18], (4.6) and (4.10), there exists a positive constant $\varepsilon$ such that the inequality

$$
\tilde{\nu} * u = \tilde{P}[u] \leq \tilde{Q}_0[u]
$$

holds for all $u \in \mathcal{B}$ with $u \leq \varepsilon$. Therefore, by Proposition 15 of [18] and (4.12), we obtain the inequality

$$
\inf_{\lambda > 0} \frac{1}{\lambda} \log \int_{y \in \mathbb{R}} e^{\lambda y} d\tilde{\nu}(y) \leq -c_-. \tag{4.13}
$$

So, from (4.11), we obtain

$$
\inf_{\lambda > 0} \frac{\int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\mu}(y) - 1 + \sigma}{\lambda} \leq -c_-.
$$

[Step 2] We show (ii). Let $\hat{\mu}$ be the Borel-measure on $\mathbb{R}$ such that

$$
\hat{\mu}((\infty, y)) = \mu((\infty, y)) \tag{4.14}
$$

holds for all $y \in \mathbb{R}$. We put a Lipschitz continuous function $\hat{f}(u) := \frac{1}{1-\alpha} f((1-\alpha)u + \alpha)$ and a monotone function $\hat{\phi}(z) := \frac{1}{1-\alpha} (\phi_+(-z) - \alpha)$ with $\hat{\phi}(\infty) = 1$ and $\hat{\phi}(\infty) = 0$. Then, the function $u(t, x) := \hat{\phi}(x - c_+ t)$ is a solution to

$$
u_t = \hat{\mu} * u - u + \hat{f}(u).
$$

So, almost similarly as (4.13), we also obtain

$$
\inf_{\lambda > 0} \frac{\int_{y \in \mathbb{R}} e^{\lambda y} d\hat{\mu}(y) - 1 + \sigma}{\lambda} \leq c_+.
$$

Hence, the conclusion of (ii) follows from (4.14).

$\blacksquare$

**Lemma 11** Suppose $\mu(\{0\}) \neq 1$. Then,

$$
0 < \inf_{\lambda_- > 0} \frac{\int_{y \in \mathbb{R}} (e^{\lambda_- y} - 1) d\mu(y) + \sigma}{\lambda_-} + \inf_{\lambda_+ > 0} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda_+ y} - 1) d\mu(y) + \sigma}{\lambda_+}
$$

holds for all $\sigma \in (0, +\infty)$.
Proof. Because \( \inf_{\lambda>0} \int_{y \in \mathbb{R}} e^{\lambda - y} d\mu(y) \neq +\infty \) implies \( \lim_{\lambda \to +0} \int_{y \in \mathbb{R}} e^{\lambda - y} d\mu(y) = 1 \), we see \( \lim_{\lambda \to +0} \frac{\int_{y \in \mathbb{R}} (e^{\lambda - y} - 1) d\mu(y) + \sigma}{\lambda} = +\infty \). Similarly, we also see \( \lim_{\lambda \to +0} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda + y} - 1) d\mu(y) + \sigma}{\lambda} = +\infty \). So, \( \inf_{\lambda>0} \frac{\int_{y \in \mathbb{R}} (e^{\lambda - y} - 1) d\mu(y) + \sigma}{\lambda} \neq -\infty \) and \( \inf_{\lambda>0} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda + y} - 1) d\mu(y) + \sigma}{\lambda} \neq -\infty \) hold. Hence, it is sufficient if we show that the inequality (4.15) holds when

\[
(4.16) \quad \inf_{\lambda>0} \frac{\int_{y \in \mathbb{R}} (e^{\lambda - y} - 1) d\mu(y) + \sigma}{\lambda} \neq +\infty
\]

and

\[
(4.17) \quad \inf_{\lambda>0} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda + y} - 1) d\mu(y) + \sigma}{\lambda} \neq +\infty
\]

hold. Suppose (4.16) and (4.17) hold. Then, we have

\[
(4.18) \quad \int_{\mathbb{R}} |y| d\mu(y) < +\infty.
\]

Because of \( \mu(\{0\}) \neq \mu(\mathbb{R}) \), we see that \( \mu((-\infty, 0)) \neq 0 \) or \( \mu((0, +\infty)) \neq 0 \) holds.

Suppose \( \mu((-\infty, 0)) \neq 0 \). Then, \( \lim_{\lambda \to +\infty} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda + y} - 1) d\mu(y) + \sigma}{\lambda} = +\infty \) holds. Hence, there exists \( N \in \mathbb{N} \) such that \( \inf_{\lambda>0} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda + y} - 1) d\mu(y) + \sigma}{\lambda} = \inf_{\lambda+\in(0,N]} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda + y} - 1) d\mu(y) + \sigma}{\lambda} \) holds. So, from (4.18), we have

\[
\inf_{\lambda>0} \frac{\int_{y \in \mathbb{R}} (e^{\lambda - y} - 1) d\mu(y) + \sigma}{\lambda} + \inf_{\lambda>0} \frac{\int_{y \in \mathbb{R}} (e^{-\lambda + y} - 1) d\mu(y) + \sigma}{\lambda} \geq \inf_{\lambda>0} \left( \int_{y \in \mathbb{R}} y d\mu(y) + \frac{\sigma}{\lambda} \right) + \inf_{\lambda \in (0,N]} \left( - \int_{y \in \mathbb{R}} y d\mu(y) + \frac{\sigma}{\lambda} \right) = \frac{\sigma}{N}.
\]

When \( \mu((0, +\infty)) \neq 0 \), we also have the inequality (4.15) almost similarly as \( \mu((-\infty, 0)) \neq 0 \). □

The following gives sub and super-solutions:

**Lemma 12** Let a Lipschitz continuous function \( \hat{f} \) on \( \mathbb{R} \) satisfy

\[
(4.19) \quad \hat{f} > 0 \quad (u < 0), \quad \hat{f} = f \quad (0 \leq u \leq 1), \quad \hat{f} < 0 \quad (1 < u).
\]

21
Let a function $\rho \in C^1(\mathbb{R})$ satisfy $\rho = 0$ in $(-\infty, 0]$, $\rho = 1$ in $[1, +\infty)$ and $\rho' > 0$ in $(0, 1)$. Suppose a positive constant $\varepsilon$ is sufficiently small. Then, the function $u(t, x) := \rho(\varepsilon x - \frac{t}{\varepsilon}) - \frac{1-\alpha}{4}$ is a sub-solution to the equation

(4.20) \quad u_t = \mu \ast u - u + \hat{f}(u)

and the function $\overline{u}(t, x) := \rho(\varepsilon x + \frac{t}{\varepsilon} + 1) + \frac{\alpha}{4}$ is a super-solution to (4.20).

**Proof.** We put a positive constant $\delta$ as

$$\delta := \min \left\{ \frac{1}{\varepsilon} \rho'(z) \left( \rho(z) - \frac{1-\alpha}{4} \right), \min_{u \in [\frac{\alpha}{8}, \frac{\alpha}{8}]} (-\hat{f}(u)) \right\}.$$

We also put a positive constant $C$ as

$$C := \min \left\{ \rho'(z) \left| \min\left\{ \frac{1-\alpha}{8}, \frac{\alpha}{4} \right\} \right. \leq \rho(z) \leq 1 - \min\left\{ \frac{1-\alpha}{8}, \frac{\alpha}{4} \right\} \right\}.$$

Then, we see

$$\frac{1}{\varepsilon} \rho'(z) + \hat{f} \left( \rho(z) - \frac{1-\alpha}{4} \right) \geq \min \left\{ \frac{1}{\varepsilon} C + \min_{u \in [\frac{\alpha}{8}, \frac{\alpha}{8}]} \hat{f}(u), \delta \right\} = \delta$$

for all $z \in \mathbb{R}$. We also see

$$\frac{1}{\varepsilon} \rho'(z) - \hat{f} \left( \rho(z) + \frac{\alpha}{4} \right) \geq \min \left\{ \frac{1}{\varepsilon} C + \min_{u \in [\frac{\alpha}{8}, \frac{\alpha}{8}]} \hat{f}(u), \delta \right\} = \delta$$

for all $z \in \mathbb{R}$. There exists $N \in \mathbb{N}$ such that $\mu(\mathbb{R} \setminus (-N, +N)) < \delta$ holds. So,

$$\left| \int_{y \in \mathbb{R}} \rho(\varepsilon(x-y) + s)d\mu(y) - \rho(\varepsilon x + s) \right|$$

$$\leq \int_{y \in \mathbb{R}} |\rho(\varepsilon(x-y) + s) - \rho(\varepsilon x + s)|d\mu(y)$$

$$\leq \int_{y \in (-N,+N)} |\rho(\varepsilon(x-y) + s) - \rho(\varepsilon x + s)|d\mu(y) + \mu(\mathbb{R} \setminus (-N,+N))$$

$$\leq \sup_{h \in (-eN,eN), x \in \mathbb{R}} |\rho(z+h) - \rho(z)| + \mu(\mathbb{R} \setminus (-N,+N)) \leq \delta$$

holds for all $s$ and $x \in \mathbb{R}$. Therefore, we have

$$-(\mu \ast u - u) \leq \delta \leq -u + \hat{f}(u)$$

and

$$\mu \ast \overline{u} - \overline{u} \leq \delta \leq \overline{u} - \hat{f}(\overline{u})$$

for all $t$ and $x \in \mathbb{R}$. \hfill \blacksquare
Proof of Theorem 1.

When \( \mu(\{0\}) = 1 \), the conclusion of Theorem 1 is trivial. Suppose \( \mu(\{0\}) \neq 1 \). Then, in virtue of Lemmas 10, 11 and \( f'(\alpha) > 0 \), the semiflow \( \{Q_t\}_{t \in [0, +\infty)} \) on \( \mathcal{M} \) generated by (1.1) satisfies Hypothesis 7. So, Theorem 8 can work.

We take a Lipschitz continuous function \( \hat{f} \) on \( \mathbb{R} \) with (4.19). Then, by Lemma 12, there exist two constants \( \underline{c}, \overline{c} \), two bounded, continuous and monotone functions \( \underline{\psi}, \overline{\psi} \) on \( \mathbb{R} \) with \( \underline{\psi}(0) \in (-\infty, 0) \), \( \underline{\psi}(+\infty) \in (0, 1) \), \( \overline{\psi}(-\infty) \in (0, \alpha) \) and \( \overline{\psi}(0) \in (1, +\infty) \) such that \( u(t, x) := \underline{\psi}(x + ct) \) is a sub-solution to (4.20) and \( \overline{u}(t, x) := \overline{\psi}(x + ct) \) is a super-solution to (4.20).

We put \( \underline{\psi} := \max\{\underline{\psi}, 0\} \in \mathcal{M} \) and \( \overline{\psi} := \min\{\overline{\psi}, 1\} \in \mathcal{M} \). Then, \( \underline{\psi}(0) = 0 \), \( \underline{\psi}(+\infty) \in (0, 1) \), \( \overline{\psi}(-\infty) \in (0, \alpha) \) and \( \overline{\psi}(0) = 1 \) hold. Further, \( (Q^t[\underline{\psi}]) \) and \( (Q^t[\overline{\psi}]) \) are solutions to not only (1.1) but also (4.20) in \( t \in [0, +\infty) \).

Hence, because \( \underline{\psi} \leq \psi \) and \( \overline{\psi} \leq \overline{\psi} \) hold, we have

\[
\underline{\psi}(x + ct) = \max\{\underline{\psi}(x + ct), 0\} \leq (Q^t[\underline{\psi}](x)
\]

and

\[
(Q^t[\overline{\psi}]) \leq \min\{\overline{\psi}(x + ct), 1\} = \overline{\psi}(x + ct)
\]

for all \( t \in [0, +\infty) \). Therefore, by Theorem 8, there exist \( c \in [\underline{c}, \overline{c}] \) and \( \phi \in \mathcal{M} \) with \( \phi(-\infty) = 0 \) and \( \phi(+\infty) = 1 \) such that \( (Q^t[\phi]) \equiv \phi(x) \) holds for all \( t \in [0, +\infty) \). So, \( u(t, x) := \phi(x + ct) \) is a solution to (1.1).

5 Appendix

In this section, we recall some known results from [17]. We use them in Section 3 to prove the abstract theorems stated in Section 2.

The following is the same as Proposition 10 of [17]:

Proposition 13 Let a map \( Q_0 : \mathcal{M} \to \mathcal{M} \) satisfy Hypotheses 2 (i), (ii) and (iii). Suppose a sequence \( \{u_k\}_{k \in \mathbb{N}} \subset \mathcal{M} \) converges to \( u \in \mathcal{M} \) almost everywhere. Then, \( \lim_{k \to \infty} (Q_0[u_k])(x) = (Q_0[u])(x) \) holds for all continuous points \( x \in \mathbb{R} \) of \( Q_0[u] \).

The following is the same as Lemma 11 of [17]:

23
Lemma 14  Let a sequence \( \{u_k\}_{k \in \mathbb{N}} \) of monotone nondecreasing functions on \( \mathbb{R} \) converge to a monotone nondecreasing function \( u \) on \( \mathbb{R} \) almost everywhere. Then, \( \lim_{k \to \infty} u_k(x_k) = u(x) \) holds for all continuous points \( x \in \mathbb{R} \) of \( u \) and sequences \( \{x_k\}_{k \in \mathbb{N}} \subset \mathbb{R} \) with \( \lim_{k \to \infty} x_k = x \).

The following is the same as Lemma 12 of [17]:

Lemma 15  Let \( Q = \{Q^t\}_{t \in [0, +\infty)} \) be a family of maps from \( M \) to \( M \). Suppose \( Q \) satisfies Hypothesis 6 (ii). Then, \( \lim_{t \to 0} (Q^t[u])(x - ct) = u(x) \) holds for all \( u \in M \), \( c \in \mathbb{R} \) and continuous points \( x \in \mathbb{R} \) of \( u \).

The following is the same as Theorem 6 of [17] (Theorem 5 of [18]):

Lemma 16  Let \( Q^t \) be a map from \( M \) to \( M \) for \( t \in [0, +\infty) \). Suppose the map \( Q^t \) satisfies Hypotheses 2 (i), (ii) and (iii) for all \( t \in (0, +\infty) \), and the family \( Q := \{Q^t\}_{t \in [0, +\infty)} \) Hypotheses 6. Suppose the map \( Q^t \) is monostable for all \( t \in (0, +\infty) \); i.e.,

\[
0 < \gamma < 1 \implies \gamma < Q^t[\gamma]
\]

for all \( t \in (0, +\infty) \) and constant functions \( \gamma \). Then, the following holds:

Let \( c \in \mathbb{R} \). Suppose there exist \( \tau \in (0, +\infty) \) and \( \phi \in M \) with \( (Q^t[\phi])(x - ct) \leq \phi(x) \), \( \phi \neq 0 \) and \( \phi \neq 1 \). Then, there exists \( \varphi \in M \) with \( \varphi(-\infty) = 0 \) and \( \varphi(+\infty) = 1 \) such that \( (Q^t[\varphi])(x - ct) \equiv \varphi(x) \) holds for all \( t \in [0, +\infty) \).

The following follows from Lemma 16:

Lemma 17  Let \( Q^t \) be a map from \( M \) to \( M \) for \( t \in [0, +\infty) \). Suppose the map \( Q^t \) satisfies Hypotheses 2 for all \( t \in (0, +\infty) \), and the family \( Q := \{Q^t\}_{t \in [0, +\infty)} \) Hypotheses 6. Then, the following two hold:

(i) Let \( \tau \in (0, +\infty) \) and \( c_- \in \mathbb{R} \). Suppose there exists \( \phi_- \in M \) with \( (Q^t[\phi_-])(x - c_-\tau) \equiv \phi_-(x) \), \( \phi_-(\infty) = 0 \) and \( \phi_-(+\infty) = 0 \). Then, there exists \( \varphi_- \in M \) with \( \varphi_-(\infty) = 0 \) and \( \varphi_-(+\infty) = \alpha \) such that \( (Q^t[\varphi_-])(x - c_-t) \equiv \varphi_-(x) \) holds for all \( t \in [0, +\infty) \).

(ii) Let \( \tau \in (0, +\infty) \) and \( c_+ \in \mathbb{R} \). Suppose there exists \( \phi_+ \in M \) with \( (Q^t[\phi_+])(x - c_+\tau) \equiv \phi_+(x) \), \( \phi_+(\infty) = \alpha \) and \( \phi_+(+\infty) = 1 \). Then, there exists \( \varphi_+ \in M \) with \( \varphi_+(\infty) = \alpha \) and \( \varphi_+(+\infty) = 1 \) such that \( (Q^t[\varphi_+])(x - c_+t) \equiv \varphi_+(x) \) holds for all \( t \in [0, +\infty) \).
Proof. We show (i). Put a set as
\[ M^- := \{ u \mid u \text{ is a monotone nondecreasing and left continuous function on } \mathbb{R} \text{ with } 0 \leq u \leq \alpha \}. \]

Put two maps \( R^- : M \to M^- \) and \( S^- : M^- \to M \) as
\[ (R^-[u])(x) := \alpha(1 - \lim_{h \downarrow 0} u(-x + h)) \]
and
\[ (S^-[u])(x) := -\frac{1}{\alpha}(\lim_{h \downarrow 0} u_{-}(x + h)) + 1. \]

So, the maps \( R^- \) and \( S^- \) are inverse in each other. In virtue of Hypotheses 2 (ii) and (iv), we can define a map \( Q^-_t : M \to M \) by
\[ Q^-_t := S^- \circ Q^t \circ R^- \]
for \( t \in [0, +\infty) \). Then, \( Q^- := \{ Q^-_t \}_{t \in [0, +\infty)} \) satisfies the assumption of Lemma 16. Hence, Lemma 16 works for the semiflow \( Q^- \). Let \( \phi_- := S_-[\phi_-] \in M \). Then, \( (Q^-_t[\phi_-])(x - c_-t) \equiv \phi_-(x) \), \( \phi_-(\infty) = 0 \) and \( \phi_-(+\infty) = 1 \) hold. Therefore, by Lemma 16, there exists \( \tilde{\phi}_- \in M \) with \( \tilde{\phi}_-(\infty) = 0 \) and \( \tilde{\phi}_-(+\infty) = 1 \) such that \( (Q^-_t[\tilde{\phi}_-])(x - c_-t) \equiv \tilde{\phi}_-(x) \) holds for all \( t \in [0, +\infty) \). So, as we put \( \phi_- := R_-[\tilde{\phi}_-] \in M_- \), we obtain the conclusion of (i).

We show (ii). Put a set as
\[ M^+ := \{ u \mid u \text{ is a monotone nondecreasing and left continuous function on } \mathbb{R} \text{ with } \alpha \leq u \leq 1 \}. \]

Put two maps \( R^+ : M \to M^+ \) and \( S^+ : M^+ \to M \) as
\[ (R^+[u])(x) := (1 - \alpha)u(x) + \alpha \]
and
\[ (S^+[u])(x) := \frac{1}{1 - \alpha}(u_+(x) - \alpha). \]

Then, almost similarly as (i), we can obtain the conclusion of (ii). \( \blacksquare \)
