Abstract
Exocelina manokwariensis sp. n. from West Papua is placed into the E. ekari-group based on the structure of its male genitalia. The new species is described, including its three subspecies, from the mainland of West Papua, Waigeo Island, Batanta and Salawati Islands, and Bomberai peninsula. An identification key to the subspecies as well as data on species distribution are provided.

Keywords
Coleoptera, Dytiscidae, Exocelina, new species, new subspecies, molecular phylogenetics, West Papua

Introduction
Of the 88 species of the genus Exocelina BROUN, 1886 described from New Guinea, only eight species are known from West Papua, and all of them belong to the E. ekari-group (Balke 1998, 1999, Shaverdo and Balke 2014, Shaverdo et al. 2005, 2012, 2013, 2014). Herein, a new member of that group is described, which is widely distributed across the Bird’s Head of West Papua, accounting for the geographical structure observed in the morphological characters studied by erecting four subspecies.
Material and methods

The present work is based on the material from the following collections:

MZB  Museum Zoologicum Bogoriense, Cibinong, Indonesia
NHMW  Naturhistorisches Museum Wien, Vienna, Austria
ZSM  Zoologische Staatsammlung München, Munich, Germany

All specimen data are quoted as they appear on the labels attached to the specimens. Label text is cited using quotation marks. Comments in square brackets are ours. All types of the herein described specimens are provided with red labels. Female specimens, identification of which is difficult or sometimes impossible, were included in the type series only when they were collected with males of respective species and did not show external morphological differences from them. If two or more morphologically similar species were collected together (i.e., males found together), their females were not included in the type series but were instead mentioned under additional material. Species descriptions are based on the whole type series.

Measurements were taken with a Wild M10 stereomicroscope. The following abbreviations were used: TL (total body length), TL-H (total body length without head), MW (maximum body width), and hw (handwritten). Number of the ventral setae of the male protarsomere 5 is given only for one specimen of each species, which was mounted on a glass slide (see below) for drawing. This character was found to be of limited practical use for species identification since it is possible to make a general statement on the setation pattern (short/long, dense/sparse) but not to count them with certainty at the magnification of normal dissecting microscopes. The potential phylogenetic information content of this character will be studied in a further work.

Drawings were made with the aid of a camera lucida attached to a Leica DM 2500 microscope. For detailed study and drawing, antennae, protarsi, and genitalia were removed and mounted on glass slides with DMHF (dimethyl hydantoin formaldehyde) as temporary preparations. The drawings were scanned and edited, using the software Adobe Illustrator CS5.1.

The terminology to denote the orientation of the genitalia (ventral for median lobe and dorsal and external for paramere) follows Miller and Nilsson (2003). The terminology on the structure of the prosternum follows Larson et al. (2000). Administrative divisions of Indonesia follow information from Wikipedia (2015).
Systematics

Exocelina manokwariensis sp. n.
http://zoobank.org/77D1CC24-24BC-4BE1-AC1F-CBAAEA851B583
Figs 1, 2

Type locality. Indonesia: West Papua Province: Manokwari Regency, Road Manokwari – Mokwam, 01°00.60’S; 133°53.92’E.

Type material. Holotype: male “Indonesia: Papua, Road Manokwari - Mokwam, 320m, 25./27.i.1990, 01.00.596S 133.53.921E, Balke (BH 01)” (MZB). Paratypes: Manokwari: 12 males, 8 females with the same label as the holotype, two males additionally with green labels “M.Balke 1267”, “M.Balke 1282” (MZB, NHMW, ZSM). 6 males, 5 females “Indonesia: Papua, Ransiki - Anggi, 1160m, 30.i.1990, 01.25.536S 134.02.456E, Balke (BH 03)”, one male additionally with a green label “M.Balke 1270” (NHMW, ZSM). 2 males, 5 females “IRIAN JAYA, Manokwari Rasiki, May – Benyas ca. 300–400m, 27.-28.IX.1990, leg. A. Riedel” (NHMW, ZSM). 121 males, 94 females “Indonesia: Papua Barat, Manokwari, Maripi, creek white pebbles, 135m, -0.907576 133.9214718 (BH039)” (MZB, NHMW, ZSM). 2 males “IN: West Papua: Manokwari Reg., on road Manokwari-Kebar, near Munbrani vill., 66 m, 8.V., 00°46’21’S, 133°22’53”E, roadside ditch (2015-WP36)” (NHMW, ZSM). 1 male “Indonesia: Papua Barat, Manokwari to Kebar, forest stream, 302m, -0.80058566 133.3216397 (BH023)”, one male additionally with a label “M.Balke 6187” (ZSM). 36 males “Indonesia: Papua Barat, Kebar to Aibogar, slow forest stream, 503m, -0.86241595 132.8299328 (BH025)”, one male additionally with a label “M.Balke 6190” (MZB, NHMW, ZSM). 2 males, 4 females “Indonesia: Papua Barat, Kebar to Aibogar, forest stream, 942m, -0.89933965 132.7221734 (BH026)”, one male additionally with a label “M.Balke 6192” (ZSM). 38 males, 26 females “Indonesia: Papua Barat, Fumato, forest stream, 820m, -0.90427148 132.7198143 (BH027)”, four males additionally with labels “M.Balke 6201”, “M.Balke 6202”, “M.Balke 6203”, “M.Balke 6204” (MZB, NHMW, ZSM). 31 males, 22 females “Indonesia: Papua Barat, Fumato to Kebar, forest stream, 674m, -0.88384738 132.73705681 (BH028)” (MZB, NHMW, ZSM). 11 males, 7 females “Indonesia: Papua Barat, Tamrau Mts. N of Kebar, forest stream, 750m, -0.783199 133.072143 (BH033)” (ZSM). 75 males, 154 females “Indonesia: Papua Barat, Tamrau Mts. N of Kebar, forest stream, puddles, 1050m, -0.774519 133.069929 (BH034)” (MZB, NHMW, ZSM). Sorong: 6 males, 9 females “Indonesia: Papua Barat, Sorong-Sausapor, 300m, -0.7629653 131.6177023 (BH041)” (ZSM). 18 males, 21 females “Indonesia: Papua Barat, Sausapor-Fef, 157m, -0.6975004 132.072253 (BH044)” (MZB, NHMW, ZSM).

Additional material. 1 female “Indonesia: Papua Barat, Tamrau Mts. N of Kebar, sandy sunny riverbank”, “758m, -0.78387424 133.07218533 (BH032)” (ZSM). 78 females “Indonesia: Papua Barat, Kebar to Aibogar, slow forest stream, 503m, -0.86241595 132.8299328 (BH025)”, the females are a mixture of E. manokwariensis sp. n. and E. polita (Sharp, 1882) (MZB, NHMW, ZSM).
Diagnosis. Beetle small, brown to blackish brown, usually with paler clypeus and pronotal sides or head and pronotum, shiny, with almost invisible dorsal punctuation; pronotum with distinct lateral bead; male antennomeres 3–4 strongly enlarged and triangular (3 distinctly larger than 4), 5 distinctly enlarged, 6–8 somewhat enlarged; male
A new, widely distributed species of the Exocelina ekari-group from West Papua...

protarsomere 4 with medium-sized, slender, evidently curved anterolateral hook-like seta; median lobe with strong submedian constriction in ventral view, apex of median lobe truncate; paramere with notch on dorsal side and subdistal part short and small, with relatively short, thick, and flattened setae.

**Description.** Size and shape: Beetle small (TL-H 3.2–3.75 mm, TL 3.45–4.15 mm, MW 1.7–2.05 mm; holotype: TL-H 3.3 mm, TL 3.7 mm, MW 1.75 mm), with oblong-oval habitus, broadest at elytral middle.

Coloration: Head reddish brown to blackish brown, paler on clypeus and vertex; pronotum reddish brown to blackish brown, with paler sides and darker disc; elytra brown to blackish brown, sometimes with brown sutural lines; head appendages and legs yellowish to yellowish red, legs darker distally (Fig. 1). Teneral specimens paler.

Surface sculpture: Head with relatively dense punctation (spaces between punctures 1–3 times size of punctures), evidently finer and sparser anteriorly; diameter of punctures smaller than diameter of cells of microreticulation. Pronotum with extremely sparse and fine punctation, almost invisible. Elytra with punctuation finer than on pronotum, indistinct. Pronotum and elytra with weakly impressed microreticulation, dorsal surface shiny. Head with microreticulation stronger. Metaventrite and metacoxa distinctly microreticulate, metacoxal plates with longitudinal striales and transverse wrinkles. Abdominal ventrites with distinct microreticulation, striales, and extremely fine, sparse punctuation, almost invisible, only slightly coarser and denser on two last abdominal ventrites.

**Structures:** Pronotum with distinct lateral bead. Base of prosternum and neck of prosternal process with distinct ridge, less rounded and smooth anteriorly, without

---

**Figure 2.** *Exocelina manokwariensis* sp. n. A male antenna B male protarsomeres 4–5 in ventral view C median lobe in ventral view D median lobe in lateral view E paramere in external view.
anterolateral extensions. Blade of prosternal process lanceolate, relatively elongate, convex, with distinct lateral bead and few setae; neck and blade of prosternal process evenly jointed. Abdominal ventrite 6 broadly rounded or slightly truncate apically.

**Male:** Antennomeres 3–4 strongly enlarged and triangular (3 distinctly larger than 4), 5 distinctly enlarged, 6–8 somewhat enlarged (Fig. 2A); antennomeres 3–7 rugose ventrally. Protarsomere 4 with medium-sized, slender, evidently curved anterolateral hook-like seta. Protarsomere 5 ventrally with anterior row of 12 and posterior row 6 short setae (Fig. 2B). Abdominal ventrite 6 with 8–16 lateral striae on each side, slightly truncate apically. Median lobe with strong submedian constriction in ventral view, apex of median lobe truncate, with relatively short tip in lateral view and relatively asymmetric in ventral view (Fig. 2C, D). Paramere with notch on dorsal side and subdistal part short and small, with numerous, relatively short, thick, and flattened setae (Fig. 2E).

**Female:** Antennae simple, abdominal ventrite 6 broadly rounded apically, without striae.

**Variability.** The species has three subspecies, which are isolated geographically, occurring in restricted regions (Fig. 9). They are very similar morphologically and show (at least on material we have) no much variability in their morphology. Comparisons are given as separate notes after the descriptions.

Here, we discuss the variability of the nominative subspecies, which is more widely distributed (Fig. 9). This subspecies demonstrates variability mainly in shape of the apex of median lobe and setation of the subdistal part of the paramere. The truncate margin of the median lobe apex varies from almost straight (especially specimens from Manokwari) to slightly concave (especially specimens from Kedar, Fumato, Sorong) in lateral view. This variability is observed within and among the populations. Also, number of the subdistal flattened setae of the paramere varies thought it is not possible to estimate that quantitatively, since they are numerous and densely attached. The specimens from western populations have less numerous subdistal flattened setae then specimens from Manokwari.

**Comparative notes.** In the *E. ekari*-group, the new species is similar to the species of the *E. polita*-complex: *E. polita* (Sharp, 1882), *E. alexanderi* Shaverdo, Hendrich & Balke, 2012, *E. anggiensis* Shaverdo, Hendrich & Balke, 2012, and *E. arfakensis* Shaverdo, Hendrich & Balke, 2012; see descriptions and illustrations in Shaverdo et al. 2012. From all these species, *E. manokwariensis* sp. n. can be distinguished by its smaller size (TL-H: 3.1–3.85 mm, MW: 1.65–2.1 mm; for *E. polita*-complex: TL-H: 3.7–4.3 mm, MW: 2.05–2.3 mm) and apex of the median lobe almost truncate in lateral view (elongate for *E. polita*-complex, if slightly truncate (in *E. alexanderi*), then antennomeres 3 and 4 of almost equal size). With its very fine dorsal punctuation, the new species particularly resembles *E. alexanderi*, which also has a slightly truncate apex of the median lobe in lateral view, but differs from it by the smaller size and distinctly different shape of the male antennomeres 3 and 4. *Exocelina polita* also has fine dorsal punctuation and it was found together with the new species in two localities. From *E. polita*, *E. manokwariensis* sp. n. can be separated by its smaller size, truncate apex of the median lobe in lateral view, and slightly different shape of the male antennomeres 3 and 4.
The nominative subspecies can be distinguished from all the other subspecies by more numerous flattened setae on the subdistal part of the paramere, the slightly shorter median lobe, and the prosternal ridge being less rounded anteriorly. From *E. m. batanta* ssp. n. and *E. m. nokensis* ssp. n., it can be also separated by slightly darker coloration and the stronger dorsal microreticulation. From *E. m. batanta* ssp. n. and *E. m. hendrichi* ssp. n., by the more asymmetric apex of the median lobe in ventral view and the smaller subdistal part of the paramere.

**Distribution.** Indonesia: West Papua Province: Sorong and Manokwari Regencies (Fig. 9).

**Etymology.** The species is named after Manokwari Regency where it is occur. The name is an adjective in the nominative singular.

**Ecology.** The species was collected in localities BH 023 and BH 025 together with *E. polita* in ratios 1:4 and 1:1, respectively.

**Description.** As nominative subspecies, except for the following characters.

Size: TL-H 3.3–3.85 mm, TL 3.75–4.45 mm, MW 1.75–2.1 mm; **holotype**: TL-H 3.75 mm, TL 4.3 mm, MW 2 mm.

Coloration: Dorsal surface more or less uniform reddish brown to dark brown, paler on clypeus, pronotal sides, along elytral suture, and sometimes on vertex (Fig. 5).

Structures: Base of prosternum and neck of prosternal process with distinct ridge, rounded and smooth anteriorly.

**Male:** Antennomeres 3–4 strongly enlarged and triangular (3 distinctly larger than 4), 5 distinctly enlarged, 6–7 somewhat enlarged (Fig. 6A). Protarsomere 5 ventrally with anterior row of 10 and posterior row 6 short setae (Fig. 6B). Abdominal ventrite 6 with 7–9 lateral striae on each side, slightly truncate apically. Median lobe larger. Its apex slightly asymmetric in ventral view and concave, with relatively long tip in lateral view (Fig. 6C, D). Subdistal part of paramere larger, with more or less numerous, thick flattened setae (Fig. 6E).

**Female:** Antennae simple, abdominal ventrite 6 broadly rounded apically, without striae.

**Comparison with the other subspecies.** *Exocelina m. hendrichi* ssp. n. can be separated from all other subspecies by the shape of the apex of its median lobe: slightly asymmetric in ventral view and concave, with relatively long tip in lateral view.

---

**Figure 6.** *Exocelina manokwariensis hendrichi* ssp. n. A male antenna B male protarsomeres 4–5 in ventral view C median lobe in ventral view D median lobe in lateral view E paramere in external view.
Distribution. Indonesia: West Papua Province: Fak-Fak Regency (Fig. 9). *Exocelina m. hendrichi* ssp. n. is the only known *Exocelina* species in this region.

Etymology. The species is named for our colleague and friend Lars Hendrich who collected this species. The species name is a noun in the genitive case.

**Exocelina manokwariensis nokensis** ssp. n.

Nok. 2,500 ft. v.1938. L.E.Cheesman. B.M.1938-593.” (BMNH).

Additional material. 27 females “N.DUTCH NEW GUINEA: Waigeu. Camp Nok. 2,500 ft. iv.1938. L.E.Cheesman. B.M.1938-593.”, one of them additionally with labels “collection 27”, “measured J.Parkin 76” (BMNH). 6 females “N.DUTCH NEW GUINEA: Waigeu.Camp 1.Mt.Nok. 2,500 ft. v.1938. L.E.Cheesman. B.M.1938-593.” (BMNH). These females might belong to two species: *E. m. nokensis* ssp. n. and *E. waigeoensis* Shaverdo, Hendrich & Balke, 2012.

**Description.** As nominative subspecies, except for the following characters.

Size: TL-H 3.1–3.6 mm, TL 3.45–4.0 mm, MW 1.65–1.9 mm; holotype: TL-H 3.4 mm, TL 3.75 mm, MW 1.8 mm (Fig. 7).

Surface sculpture: Dorsal microreticulation, especially on head and pronotum, slightly weaker.

Structures: Base of prosternum and neck of prosternal process with distinct ridge, less rounded, smooth or with few transverse lines anteriorly.

Male: Protarsomere 5 ventrally with anterior row of 9 and posterior row 4 short setae (Fig. 8B). Abdominal ventrite 6 with 3–6 lateral striae on each side. Median lobe slightly larger and somehow more slender. Its apex with relatively short tip and truncate margin almost straight in lateral view and asymmetric in ventral view (Fig. 8C, D). Subdistal part of paramere with less numerous, thick flattened setae (Fig. 8E).

Female: Antennae simple, abdominal ventrite 6 broadly rounded apically, without striae.
A new, widely distributed species of the Exocelina ekari-group from West Papua...

Figure 7. Habitus and coloration of Exocelina manokwariensis nokensis ssp. n.

Comparison with the other subspecies and co-inhabiting species. Although widely separated geographically, *E. m. nokensis* ssp. n. is very similar to the nominative subspecies, from which can be separated by the larger and somehow more slender median lobe, less numerous flattened setae on the paramere, and its finer dorsal

Figure 9. Map of the western part of New Guinea showing distribution of subspecies of *Exocelina manokwariensis* sp. n. and co-occurring species.
A new, widely distributed species of the Exocelina ekari-group from West Papua...

This subspecies was collected together with two other species of the *E. ekari*-group: *E. evelyncheesmanae* Shaverdo, Hendrich & Balke, 2012 and *E. waigeoensis* Shaverdo, Hendrich & Balke, 2012; see descriptions and illustrations in Shaverdo et al. 2012. From the former (both males and females), it can be easily separated by its smaller size and distinctly modified male antennae (TL-H: 3.75–4.1 mm, MW: 1.9–2.2 mm and slightly modified male antennae: antennomeres 3–7 very slightly enlarged, antennomere 3 slightly more triangular than other antennomeres, in *E. evelyncheesmanae*). From the latter, males can be distinguished by their distinctly modified antennae and the shapes of the median lobes (slightly modified antennae and apex of the median lobe elongate in lateral view in *E. waigeoensis*).

**Distribution.** Indonesia: West Papua Province: Raja Ampat Regency, Waigeo Island (Fig. 9).

**Etymology.** The species is named after Nok Mountain, the type locality of the species. The name is an adjective in the nominative singular.

**Ecology.** The species was collected in two localities on Nok Mountain together with *E. evelyncheesmanae* and *E. waigeoensis* and in one locality together with *E. evelyncheesmanae* in ration ca. 1:1.

---

**Key to subspecies of the Exocelina manokwariensis sp. n.**

This key is a modified part of the key to species of the *E. ekari*-group from Shaverdo et al. (2014). It is based mostly on male characters. In many cases, females cannot be assigned to species due to similarity of their external and internal structures (for female genitalia, see figs 17a and 17b in Shaverdo et al. (2005) and fig. 7C in Shaverdo et al. (2013)).

27 Male antennomere 3 much larger than other antennomeres, triangular; beetle larger, TL-H: 3.8–4.8 mm, MW: 2.0–2.55 mm; male protarsomere 4 with anterolateral hook very small (smaller than more laterally situated large seta), thin, and slightly curved; paramere distinctly longer than median lobe, without notch on dorsal side, with dense, thin setae subdistally and sparse, thin setae and spines proximally

28 Male antennomeres 3 and 4 much larger than other antennomeres, triangular; beetle smaller, TL-H: 3.1–4.3 mm, MW: 1.65–2.3 mm; male protarsomere 4 with anterolateral hook thin or thick, slightly curved but larger than more laterally situated large seta; paramere equal or shorter than median lobe, with notch on dorsal side, setae of subdistal part thick and flattened, proximally setae dense and thinner, no spines

29A Beetle larger, TL-H: 3.7–4.3 mm, MW: 2.05–2.3 mm; dorsal punctuation very fine to dense and coarse; apex of median lobe elongate in lateral view (figs 9–11 in Shaverdo et al. (2012)); if almost truncate, *E. alexanderi*, antennomeres 3 and 4 larger, triangular but elongated due to external margin strongly expanded (figs 8A, D in Shaverdo et al. (2012))
– Beetle smaller, TL-H: 3.1–3.85 mm, MW: 1.65–2.1 mm; dorsal punctuation very fine; apex of median lobe almost truncate in lateral view (Figs 2D, 4D, 6D, 8D); male antennomeres 3 and 4 evidently smaller, more distinctly triangular, not elongated due to external margin only slightly expanded (Figs 2A, 4A, 6A, 8A) .................................................. **manokwariensis sp. n.** 32A

32A Apex of median lobe more strongly concave, with tip distinctly longer in lateral view (Fig. 6A, D) .................................................. **m. hendrichi** ssp. n.

– Apex of median lobe not concave or slightly concave, with tip shorter in lateral view (Figs 2A, 4A, 8A) .................................................. 32B

32B Apex of median lobe with truncate margin more strongly curved in lateral view and symmetrical in ventral view; subdistal part of paramere larger, with flattened setae less numerous and thinner (Fig. 4C–E) .......................... **m. batanta** ssp. n.

– Apex of median lobe with truncate margin almost straight in lateral view and asymmetrical in ventral view; subdistal part of paramere smaller, with flattened setae more numerous and thicker .................................................. 32C

32C Median lobe longer, somehow more slender, subdistal part of paramere with less numerous flattened setae (Fig. 8C–E) ...................... **m. nokensis** ssp. n.

– Median lobe shorter and more robust, subdistal part of paramere with more numerous flattened setae (Fig. 2C–E) .................. **m. manokwariensis** ssp. n.

**Acknowledgements**

We are grateful Dr. H. Schillhammer (Vienna) for the habitus photos and Prof. D. Bilton (Plymouth) for a linguistic review of the manuscript.

Recent fieldwork in West Papua was conducted by the University of Papua (Manokwari, West Papua). Permission to conduct fieldwork was provided by Department of Forestry/Nature Conservation in Manokwari, e.g., with permit number SI.79IV18/KSDA.PB-4/2015, and transferred to MZB in Cibinong, West Java with permission as well, e.g., S. 5 245/IV18/KSDA.PB-4/IPNBP /2014.

Financial support for the study was provided by the FWF (Fonds zur Förderung der wissenschaftlichen Forschung – the Austrian Science Fund) through a project P 24312-B17 to the senior author. Michael Balke was supported by the UK Darwin Initiative and the German Science Foundation (DFG).
A new, widely distributed species of the Exocelina ekari-group from West Papua...
