Supplementary Figure 1 IL-13, TGFβ and CD40L are expressed by bone marrow Th cells. a-b) Rested Th cells were stimulated using anti-CD3/CD28 beads. Supernatants were collected after 1-5 days of stimulation. Cytokine concentration was determined by ELISA. c) Th cells were stimulated using anti-CD3/CD28 beads and/or co-cultured with autologous BCP-ALL cells for 3d. CD40L surface expression was analyzed using flow cytometry. P-values were calculated using two-tailed t-tests. P<0.05 *
