RECOVERING $S^1$-INVARIANT METRICS ON $S^2$ FROM THE EQUIVARIANT SPECTRUM

EMILY B. DRYDEN, DIANA MACEDO, AND ROSA SENA-DIAS

Abstract. We prove an inverse spectral result for $S^1$-invariant metrics on $S^2$ based on the so-called asymptotic equivariant spectrum. This is roughly the spectrum together with large weights of the $S^1$ action on the eigenspaces. Our result generalizes an inverse spectral result from [DGS3] concerning $S^1$-invariant metrics on $S^2$ which are invariant under the antipodal map. We use higher order terms in the asymptotic expansion of a natural spectral measure associated with the Laplacian and the $S^1$ action.

1. INTRODUCTION

Does the spectrum of the Laplacian on a compact Riemannian manifold determine the Riemannian manifold? The answer is known to be no. John Milnor [M] constructed the first such example, producing two metrics on flat tori of dimension 16 which have the same spectrum, but are not globally isometric. There are now a plethora of examples of non-isometric isospectral manifolds, constructed using sophisticated methods and tools. On the other hand, there are also many spectral invariants, quantities associated with the Riemannian manifold which are determined by the spectrum. Dimension and volume are perhaps the most famous of these spectral invariants, but many more are known. Given these extremes of examples and spectral invariants, it is natural to ask if there is a special class of Riemannian manifolds for which the spectrum determines the Riemannian structure. In this spirit, Miguel Abreu formulated the following question.

Question 1.1. Let $X$ be a toric manifold endowed with a toric Kähler structure. Does the spectrum of the Laplacian on the resulting Riemannian manifold determine the underlying manifold?

Toric manifolds are rather manageable objects. They are classified by convex polytopes of so-called Delzant type and the question above can be reformulated in terms of recovering the Delzant polytope of a toric manifold from the spectrum of a toric Kähler metric on it. (See [DGS1] for some basic background on toric manifolds and Delzant polytopes; see [G] for a more complete account of the Kähler geometry of toric manifolds.) In the setting of toric orbifolds, a partial answer to Question 1.1 using the asymptotic equivariant spectrum is known; the asymptotic equivariant spectrum adds information about the large weights of the $S^1$ action on the eigenspaces to the usual spectrum.

Theorem 1.2. \[\text{DGS3}\]  The asymptotic equivariant spectrum of a generic toric orbifold endowed with a toric Kähler metric determines the toric orbifold up to equivariant biholomorphism.

Since the asymptotic equivariant spectrum contains more information than the spectrum, and toric orbifolds are more “flexible” than toric manifolds, the above theorem does not answer Abreu’s question. However, it is also possible to obtain spectral rigidity for the metric, at least in a simple case. Note that a toric Kähler metric can be entirely described in terms of a function $g$ known as its symplectic potential.

Theorem 1.3. \[\text{DGS3}\]  The asymptotic equivariant spectrum of an $S^1$-invariant metric on $S^2$ with symplectic potential $g$ determines the metric if $\ddot{g}$ is even and convex.

Our goal is to extend Theorem 1.3 to more general $S^1$-invariant metrics on $S^2$. Namely, we prove

Theorem 1.4.  The asymptotic equivariant spectrum of an $S^1$-invariant metric on $S^2$ with symplectic potential $g$ determines the metric if $\ddot{g}$ is a single well.

Although this result concerns only $S^2$, results on spectral rigidity for metrics are known to be difficult to obtain. One of the reasons we are able to prove such a result in this setting is the parametrization of $S^1$-invariant metrics on $S^2$ via the symplectic potential. This framework was also used by Miguel Abreu and Pedro Freitas [AF] to investigate upper bounds for the invariant eigenvalues of the Laplace operator defined by these $S^1$-invariant metrics on $S^2$.

We can normalize $S^2$ so that its symplectic potential is a function $g$ defined on $(-1,1)$. Given the symplectic potential $g$, the metric can be written as

$$\ddot{g} dx \otimes dx + \frac{d\theta \otimes d\theta}{\ddot{g}}.$$

A single well on $(-1,1)$ will mean a function $v : (-1,1) \to \mathbb{R}$ which is decreasing on $(-1,0)$ and increasing on $(0,1)$. The unique minimum at 0 is the well. The techniques we use to prove this theorem are inspired by the techniques of Victor Guillemin and Zuoqin Wang in [GW]. Namely, we give an explicit inductive formula giving higher order semi-classical spectral invariants for toric manifolds based on the asymptotic expansion of a spectral measure associated to the toric metric. This spectral measure was introduced in [DGS3] but there only the highest term in its asymptotic expansion was derived and used. The formula for higher order invariants turns out to be surprisingly explicit in the context of toric manifolds and is interesting in its own right. In the case of $S^2$ it becomes even simpler and we are able to derive some new spectral invariants which we use to prove Theorem 1.4.

One can’t help but wonder if semi-classical spectral invariants of even higher order on $S^2$ would help recover symplectic potentials with a finite number of wells from the asymptotic equivariant spectrum. It would also be interesting to study these invariants in higher dimensional toric manifolds.

The paper is organized as follows: in §2 we derive a general formula for the asymptotic expansion of a spectral measure associated to the Laplacian of a toric Kähler metric on a toric manifold. The formula simplifies in the case of $S^2$ and we give two non-trivial terms in the asymptotic expansion. The first term was given and used in [DGS3]. Section 3 is devoted to the proof of Theorem 1.4. We use both
spectral invariants derived in §2.

Acknowledgements. We would like to thank Victor Guillemin for his encouragement and interest in this project. Emily Dryden appreciates the hospitality of the Mathematics Department at Instituto Superior Técnico during the preparation of this paper. Diana Macedo and Rosa Sena-Dias would like to thank the Gulbenkian Foundation and in particular the “Novos talentos em Matemática” program organizers for support and for creating a great environment for mathematical research.

2. Asymptotic expansion of the spectral measure

Let $X^{2n}$ be a toric manifold with moment polytope $P$. Suppose $X$ is endowed with a toric Kähler metric defined by a symplectic potential $g$ (see [A] for the definition of symplectic potential and the associated metric). The torus $T^n$ acts on $X$ by isometries, and we let $\psi : T^n \to \text{Iso}(X, g)$ denote the action. The metric on $X$ has a Laplace operator associated to it. We are interested in the question: Does the spectrum of this Laplacian determine the metric, or equivalently, the symplectic potential $g$? In fact, the torus action induces a representation on each eigenspace which splits according to weights in the Lie algebra of the torus, suitably identified with $\mathbb{R}^n$. We will sometimes write $\psi$ for the map from $\mathbb{R}^n$ to $\text{Iso}(X,g)$ where we identify $T^n$ with $\mathbb{R}^n$ via the exponential map. The equivariant spectrum of $X$ endowed with the metric determined by $g$ is the set of eigenvalues of the Laplacian of the metric and, for each eigenvalue, the list of weights of the torus representation on the corresponding eigenspace. The eigenvalues and weights are counted with multiplicities. We say that a toric Kähler metric or any quantity associated with it is espectrally determined if it is determined by its equivariant spectrum (see [DGS1] for more details about the equivariant spectrum).

Definition 2.1. Let $K > 0$. The $K$-equivariant spectrum of a toric Kähler manifold is the set of eigenvalues of its metric Laplacian and, for each eigenvalue, the list of weights of the torus representation on the corresponding eigenspace whose norms are larger than $K$. The eigenvalues and weights are counted with multiplicities.

We will say that a toric Kähler metric or any quantity associated with it is espectrally determined if it is determined by the $K$-equivariant spectrum for any given $K$. Let $\alpha$ be a generic element in $\mathbb{R}^n$, where “generic” means that $\alpha$ is a regular value of the moment map $\Phi : T^*X \to \mathbb{R}^n$ arising from the lift of $\psi$ to a Hamiltonian action on $T^*X$. Consider the measure $\mu_{\alpha}$ defined by

$$\mu_{\alpha}(\rho) = \int_{T^n} e^{-\frac{\rho}{\hbar^2} \cdot \alpha} \text{tr}(\psi(\theta)_* \rho(\hbar^2 \Delta)) d\theta$$

for any $\rho \in C^\infty_0(\mathbb{R})$. As shown in [DGSS] this measure has an asymptotic expansion in powers of $\hbar$, as $\hbar$ tends to zero, and the terms in that expansion are espectrally determined; the first term in the expansion is calculated explicitly. We will give an algorithm to calculate terms in the expansion for toric manifolds. Our work is very much in the spirit of [GW], in which the authors describe an analogous algorithm for semi-classical operators in $\mathbb{R}^n$. Because toric manifolds admit an open dense set with global coordinates, we will use essentially the same techniques as in [GW].

In particular, we will use this algorithm to calculate the second nontrivial term in the asymptotic expansion for $S^2$ with an $S^1$-invariant metric. The first term of the expansion was used in [DGSS] to show that, for $S^1$-invariant metrics on $S^2$,
when the symplectic potential is convex and even it is espectrally determined. Using the first and second terms, we are able to extend the result to single well symplectic potentials. This is analogous to the situation in [GW], in which the authors extended a result of Yves Colin de Verdière [CdV] on Schrödinger operators to more general potentials.

We begin with the asymptotic expansion of \( \mu_{\mathfrak{g}} \).

**Theorem 2.2.** Let \( X^{2n} \) be a toric manifold with a \( T^n \) action \( \psi \). Let \( X \) be endowed with a toric Kähler metric whose symplectic potential is \( g \). Let \( \alpha \in \mathbb{R}^n \) be generic. Then the measure \( \mu_{\mathfrak{g}} \) defined in (1) has an asymptotic expansion in powers of \( h \) given by

\[
(2\pi h)^{-n} \sum_{k \geq 0} h^k \sum_{l \leq 2k} b_{k,l}^\alpha(u, \hat{u}) \frac{1}{(\sqrt{-1})^l} \frac{d^l \rho}{d\sigma^l} \left( \hat{u}^t \text{Hess}^{-1}(g) \hat{u} + \alpha^t \text{Hess}(g) \alpha \right) d\hat{u};
\]

the functions \( b_{k,l}^\alpha \) are given by \( b_{k,l}^\alpha(u, \hat{u}, t) = \sum_{l \leq 2k} b_{k,l}^\alpha(u, \hat{u}) t^l \) where \( b_{k,l}^\alpha(u, \hat{u}, t) \) are given recursively by \( b_{0,0}^\alpha(u, \hat{u}, t) = 1 \) and

\[
\frac{1}{\sqrt{-1}} \frac{\partial b_{k,0}^\alpha}{\partial t} = 2t \sum_{i,j=1}^n g^{ij} \hat{u}_j \left( \hat{u}_i \frac{\partial \text{Hess}^{-1}(g)}{\partial u_i} \hat{u} + \alpha^t \frac{\partial \text{Hess}(g)}{\partial u_i} \alpha \right),
\]

\[
\frac{1}{\sqrt{-1}} \frac{\partial b_{k,l}^\alpha}{\partial t} = 2 \sum_{i,j=1}^n g^{ij} \hat{u}_j \left( \frac{\partial}{\partial u_i} + \sqrt{-1} t \left( \hat{u}_i \frac{\partial \text{Hess}^{-1}(g)}{\partial u_i} \hat{u} + \alpha^t \frac{\partial \text{Hess}(g)}{\partial u_i} \alpha \right) \right) b_{k-1}
\]

\[
- \sum_{i,j=1}^n g^{ij} \left( \frac{\partial}{\partial u_j} + \sqrt{-1} t \left( \hat{u}_i \frac{\partial \text{Hess}^{-1}(g)}{\partial u_i} \hat{u} + \alpha^t \frac{\partial \text{Hess}(g)}{\partial u_j} \alpha \right) \right) b_{k-2},
\]

for all \( k > 1 \), and \( b_{k,0}^\alpha(u, \hat{u}, 0) = 0 \) for \( k \geq 1 \). Here \( g_{ij} \) denote the entries of \( \text{Hess}(g) \) and \( g^{ij} \) denote the entries of its inverse \( \text{Hess}^{-1}(g) \).

The proof of this theorem is very similar to the proof of Theorem 5.1 in [DGS3]. Since we are treating the case of the Laplace operator for a toric Kähler metric, rather than the more general case of a Riemannian metric on a manifold that admits an isometric action of some torus as in [DGS3], we have global coordinates on a open dense set and some simplifications occur. For the convenience of the reader we will essentially give a complete proof. We need two main ingredients for this proof.

**Lemma 2.3 (Schwartz kernel asymptotic expansion).** With the setup and notation given above, \( \rho(h^2 \Delta) \) is a semi-classical operator on \( X \) with Schwartz kernel \( K_{\rho,h} \). In local coordinates \( K_{\rho,h} \) admits an asymptotic expansion in powers of \( h \):

\[
K_{\rho,h}(x, y) = (2\pi h)^{-2n} \sum_{k \geq 0} h^k \sum_{l \leq 2k} b_{k,l}(y, \xi) \frac{1}{(\sqrt{-1})^l} \frac{d^l \rho}{d\sigma^l} \left( |\xi|^2_g \right)^l d\xi,
\]

where \( |\cdot|^2_g \) denotes the norm on the cotangent space given by the metric associated to \( g \) and where \( b_{k,l} \) are given as follows. Let \( b_k \) be defined recursively by \( b_0(x, \xi, t) = 1 \),
changing variables our expression becomes (2
\pi
Schwartz kernel as
\begin{equation}
\frac{1}{\sqrt{-1}} \frac{\partial b_k}{\partial t} = \sum_{a=(a_1,\ldots,a_{2n}) \in (\mathbb{Z}_+)^{2n}, j+|a|=k} \sum_{|a| \geq 1} D^a_\xi(|\xi|^2) Q_{a} b_j
\end{equation}
where
\[ Q_{a} = \frac{1}{a!} \left( \frac{\partial}{\partial x} + \sqrt{-1} t \frac{\partial |\xi|^2}{\partial x} \right)^a. \]
Then \( b_k(y, \xi, t) = \sum_{l \leq 2k} b_{k,l}(y, \xi) t^l \).

See [GW] or [GS2, Chap. 10] for more details and a proof of this expansion. The other ingredient is a special case of the lemma of stationary phase.

**Lemma 2.4 (Lemma of stationary quadratic phase).** Let \( A \) be an \( n \times n \) nonsingular self-adjoint matrix, and let \( f \in C_0^\infty(\mathbb{R}^n) \). There is a complete asymptotic expansion
\[
\int_{\mathbb{R}^n} f(x) e^{i(Ax, x)/2\hbar} \, dx \sim (2\pi \hbar)^{-n/2} |\det A|^{-1/2} e^{i\pi \text{sgn } A} \left( \text{exp} \left( -\frac{i\hbar}{2} b(D) \right) f \right)(0)
\]
where \( \text{sgn } A \) is the signature of \( A \) and \( b(D) = -\sum_{j} b_{ij} \frac{\partial}{\partial x_j} \frac{\partial}{\partial x_i}, \text{ with } B = A^{-1} \).

We are now in a position to prove Theorem 2.2.

**Proof.** Let \( x = (u, v) \) be action-angle coordinates for \( X \), i.e., \( u \in P \) and \( v \in \mathbb{R}^n \). Let \( \xi = (\hat{u}, \hat{v}) \) be fiber coordinates on \( T^*(u,v)X \). We can write \( \mu_\hat{\xi}(\rho) \) in terms of its Schwartz kernel as
\[
\mu_\hat{\xi}(\rho) = \int_{\mathbb{T}^n} e^{-i\hbar \rho \Delta} \text{tr}(\psi(\theta) \rho(h^2 \Delta)) \, d\theta
= \int_{\mathbb{T}^n} e^{-i\hbar \rho \Delta} \int_{P \times \mathbb{R}^n} K_{\rho, \hbar}(\psi(\theta)(u, v), (u, v)) \, du \, dv \, d\theta
= \int_{\mathbb{T}^n} e^{-i\hbar \rho \Delta} \int_{P \times \mathbb{R}^n} K_{\rho, \hbar}(u, v + \theta, (u, v)) \, du \, dv \, d\theta.
\]
By the Schwartz kernel asymptotic expansion, this expression is \((2\pi \hbar)^{-2n}\) times
\[
\sum_{k \geq 0} \hbar^k \sum_{l \leq 2k} \int_{\mathbb{R}^n \times P \times \mathbb{R}^n \times \mathbb{R}^{2n}} b_{k,l}(u, v, \hat{u}, \hat{v}) \frac{1}{(\sqrt{-1})^l} d^l \rho \left( |\xi|^2 \right) e^{\frac{i\hbar}{\hbar} \frac{\alpha \cdot \theta}{n}} \, d\theta \, du \, dv \, d\hat{u} \, d\hat{v},
\]
where \( b_{k,l} \) are given by Lemma 2.3. Because the metric is torus invariant, the Laplace operator is as well and this implies that the \( b_{k,l} \) do not depend on \( v \). By changing variables our expression becomes \((2\pi \hbar)^{-2n}\) times
\[
\sum_{k \geq 0} \hbar^k \sum_{l \leq 2k} \int_{\mathbb{R}^n \times P \times \mathbb{R}^n \times \mathbb{R}^{2n}} b_{k,l}(u, \hat{u}, \hat{v} + \alpha) \frac{1}{(\sqrt{-1})^l} d^l \rho \left( |\xi|^2 \right) e^{\frac{i\hbar}{\hbar} \frac{\alpha \cdot \theta}{n}} \, d\theta \, du \, dv \, d\hat{u} \, d\hat{v}.
\]
For each \((u, \hat{u}, \hat{v})\), we are going to apply Lemma 2.4 to the above integral in \((\hat{v}, \theta)\) exactly as in [DGS3, Thm. 5.1]. We can take the matrix \( A \) in Lemma 2.4 to be the \( 2n \times 2n \) matrix given by \( A = \begin{bmatrix} 0 & I \\ I & 0 \end{bmatrix} \). We have \( |\det A|^{-1/2} = 1 \), \( \text{sgn } A = 0 \), and
\[ B = \begin{bmatrix} 0 & I \\ I & 0 \end{bmatrix}. \] Since the functions \( b_{k,l}(u, \dot{u}, \dot{v} + \alpha) \) do not depend on \( \theta \), we see that applying \( b(D) \) to them gives 0. Thus we see that \( \mu_g(\rho) \) is given mod \( O(h^\infty) \) by

\[
\mu_g(\rho) = (2\pi h)^{-n} \sum_{k \geq 0} \sum_{t \leq 2k}^k \int_{P \times \mathbb{R}^n \times \mathbb{R}^n} b_{k,l}(u, \dot{u}, \alpha) \frac{1}{(\sqrt{-1})^l} d^l \rho (|\xi|^2) dud\dot{u}
\]

where \( |\xi|^2 \) is taken at points where \( \dot{v} = \alpha \). Since \( b_{k,l} \) does not depend on \( v \), we write this as

\[
(2\pi h)^{-n} \sum_{k \geq 0} \sum_{t \leq 2k}^k \int_{P \times \mathbb{R}^n} b_{k,l}(u, \dot{u}, \alpha) \frac{1}{(\sqrt{-1})^l} d^l \rho (|\xi|^2) du d\dot{u}.
\]

At a point \((u, v)\) the norm of the cotangent vector \( \xi = (\dot{u}, \dot{v}) \) is

\[
|\xi|^2 = |(\dot{u}, \dot{v})|^2 = \dot{u}^T \text{Hess}^{-1}(g) \dot{u} + \dot{v}^T \text{Hess}(g) \dot{v},
\]

and therefore when restricted to the set where \( \dot{v} = \alpha \) this gives

\[
|\xi|^2 = \dot{u}^T \text{Hess}^{-1}(g) \dot{u} + \alpha^T \text{Hess}(g) \alpha.
\] (3)

Set \( b^\alpha(u, \ddot{u}) = b(u, \ddot{u}, \alpha) \). Because the functions \( b_k(u, \ddot{u}, \alpha) \) do not depend on \( v \) or \( \ddot{v} \), the formula for \( b_k(u, \ddot{u}, \alpha) \) gives

\[
\frac{1}{\sqrt{-1}} \frac{\partial b^\alpha}{\partial t} = \sum_{|a| \geq 1} \sum_{j+k=|a|} D_0^a (|\xi|^2) Q_a b_j
\] (4)

where

\[
Q_a = \frac{1}{a!} \left( \frac{\partial}{\partial u} + \sqrt{-1} t \frac{\partial |\xi|^2}{\partial u} \right)^a
\]

and \( b^\alpha_k(u, \ddot{u}, t) = \sum_{t \leq 2k} b_{k,l}^\alpha(u, \ddot{u}) t^l \). From formula (3) for \( |\xi|^2 \) we see that \( D_0^a (|\xi|^2) = D_0^a (\dot{u}^T \text{Hess}^{-1}(g) \dot{u}) \) is zero whenever \(|a| > 2\) and

\[
D_0^a (|\xi|^2) = \left\{ \begin{array}{ll}
\frac{2}{\sqrt{-1}} \sum_{j=1}^n g^{ij} \ddot{u}_j, & \text{if } a \text{ has a 1 in position } i \text{ and 0 elsewhere;} \\
-2g^{ij}, & \text{if } a \text{ has a 1 in positions } i \text{ and } j \text{ and 0 elsewhere.}
\end{array} \right.
\]

Note also that if \( a \) has a 1 in position \( i \) and 0 elsewhere then

\[
Q_a = \left( \frac{\partial}{\partial u_i} + \sqrt{-1} t \left( \ddot{u}_i \frac{\partial \text{Hess}^{-1}(g)}{\partial u_i} \dot{u} + \alpha^T \frac{\partial \text{Hess}(g)}{\partial u_i} \alpha \right) \right),
\]

and if \( a \) has a 1 in positions \( i \) and \( j \) and 0 elsewhere then

\[
Q_a = \frac{1}{2} \left( \frac{\partial}{\partial u_i} + \sqrt{-1} t \left( \ddot{u}_i \frac{\partial \text{Hess}^{-1}(g)}{\partial u_i} \dot{u} + \alpha^T \frac{\partial \text{Hess}(g)}{\partial u_i} \alpha \right) \right).
\]

Substituting these expressions into (4) gives the expansion in Theorem 2.2.
The leading order term above is simply \( \mu \) in the asymptotic expansion of \( \mathcal{A} \).

We will show that the above quantities are the first two nonzero coefficients.

Proof. Let \( \alpha \neq 0 \) be a real number. Then, for any compactly supported smooth function \( \rho \) on \( \mathbb{R} \),

\[
\int_{[-1,1] \times \mathbb{R}} \rho(\tau) \, dx \, d\xi
\]

and

\[
\frac{1}{2} \int_{[-1,1] \times \mathbb{R}} \frac{1}{v} \left[ \xi^2 \left( \frac{v}{v^2} - \frac{2(v')^2}{v^3} \right) - \alpha^2 v(2) \right] \rho(\tau) \, d\xi \, dx
\]

\[
\frac{2}{3} \int_{[-1,1] \times \mathbb{R}} \frac{\xi^2}{v} \left[ \xi^2 \left( \frac{3(v')^2}{v^4} - \frac{v(2)}{v^3} \right) + \alpha^2 \left( \frac{v(2)}{v} - \frac{(v')^2}{v^2} \right) \right] \rho(\tau) \, d\xi \, dx
\]

\[
\frac{2}{3} \int_{[-1,1] \times \mathbb{R}} \frac{(v')^2}{v} \left( \frac{\xi^2}{v^2} + \alpha^2 \right)^2 \rho(\tau) \, d\xi \, dx
\]

are aspectrally determined, where \( v = \tilde{g} \) and \( \tau = \frac{\xi^2}{v} + \alpha^2 v \).

In \cite{DGS3}, the expression in (5) is shown to be aspectrally determined. Note that the metric defined by \( v = \tilde{g} \) is smooth at the poles if and only if \( v - \frac{1}{x^2} \) is smooth on \([-1,1]\).

Proof. We will show that the above quantities are the first two nonzero coefficients in the asymptotic expansion of \( \mu_{\tilde{g}}(\rho) \). The result will follow from the fact that the asymptotic expansion of \( \mu_{\tilde{g}} \) is aspectrally determined. By Theorem 2.2, the spectral measure \( \mu_{\tilde{g}} \) can be expanded in powers of \( \hbar \) as

\[
(2\pi\hbar)^{-1} \sum_{k \geq 0} \hbar^k \sum_{|\ell| \leq 2k} \int_{[-1,1] \times \mathbb{R}} b_{k,\ell}^0(x,\xi) \frac{1}{(\sqrt{-1})^|\ell|} \frac{d^\ell \rho}{d\sigma^\ell} \left( \frac{\xi^2}{v} + \alpha^2 v \right) \, dx \, d\xi
\]

with the functions \( b_{k,\ell}^0 \) defined as in the theorem. Since \( b_{k,0}^0(x,\xi,\alpha) = 1 \) we see that the leading order term above is simply

\[
(2\pi\hbar)^{-1} \int_{[-1,1] \times \mathbb{R}} \rho \left( \alpha^2 v + \frac{\xi^2}{v} \right) \, dx \, d\xi.
\]

In our current setting, we note that

\[
\frac{\partial}{\partial t} \frac{\partial \mathcal{H}^{-1}(g)}{\partial u_i} \frac{\partial}{\partial t} + \alpha \frac{\partial \mathcal{H}(g)}{\partial u_i} \alpha = v' \left( \alpha^2 - \frac{\xi^2}{v^2} \right).
\]

Thus

\[
\frac{\partial b_{k,\ell}^0}{\partial t} = -\frac{2v'\xi}{v\sqrt{-1}} \left( \alpha^2 - \frac{\xi^2}{v^2} \right),
\]

so that

\[
b_{1,0}^0 = b_{1,1}^0 = 0, \quad b_{1,2}^0 = -\frac{v'\xi}{v\sqrt{-1}} \left( \alpha^2 - \frac{\xi^2}{v^2} \right).
\]
We see that the 0th order term in the expansion of $\mu_{\mathbb{R}}$ is zero because
\[
\int_{\mathbb{R}} \frac{v' \xi}{v} \left( \alpha^2 - \frac{\xi^2}{v^2} \right) \frac{d^2 \rho}{d\sigma^2} \left( \frac{\xi^2}{v} + \alpha^2 v \right) d\xi = 0 \text{ for all } x \in (-1, 1).
\]

Next we calculate $b_2$. It follows from Theorem 2.2 and (7) that
\[
\frac{1}{\sqrt{-1}} \frac{\partial b_2^\alpha}{\partial t} = \frac{2\xi}{\sqrt{-1}v} \left( \frac{\partial}{\partial x} + \sqrt{-1}tv' \left( \alpha^2 - \frac{\xi^2}{v^2} \right) \right) b_1^\alpha
\]
\[
- \frac{1}{v} \left( \frac{\partial}{\partial x} + \sqrt{-1}tv' \left( \alpha^2 - \frac{\xi^2}{v^2} \right) \right)^2 1
\]
This gives
\[
b_2^\alpha = \frac{t^2}{2v} \left( v' \left( \alpha^2 - \frac{\xi^2}{v^2} \right) \right)' + \frac{\sqrt{-1}t^3}{3} \left( \frac{(v')^2}{v} \left( \alpha^2 - \frac{\xi^2}{v^2} \right)^2 + \frac{2\xi^2}{v} \left( \frac{v'}{v} \left( \alpha^2 - \frac{\xi^2}{v^2} \right) \right)' \right)
\]
\[
- \frac{t^4(v')^2\xi^2}{2v^2} \left( \alpha^2 - \frac{\xi^2}{v^2} \right)^2
\]
Therefore the coefficient of $\hbar$ in the expansion of $\mu_{\mathbb{R}}$ is

\[
\frac{1}{2\pi} \int_{[-1,1] \times \mathbb{R}} \left[ \frac{1}{2v} \left( \xi^2 \left( \frac{v''}{v^2} - 2\frac{(v')^2}{v^3} - \alpha^2 v'' \right) \right) \frac{d^2 \rho}{d\sigma^2} \left( \frac{\xi^2}{v} + \alpha^2 v \right)
\]
\[
- \frac{(v')^2}{3v} \left( \alpha^2 - \frac{\xi^2}{v^2} \right)^2 \frac{d^3 \rho}{d\sigma^3} \left( \frac{\xi^2}{v} + \alpha^2 v \right)
\]
\[
- \frac{2\xi^2}{3v} \left( \xi^2 \left( - \frac{v''}{v^3} + \frac{3(v')^2}{v^4} \right) + \alpha^2 \left( \frac{v''}{v} - \frac {(v')^2}{v^2} \right) \right) \frac{d^3 \rho}{d\sigma^3} \left( \frac{\xi^2}{v} + \alpha^2 v \right)
\]
\[
- \frac{(v')^2\xi^2}{2v^2} \left( \alpha^2 - \frac{\xi^2}{v^2} \right)^2 \frac{d^4 \rho}{d\sigma^4} \left( \frac{\xi^2}{v} + \alpha^2 v \right)
\]
and the result follows. \[\square\]

3. INVERSE SPECTRAL RESULTS FOR $S^1$-INVARIANT METRICS ON $S^2$

In this section we prove Theorem 1.4. In DGS3 Thm. 6.15, the first invariant in Theorem 2.5 was used to show that when $v$ is even and convex, the corresponding $S^1$-invariant metric on $S^2$ is determined by the asymptotic equivariant spectrum. Colin de Verdière [CDV] has shown that the spectrum of a Schrödinger operator on $\mathbb{R}^2$ with a single well potential essentially determines the potential. In GW, Guillemin and Wang use higher order semi-classical spectral invariants to generalize this result to double wells. Our approach is analogous to the Guillemin-Wang generalization of Colin de Verdière’s result. Using the new spectral invariant in Theorem 2.5 we generalize Theorem 6.15 in DGS3 to show that when $v$ is a single well, the asymptotic equivariant spectrum determines $v$ and hence the metric. Functions that are even and convex are clearly very special cases of single wells.

Suppose now that $v$ is a single well, i.e., suppose it has a unique nondegenerate minimum at $x = 0$, and that $v$ is increasing for $x$ positive and decreasing for $x$ negative. Let $c \neq 0$ be the minimum value of $v$ at the point $x = 0$. Let $\alpha \neq 0$ be a
fixed real number. We will show how to use invariants (5) and (6) to recover the function \( v(x) \) on the interval \( |x| < a \).

For \( 0 < \lambda < a \), we denote by \( A_1^\lambda \) the region in the first quadrant bounded by the curve \( \frac{x^2}{v(x)} + \alpha^2 v(x) = \lambda \) and by \( A_2^\lambda \) the region in the second quadrant bounded by the same curve. Note that, for instance, \( A_1^\lambda \) can be described as
\[
A_1^\lambda = \{(x, \xi) : 0 < \xi < \sqrt{\lambda v(x) - \alpha^2 v(x)^2}\}
\]
for all \( x \in [0, 1] \) such that \( v(x) < \frac{\lambda}{\alpha^2} \). Since \( v \) is a single well with minimum at 0, the \( x \)-values satisfying this condition lie in an interval containing 0 and contained in \([0, 1]\). Thus \( A_1^\lambda \) is, indeed, bounded. If we could choose \( \rho_\lambda \) to be the characteristic function of \([0, \lambda]\), we would see from invariant (5) that the sum
\[
\int_{A_1^\lambda} dxd\xi + \int_{A_2^\lambda} dxd\xi
\]
would be espectrally determined. However, such a \( \rho_\lambda \) is not smooth, so to make this precise we must consider \( \rho_\lambda \) as the limit of an appropriate sequence of functions that equal the characteristic function of \([0, \lambda]\) on larger and larger subsets of \([0, \lambda]\).

Let \( x = f_1(s) \) be the inverse function of \( s = v(x) \), for \( x \in (0, 1) \). Then
\[
\int_{A_1^\lambda} dxd\xi = \int_0^{f_1(\frac{\lambda}{\alpha^2})} \int_0^\sqrt{\lambda v(x) - \alpha^2 v(x)^2} d\xi dx
\]
\[
= \int_0^{f_1(\frac{\lambda}{\alpha^2})} \sqrt{\lambda v(x) - \alpha^2 v(x)^2} dx
\]
\[
= \int_c^{\frac{\lambda}{\alpha^2}} \sqrt{\lambda s - \alpha^2 s^2} \frac{df_1}{ds} ds.
\]
(9)

Analogously, we define \( x = f_2(s) \) to be the inverse function of \( s = v(-x) \), for \( x \in (0, 1) \). Then the same calculations give
\[
\int_{A_2^\lambda} dxd\xi = \int_c^{\frac{\lambda}{\alpha^2}} \sqrt{\lambda s - \alpha^2 s^2} \frac{df_2}{ds} ds.
\]
(10)

This implies in particular that \( c \) is espectrally determined: if \( \lambda/\alpha^2 < c \), then integral (9) is zero, whereas it is non-zero if \( \lambda/\alpha^2 > c \).

Now set \( S = s - c \) and \( \beta = \frac{\lambda}{\alpha^2} - c \). Substituting the expressions in (9) and (10) into (8), we see that the following quantity is espectrally determined for all \( \beta \):
\[
\int_0^\beta \sqrt{\beta - S} \left( \sqrt{S + c} \left( \frac{df_1}{dS} + \frac{df_2}{dS} \right) \right) dS.
\]
(11)

The function in (11) can be viewed as the Abel transform of another function, as we now explain. Recalling that the fractional integration operation of Abel is defined as
\[
J^a g(s) = \frac{1}{\Gamma(a)} \int_0^a (s - \nu)^{a-1} g(\nu) d\nu,
\]
for \( a > 0 \), we observe that (11) corresponds to
\[
\Gamma \left( \frac{3}{2} \right) J^\frac{3}{2} \left( \sqrt{S + c} \left( \frac{df_1}{dS} + \frac{df_2}{dS} \right) \right) (\beta).
\]
As the Abel transform of a function determines the function, we may recover the quantity $\sqrt{S + \epsilon \left( \frac{df}{dS} + \frac{df}{d\xi} \right)}$ and hence $\frac{df}{dS} + \frac{df}{d\xi}$ as a function of $S$.

Next we integrate the first and last terms of invariant (6). Integration by parts with respect to $\xi$ gives

$$\frac{1}{2} \int_{[-1,1] \times R} \frac{1}{v} \left[ c^2 \left( \frac{v(2)}{v^2} - \frac{2(v')^2}{v^3} \right) - \alpha^2 v(2)^2 \right] \rho^{(2)}(\tau) d\xi dx$$

and

$$\frac{1}{2} \int_{[-1,1] \times R} \frac{1}{v} \frac{\partial}{\partial \xi} \left[ \frac{\xi^3}{3} \left( \frac{v(2)}{v^2} - \frac{2(v')^2}{v^3} \right) - \xi \alpha^2 v(2)^2 \right] \rho^{(2)}(\tau) d\xi dx$$

$$\frac{1}{2} \int_{[-1,1] \times R} \left[ \frac{2\xi^2 (v')^2}{3v^2} \left( -\xi^2 v^2 + \alpha^2 \right)^2 \right] \rho^{(4)}(\tau) d\xi dx$$

Note that we do not pick up boundary terms because $\rho$ is compactly supported. Combining these new expressions for the first and last terms of (6) with the middle terms of (6), we conclude that

$$\int_{[-1,1] \times R} \left[ -\frac{1}{2} \left( \frac{2\xi^4}{3v^2} \left( \frac{v(2)}{v^2} - \frac{2(v')^2}{v^3} \right) - \frac{2\alpha^2 v(2)^2}{v^2} \right) - \frac{2\xi^2}{3v} \left( \frac{3(v')^2}{v^4} - \frac{v(2)}{v^3} \right) + \alpha^2 \left( v(2) - \frac{(v')^2}{v^2} \right) \right] \rho^{(3)}(\tau) d\xi dx$$

is espectrally determined for all $\alpha$ and all compactly supported $\rho$. This implies the following lemma.

**Lemma 3.1.** The quantity

$$\int_{A^\lambda_1 + A^\lambda_2} \left[ -\frac{1}{2} \left( \frac{2\xi^4}{3v^2} \left( \frac{v(2)}{v^2} - \frac{2(v')^2}{v^3} \right) - \frac{2\alpha^2 v(2)^2}{v^2} \right) - \frac{2\xi^2}{3v} \left( \frac{3(v')^2}{v^4} - \frac{v(2)}{v^3} \right) + \alpha^2 \left( v(2) - \frac{(v')^2}{v^2} \right) \right] d\xi dx$$

is espectrally determined for all $\alpha$ and $\lambda$. 

Proof. We sketch the proof. By taking the limit of an appropriate sequence of functions that equal \( \rho \) on larger and larger sets, we see that we can make \( \rho_\lambda(\tau) = e^{-\Lambda \tau} \) in [12]. It follows that

\[
\int_{[-1,1] \times \mathbb{R}} \frac{1}{2} \left( 2 \xi^4 \left( \frac{v(2)}{v^2} - \frac{2(v')(2)}{v^3} \right) - \frac{2 \alpha^2 v(2) \xi^2}{v^2} \right) - \frac{2 \xi^2}{3v} \left( \xi^2 \left( 3 \xi^2(2) - \frac{v(2)}{v^3} \right) + \alpha^2 \left( \frac{v(2)}{v} - \frac{(v')(2)}{v^2} \right) \right) - \frac{(v')^2}{3v} \left( -\xi^2 + \alpha^2 \right)^2 + \frac{(v')^2}{2v} \left( 5 \xi^4 \left( 2 \xi(2) - \frac{3 \xi^2 \alpha^2}{v^2} + \frac{\alpha^4}{2} \right) \right) \Lambda^3 e^{-\Lambda \tau} d\xi dx
\]

is spectrally determined for all \( \alpha \) and \( \Lambda \); thus

\[
\int_{[-1,1] \times \mathbb{R}} \frac{1}{2} \left( 2 \xi^4 \left( \frac{v(2)}{v^2} - \frac{2(v')(2)}{v^3} \right) - \frac{2 \alpha^2 v(2) \xi^2}{v^2} \right) - \frac{2 \xi^2}{3v} \left( \xi^2 \left( 3 \xi^2(2) - \frac{v(2)}{v^3} \right) + \alpha^2 \left( \frac{v(2)}{v} - \frac{(v')(2)}{v^2} \right) \right) - \frac{(v')^2}{3v} \left( -\xi^2 + \alpha^2 \right)^2 + \frac{(v')^2}{2v} \left( 5 \xi^4 \left( 2 \xi(2) - \frac{3 \xi^2 \alpha^2}{v^2} + \frac{\alpha^4}{2} \right) \right) e^{-\Lambda \tau} d\xi dx
\]

is spectrally determined for all \( \alpha \) and \( \Lambda \). We may approximate the characteristic function of \([0, \lambda]\) by a linear combination of functions of the form \( e^{-\Lambda \tau} \) and the result follows. □

We will treat the integral over \( A_1^\lambda \) first. By integrating the part of expression (13) concerning the region \( A_1^\lambda \) with respect to \( \xi \), we obtain

\[
\left. \right|_0 \frac{1}{2} \left[ 2 \xi^5 \left( \frac{v(2)}{v^2} - \frac{2(v')(2)}{v^3} \right) - \frac{2 \alpha^2 v(2) \xi^2}{v^2} \right] d\tau
\]

After rearranging terms, we get

\[
\int_0^{f_1(\tau)} \left[ -\frac{\alpha^4}{12} \left( \frac{v'}{v} \right)^2 \xi + \frac{\alpha^2 \xi^3 v(2)}{9} - \frac{\alpha^2 \xi^3 (v')^2}{18} + \frac{1}{15} \frac{\xi^5 v(2)}{v^4} - \frac{1}{12} \frac{\xi^5 (v')^2}{v^5} \right] \frac{\sqrt{\lambda e^{-\alpha^4 \tau'}}}{v} dx
\]
Expression (14) can now be rewritten as
\[
\int_{0}^{f_1(x)} \sqrt{\lambda v - \alpha^2 v^2} \left( -\frac{\alpha^4 (v')^2}{9v} - \frac{\lambda \alpha^2 v^{(2)}}{45v} + \frac{\lambda \alpha^2 (v')^2}{9v^2} + \frac{\lambda^2 v^{(2)}}{15v^2} - \frac{2\alpha^4 v^{(2)}}{45} - \frac{\lambda^2 (v')^2}{12v^3} \right) \, dx.
\] (14)

Recalling that \( x = f_1(s) \) is the inverse function of \( s = v(x) \) for \( x \in (0,1) \), we have
\[
v'(f_1(s)) = \frac{1}{f_1'(s)}.
\]
\[
v''(f_1(s)) = -\frac{f_1''(s)}{(f_1'(s))^3}.
\]

Expression (14) can now be rewritten as
\[
\int_{c}^{\lambda} \sqrt{\lambda - \alpha^2 s} \left[ -\frac{\alpha^4}{9} \left( \frac{1}{\sqrt{s}} \right) \frac{df_1}{ds} + \frac{\lambda \alpha^2}{45} \left( \frac{1}{\sqrt{s}} \right) \frac{d^2f_1}{ds^2} + \frac{\lambda^2}{9} \left( \frac{1}{\sqrt{s}} \right) \frac{1}{ds} 
- \frac{\lambda^2}{15} \left( \frac{1}{s \sqrt{s}} \right) \frac{d^2f_1}{ds^2} + \frac{2\alpha^4}{45} \left( \frac{1}{\sqrt{s}} \right) \frac{d^2f_1}{ds^2} - \frac{\lambda^2}{12} \left( \frac{1}{s^2 \sqrt{s}} \right) \frac{1}{ds} \right]
= \int_{c}^{\lambda} \sqrt{\lambda - \alpha^2 s} \left[ -\frac{\alpha^4}{9} \left( \frac{1}{\sqrt{s}} \right) \frac{df_1}{ds} + \frac{\lambda \alpha^2}{45} \left( \frac{1}{\sqrt{s}} \right) \frac{d^2f_1}{ds^2} + \frac{\lambda^2}{9} \left( \frac{1}{\sqrt{s}} \right) \frac{1}{ds} 
+ \left( \frac{\lambda \alpha^2}{45} \frac{1}{\sqrt{s}} - \frac{\lambda^2}{15} \frac{1}{s \sqrt{s}} + \frac{2\alpha^4}{45} \right) \left( \frac{d^2f_1}{ds^2} \right)^2 \right] \, ds.
\] (15)

Next we make a change of variable, setting \( \beta = \frac{\lambda}{\alpha^2} - c \) and \( S = s - c \), so that (15) can be rewritten as
\[
\alpha^5 \int_{0}^{\beta} \sqrt{\beta - S} \left[ -\frac{1}{9 \sqrt{S + c}} + \frac{\beta + c}{9(S+c)\sqrt{S+c}} - \frac{(\beta + c)^2}{12(S+c)^2 \sqrt{S+c}} \right] \frac{1}{ds}
+ \left( \frac{\beta + c}{45 \sqrt{S+c}} - \frac{(\beta + c)^2}{15(S+c)^2 \sqrt{S+c}} + \frac{2\sqrt{S+c}}{45} \right) \frac{d^2f_1}{ds^2} \, ds.
\]

We repeat this calculation for \( A^2_3 \) and we conclude that the second order spectral invariant (13) is given by
\[
\alpha^5 \int_{0}^{\beta} \sqrt{\beta - S} \left[ -\frac{1}{9 \sqrt{S + c}} + \frac{\beta + c}{9(S+c)\sqrt{S+c}} - \frac{(\beta + c)^2}{12(S+c)^2 \sqrt{S+c}} \right] \left( \frac{1}{ds} + \frac{1}{ds} \right)
+ \left( \frac{\beta + c}{45 \sqrt{S+c}} - \frac{(\beta + c)^2}{15(S+c)^2 \sqrt{S+c}} + \frac{2\sqrt{S+c}}{45} \right) \left( \frac{d^2f_1}{ds^2} \right)^2 \, dS.
\]
Using Abel’s fractional integration, we observe that the preceding expression corresponds to
\[ \Gamma\left(\frac{3}{2}\right)J^{\frac{3}{2}} \left[ \left( -\frac{1}{9\sqrt{S+c}} + \frac{\beta + c}{9(S+c)\sqrt{S+c}} - \frac{(\beta + c)^2}{12(S+c)^2\sqrt{S+c}} \right) \left( \frac{1}{dS} + \frac{1}{ds} \right) \right. \]
\[ \left. + \left( \frac{\beta + c}{45\sqrt{S+c}} - \frac{(\beta + c)^2}{15(S+c)\sqrt{S+c}} + \frac{2\sqrt{S+c}}{45} \right) \left( \frac{d^2f_1}{ds^2} + \frac{d^2f_2}{ds^2} \right) \right]. \]

As a function is uniquely determined by its Abel transform, we recover the quantity
\[ \left[ \left( -\frac{1}{9\sqrt{S+c}} + \frac{\beta + c}{9(S+c)\sqrt{S+c}} - \frac{(\beta + c)^2}{12(S+c)^2\sqrt{S+c}} \right) \left( \frac{1}{dS} + \frac{1}{ds} \right) \right. \]
\[ \left. + \left( \frac{\beta + c}{45\sqrt{S+c}} - \frac{(\beta + c)^2}{15(S+c)\sqrt{S+c}} + \frac{2\sqrt{S+c}}{45} \right) \left( \frac{d^2f_1}{ds^2} + \frac{d^2f_2}{ds^2} \right) \right]. \]

We rewrite this quantity as
\[ A_{\beta,c}(S) \left( \frac{1}{dS} + \frac{1}{ds} \right) + B_{\beta,c}(S) \frac{d}{dS} \left( \frac{1}{dS} + \frac{1}{ds} \right), \quad (16) \]
where we set
\[ A_{\beta,c}(S) = -\frac{1}{9\sqrt{S+c}} + \frac{\beta + c}{9(S+c)\sqrt{S+c}} - \frac{(\beta + c)^2}{12(S+c)^2\sqrt{S+c}} \]
and
\[ B_{\beta,c}(S) = -\frac{\beta + c}{45\sqrt{S+c}} + \frac{(\beta + c)^2}{15(S+c)\sqrt{S+c}} - \frac{2\sqrt{S+c}}{45}. \]

Our goal is to show that the function (16) completely determines \( \frac{1}{dS} + \frac{1}{ds} \). Since \( v \) has a minimum at 0, we have \( v'(0) = 0 \) and the derivatives of \( f_1 \) and \( f_2 \) tend to +\( \infty \) as \( s \) tends to \( c \), i.e., as \( S \) tends to 0. This implies that
\[ \left( \frac{1}{dS} + \frac{1}{ds} \right)(0) = 0. \]

We want to show that the initial value ODE
\[ \begin{cases} A_{\beta,c}(S)F(S) + B_{\beta,c}(S)F''(S) = K(S), & S \in [0, \beta] \\ F(0) = 0 \end{cases} \]
has at most one solution, for any given function \( K \). Let \( M \) and \( N \) be two solutions. Then \( M - N = f \) satisfies
\[ \begin{cases} A_{\beta,c}(S)f(S) + B_{\beta,c}(S)f'(S) = 0, & S \in [0, \beta] \\ f(0) = 0. \end{cases} \]

We show that \( f \) vanishes identically. Explicit integration of this first-order linear equation gives
\[ f(S) = Ce^{-\int_0^S \frac{A_{\beta,c}(\tau)}{B_{\beta,c}(\tau)} d\tau}, \]
for some constant $C$. One can check that
\[ A_{\beta,c}(S) = -\frac{(S + c)^2 - (S + c)(\beta + c) + \frac{3}{4}(\beta + c)^2}{9(S + c)^2 \sqrt{S + c}} \]
and
\[ B_{\beta,c}(S) = \frac{(\beta - S)(2S + 3\beta + 5c)}{45(S + c) \sqrt{S + c}} \]
so that
\[ \frac{A}{B} = -\frac{5((S + c)^2 - (S + c)(\beta + c) + \frac{3}{4}(\beta + c)^2)}{(S + c)(\beta - S)(2S + 3\beta + 5c)} \]
which we can rewrite as
\[ \frac{A}{B} = \frac{q_1}{S + c} + \frac{q_2}{\beta - S} + \frac{q_3}{2S + 3\beta + 5c} \]
for some constants $q_1, q_2, q_3$. Thus
\[ \int_0^S \frac{A_{\beta,c}(\tau)}{B_{\beta,c}(\tau)} d\tau = q_1 \log(S + c) - q_2 \log(\beta - S) + \frac{q_3}{2} \log(2S + 3\beta + 5c), \]
and hence
\[ f(S) = C(S + c)^{-q_1}(\beta - S)^{q_2}(2S + 3\beta + 5c)^{q_3}, \]
Because $f(0) = 0$, this forces $C = 0$ and therefore $f$ is identically zero as claimed.

We conclude that
\[ \frac{1}{s_1'} + \frac{1}{s_2'} \]

is a spectrally determined. Recall that we used a straightforward Abel transform argument to show that
\[ \frac{df_1}{dS} + \frac{df_2}{dS} \]

is spectrally determined. But if we know $\frac{1}{p} + \frac{1}{q} = \frac{p+q}{pq}$ and we know $p + q$, then we clearly know $pq$. This in turn implies that we know $|p - q|$, since $(p - q)^2 = (p + q)^2 - 4pq$. Thus we know $p$ and $q$, up to order. Hence the functions $\frac{df_1}{dS}$ and $\frac{df_2}{dS}$ are spectrally determined, and we recover the functions $f_1$ and $f_2$. Therefore the function $v(x)$ on the interval $|x| < a$ is spectrally determined, and we have proved Theorem 1.4.
