|-------------------|----------------------|-----------------------------------------|-----------------------------------------------|-----------------------------------------------------|----------|
| E46, 1973         | rN                   | 3.2.1.1 page 56                         | No remarkable motor or behavioural activities. No mortalities in the experimental period (7 days) | Motor and behavioural activities unremarkable. | Inflammation in kidneys and endocardium assumed, by authors, to be a result of an infection; ie not an adverse effect of aspartame |
|                   |                      | Appendix F page 202                     |                                               |                                                     |          |
| E84, 1974         | rN                   | 3.2.1.1 page 57                         | No, but inflammation was observed in the kidneys and endocardium | Physical, opthalmoscopic and body weight changes were unremarkable. No compound-related changes were observed at the gross or microscopic level, organ weights and organ to body weight ratios were unchanged. | Inflammation in kidneys and endocardium assumed, by authors, to be a result of an infection; ie not an adverse effect of aspartame |
|                   |                      | Appendix F page 202                     |                                               |                                                     |          |
| E85, 1974         | rN                   | 3.2.1.1 page 57                         | All animals survived during the observation period (72 hours). Electrocardiogram patterns were unremarkable. No statistically significant changes were observed in the haematology, clinical chemistry and urinalysis parameters evaluated. Post-mortem gross and microscopic changes were unremarkable. | Physical and biochemical parameters, ECC unremarkable. |          |
| E2, 1972 | rN | 3.2.2.1 page 57 | Intestinal mucosa from the high-dose treated mice was heavily coated with a clear, moderately viscous fluid. "No statistically significant difference in body weight was observed between treated and control animals. No adverse clinical conditions were noted and 100% survival was reported." (p 57) | 5 mice per gender per dose group for 4 weeks. Implicitly, the wording acknowledged that there were 'effects' but discounted them as they were not 'unequivocal'. With only 5 animals per gender per dose group, the absence of a 'statistically significant' finding is not a reliable indicator of the absence of an adverse effect. |
| --- | --- | --- | --- | --- |
| Appendix G page 205 | Clear, viscous fluid coating intestinal mucosa in treated rats. "100% survival. No unequivocal effect on body weight....No adverse physical/behavioural changes; no treatment related pathological changes except for intestinal mucosa." (emphasis added) | Only the controls and those from the high dose group were examined. |
| E3, 1972 | uP | 3.2.2.1 page 57 | Significant decrease in feed consumption. Intestinal mucosa from the treated rats was heavily coated with a clear, moderately viscous liquid. No consistent statistically significant effect in body weight was observed. No adverse clinical conditions were reported and 100% survival was reported. No treatment related histopathological changes were reported from the high dose groups. With only 5 rats per gender per dose group, the absence of a consistent statistically significant finding is not a reliable indicator of the absence of an adverse effect. Implicitly, the wording acknowledged that there were 'effects' but discounted them (Appendix G p 204) as they were not 'unequivocal'. |
| Appendix G page 204 | Decreased food consumption in high dose females, weeks 2-3. Clear, viscous fluid coating intestinal mucosa in treated rats. "100% survival; no unequivocal effect on body weight or food consumption, except high dose females, wks 2-3." (emphasis added) No adverse physical/behavioural changes; no treatment related pathological changes except for intestinal mucosa. "N.B. only examined 5 controls and all high dose animals; remaining animals were discarded." (p 204) |
| E20, 1969 | rN & ELow | 3.2.2.1 page 57 | In the high dose [125 mg/kg bw/day] males a significantly higher liver to body weight ratio was observed. Survival was 100%. No effect on body weight and feed consumption. No effect on physical appearance or behaviour. No treatment related changes in haematology or urinanalysis. Organ weights were unaltered except in the high dose males. No histopathological finding except bile duct hyperplasia/pericholangitis in all groups. The Panel discounted elevated liver weights and blood sugar levels. With only 10 animals per gender per dose group, of which only 5 examined after sacrifice) per group little reliance can be placed on its negative findings. |
| Source | Page | Textual Content |
|--------|------|-----------------|
| Appendix G page 204 | Increased liver/body weight ratio in high dose males. Increased terminal blood sugar at high dose. | No signs of systemic toxicity or pharmacological effects. No treatment related changes in haematology or urinanalysis. Apart from blood sugar level in high dose group there were no other significant changes in clinical chemistry. Organ weights were unaltered except in the high dose males. No histopathological finding except bile duct hyperplasia/pericholangitis in all groups. But 'high dose' level was only 125 mg/kg bw/day. Changes were discounted as being neither systemic or pharmacological, which was implicitly setting a very high hurdle. |
| E21, 1969 rN 3.2.2.1 page 58 | 100 % survival” “No consistent haematology, clinical chemistry or urinanalysis findings; no consistent ocular findings; no gross pathology; no consistent effects on organ weights; no cytopathological changes.” | The text implies there were ‘findings’ but they were not ‘consistent’. But this study used only 2 dogs per group, and lasted only 8 weeks. The implicit assumption seems to have been that effects on only half of the dogs should not be deemed ‘consistent. By in effect deeming this study to be a reliable negative, despite using only two dogs per group, the implicit hurdle of acceptability was ridiculously low. |
| Abhilash et al | uP | 3.2.2.2 page 58 | "...a significant serum increases in activities of alanine aminotransferase, aspartate amino-transferase, alkaline phosphatase and gammaglutamyl transferase...a significant serum increases in activities of alanine aminotransferase, aspartate amino-transferase, alkaline phosphatase and gammaglutamyl transferase...The levels of GSH were significantly decreased...Histopathological examination revealed leukocyte infiltration...mild vascular congestion". | Panel stated "...that only six rats were used per group and that the exposure was not long term but only 6 months." But elsewhere, eg E 21, the Panel deemed as reliable shorter tests with fewer animals showing no adverse effects. Imperfections in the study were listed, and the authors quoted as saying larger studies were needed to confirm their findings. The Panel discounted the findings of 'significant changes' as if they could be unproblematically deemed as toxicologically insignificant. If they had taken the findings seriously, they should at least have called for longer-term tests on larger numbers of animals. |
|---|---|---|---|---|
| Abhilash et al | uP | 3.2.2.2 page 58 | Yes "...a significant serum increases in activities of alanine aminotransferase, aspartate amino-transferase, alkaline phosphatase and gammaglutamyl transferase." "The levels of GSH were significantly decreased" "mild vascular congestion". | Panel stated "...that only six rats were used per group and that the exposure was not long term but only 6 months." But elsewhere, eg E21, the Panel deemed as reliable shorter tests with fewer animals showing no adverse effects. The Panel cited imperfections in the study, and cited the authors arguing that larger follow-up studies were required to confirm their findings. Panel discounted all the findings, but without calling for follow-up studies. |
| 3.2.3. Genotoxicity of aspartame |  |  |  |  |
| E97 1978 | rN | 3.2.3.1 page 59 | "Aspartame was not mutagenic in this [salmonella] test system" | Salmonella test methods described as non-GLP but still accepted by Panel as reliably negative. |
| Appendix H page 207 |  |  |  |  |
| E101 1978 | rN | 3.2.3.1 page 59 | "Aspartame was not mutagenic in this [salmonella] test system" | Salmonella test methods described as non-GLP but still accepted by Panel as reliably negative. Also tester strains bearing AT mutation not used. |
| Study Year | Experiment | Parameters Analysed | Observations | Panel Comments |
|------------|------------|---------------------|--------------|----------------|
| E81 1974  | uN & Cont  | 3.2.3.1 page 59     | "...the host-mediated assay revealed no evidence for mutagenicity" | "The Panel noted some discrepancies in description of doses in different sections of the report and that the test system employed has not received further validation and is presently considered obsolete and therefore, the results of the study were not included in the assessment." But which other test systems have been 'validated', and what is to count as validation? |
| Cont      | Appendix H page 210 | Yes | Host mediated assay in mice. Methods thought sufficiently robust! |
| E40 1973  | rN         | 3.2.3.1 page 59     | The parameters analysed: paternal growth, maternal pregnancy rate, uterine and ovary examination data and incidence of foetal deaths were not affected by aspartame. | |
| E41 1973  | rN         | 3.2.3.1 page 59     | The parameters analysed "paternal growth, maternal pregnancy rate, uterine and ovary examination data and incidence of foetal deaths" were not affected by aspartame | |
| E43 1972  | rN         | 3.2.3.1 page 59     | "...did not increase the normal [chromosome] aberration frequencies compared to the control rats. The authors concluded that aspartame was not mutagenic." | "The Panel considered that the methods implemented were sufficiently robust to support the results reported, but considered the study limited since mitotic indices were not reported." |
| E12 1970  | uN         | 3.2.3.1 page 60     | "Aspartame was reported not to induce chromosome aberrations in bone marrow or spermatogonial cells" | Panel comments that "the dose levels applied were reported inconsistently" "The Panel considered that the reported results of this study were not supported by the outcome of the methods applied" |
|           | Appendix H page 210 | Yes | Chromosome aberrations in bone marrow erythrocytes and spermatogonial cells. Inconsistent reporting of dose levels plus other experimental problems. "...methods implemented were thought not to be sufficiently robust to support the results reported." |
| Study Reference | Studies | Page | Summary |
|-----------------|---------|------|---------|
| E44 1972        | uN & Cont | 3.2.3.1 page 60 | "No statistically significant effects on mutation frequency were noted in the treatment groups, as compared to the control. Rats, host mediated assay. "The Panel noted that the test system employed has not received further validation and it is presently considered obsolete, and therefore the results of the study were not included in the assessment." |
| Cont            | Appendix H page 210 | | "...methods thought sufficiently robust" |
| NTP 2005        | rN      | 3.2.3.2 page 60 | "No mutagenicity was detected in strains TA98, TA100, TA1535, TA1537 or TA97" "The authors of the study judged the small increase in mutant colonies with 30% rat liver S9 as equivocal." Salmonella test. Tester strain bearing AT mutation not used. Small increase with one strain, deemed equivocal by NTP authors and consequently was discounted. |
| Rencuzogullari et al 2004 | uN | 3.2.3.2 page 60 | "No mutagenicity was observed." Salmonella test, major deviations from OECD guideline so "...methods implemented were not sufficiently robust to support the results reported". |
| Rencuzogullari et al 2004 CA | uP | 3.2.3.2 page 60 | Yes, chromosomal aberrations at high dose of 2000 microgrammes/Litre. Human lymphocytes, 3 tests. Panel noted several flaws and overall: "...the Panel considered the experimental findings reported in this study of limited relevance for aspartame risk assessment." |
| Rencuzogullari et al 2004 MN | uP | 3.2.3.2 page 60 | Yes, micronuclei chromosomal damage at high dose of 2000 microgrammes/Litre. |
| Rencuzogullari et al 2004 SCE | uN | 3.2.3.2 page 60 | Yes, SCE "...methods implemented were thought not to be sufficiently robust to support the results reported." |
| Jeffrey and Williams 2000 | rN | 3.2.3.2 page 60 | Aspartame was found to be negative in this assay" rat hepatocyte/DNA repair assay. |
| Rencuzogullari et al 2004 SCE | Appendix H page 208 | | Yes, SCE |
| Yes, SCE | | | |
| Yes, chromosomal aberrations. | | | |
| Yes micronuclei | | | |
| Yes, SCE | | | |
| Study                                    | Species | Design | Page | Summary                                                                 | Comments |
|------------------------------------------|---------|--------|------|-------------------------------------------------------------------------|----------|
| Durnev et al 1995                        | uN      | 3.2.3.2 page 61 | "...aspartame did not induce any increase in the incidence of chromosomal aberrations." | CA in BME, mice, "Study poorly reported" no positive control, inadequate sampling "...the Panel considered that the methods implemented were not sufficiently robust to support the results reported." |
| Mukhopadhyay et al 2000                  | uN      | 3.2.3.2 page 61 | "...blend of the two sweeteners showed a negative outcome for chromosomal aberrations." | CA in mice, blend of sweeteners and no mitotic index determination, so not deemed relevant for evaluation of aspartame. |
| NTP 2005 micronucleus                    | rN      | 3.2.3.2 page 61 | "No increase in the number of micronucleated polychromatic erythrocytes was observed." | Male rat micronucleus test in BME. Deviation from OECD guidelines - time and type of animal used. Panel thought "methods sufficiently robust to support the results." |
| NTP 2005 (p53-haploinsufficient)         | uP in p53-haploinsufficient, but rN in other mice strains | 3.2.3.2 page 61 | Yes, female p53-haploinsufficient | PB Micronucleus test, transgenic mice, 9 months, p53 haploinsufficient "The Panel concluded that the findings were equivocal in the p53 transgenic strain (positive in female but not in male p53 haploinsufficient mice) but negative in the other two strains, and, overall, did not indicate a genotoxic potential for aspartame." |
| NTP 2005 (TG.AC hemizygous)              | rN      | 3.2.3.2 page 61 | Yes | PB micronucleus test, transgenic mice, 9 mths, TG.AC hemizygous |
| NTP 2005 (CDkn2A deficient)              | rN      | 3.2.3.2 page 61 | Yes | PB Micronucleus test, transgenic mice, 9 months, Cdkn2a deficient |
|                                           |         | Appendix H page 212 | Yes | PB Micronucleus test, transgenic TG.AC hemizygous. Panel considered study robust but deviations from guidelines and no +ve control. |
|                                           |         | Appendix H page 212 | Yes in females | PB Micronucleus test, tg p53 haploinsufficient. Panel considered study robust but deviations from guidelines and no +ve control. |
|                                           |         | Appendix H page 212-213 | Yes | PB Micronucleus test, Tg Cdkn2a deficient. Panel considered study robust but deviations from guidelines and no +ve control. |
| Study                        | Type | Page | Notes | Details                                                                 |
|------------------------------|------|------|-------|-------------------------------------------------------------------------|
| Sasaki et al 2002            | rN   | 62   |       | "...did not induce any significant increases in DNA migration."        |
|                              |      |      |       | Comet using: "...a single dose of aspartame (2000 mg aspartame/kg bw) to mice (four male/group) and analysed the stomach, colon, liver, kidney, bladder, lung, brain, bone marrow. Aspartame did not induce any significant increases in DNA migration. Based on these results, the Panel considered that aspartame was not genotoxic in the organs assayed." Even though this study administered only one dose, and only tested 4 mice, and the observed DNA migration was deemed not 'significant', so the panel deems this very weak study to be a reliable negative. |
|                              |      |      |       | Appendix H page 213                                                   |
| Bandyopadhyay et al 2008     | uP   | 62   | Yes   | "increases of DNA damage evaluated...were small and no historical control values were reported and used to exclude possible spontaneous biological fluctuations... Therefore, the Panel considered that the methods implemented were not sufficiently robust to support the results reported in the study, and that no conclusion could be drawn from it....methods implemented were not sufficiently robust to support the results reported."  
**Perhaps the most generous judgement in the entire report.** |
|                              |      |      |       | Comet assay. r=4. ANS panel said: "...increases of DNA damage evaluated...were small and no historical control values were reported and used to exclude possible spontaneous biological fluctuations... Therefore, the Panel considered that the methods implemented were not sufficiently robust to support the results reported in the study, and that no conclusion could be drawn from it....methods implemented were not sufficiently robust to support the results reported."  
**Ie despite fewer shortcomings than eg Sasaki 2002, the positive results were discounted and deemed as a false, or at any rate an unreliable, positive.** |
|                              |      |      |       | Appendix H page 213                                                   |
| Kamath et al 2010            | uP   | 62   | Yes   | "...methods thought not to be sufficiently robust"                    |
|                              |      |      |       | Comet assay. Deviations from recommended protocol x 2 "...methods thought not to be sufficiently robust" |
|                              |      |      |       | Appendix H page 213                                                   |
| AlSuhaibani 2010 CA          | uP   | 62   | Yes, CA | "methods thought not to be sufficiently robust"                       |
|                              |      |      |       | Deviations from guidelines x 5 "...methods implemented were not sufficiently robust to support" |
| Author(s)  | Ref. | Section | bool | Reference | Page | Result | Comments |
|------------|------|---------|------|-----------|------|--------|----------|
| AlSuhaibani 2010 | uN | Appendix H page 214 | Yes, SCE | "...the methods were thought not to be sufficiently robust" |
| Karikas et al 1998 | uP | 3.2.3.2 page 63 | A non-covalent interaction of excess aspartame, aspartic acid and phenylalanine with calf thymus DNA. | "The Panel considered these findings...of minimal relevance for the evaluation of the genotoxic potential of aspartame." |
| Meier et al 1990 | uP | 3.2.3.2 page 63 | Yes, the nitrosation products displayed an 'alkylating' activity in vitro. | Nitrosation is important because it has been implicated in some mechanisms of carcinogenesis."...the Panel noted the harsh conditions utilised for the in vitro nitrosation of substrates and considered the results of doubtful relevance for the assessment of the genotoxic risk posed by the dietary intake of aspartame" |
| Shephard et al 1993 | uP | 3.2.3.2 page 63 | Yes, The nitrosation products of aspartame exhibited a direct mutagenic activity. | "...the Panel noted the harsh conditions utilised for the in vitro nitrosation of substrates and considered the results of doubtful relevance for the assessment of the genotoxic risk posed by the dietary intake of aspartame..." |
| E75 1974 | uP | 3.2.4.1 page 64 | Yes, the relative weight of the heart to the thyroid was increased in females in both the high (4000mg/kg bw/day) and the low dose (1000mg/kg bw/day) groups. The panel refers to that as: "Random fluctuations reaching statistical significance were observed occasionally ...Body weight gain for the male mice at all dose levels was significantly lower than that for the male controls." | Mice, n=36/gp. NOAEL = 4000mg/kg bw/day, organ weights unaffected except for dose effects on heart/thyroid in females. "The authors concluded that aspartame, administered to the mouse for 104 weeks in the diet at dose levels of 1000, 2000 and 4000 mg/kg bw/day exhibited no adverse effects regarding survival rate, and that there was no evidence of an effect with respect to the incidence of neoplasms or with regard to non-neoplastic changes in any organ or tissue. The Panel agreed with this evaluation and identified a NOAEL for this study of 4000 mg/kg bw/day, the highest dose level tested." |
| Study Reference | Study Design | Study Type | Summary |
|-----------------|--------------|------------|---------|
| E33-34 1973     | ELhigh       | 3.2.4.1 page 64 | Yes (> NOAEL) Females of the 8000 mg/kg bw/day group showed statistically significant lower survival rates. + other changes to lungs, ovaries, seminal vesicles, prostate, pancreas. Statistically significant adverse effects discounted as occurring only at high dose level. |
| E70 1974        | uP and ELhigh | 3.2.4.1 page 65 | Yes, growth rates for the exposed animals were comparable to growth rates of the controls except for the high dose (4000mg/kg bw/day) in males for which growth rates were significantly lower than for controls. Rats, n=40/gp. some effects, mostly dismissed by the authors. NOAEL = 4000mg/kg bw/day |
| E87 1973 (brains from E33-34 and E70) | rN | 3.2.4.1 page 66 | Yes, the panel concluded |
| Ishii et al 1981 | uP and ELlow | 3.2.4.1 page 68 | Yes. "There was a dose-dependent depression of body weight gain at 2000 and 4000 mg/kg bw/day, and at 4000 mg/kg aspartame plus DKP (3:1) in males, and at all dose levels in females...a dose-related increase in focal mineralisation of the renal pelvis in both males and females (incidences in males: control, 1/57; 1000 mg aspartame/kg bw/day, 5/55; 2000 mg aspartame/kg bw/day, 10/60; 4000 mg aspartame/kg bw/day, 15/59; incidences in females: control, 16/59; 1000 mg aspartame/kg bw/day, 23/59; 2000 mg aspartame/kg bw/day, 30/59; 4000 mg aspartame/kg bw/day, 46/60)." Rats, n=86/group, with evidence of dose-related changes. Focal mineralisation of the renal pelvis was said by the panel to be of: "...minimal toxicological significance..." NOAEL = 4000mg/kg bw/day. "...the Panel noted that the study provided information on the lack of toxicity of aspartame when administered in conjunction with DKP." But some adverse effects were evident at doses below 4000mg/kg/bw/day, so that dose level should not have been deemed to be a NOAEL. |
| E27 1972        | uN           | 3.2.4.1 page 68 | Nothing reported |

Hamsters, n=5 study, discounted for evaluation by panel because of: short duration, small numbers, infection - no (adverse) effects reported.
| Study ID     | Category | Page | Description | Results | Notes |
|-------------|----------|------|-------------|---------|-------|
| E35-36 1972 | uN       | 68   | Nothing reported | Nothing reported | Hamsters, n=5 study, discounted for evaluation by panel because of: short duration, small numbers, infection - no (adverse) effects reported. |
| E28 1972    | uN       | 69   | Yes, "...transient sporadic significant differences" in haematology and clinical chemistry findings...significant increase in excretion of urinary phenylketones | Dogs, n=5 per group. Transient sporadic differences (deemed not biologically meaningful) and "transient sporadic significant differences were reported in several of the parameters." (p 69 lines 11-12) "A significant increase in excretion of urinary phenylketones was observed in some high dose dogs at week 2, 4 and 26 of treatment, but not at all other time intervals." NOAEL deemed = 4000mg/kg bw/day. |
| E86 1973    | rN       | 69   | Dogs, brain analysis of E28 as above. Deemed reliable negative despite just n=5. | |
| E32 1972    | uP pWaisman study | 69 | Yes, grand mal seizures in lab monkeys. | The notorious Waisman monkey study. (see eg http://www.dldewey.com/columns/asparstu.htm and https://dash.harvard.edu/bitstream/handle/1/8846759/Nill_Ashley_-_The_History_of_Aspartame.html?sequence=6. 7 monkeys, 1-2 per group. Shigella and seizures! Rejected by Searle on the basis of Shigella infection. The Panel concluded that the study provided insufficent information to conclude on the chronic effects of aspartame in monkeys. But no grounds for supposing Shingella could cause grand mal seizures. John Olney and James Turner both judged that sufficient information could be drawn from this study to indicate a risk that aspartame might cauise seizures in some vulnerable people. |
| Soffritti et al 2006 | uP | 70 | Yes, increased numbers of various types of cancers. | Rats. N = 100-150 per dose groupup. The Panel used conclusions of previous evaluations of these studies and other ERF studies to conclude that "...methodological concerns…would apply to…the aspartame studies". |
| Study             | Dose Form | Section | Yes/No | Details |
|-------------------|-----------|---------|--------|---------|
| Soffritti et al 2007 | uP        | 3.2.4.2 page 70 | Yes | dose related increases in various types of cancers. Rats, n = 70-95 per dose group. The Panel used conclusions of previous evaluations of these studies and other ERF studies to conclude that "...methodological concerns...would apply to...the aspartame studies". |
| Soffritti et al 2010 | uP        | 3.2.4.2 page 71 | Yes | dose related increases in various types of cancers. Mice, n = 62-122 per dose group. The panel concluded (based on previous evaluations as well as this one) "...that the results of the studies..do not provide evidence for a carcinogenic effect of aspartame in mice." BUT while they do not provide proof they certainly provide evidence of carcinogenicity in mice. |
| NTP 2005 | rN - counted above | 3.2.4.2 page 71 | Yes | Study already listed. n=15/group. Transgenic, recorded again as looking for neoplasms. |
| E11 1971 | uP and ELlow | 3.2.5.1.1 page 72 | Yes | Reproductive and developmental toxicity of aspartame. "...the body weights at the end of weaning of both sexes at the high dose (4000 mg/kg bw/day) level to be statistically significantly lower... than those of the controls." Rats. NOAEL = 2000mg/kg bw/day, but not reported to current standards. Panel assessment of reliability - y (when used with other studies - E10, E47, E48). No - taken on its own. But many 'negative studies' not reported to current standards were deemed reliable. |
| Appendix I page 227 | | | | |
| E9 1972 | uP and ELlow | 3.2.5.1.1 page 72 | Yes | Yes. kidney - histological "...changes were treatment-related but of a transient nature." Rats. F2 generation from above study, looking at haem and biochemical. changes transient (so deemed not adverse?). NOAEL = 2000mg/kg bw/day (implies ADI ≤ 20mg/kg bw/day). No reason given why 'transient' effects are not deemed adverse; nor why NOAEL is not 2000. |
| Appendix I page 227 | | | | |
| E10 1972 | uP | 3.2.5.1.1 page 72 | Yes | "Female body weights were slightly but significantly decreased in the high dose group (fed 4000 mg/kg bw/day)." Rats. N=12 males, 40 females. significant decrease in weight! NOAEL = 4000mg/kg bw/day "...actual ingested doses ranged from 4100 mg/kg bw/day during gestation to 5900 mg/kg bw/day during the last 14 days of lactation..." Statistical significance even in small sample. |
| Study (Year) | Treatment | Study Details | Observations | Notes |
|-------------|-----------|---------------|--------------|-------|
| E39 1973    | uP and ELow | 3.2.5.1.1 page 73 | Yes. "The number of viable pups per litter at birth and pup survival until weaning was significantly decreased in the high dose group" (intended 4000 mg/kg bw/day) "During lactation, maternal body weight...in the high dose group... mean body weight was significantly lower at postpartum day 21 (approximately 12%)." | Rats. n=30. NOAEL = 2000 mg/kg bw/day during gestation, 3500 mg/kg bw/day during lactation. Panel noted that "...health status of all the animals in the study might have been compromised..." But: “According to the authors, the NOAEL in this study was 2000 mg/kg bw/day [which implies an ADI ≤ 20mg/kg bw/day]. "The Panel agreed with the author’s conclusion on the NOAEL but noted that, considering the poor survival of control pups, the health status of all the animals in the study might have been compromised.” Text said nothing about survival of control pups. |
| E88 1975    | uP        | 3.2.5.1.1 page 73 | Yes. "...two abortions reported were spontaneous..." | Monkeys. n=8, dose levels up to 3800 mg/kg bw/day, but treated as unreliable because incomplete data, no information regarding reproductive status and other factors. |
| E89 1975    | rN        | 3.2.5.1.2 page 73 | Yes. | Mice. n=36/gp. NOAEL = 5700mg/kg bw/day |
| E47 1973    | uP, Cont and ELow | 3.2.5.1.2 page 74 | Yes. High dose group, effects on various weight parameters and "...incomplete eyelid opening..." and "...body weight suppression of the pups at weaning (at postpartum day 21) in females at both low" (intended 2000mg/kg bw/day) "and high doses" (intended 4000mg/kg bw/day). | Rats. n=24/gp. High dose effects. NOAEL = 2500 mg/kg bw/day (gestation) and 3600 mg/kg bw/day (lactation). Anomaly - inconsistency between panel suggested NOAEL and results. |
| Cont        | Appendix I page 227 | Yes. | NOAEL = 2000 mg/kg bw/day |
| Study (Reference) | Treatment Type | Page | Yes/No | Details |
|------------------|----------------|------|--------|---------|
| E48 1973         | uP and Cont    | 3.2.5.1.2 page 74 | Yes, high dose | Rats. n = 36/gp. high dose effects. NOAEL = 1800 mg/kg bw/day (gestation) and 3700 mg/kg bw/day (lactation). No reason given why NOAEL was not specified as 1800 mg/kg bw/day. |
|                  |                |      |        |         |
| Cont             | Appendix I page 228 | Yes. |        | NOAEL = 2000 mg/kg bw/day. No reason given why NOAEL is not 2000 or 1800 mg/kg bw/day. |
| E49 1973         | uP             | 3.2.5.1.2 page 74 | Yes. | “...a significant decrease in body weight in the aspartame, L-phenylalanine and L-phenylalanine + L-aspartic acid groups...” |
|                  |                |      |        | Rats. n= 30/gp. “The authors of the study concluded that L-phenylalanine on its own or in combination with aspartic acid decreased maternal and pup body weight, which reproduced the observed effects of aspartame on these endpoints. The Panel agreed with the author’s conclusion but noted the poor survival of control pups.” Significant adverse effects discounted, but reasons not given. |
| E5 1970          | uP and Cont    | 3.2.5.1.2 page 74 | Yes. | Rats. n= 30/gp. Food consumption in high dose (4000mg/kg bw/day) group decreased at beginning of treatment but recovered to control levels. NOAEL = 4000mg/kg bw/day. |
|                  |                |      |        | 15% decrease in food consumption at high dose mentioned as an adverse effect. So why was that dose portrayed as a NOAEL? |
| E53 1973         | uP, Cont, ELow | 3.2.5.1.2 page 75 | y?   | Rabbits. NOAEL = 2000 mg/kg bw/day. abortions in high dose group, but that group did not receive 2000 mg/kg bw/day but less! |
| Reference | Type | Page | Yes, "...a significant decrease in fetal body weight and skeletal anomalies..." | Rabbits. "...the Panel concluded from these observations that the developmental effects on body weight and skeletal development reported in the aspartame feeding studies may be caused by the significant depression of feed consumption in the high dose group." Although: “The actual aspartame doses were reported to be 1880 and 1870 mg/kg bw/day for the intended 2000 and 4000 mg/kg bw/day groups, respectively. The Panel noted that a significant decrease in fetal body weight and skeletal anomalies were reported for the 4000 mg/kg bw/day group but not for the 2000 mg/kg bw/day group even though both groups received the same dose of aspartame based on feed intake.” But if they had the same intake then the panel’s reasoning is flawed! |
| --- | --- | --- | --- | --- |
| Appendix I page 227 | Y (with just 16 animals per group) | NOAEL = 2000 mg/kg bw/day |
| E55 1973 | uP and ELlow | 3.2.5.1.2 page 75 | Rabbits. No comments either way |
| Appendix I page 229 | Yes, at the high dose. | “Feed consumption decreased by up to 29% in the high dose group.” Nonetheless the panel portrayed 4000 mg/kg/bw as a NOAEL, but that group actually received ~ 1160 mg/kg. |
| E62 1973 | uP | 3.2.5.1.2 page 75 | Rabbits. |
| Appendix I page 229 | Yes, at high dose, with 3 fetuses of one litter open eye (considered by the authors as minor malformations). | Minor malformations at 2000mg/kg bw/day. Nonetheless ANS panel says: NOAEL = 2000mg/kg bw/day. Text in main body and in appendix conflict |
| Source   | Study Design | Page | Yes/No | Summary
|----------|--------------|------|--------|---------------------------------------------|
| E63, 1973 | uP, Cont and ELow | 3.2.5.1.2 page 75 | Yes. "There were no deaths in the pair-fed control group, two deaths in the 1400 mg/kg bw group and three deaths in the 2400 mg/kg bw group. One female in the high dose group had an early delivery. Conception rates were 96, 81 and 77 % in the control, 1400 and 2400 mg/kg bw groups, respectively." | Rabbits. n=26/gp. "There were no deaths in the pair-fed control group, two deaths in the 1400 mg/kg bw group and three deaths in the 2400 mg/kg bw group. One female in the high dose group had an early delivery. Conception rates were 96, 81 and 77 % in the control, 1400 and 2400 mg/kg bw groups, respectively." |
| Cont     | Appendix I page 229 | | | No comment, but states: NOAEL=2400 mg/kg bw/day. Text in main body and in appendix conflict with each other. |
| E51 1973 | uP, Cont and ELow | 3.2.5.1.2 page 76 | Yes. The administration of aspartame was associated with depression of feed consumption by up to 40%. | "The authors concluded that no embryotoxic or teratogenic effects were observed." |
| Cont     | Appendix I page 230 | | Yes | "GD 6-18: pregnant animals: 5,11 Deaths: 4,9 , Abortions: 1,2" "Study confounded by poor health and gastric intubation technique issues; high maternal mortality; depression of feed consumption by 40% compensated by pairfeeding of controls... Very low pregnancy rate. Authors mention infectious pulmonary disease and dosing errors. No malformations. But authors conclusions did not reflect the data."
| E52 1973 | uP, Cont and ELow | 3.2.5.1.2 page 76 | "The authors concluded that no embryotoxic or teratogenic effects were observed." | Rabbits. n=72/gp "...maternal mortality due to poor health and the gavage technique issues..." |
| **Cont** | **Appendix I page 230** | **Yes. 0.2000 mg/kg bw/day”...pregnancy rate decreased in high dose group; depression of feed consumption by up to 62% compensated by pair-feeding...”** | **NOAEL = 2000 mg/kg bw/day although: “Study confounded by poor health and gastric intubation technique issues; pregnancy rate decreased in high dose group; depression of feed consumption by up to 62% compensated by pair-feeding.”** |
|-----------|--------------------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| **E79 1974** | **uP, Cont and ELlow** | **3.2.5.1.2 page 76** | **“The authors concluded that no embryotoxic or teratogenic effects were observed.”** |
| **Cont** | **Appendix I page 230** | **Y “Major malformations in 7 fetuses of high dose group” – findings not mentioned on page 76** | **NOAEL = 750 mg/kg bw/day** |
| Study                                    | Species | Treatment | Page/Section | Findings                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|---------|-----------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E90 1975                                | uP and ELow | 3.2.5.1.2 page 76 | Yes. “A number of animals died spontaneously during the study… mainly due to misdosing. … No abortions were detected in the control, mid dose and L-aspartic acid groups, two abortions in the low dose aspartame group and 24 abortions were observed in the high dose aspartame group (a significant increase compared to controls) and four in the L-phenylalanine group” | Rats. “…contained a sufficient number of animals for the evaluation of developmental toxicity” high dose effect. NOAEL = 1000mg/kg bw/day. A number of animals died spontaneously during the study… mainly due to misdosing. … No abortions were detected in the control, mid dose and L-aspartic acid groups, two abortions in the low dose aspartame group and 24 abortions were observed in the high dose aspartame group (a significant increase compared to controls) and four in the L-phenylalanine group. … Since the decrease in body weight started several days before (13 and 18 days) the abortions (28 days), the authors concluded that abortion was a consequence of significant and rapid body weight loss caused by decreased feed intake. |
| Brunner et al 1979                      | ELhigh  | 3.2.5.2.1 page 78 | Yes, at high doses, 5,000 mg/kg bw/day; 6000; 9,000. “Increased offspring mortality was observed in rats fed the highest aspartame dose and in the phenylalanine-exposed animals.” | Rats, reproduction study, number of rats not stated. Adverse effects reported in original Brunner study, but “…the Panel agreed with Brunner et al” that the adverse effects only occurred at highest doses, but sample size was small so cannot provide reassurances at lower doses. |
| Lennon et al 1980                       | uN      | 3.2.5.2.1 page 78 | “There were no differences noted in the number of rats that became pregnant.” | Study funded by US FDA. Rats, 6 per group, post coital fertility, followed for just 7 days. “The Panel noted that the number of animals used in these studies was small.” |
| Lennon et al 1980                       | uN      | 3.2.5.2.1 page 78 | “...no differences were reported in implantation and regression of corpora lutea.” | Hamsters, 5 per group, post coital fertility, followed for just 7 days. “The Panel noted that the number of animals used in these studies was small.” |
| Mahalik and Gautieri 1984               | uP      | 3.2.5.2.2 page 79 | Yes, “…the achievement age for visual placing was significantly delayed, in a dose-dependent manner, in both groups of treated animals.” | Mice, number not reported. “The Panel noted that uncontrolled litter size and pup weight were not taken into consideration and performance of the offspring was assessed only the last day of achievement for the entire litter.” |
| Study                          | Species | Reference | Page | Summary                                                                                                      | Notes                                    |
|-------------------------------|---------|-----------|------|----------------------------------------------------------------------------------------------------------------|------------------------------------------|
| McAnulty et al 1989           | Mice    | uP & ELow | 79   | "Time of eye opening was statistically significantly later than control at the lowest and highest doses (14.3 ± 0.15 for both doses vs. 14.8 ± 0.15 in controls), as well as the development of the visual placing which was statistically significantly lower than control at the lowest dose of 500 mg aspartame/kg bw/day (18.8 0.28 vs. 20.5 ± 0.40 in controls)." | Mice, 20/group. Significant changes, but authors concluded not biologically meaningful, and the panel agreed. "Time of eye opening was statistically significantly later than control at the lowest and highest doses (14.3 ± 0.15 for both doses vs. 14.8 ± 0.15 in controls), as well as the development of the visual placing which was statistically significantly lower than control at the lowest dose of 500 mg aspartame/kg bw/day (18.8 0.28 vs. 20.5 ± 0.40 in controls). The authors considered these findings as isolated points that may vary in either direction. They were not dose-related and as such, the results were not considered to be biologically meaningful. " Discounted as non-monotonic dose-response relationship. |
| Holder 1989                   | Rats    | rN        | 79/81| "...findings indicated to the authors that spatial memories, as well as motor and visual components of these tasks were not affected by perinatal exposure to aspartame."          | Rats, n=10/group. "The authors concluded that exposure in utero and later directly of the pups did not affect reflex development, morphological development and spatial memory. The Panel agreed with the conclusion of the authors." |
| NTP-CERHR Report 2003         | Monkeys | rN & ELow | 79   | Yes.                                                                                                         | Monkeys, NOAEL = 2500-2700 mg/kg bw/day (highest dose tested). not known how many. |
| Collison et al 2012a          | Mice    | uP        | 80   | "The authors concluded that aspartame exposure might promote hyperglycaemia and insulin intolerance, and MSG might interact with aspartame to impair further glucose homeostasis." | Mice, n= 12-18/group. MSG study too. Panel noted problems with mouse strain used and no dose response assessed, and other reasons for negating outcome including data from Anton et al 2010 which were ".short term preliminary interventional trials." |
| Study Authors         | Study Type | Study Details                                                                 | Results                                                                 | Study Species          |
|----------------------|------------|-------------------------------------------------------------------------------|------------------------------------------------------------------------|------------------------|
| Collison et al 2012b | uP         | 3.2.5.2.2 page 80 Yes. The authors of the study concluded that lifetime exposure to aspartame, commencing in utero, might affect spatial cognition and glucose homeostasis in Cont7BL/6J mice, particularly in males. | Panel noted problems with the method reporting, no dose response assessed and statistical procedures. The Panel noted that the selection method of pups for several tests was not clearly reported by Collison et al and that only one dose level was used thus rendering any assessment of dose-response relationship impossible. The Panel noted that the findings in mice reported by Collison et al (2012 b) might not apply to other species, since in a large study on Sprague-Dawley rats (Holder, 1989) performances on radial-maze and milk maze was similar for rat pups given aspartame at doses from 14 to 1614 mg/kg bw/day or phenylalanine at a dose of 835 mg/kg bw/day compared to controls. | Mice, n=12-18/gp. |
| Lennon et al 1980    | ELhigh     | 3.2.5.2.2 page 81 Yes “Feed consumption and body weights were significantly lower in dams fed 7.5 and 14 % aspartame diets on day one and throughout the experiment (e.g. body weight reduction by up to 65%).” (9110 and 8830 mg/kg bw/day) | “…no effects...at doses up to 7120mg/kg bw/day on feed consumption, dam and pup body weight, pup survival and mammary gland histology” | Rats, n=60. High dose effects. NOAEL = 7120 mg/kg bw/day. |
| Ranney et al 1975    | uP         | 3.2.5.2.2 pages 81-82 Significant increases to "Maternal plasma phenylalanine and tyrosine levels" and "Fetal plasma tyrosine was significantly higher in aspartame-fed animals compared to controls..." and other changes too. | Yes | Rabbits, n=30. Significant increases to "Maternal plasma phenylalanine and tyrosine levels" and "Fetal plasma tyrosine was significantly higher in aspartame-fed animals levels" and other changes but the ratios between concentrations changed little, so level changes were discounted by the authors "The authors concluded that the treatment of pregnant rabbits with a high dose of aspartame did not affect the transport of phenylalanine and tyrosine across the placental membrane since the ratios of fetal/maternal plasma amino acid concentrations were unaffected by the treatment." | Rabbits, n=30. |
| Study Details | Dose Details | Key Details | Notes |
|---------------|--------------|-------------|-------|
| E94 year not reported | uP | Yes. Original typescript of report stated p. 5: "Major lesions...were largely confined to mid-line structures, namely the hypothalamic arcuate nucleus, the subfornical organ and the area postrema." | Mice. No results described in report. "The Panel however noted that the design of the study was not adequately described and no control group was included, and, therefore, this study was considered not relevant for the overall risk assessment." |
| Reynolds et al 1976 | uP | Yes | Reported by the ANS panel as a study on mice. No results were described in the ANS’s report. The Panel "...noted the absence of control animals in the study and therefore did not take this study into consideration." But the paper was mis-reported by ANS panel. It was not simply a study of aspartame with mice, it tested both aspartame and msg in both neonatal mice and infant macaque monkeys. In effect the MSG and the aspartame groups were used as if controls in relation to each other, as the purpose of the study was primarily comparative. Moreover the authors said, when comparing the effects of aspartame with those caused by consuming msg: "The lesion encountered at 2 g/kg of aspartame is quite similar to what is seen in a neonatal mouse treated at 0.5 g/kg MSG..." (p 476) G D Searle funded this study. |
| E14 1972 | uP, ELhigh | Yes, at the high dose. “For the high dose groups (5 % phenylalanine and 9 % aspartame), statistically significantly [emphasis added] in groups of 32 animals] impaired learning performances were reported (i.e. conditioned or nondiscriminated avoidance responses).” (6100mg/kg bw/day (male); 6900mg/kg bw/day (female)) | Yes, at lower dose. The ANS panel discounted evidence of adverse effects as they were only reported at doses > 4000 mg/kg bw/day. |
| Reference          | Type | Page | Notes                                                                 |
|--------------------|------|------|----------------------------------------------------------------------|
| Beck et al 2002    | uP   | 83   | Yes. "...aspartame treated rats gained less body weight than controls" (p<0.02)...the level of hypothalamic neuropeptide Y in the arcuate nucleus (but not in other parts of the brain) was significantly lower in aspartame-treated rats than in controls by 23.2% (p < 0.02)." |
| Christian et al 2004 | uP   | 83   | Yes. "From day 90 onward, latencies of the aspartame group increased which the authors interpreted as a sign of memory loss." |
| Puica et al 2008   | uP   | 83   | Ultrastructural damage, described as "...selective degeneration of all subcellular neurons ultrastructures both in CA1 pyramidal neurons of the hippocampus and ventromedial area of the hypothalamus..." was reported in rabbits. |
| Puica et al 2009   | uP   | 83   | Ultrastructural damage, described as "...selective degeneration of all subcellular neurons ultrastructures both in CA1 pyramidal neurons of the hippocampus and ventromedial area of the hypothalamus..." was reported in rats. |
| E104 1979          | rN   | 83   | Yes. Monkeys, n=2-6/gp. These 3 studies are grouped together and "...the panel noted that the design of the study is inappropriate to evaluate effectively any potential neurotoxic effects of aspartame." |
| Reynolds et al 1980 | rN   | 83   | Yes. |
| E105 year not reported | rN | 3.2.6.1 page 83 | Yes | Three reviews of the neurotoxicity of aspartame concluded that the data obtained from the extensive investigations of the potential neurotoxic effects due to aspartame consumption did not support the hypothesis that aspartame present in the human diet would cause any impairment of the neuronal function, learning or behaviour. "The Panel agreed with their conclusions." The guidelines have criteria for inclusion/exclusion which state "Types of studies that were considered within the criteria for inclusion in the selection process: a) Experimental studies b) Epidemiological studies in humans, c) Case reports supported by medical evidence." But unclear about inclusion of reviews. One question is whether other reviews should also have been included? Citing SCF 2002 and EFSA 2010 are examples of 'institutional inertia', ie an institution never criticising its prior judgements or those of its predecessors. |
|------------------------|----|----------------|-----|--------------------------------------------------|
| Magnuson 2007          | rN | 3.2.6.1 page 84| Yes | EFSA agreed with EFSA, an example of institutional inertia. |
| EFSA 2010 Review       | rN | 3.2.6.1 page 84| Yes | EFSA agreed with its predecessor, an example of institutional inertia. |
| SCF 2002 Review        | rN | 3.2.6.1 page 84| Yes | EFSA agreed with EFSA, an example of institutional inertia. |
| E15 1972               | uN | 3.2.6.2 page 84|     | Rats. "The Panel noted that the findings have minimal relevance for human risk assessment." But no reasons were given. |
| Tutelyan et al 1990    | uP | 3.2.6.2 page 84| Yes | Rats. The Panel noted that the findings have minimal relevance for human risk assessment. But no reasons were given. |

...no acute effect on hepatic cytochrome P450 (CYP)-mediated xenobiotic metabolism...
| Study                          | Type | Page   | Yes/No | Summary                                                                                                                                                                                                 | Additional Info                                                                 |
|-------------------------------|------|--------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Vences-Mejia et al 2006       | uP   | 3.2.6.2| Yes    | “…bands corresponding to CYPs 1A1, 1A2, 2B, 3A2 were detectable in the cerebrum and cerebellum samples brain samples after aspartame treatment (but not in the control samples) and increases in all the enzyme activities were reported.” | “The Panel noted that the findings have minimal relevance for human risk assessment.” But no reasons were given. |
| Alleva et al 2011             | uP   | 3.2.6.3| Yes    | Transient increases in the inflammatory cytokine IL-6 and the growth factor VEGF-A were also observed in the HUVEC cells following treatment with aspartame. This increase coincided with a temporary induction of ROS in HUVEC cells but not in IMR-90 fibroblasts thus concluding that generation of ROS is related to the target.” | In vitro model. The panel concluded the study was not relevant; no controls in either part. The Panel noted that production of ROS could not be attributed to specific cell types but rather a general phenomenon. Furthermore, the authors did not evaluate the fate of aspartame in culture medium ascertaining whether it was hydrolysed to its usual metabolites or remained intact. For induction of angiogenesis, no positive and negative controls were reported. Therefore, the findings reported might be ascribed specifically to the conditions of the study. For these reasons, the Panel considered that this study was not relevant for the risk assessment of aspartame. |
| Haque and Mozaffar 1993        | uN   | 3.2.6.3|        | The study authors concluded that aspartame does not affect AChE activity.                                                                                                                                   | Mice, n=42/group. Effects on acetylcholine esterase (AChE). "The Panel noted that there was an error in authors’ calculation of aspartame daily consumption dose, because applying EFSA’s conversion factor (EFSA Scientific Committee, 2012) gives a daily dose of 2150 and 1690 mg/kg bw for females and for males respectively." |

|----------------------|--------|------|---------|
| Simintzi et al 2007a | Yes    | 3.2.6.3 page 85 | In vitro model. The panels says: “...the authors concluded that AChE activity could be reduced by aspartame metabolites after ingestion of very high amounts of aspartame. Metabolites derived from a realistic beverage consumption of aspartame does not affect AChE activity. The Panel, noting the unrealistic high doses of aspartame metabolites assumed to be present in CSF and several assumptions and speculations that were applied to explain the effect on AChE activity, considered that no conclusions can be drawn from these studies. The Panel concluded that these studies are of no relevance for aspartame risk assessment under realistic use conditions.” (p 85) (emphasis added) |
| Simintzi et al 2007b | Yes    | 3.2.6.3 page 85 | In vitro model. Ache, dismissed because of assumptions and speculations. Panel deemed this study of “no relevance” under “realistic use conditions” |
| Kim et al 2011       | Yes    | 3.2.6.3 page 86 | Zebrafish. n=70. ANS Panel report stated: “No effect of aspartame on survival was observed.” …but it did cause an ‘inflammatory response’ Kim JY, Seo J and Cho KH, 2011 stated: “Aspartame-fed zebrafish exhibit acute deaths with swimming defects and saccharin-fed zebrafish have elevation of cholesteryl ester transfer protein activity in hypercholesterolemia.” Food and Chemical Toxicology, 49, 2899-2905. Original paper suggested that aspartame on its own did not show adverse effects, but had serious adverse effects when combined with high cholesterol diet. Study mis-reported by the ANS panel. |

|----------|--------|------|---------|
| Halldorsson et al 2010 | uP | 3.2.7.1 page 86 | Yes. "Statistically significant trends were found in the risk of pre-term delivery with increasing consumption of artificially sweetened drinks (both carbonated and non-carbonated), but not for sugar-sweetened drinks." |

Retrospective epidemiological study: 1996-2002. Limitations mentioned, replication suggested by authors. Panel agree with authors that replication was required, implying that it agreed with authors that their study had major strengths (p 87, para 5, first line), and that there were no important flaws in the methods used. However, panel speculated that risk estimates may have been inflated by residual confounding (including by year of delivery). No account was taken of other dietary sources of methanol, and use of aspartame specifically was not distinguished from that of other artificial sweetener). Therefore, given these limitations, the Panel agreed with the authors who concluded that replication of their findings in another setting was warranted. However, if the findings were treated as reliable the conclusion of the section and the report would have been conspicuously different, but the panel concluded: "Overall, currently available epidemiological data do not suggest that consumption of artificially sweetened soft drinks is a cause of pre-term delivery." (p 88) The panel did not set a temporary ADI contingent upon attempts to replicate the findings.
| Study                                      | Type | Page | Summary                                                                 | Details                                                                                                                                 |
|-------------------------------------------|------|------|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Englund-Ögge et al 2012                   | uP   | 3.2.7.1 page 87 | Yes. Small elevations of risk [for pre-term delivery] were observed with higher consumption of artificially sweetened soft drinks, but after adjustment for covariates, these reached statistical significance only when categories of consumption were aggregated to four levels, and then the odds ratio for the highest category (≥ 1 serving/day) was only 1.11 (95 % CI 1.00-1.24) in comparison with non-consumption. | 1999-2008 “Both Halldorsson et al. (2010) and Englund-Ögge et al. (2012) studies appear to have been well designed and conducted. Noting this, the Panel concluded that even at high levels of exposure to artificially sweetened soft drinks the risk of pre-term delivery is likely to be small, if any. The observed associations could be a consequence of uncontrolled residual confounding, and the inconsistencies in the patterns of association reinforce this uncertainty.” The panel interprets Englund-Ögge et al as refuting Halldorsson et al and being a replication rather than the other way round, and acknowledging that they were overlapping studies. The panel did not set temporary ADI contingent upon attempts to replicate the findings. |
| La Vecchia 2013 - meta-analysis of Halldorsson et al (2010) and Englund-Ögge et al (2012) | uP   | 3.2.7.1 page 88 | Yes, also sugar sweetened. | Meta analysis of above 2 studies, but elevated risk was evident with sugar sweetened drinks too! Panel said: “The analysis indicated similarly elevated risks of pre-term delivery with higher consumption both of sugar-sweetened and of artificially sweetened drinks. This lack of specificity in the associations again points to possible residual confounding. Currently available epidemiological data do not suggest that consumption of artificially sweetened soft drinks is a cause of pre-term delivery.” (p 88) |
| Maslova et al 2013                         | uP   | 3.2.7.1.2 page 88 | Yes, increased risk of asthma. | Asthma, “…weakly suggestive of hazard…” Limitations mentioned, further exploration suggested. “Because in epidemiological terms, the elevations of risk were only small and inconsistent, the findings from this study can only be considered weakly suggestive of hazard i.e. an association between the consumption of artificially sweetened beverages during pregnancy and the diagnosis of asthma or allergic rhinitis in children. Before a final conclusion can be reached with regard to aspartame, the findings need to be explored further with more detailed assessment of exposure to specific artificial sweeteners.” |
| Study                        | Type | Page | Yes/No | Findings/Notes                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|------|------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardell et al 2001           | uP   | 89   | Yes    | "Non-significant elevations of risk were observed for consumption of such drinks in relation to brain tumours overall (OR 1.24, 95% CI 0.72-2.14) and malignant brain tumours specifically (OR 1.70, 95% CI 0.84-3.44). "Non-significant elevations of risk were observed for consumption of such drinks in relation to brain tumours..." with odds ratio higher than for any other parameter. The ANS panel commented that: "The study had a high response rate, but was limited by its relatively small size, the basic assessment of exposure (low-calorie drinks were the only source of aspartame investigated in this study), and the potential for recall bias (because cases knew that they had a brain tumour) all of which could have led to spurious inflation of risk estimates." But the authors reported a 24% increased risk for regular consumption of artificially-sweetened beverages compared to non-consumers, which was very close to being statistically significantly. The fact that the odds ratio was lower than for other parameters is irrelevant, given that the authors chose to study factors strongly suspected to increase cancer risks. Moreover, the fact that the study only gathered data on the consumption of artificially-sweetened beverages, rather than all sources of aspartame intake, strengthens the evidence rather than weakens it. |
| Bunin et al 2005              | uP   | 89   | Yes    | "...no significant elevations of risk..." although there was a significant trend before adjustment.                                                                                                                                                                                                                                          |
| Gallus et al 2006            | uN   | 90   |        | "...the results do not suggest a hazard for the cancers studied"                                                                                                                                                                                                                                                                              |

| Shaywitz et al 1994a         | rN     | 96   | "The authors did not observe any significant effect of aspartame administration on cognitive, attentive or behavioural testing" | Children with ADD, n=15, changes to phenylalanine deemed 'acceptable'. |
| Roshon and Hagen 1989        | rN     | 96   | "...did not find any significant difference in locomotion, task orientation and learning" | N = 6 of each sex |
| Saravis et al 1990           | rN     | 97   | "...did not have a detrimental effect on learning, behaviour and mood in children." | Number not given |
| Lapierre et al 1990          | rN     | 97   | "No significant differences... were found in measures of sedation, hunger, headache, reaction-time, cognition or memory" | N=10, changes to phenylalanine levels deemed acceptable. |
| Ryan-Harshman et al 1987     | rN     | 97   | Neither phenylalanine nor aspartame altered mean energy intakes or macronutrient selection nor caused any behavioural effects. | N=13/group |
| Pivonka & Grunewald 1990     | rN     | 97   | "The only observed effect was increased sleepiness following the consumption of sugar-sweetened beverages." | N=120 |
| Stokes et al 1991            | rN     | 97   | "...no detectable performance decrements were associated with the exposure to aspartame" | N=12 |
| Stokes et al 1994            | rN     | 97   | "...no significantly impaired performance on flight-relevant cognitive tasks were observed..." | Apparent improvement in aviation-relevant cognitive task after aspartame |
| Walton et al 1993            | uP     | 97   | Yes. "...there was a significant difference in the number and severity of self-scored symptoms between aspartame and placebo in the patient [depressed] group." | The methodology was a randomised double-blind cross-over challenge study, ie it was designed to use a 'gold standard' methodology. It aimed to test 40 patients with depression and 40 without. It was stopped after just 13 patients had been tested. Small numbers, but adverse reactions of 3 patients caused test to be stopped. Given the statistically significant evidence evidence generated by this study, and the uncertainties attending it, it is puzzling that the ANS panel failed to call for further studies; on this issue or on any other. |
| Study            | rN | Page | Summary                                                                                                                                                                                                                                                                                                                                 |
|------------------|----|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spiers et al 1998|rN  | 98   | "...no neuropsychologic, neurophysiologic and behavioural effects linked to aspartame consumption were observed."                                                                                                                                                                                                                       |
| Camfield et al 1992| uP | 98   | Yes. "The authors reported that following the consumption of aspartame but not of sucrose, the total duration of spike-wave discharge per hour was significantly increased and concluded that aspartame appeared to exacerbate the amount of EEG spike wave in children with absence seizures."                                                                                   |
| Shaywitz et al 1994b|rN  | 99   | "...there was no difference in the occurrence of seizures between aspartame and placebo exposure."                                                                                                                                                                                                                                    |
| Rowan et al 1995  | rN  | 99   | "The authors reported no seizures or other adverse effects from aspartame ingestion."                                                                                                                                                                                                                                                  |

Panel noted limitations to all studies in Section 3.2.7.4 but concluded "...no evidence that aspartame affects behaviour or cognitive function in children or adults."

"The Panel noted that the changes in the plasma phenylalanine levels in the studies described above (Shaywitz et al, 1994b; Rowan et al, 1995) were consistent with those in the toxico-kinetic studies. Overall the Panel concluded that the available data did not provide evidence for a relationship between aspartame consumption and seizures." (p 99)
| Study                        | Type | Section | Yes/No | Description                                                                                                                                                                                                 | N  |
|------------------------------|------|---------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| Schiffman et al 1987         | rN   | 3.2.7.6 page 99 | Yes    | "The authors reported that the incidence rate of headache after consumption of aspartame (35%) was not significantly different from that after placebo (45%)."                                                                 | 40 |
| Koehler and Glaros 1988      | uP   | 3.2.7.6 page 99, 101 | Yes, "...a significant increase in the frequency of migraine headaches from the placebo to the aspartame treatment (mean number of migraines per subject: 1.72 (baseline phase), 1.55 (placebo phase), and 3.55 (aspartame phase)." | 11 |
| Lipton et al 1989            | uP   | 3.2.7.6 page 99, 101 | Yes. "About 8% reported aspartame as a trigger of headaches compared to 2.3% for carbohydrates, and to about 50% for alcohol."                                                                 | 171|
| Van den Eeden et al 1994     | uP   | 3.2.7.6 page 100, 101 | Yes. "The authors concluded that a small subset of the population may be susceptible to headaches induced by aspartame."                                                                 | 32 |
“Overall, the panel noted that because of the limitations of the studies it is not possible to conclude on a relationship between aspartame consumption and headaches.” Then on p101 “Although the results of a questionnaire-based study (Lipton et al., 1989) and two double-blind out-patient investigations (Koehler and Glaros, 1988; Van den Eeden et al., 1994) employing daily doses of up to 30 mg/kg bw/day indicated a potential association between aspartame intakes and headache, it is still not possible to deduce causality, as the effect of diet has not been adequately controlled for and the interpretation of the data was complicated by a high dropout rate and a limited experimental design.” (emphasis added)

| Study                  | Design | Page | Finding                                                                 | Method                                                   |
|------------------------|--------|------|------------------------------------------------------------------------|-----------------------------------------------------------|
| Szucs et al 1986       | rN     | 3.2.7.8 page 100 | Aspartame “…did not affect IgE-mediated histamine release from mast cells in vitro.” “Aspartame did not stimulate mast cell or basophil in vivo as assessed by skin testing.” | Mast cell proliferation and IgE mediated histamine release |
| Kulczycki 1986         | uP     | 3.2.7.8 page 100 | Yes, "...a case of aspartame induced urticaria confirmed by double blind challenge." | Case report of aspartame induced urticaria. Discounted all self-reported allergic-like reactions because SCF discounted them in 2002 on the grounds that they were not confirmed double blind. But on p 100 the ANS Panel acknowledged that : “Kulczycki (1986) reported a case of aspartame induced urticaria confirmed by double blind challenge” (emphasis added) and”...the Panel cannot exclude the possibility that in rare instances individuals could be susceptible to allergic reactions following aspartame ingestion.” The panel was unclear as to whether, or not, that evidence was deemed reliable. The panel's reasoning remains opaque. |
| Garriga et al 1991      | rN     | 3.2.7.8 page 100 | “The authors concluded that subjects who believed themselves to be allergic to aspartame did not have reproducible reactions.” | n=12                                                       |
| Reference | Type | Page | Relevant Text |
|-----------|------|------|---------------|
| Geha et al 1993 | rN | 3.2.7.8 page 100 | "The authors concluded that aspartame and its conversion products were no more likely than placebo to cause allergic symptoms in subjects with a history consistent with hypersensitivity to aspartame." |
| ANS Panel reported p101 that Kulczycki subsequently commented in 1995: "...that in the Geha et al. (1993) study, several aspects in subject recruitment method, convenience, compensation and safety for subjects, as well as inclusion and exclusion criteria and challenge may limit the conclusions of their study." “Because of these deficiencies in study design, I am concerned that the NutraSweet Company-sponsored study by Geha et al. does not accurately reflect the incidence of aspartame-induced hives.” But the ANS panel did not comment further on Kulczycki’s criticism of this study, which is a puzzling omission. There is no evidence that the panel accepted Kulczucki’s complaint or discounted the findings on this study. |
| Butchko et al 2002 Review | uP | 3.2.7.8 page 101 | "When all the research on aspartame, including evaluations in both the premarketing and postmarketing periods, is examined as a whole, it is clear that aspartame is safe, and there are no unresolved questions regarding its safety under conditions of intended use." Reg. Tox & Pharmacol., 35, 2002, p S5 |
| Authors, many of whom worked for the Nutrasweet Company, discounted any and all evidence of putative adverse effects from the consumption of aspartame. |
| Novick 1985 | uP | 3.2.7.8 page 101 | Yes. "Case[s] of granulomatous panniculitis thought to be related to aspartame were reported" |
| "The SCF (2002) noted that studies on allergic-like reactions in […]other[…] individuals who themselves reported such reactions to aspartame have not confirmed the occurrence when later studied under control conditions." – so far as the panel was concerned, they don’t count. |
| McCauliffe and Poitras 1991 | uP | 3.2.7.8 page 101 | Yes, “Case[s] of granulomatous panniculitis thought to be related to aspartame were reported” |
| as above |

|--------|--------------|--------|------|------|
| Veien and Lomholt 2012 | Yes, “…few cases of presumed systemic allergic dermatitis in patients with contact sensitivity to formaldehyde, apparently caused by the intake of aspartame in artificial sweeteners, have been described. The four patients described in the literature all had eyelid dermatitis (as cited in Veien et al, 2012).” | Yes | 101 | 4 cases – AMNS: “The Panel noted that the studies available were performed on a limited number of participants.” (As if other studies were performed on unlimited numbers.) |
| Robert 2001, reviewed by EFSA 2010 | Yes. ”The case reports consisted of reports published in peer reviewed journals and reports compiled by Dr H.J. Roberts and published under the title 'Aspartame Disease – An ignored Epidemic' ”The total number of symptoms reported from all sources was 4281, as most cases reported more than one symptom. Headache was the most frequently reported adverse effect (28.5 %), followed by dizziness and giddiness (19.2 %).” | Spontaneous case reports. Panel commented that: “The case reports consisted of reports published in peer reviewed journals and reports compiled by Dr H.J. Roberts and published under the title Aspartame Disease – An ignored Epidemic ...The total number of symptoms reported from all sources was 4281, as most cases reported more than one symptom.” The Panel said that: “…the number of cases is low when compared with the widespread use and that the effects were mild to moderate.” The panel discounts the evidence in part because ‘too few’ cases had been reported, but provided no indication of how many cases might have been deemed sufficient. They repeatedly complained that ‘that is not enough’, in ways that suggested that no quantity could be sufficient. |

Whilst acknowledging that these data exist, the Panel noted that the data do not meet the pre-specified inclusion/exclusion criteria. To ensure a comprehensive risk assessment the Panel examined the recent assessment of anecdotal reports by the EFSA National Expert Group (EFSA, 2010).
