Abstract. In this paper, we study the existence and other properties of the solution of nonlinear mixed fractional integro–differential equations with constant coefficient. Also with the help of integral inequality of mixed type, we prove the continuous dependence of the solutions on the initial conditions.

1. Introduction

Fractional differential equations have been recently used as effective tools in the modeling of many phenomena in various fields of applied sciences and engineering such as acoustic control, signal processing, porous media, electrochemistry, viscoelasticity, rheology, polymer physics, proteins, electromagnetics, optics, medicine, economics, astrophysics, chemical engineering, chaotic dynamics, statistical physics and so on (see [1],[3],[5],[6],[9],[13],[22],[23],[30],[35] and the references therein). Many problems can be modeled by fractional integro–differential equations from various sciences and engineering applications.

Recently, many researchers have studied the Cauchy problem and long time behavior for nonlinear fractional differential and integro–differential equations and obtained many interesting results by using all kinds of fixed point theorems, for example, by Aghajani et al. [2], Balachandran and Park [4], Barbagallo et al. [7], Cabrera et al. [8], Dong et al. [11], Furati and Tatar [12], Jagtap and Kharat [14], Kharat [15], Kharat et al. [16], Kendre and Kharat [19], Kendre et al. [18, 20, 21], Liang et al. [24], N’Guérékata [26, 27], Pierri and O’Regan [29], Ragusa and Scapellato [31], Ren et al. [32], Ruggieri et al. [33], Tate et al.[37], Turmetov [40], Wang and Li [41], Zhou et al. [42, 43], Zhou and Jiao [44] and the references therein.

In [36], by using generalized Banach fixed point theorem, Tate and Dinde discussed the existence and interval of existence of solutions, uniqueness, continuous dependence of solutions on initial conditions, estimates on solutions and continuous dependence on parameters and functions involved in the nonlinear fractional differential equation with constant coefficient $\lambda > 0$ of the type:

\[
\begin{cases}
\frac{d^\alpha}{dt^\alpha} x(t) = \lambda x(t) + f(t, x(t)), & t \in [0, T], \ T > 0, \\
x(0) = x_0 \in \mathbb{R},
\end{cases}
\]

where \( D^\alpha (0 < \alpha < 1) \) denotes the Caputo fractional derivative, \( f : J \times \mathbb{R} \to \mathbb{R} \) is a continuous function.

In [38], by using Banach fixed point theorem coupled with Bielecki type norm and the integral inequality, Tidke investigated the existence, uniqueness and other properties of solutions of fractional semilinear evolution equation of the type:

\[
\begin{cases}
D^\alpha x(t) = A(t)x(t) + f(t,x(t)), & t \in J = [0,b], \\
x(0) = x_0,
\end{cases}
\]

where \( 0 < q < 1 \), \( D^\alpha \) denotes the Caputo fractional derivative of order \( q \), the unknown \( x(.) \) takes the values in the Banach space \( X \); \( f \in C(J \times X, X) \), and \( A(t) \) is a bounded linear operator on \( X \) and \( x_0 \) is a given element of \( X \).

Fractional differential equations with constant coefficients are used to describe many physical and chemical problems [30] such as the motion of a large thin plate in a Newtonian fluid, the process of cooling a semi-infinite body by radiation, the phenomena in electromagnetic, acoustic, viscoelasticity, electrochemistry and material science and so on. Therefore, it is worth to study a nonlinear fractional differential equations with constant coefficient.

In [39], Tidke studied the non–fractional mixed Volterra–Fredholm integro–differential equations with nonlocal conditions via Leray - Schauder theorem. These type of equations play a vital position for abstract existence, uniqueness, continuous dependence of solutions on initial conditions of a nonlinear mixed problems.

Motivated by the above-mentioned work, in this paper, we investigate the existence and interval of existence, uniqueness, continuous dependence of solutions on initial conditions of a nonlinear mixed fractional integro–differential equations with constant coefficient \( \lambda > 0 \) of the type:

\[
\begin{cases}
\mathcal{D}^\alpha x(t) = \lambda x(t) + f(t,x(t), \int_0^t h(t,s)x(s)ds, \int_0^t k(t,s)x(s)ds), & t \in J = [0,T], T > 0, \\
x(0) = x_0 \in \mathbb{R},
\end{cases}
\]

(1)

where \( \mathcal{D}^\alpha \) denotes the Caputo fractional derivative of order \( 0 < \alpha < 1 \), \( f : J \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \to \mathbb{R} \), \( h : J \times J \to \mathbb{R} \) and \( k : J \times J \to \mathbb{R} \) are given continuous functions.

We further derive an estimate on solutions and continuous dependence on parameters and functions involved in the right hand side of Eq.(1). Finally, one illustrative example is given to demonstrate the theoretical results.

2. Preliminaries

Here we present some definitions, notations and results from ([9],[25],[30],[34]) which are used throughout this paper.

Let \( C(J, \mathbb{R}) \) be the Banach space of continuous functions from \( J \) into \( \mathbb{R} \) with the supremum norm \( \| \cdot \| \).

**Definition 2.1.** A real valued function \( f(t) (t > 0) \) is said to be in space \( C_\mu (\mu \in \mathbb{R}) \) if there exists a real number \( p > \mu \) such that \( f(t) = \mathcal{V}^\mu g(t) \), where \( g \in C[0,\infty) \).

**Definition 2.2.** A real valued function \( f(t) (t > 0) \) is said to be in the space \( C^n_\mu, n \in \mathbb{N} \cup \{0\} \), if \( f^n \in C_\mu \).

**Definition 2.3.** Let \( f \in C_\mu (\mu \geq -1) \), then the (left–sided) Riemann–Liouville fractional integral of order \( \alpha > 0 \) of the function \( f \) is given by

\[
I^\alpha f(t) = \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} f(s) ds, \ t > 0 \text{ and } I^0 f(t) = f(t),
\]

where \( \Gamma(.) \) is Euler’s Gamma function.
Definition 2.4. The (left–sided) Caputo fractional derivative of order $\alpha > 0$ of the function $f \in \mathcal{C}^n_{-1} (n \in \mathbb{N} \cup \{0\})$, is given by:

$$^cD^\alpha f(t) = \begin{cases} f^n(t), & \text{if } \alpha = n \\ \frac{1}{\Gamma(n-\alpha)} \sum_{k=0}^{\lfloor \alpha \rfloor} \frac{f^{(k)}(t)}{k!} t^{\alpha-n}, & \text{if } n-1 < \alpha < n, \ n \in \mathbb{N} \end{cases}$$

where $n = \lfloor \alpha \rfloor + 1$ denotes the integer part of the real number $\alpha$.

Note that $I^\alpha \ ^cD^\alpha f(t) = f(t) - \sum_{k=0}^{\lfloor \alpha \rfloor} \frac{f^{(k)}(0^+)}{k!} t^k$, $n-1 < \alpha < n, \ n \in \mathbb{N}$.

Definition 2.5. The (left–sided) Riemann–Liouville fractional derivative of order $\alpha > 0$ of the function $f \in \mathcal{C}^n_{-1} (n \in \mathbb{N} \cup \{0\})$, is given by:

$$D^\alpha f(t) = \frac{d^n}{dt^n} I^{n-\alpha} f(t), \ n-1 < \alpha \leq n, \ n \in \mathbb{N}.$$
3. Existence Results and Interval of Existence

The following lemma deals with the equivalence of a nonlinear mixed fractional integro–differential equation (1).

**Lemma 3.1.** If the function $f : J \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \to \mathbb{R}$ is a continuous function, then a nonlinear mixed fractional integro–differential equation (1) is equivalent to the integral equation,

$$x(t) = x_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} x(s) ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} f\left(s,x(s),\int_0^s h(t,s)x(s) ds, \int_0^{\tau} k(t,\tau)x(\tau) d\tau\right) ds,$$

$t \in J$.

**Proof.** Let $x(t)$ be a solution of Eq. (1). Define

$$z(t) = \lambda x(t) + f\left(t,x(t),\int_0^t h(t,s)x(s) ds, \int_0^{\tau} k(t,\tau)x(\tau) d\tau\right).$$

Then

$$z(t) = {}^cD^\alpha x(t).$$

Since

$${}^cD^\alpha x(t) = D^\alpha(x(t) - x_0),$$

where $D^\alpha$ is Riemann–Liouville fractional derivative of order $\alpha$ with lower limit 0, then we get

$$z(t) = D^\alpha(x(t) - x_0) = \frac{d}{dt} I_0^{1-\alpha}(x(t) - x_0)$$

This gives

$$I_0^{1-\alpha} z(t) = I_0^{1-\alpha} (x(t) - x_0) + k,$$

where $k$ is any constant. since $z(t)$ and $x(t) - x_0$ are both continuous functions, for $t = 0$ we get $k = 0$. This gives

$$I_0^{1-\alpha} z(t) = I_0^{1-\alpha} (x(t) - x_0).$$

Operating Riemann–Liouville fractional differential operator $D^{1-\alpha}$ on both sides, we obtain

$$x(t) - x_0 = D^{1-\alpha} I_0^{1-\alpha} z(t)$$

$$= D^{1-\alpha} I_0^{1-\alpha} z(t)$$

$$= D^{1-\alpha} I_0^{1-\alpha} f^\alpha z(t)$$

$$= I_0^{\alpha} I_0^{1-\alpha} z(t)$$

Using the definition of $z(t)$, we obtain Eq. (2).

Conversely, suppose that $x(t)$ is the solution of the Eq. (2). Then it can be written as

$$x(t) = x_0 + I_0^{\alpha} f^\alpha z(t).$$

(3)

where

$$z(t) = \lambda x(t) + f\left(t,x(t),\int_0^t h(t,s)x(s) ds, \int_0^{\tau} k(t,\tau)x(\tau) d\tau\right).$$
Since \( z(t) \) is continuous and \( x_0 \) is constant, operating the Caputo fractional differential operator \( \mathcal{D}^\alpha \) on both sides of Eq. (3) we obtain

\[
\mathcal{D}^\alpha z(t) = \mathcal{D}^\alpha x_0 + \mathcal{D}^\alpha f(t) = z(t).
\]

This gives

\[
\mathcal{D}^\alpha x(t) = \lambda x(t) + \int_0^t h(t,s)x(s)ds + \int_0^\tau k(t,s)x(s)ds.
\]

From (3), we get \( x(0) = x_0 \). This proves that \( x(t) \) is the solution of Eq. (1).

**Theorem 3.2.** Let \( T > 0 \) and \( \xi > 0 \) be a constant such that \( 0 \in [x_0 - \xi, x_0 + \xi] \). Assume that \( f : ]x_0 - \xi, x_0 + \xi[ \times [x_0 - \xi, x_0 + \xi[ \times [x_0 - \xi, x_0 + \xi] \to \mathbb{R} \) satisfies the following condition:

(H1) There exists a constant \( L > 0 \) such that

\[
|f(t, x, y, z) - f(t, \tilde{x}, \tilde{y}, \tilde{z})| \leq L(\|x - \tilde{x}\| + \|y - \tilde{y}\| + \|z - \tilde{z}\|)
\]

Let

\[
\lambda = \min \left\{ T, \left[ \frac{\Gamma(\alpha + 1)\xi}{(\xi + |x_0|)(\lambda + L(1 + TH_T + TK_T))} + M \right]^{1/2} \right\}
\]

where \( h_T = \sup_{0 \leq s \leq t \leq T} |h(t, s)|, k_T = \sup_{0 \leq s \leq t \leq T} |k(t, s)|, M = \sup_{t \in [0, T]} |f(t, 0, 0, 0)| \). Then the Eq. (1) has a unique solution \( x : [0, \lambda] \to \mathbb{R} \).

**Proof.** Define the set \( U = \{ x \in C([0, \lambda], \mathbb{R}) : x(0) = x_0, \|x - x_0\| \leq \xi \} \). Since \( x_0 \in U \), \( U \) is nonempty. Also, \( U \) is a closed, bounded and convex subset of Banach space \( C([0, \lambda], \mathbb{R}) \). On \( U \) we define an operator \( A \) by

\[
Ax(t) = x_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} x(s) ds + \frac{1}{\Gamma(\alpha)} \int_0^\tau (t-s)^{\alpha-1} f\left(s, x(s), \int_0^s h(s, \tau)x(\tau)d\tau, \int_0^\tau k(s, \tau)x(\tau)d\tau \right) ds,
\]

\( t \in [0, \lambda] \).

Now, we prove that \( A \) maps the set \( U \) to itself. Let’s take any \( x \in U \) and \( t \in [0, \lambda] \). Then

\[
|Ax(t) - x_0| \leq \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x(s)| ds + \frac{1}{\Gamma(\alpha)} \int_0^\tau (t-s)^{\alpha-1} \left| f\left(s, x(s), \int_0^s h(s, \tau)x(\tau)d\tau, \int_0^\tau k(s, \tau)x(\tau)d\tau \right) \right| ds
\]

\[
\leq \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x(s)| ds + \frac{1}{\Gamma(\alpha)} \int_0^\tau (t-s)^{\alpha-1} \left| f\left(s, x(s), \int_0^s h(s, \tau)x(\tau)d\tau, \int_0^\tau k(s, \tau)x(\tau)d\tau \right) \right| ds
\]

\[
- f(s, 0, 0, 0) ds + \frac{1}{\Gamma(\alpha)} \int_0^\tau (t-s)^{\alpha-1} \left| f(s, 0, 0, 0) \right| ds
\]

Using (H1) and the definition of \( U \), for any \( t \in [0, \lambda] \),

\[
|Ax(t)| \leq |Ax(t) - x_0| + |x_0| \leq \xi + |x_0| \tag{4}
\]

\[
\left| f\left(s, x(s), \int_0^s h(s, \tau)x(\tau)d\tau, \int_0^\tau k(s, \tau)x(\tau)d\tau \right) - f(s, 0, 0, 0) \right| \leq L \left[ |x(t)| + \int_0^\tau |h(s, \tau)||x(\tau)|d\tau + \int_0^\tau |k(s, \tau)||x(\tau)|d\tau \right]
\]

\[
\leq L(\xi + |x_0|)(1 + TH_T + TK_T). \tag{5}
\]
Therefore

$$\|Ax(t) - x_0\| \leq \frac{\lambda}{\Gamma(a)} \int_0^t (t - s)^{a-1}(\xi + |x_0|) ds + \frac{1}{\Gamma(a)} \int_0^t (t - s)^{a-1} L(1 + Th_T + T_k)(\xi + |x_0|) ds$$

$$+ \frac{M}{\Gamma(a)} \int_0^t (t - s)^{a-1} ds$$

$$\leq \frac{\int_0^t (t - s)^{a-1} x(s) ds + \int_0^t (t - s)^{a-1} f \left\{ s, x(s), \int_0^s h(s, \tau)x(\tau) d\tau, \int_0^\tau k(s, \tau)x(\tau) d\tau \right\} ds}{\int_0^t (t - s)^{a-1} - (t_2 - s)^{a-1} x(s) ds}$$

$$+ \frac{\int_0^{t_1} (t_1 - s)^{a-1} - (t_2 - s)^{a-1} x(s) ds}{\int_0^{t_1} (t_1 - s)^{a-1} - (t_2 - s)^{a-1} x(s) ds}$$

$$+ \frac{1}{\Gamma(a)} \int_0^{t_1} \frac{(t_2 - s)^{a-1} - (t_2 - s)^{a-1}}{(t_1 - s)^{a-1} - (t_2 - s)^{a-1}} \left\{ f \left\{ s, x(s), \int_0^s h(s, \tau)x(\tau) d\tau, \int_0^\tau k(s, \tau)x(\tau) d\tau \right\} - f(s, 0, 0, 0) \right\} ds + \frac{1}{\Gamma(a)} \int_0^{t_1} \frac{(t_2 - s)^{a-1} - (t_2 - s)^{a-1}}{(t_1 - s)^{a-1} - (t_2 - s)^{a-1}} \left\{ f \left\{ s, x(s), \int_0^s h(s, \tau)x(\tau) d\tau, \int_0^\tau k(s, \tau)x(\tau) d\tau \right\} - f(s, 0, 0, 0) \right\} ds$$

$$\leq \frac{\int_0^{t_1} (2(t_2 - t_1)^a + t_1^a - t_2^a)}{\int_0^{t_1} (2(t_2 - t_1)^a + t_1^a - t_2^a)}.$$

We note that, for $0 \leq t_1 \leq t_2 \leq \chi$,

$$\|Ax(t_1) - Ax(t_2)\|$$

$$\leq \frac{\int_0^{t_1} (t_1 - s)^{a-1} x(s) ds + \int_0^{t_1} (t_1 - s)^{a-1} f \left\{ s, x(s), \int_0^s h(s, \tau)x(\tau) d\tau, \int_0^\tau k(s, \tau)x(\tau) d\tau \right\} ds}{\int_0^{t_1} (t_1 - s)^{a-1} - (t_2 - s)^{a-1} x(s) ds}$$

$$+ \frac{\int_0^{t_1} (t_1 - s)^{a-1} - (t_2 - s)^{a-1} x(s) ds}{\int_0^{t_1} (t_1 - s)^{a-1} - (t_2 - s)^{a-1} x(s) ds}$$

$$+ \frac{1}{\Gamma(a)} \int_0^{t_1} \frac{(t_2 - s)^{a-1} - (t_2 - s)^{a-1}}{(t_1 - s)^{a-1} - (t_2 - s)^{a-1}} \left\{ f \left\{ s, x(s), \int_0^s h(s, \tau)x(\tau) d\tau, \int_0^\tau k(s, \tau)x(\tau) d\tau \right\} - f(s, 0, 0, 0) \right\} ds + \frac{1}{\Gamma(a)} \int_0^{t_1} \frac{(t_2 - s)^{a-1} - (t_2 - s)^{a-1}}{(t_1 - s)^{a-1} - (t_2 - s)^{a-1}} \left\{ f \left\{ s, x(s), \int_0^s h(s, \tau)x(\tau) d\tau, \int_0^\tau k(s, \tau)x(\tau) d\tau \right\} - f(s, 0, 0, 0) \right\} ds$$

Using (4) and (5), we get

$$\|Ax(t_1) - Ax(t_2)\|$$

$$\leq \frac{\int_0^{t_1} (2(t_2 - t_1)^a + t_1^a - t_2^a)}{\int_0^{t_1} (2(t_2 - t_1)^a + t_1^a - t_2^a)}.$$
This shows that $Ax$ is continuous. Thus for any $x \in U$, we have $Ax \in \mathbb{C}([0, \chi], \mathbb{R})$, $Ax(0) = x_0$ and $\|Ax - x_0\| \leq \xi$. This proves that $Ax \in U$ whenever $x \in U$ i.e A maps the set $U$ into itself.

The next step is to prove that, for every $\alpha \in \mathbb{N} \cup \{0\}$, and every $x, y \in U$, we have

$$\|A^m x - A^m y\|^\alpha \leq \frac{[(\lambda + L(1 + T \tau + T \kappa))^{\alpha}]^n}{\Gamma(n \alpha + 1)} \|x - y\|, \quad t \in [0, \chi].$$

(6)

This can be seen by induction. For $n = 0$, the inequality (6) is trivially true. We assume that (6) is true for $n = m - 1$ and prove it for $n = m$. By using definition of operator $A$ and hypothesis (H1), we have

$$\begin{align*}
A^m x(t) - A^m y(t) &= \frac{1}{\Gamma(\alpha)} \left[ \int_0^t (t - s)^{\alpha - 1} A^m x(s) ds \right. \\
&\quad - \left. \frac{1}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} A^m y(s) ds \right] \\
&\quad \frac{1}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} \{h(s, \tau) A^{m-1} x(\tau) d\tau, \int_0^T k(s, \tau) A^{m-1} x(\tau) d\tau\} ds
\end{align*}$$

(7)

By using hypothesis (H1) and (6) in (7) for $n = m - 1$, we get

$$\begin{align*}
A^m x(t) - A^m y(t) &\leq \frac{\lambda}{\Gamma(\alpha)} \left[ \int_0^t (t - s)^{\alpha - 1} A^{m-1} x(s) ds \right. \\
&\quad + \frac{L}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} \left\{ A^{m-1} x(s) - A^{m-1} y(s) \right\} ds \\
&\quad + \frac{\int_0^T |k(s, \tau)| A^{m-1} x(\tau) - A^{m-1} y(\tau) d\tau \right\} ds
\end{align*}$$

which is our desired inequality (6). Hence, we have

$$\|A^m x - A^m y\| \leq \frac{[(\lambda + L(1 + T \tau + T \kappa))^{\alpha}]^n}{\Gamma(n \alpha + 1)} \|x - y\|, \quad \text{for all } n \in \mathbb{N} \cup \{0\}.$$

By definition 2.6, we have

$$\sum_{n=0}^{\infty} \frac{[(\lambda + L(1 + T \tau + T \kappa))^{\alpha}]^n}{\Gamma(n \alpha + 1)} = \mathbb{E}_x[(\lambda + L(1 + T \tau + T \kappa))^{\alpha}]$$

We have proved that the operator $A$ satisfies all the conditions of Theorem 2.9 and hence $A$ has a unique fixed point $x : [0, \chi] \rightarrow \mathbb{R}$ which is the solution of Eq. (1). \qed

**Remark 3.3.** Hereafter, to study the other properties of solutions of Eq. (1), we take $f : J \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$ and $C(J, \mathbb{R})$ the Banach space endowed with the supremum norm $\|\cdot\|$. 

S. Tate et al. / Filomat 33:17 (2019), 5623–5638
4. Estimates on the solutions

The following theorem contains the estimate on the solution of Eq. (1).

**Theorem 4.1.** Suppose that the function \( f : J \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R} \) satisfies the hypothesis (H1). If \( x(t), \ t \in J \) is any solution of Eq. (1) then

\[
|x(t)| \leq |x_0| + \frac{MT^\alpha}{\Gamma(\alpha + 1)} \exp \left( \int_0^t A(\tau) d\tau \right),
\]

where \( A(t) = \frac{(\lambda + L)(T - t)^{\alpha - 1}}{\Gamma(\alpha)} \left( 1 + \int_0^t \frac{Lh_\tau}{(\lambda + L)} d\tau + \int_0^T \frac{Lk_\tau}{(\lambda + L)} d\tau \right) \),

\[
M = \sup_{t \in J} |f(t, 0, 0, 0)|, \quad h_\tau = \sup_{0 \leq s \leq t \leq T} |h(t, s)|, \quad k_\tau = \sup_{0 \leq s \leq t \leq T} |k(t, s)|.
\]

**Proof.** Let \( x(t) \) be any solution of Eq. (1) then

\[
'D'x(t) = \lambda x(t) + f \left( t, x(t), \int_0^t h(t, s)x(s)ds, \int_0^t k(t, s)x(s)ds \right),
\]

\[
x(0) = x_0
\]

\[
\Rightarrow x(t) = x_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} x(s) ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} f \left( s, x(s), \int_0^s h(s, \tau)x(\tau)d\tau, \int_0^s k(s, \tau)x(\tau)d\tau \right) ds.
\]

Therefore

\[
|x(t)| \leq |x_0| + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} |x(s)| ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} \left| f \left( s, x(s), \int_0^s h(s, \tau)x(\tau)d\tau, \int_0^s k(s, \tau)x(\tau)d\tau \right) \right| ds
\]

\[
- f(s, 0, 0, 0) \right| ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} \left| f(s, 0, 0, 0) \right| ds.
\]

Using hypothesis (H1), for any \( t \in J \), we get

\[
|x(t)| \leq |x_0| + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} |x(s)| ds + \frac{L}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} |x(s)| ds
\]

\[
+ \frac{M}{\Gamma(\alpha + 1)} \int_0^t (t - s)^{\alpha - 1} \left( \int_0^s |h(s, \tau)||x(\tau)| d\tau + \int_0^T |k(s, \tau)||x(\tau)| d\tau \right) ds + \frac{M}{\Gamma(\alpha + 1)} \int_0^t (t - s)^{\alpha - 1} ds
\]

\[
\leq |x_0| + \frac{MT^\alpha}{\Gamma(\alpha + 1)} + \frac{(\lambda + L)}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} |x(s)| ds + \frac{Lh_\tau}{\Gamma(\alpha)} \int_0^T (t - s)^{\alpha - 1} \left( \int_0^s |h(\tau)| d\tau \right) ds
\]

\[
+ \frac{Lk_\tau}{\Gamma(\alpha)} \int_0^T (t - s)^{\alpha - 1} \left( \int_0^s |k(\tau)| d\tau \right) ds
\]

\[
\leq |x_0| + \frac{MT^\alpha}{\Gamma(\alpha + 1)} + \frac{(\lambda + L)}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} |x(s)| ds
\]

\[
+ \frac{Lh_\tau}{\Gamma(\alpha)} \int_0^T (T - s)^{\alpha - 1} |x(s)| ds + \frac{Lk_\tau}{\Gamma(\alpha)} \int_0^T (T - s)^{\alpha - 1} \left( \int_0^T |x(\tau)| d\tau \right) ds
\]

\[
\leq |x_0| + \frac{MT^\alpha}{\Gamma(\alpha + 1)} + \int_0^t (\lambda + L)(T - s)^{\alpha - 1} |x(s)| ds + \int_0^T \frac{Lh_\tau}{(\lambda + L)} |x(\tau)| d\tau + \int_0^T \frac{Lk_\tau}{(\lambda + L)} |x(\tau)| d\tau
\]
Applying inequality given in the Theorem 2.8 to the inequality (8) with

\[ u(t) = x(t), \quad c = |x_0| + \frac{MT^\alpha}{\Gamma(\alpha + 1)} h(t), \quad h(s) = \frac{(\lambda + L)}{\Gamma(\alpha)} (T - s)^{\alpha - 1}, \quad f(\tau) = \frac{Lh_T}{(\lambda + L)}, \quad g(\tau) = \frac{Lk_T}{(\lambda + L)}, \]

\[ p = q = 1, \quad n_1 = 1, \quad n_2 = 0 \]

we obtain

\[ |x(t)| \leq \left( |x_0| + \frac{MT^\alpha}{\Gamma(\alpha + 1)} \right) \exp \left( \int_0^t A(\tau) d\tau \right). \]

where

\[ A(t) = \frac{(\lambda + L)(T - t)^{\alpha - 1}}{\Gamma(\alpha)} \left[ 1 + \int_0^t \frac{Lk_T}{(\lambda + L)} \lambda ds + \int_0^T \frac{Lk_T}{(\lambda + L)} d\tau \right]. \]

□

5. Continuous Dependence and Uniqueness of Solutions

**Theorem 5.1.** Suppose that the function \( f : J \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R} \) satisfies the hypothesis (H1). Let \( x_1(t) \) and \( x_2(t) \) be the solutions of equation

\[ ^cD^\alpha x(t) = \lambda x(t) + f(t, x(t), \int_0^t h(t, s)x(s)ds, \int_0^T k(t, s)x(s)ds), \quad t \in J \]

(9)

corresponding to \( x(0) = x_0 \) and \( x(0) = x_0^* \) respectively. Then

\[ ||x_1 - x_2|| \leq |x_0 - x_0^*| \exp \left( \int_0^t A(\tau) d\tau \right), \]

(10)

where \( A(t) = \frac{(\lambda + L)(T - t)^{\alpha - 1}}{\Gamma(\alpha)} \left[ 1 + \int_0^t \frac{Lk_T}{(\lambda + L)} \lambda ds + \int_0^T \frac{Lk_T}{(\lambda + L)} d\tau \right]. \)

**Proof.** Let \( x_1(t) \) and \( x_2(t) \) be the solutions of Eq. (9) corresponding to \( x(0) = x_0 \) and \( x(0) = x_0^* \) respectively. Therefore

\[ ^cD^\alpha x_1(t) = \lambda x_1(t) + f \left( t, x_1(t), \int_0^t h(t, s)x_1(s)ds, \int_0^T k(t, s)x_1(s)ds \right), \]

\[ x_1(0) = x_0 \]

and

\[ ^cD^\alpha x_2(t) = \lambda x_2(t) + f \left( t, x_2(t), \int_0^t h(t, s)x_2(s)ds, \int_0^T k(t, s)x_2(s)ds \right), \]

\[ x_2(0) = x_0^*. \]

This implies

\[ x_1(t) = x_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} x_1(s)ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} f \left( s, x_1(s), \int_0^s h(t, \tau)x_1(\tau)d\tau, \int_0^T k(t, \tau)x_1(\tau)d\tau \right) ds, \]

and

\[ x_2(t) = x_0^* + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} x_2(s)ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} f \left( s, x_2(s), \int_0^s h(t, \tau)x_2(\tau)d\tau, \int_0^T k(t, \tau)x_2(\tau)d\tau \right) ds. \]
Using the hypothesis (H1), for any \( t \in [0, T] \), we obtain
\[
|x_1(t) - x_2(t)| \leq |x_0 - x'_0| + \frac{(\lambda + L)}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} |x_1(s) - x_2(s)| \, ds
\]
\[
+ \frac{L}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} \left( \int_0^s |h(s, \tau)| |x_1(\tau) - x_2(\tau)| \, d\tau \right) \, ds
\]
\[
\leq |x_0 - x'_0| + \frac{(\lambda + L)}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} |x_1(s) - x_2(s)| \, ds
\]
\[
+ \frac{Lh_T}{\Gamma(\alpha)} \int_0^t (t - s)^{\alpha - 1} \left( \int_0^s |x_1(\tau) - x_2(\tau)| \, d\tau \right) \, ds
\]
Therefore
\[
|x_1(t) - x_2(t)| \leq |x_0 - x'_0| + \int_0^t \left( \frac{(\lambda + L)}{\Gamma(\alpha)} \right) (T - s)^{\alpha - 1} |x_1(s) - x_2(s)| \, ds
\]
\[
+ \int_0^t \frac{Lk_T}{\lambda + L} |x_1(\tau) - x_2(\tau)| \, d\tau
\]
\[
\tag{11}
\]
Applying inequality given in the Theorem 2.8 to the inequality (11) with
\[
u(t) = |x_1(t) - x_2(t)|, \quad c = |x_0 - x'_0|, \quad h(s) = \frac{(\lambda + L)}{\Gamma(\alpha)} (T - s)^{\alpha - 1}, \quad f(\tau) = \frac{Lh_T}{\lambda + L}, \quad \rho(\tau) = \frac{Lk_T}{\lambda + L},
\]
\[
p = q = 1, \quad n_1 = 1, \quad n_2 = 0
\]
we obtain
\[
|x_1(t) - x_2(t)| \leq |x_0 - x'_0| \exp \left( \int_0^t A(\tau) \, d\tau \right),
\]
where
\[
A(t) = \frac{(\lambda + L)(T - \tau)^{\alpha - 1}}{\Gamma(\alpha)} \left[ 1 + \int_0^\tau \frac{Lh_T}{\lambda + L} \, d\tau + \int_0^T \frac{Lk_T}{\lambda + L} \, d\tau \right].
\]
This gives the inequality (10). \( \square \)

**Remark 5.2.** The inequality (10) shows continuous dependence of solution of Eq. (1) on initial conditions and also it gives the uniqueness. The uniqueness follows by putting \( x_0 = x'_0 \) in (10).

### 6. Continuous Dependence on Functions Involved and Parameters in nonlinear mixed fractional integro-differential equation

This section deals with the study of continuous dependence of solution of a Eq. (1) on functions and parameters involved therein.

Consider the Eq. (1) and
\[
\begin{cases}
^cD^\alpha y(t) = \lambda y(t) + F \left( t, y(t), \int_0^t h(t, s)y(s) \, ds, \int_0^t k(t, s)y(s) \, ds \right), \\
y(0) = y_0 \in \mathbb{R},
\end{cases}
\]
where \( F : [0, T] \times \mathbb{R} \rightarrow \mathbb{R} \). In the following theorem we prove continuous dependence of solutions of Eq. (1) on the functions involved in right hand side of Eq. (1).
Theorem 6.1. Suppose that \( f \) in Eq. (1) satisfies the hypothesis (H1). Let \( y(t) \) be a solution of Eq. (12) and suppose that
\[
|f(t, y(t), g(t), \dot{g}(t)) - F(t, y(t), g(t), \dot{g}(t))| \leq \epsilon, \quad t \in I \quad \text{and} \quad x_0 - y_0 < \delta,
\]
where \( \epsilon, \delta > 0 \) are arbitrary small constants. Then the solution \( x(t) \) of the Eq. (1) depends continuously on the functions involved therein.

Proof. Let \( x(t) \) and \( y(t) \) be any solution of Eq. (1) and (12) respectively. Then
\[
' \dot{D}^\alpha x(t) = \lambda x(t) + f \left( t, x(t), \int_0^T h(t, s)x(s)ds, \int_0^T k(t, s)x(s)ds \right), \quad x(0) = x_0
\]
and
\[
' \dot{D}^\alpha y(t) = \lambda y(t) + F \left( t, y(t), \int_0^T h(t, s)y(s)ds, \int_0^T k(t, s)y(s)ds \right), \quad y(0) = y_0
\]
This implies
\[
x(t) = x_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} x(s)ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} f \left( s, x(s), \int_0^\tau h(s, \tau)x(\tau)d\tau, \int_0^\tau k(s, \tau)x(\tau)d\tau \right) ds
\]
and
\[
y(t) = y_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} y(s)ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} F \left( s, y(s), \int_0^\tau h(s, \tau)y(\tau)d\tau, \int_0^\tau k(s, \tau)y(\tau)d\tau \right) ds.
\]
Using hypothesis, we obtain
\[
|\dot{x}(t) - \dot{y}(t)|
\]
\[
\leq |x(t) - y(t)|
\]
\[
\leq |x_0 - y_0| + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x(s) - y(s)| ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} \left| f \left( s, x(s), \int_0^\tau h(s, \tau)x(\tau)d\tau, \int_0^\tau k(s, \tau)x(\tau)d\tau \right) - F \left( s, y(s), \int_0^\tau h(s, \tau)y(\tau)d\tau, \int_0^\tau k(s, \tau)y(\tau)d\tau \right) \right| ds
\]
\[
\leq |x_0 - y_0| + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x(s) - y(s)| ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} \left| f \left( s, x(s), \int_0^\tau h(s, \tau)x(\tau)d\tau, \int_0^\tau k(s, \tau)x(\tau)d\tau \right) - F \left( s, y(s), \int_0^\tau h(s, \tau)y(\tau)d\tau, \int_0^\tau k(s, \tau)y(\tau)d\tau \right) \right| ds
\]
\[
\leq |x_0 - y_0| + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x(s) - y(s)| ds + \frac{L}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x(s) - y(s)| ds
\]
\[
+ \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} \left| h(s, \tau) \left| x(\tau) - y(\tau) \right| d\tau + \int_0^\tau \left| k(s, \tau) \left| x(\tau) - y(\tau) \right| d\tau \right| ds
\]
\[
+ \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} \left| f(s, y(s), \int_0^\tau h(t, \tau)y(\tau)d\tau, \int_0^\tau k(s, \tau)y(\tau)d\tau) - F(s, y(s), \int_0^\tau h(t, \tau)y(\tau)d\tau, \int_0^\tau k(s, \tau)y(\tau)d\tau) \right| ds
\]
\[
\leq \left( \delta + \frac{\epsilon}{\Gamma(\alpha + 1)} \right) + \frac{\lambda + L}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x(s) - y(s)| ds + \frac{Lh}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} \left( \int_0^\tau |x(\tau) - y(\tau)| d\tau \right) ds
\]
\[
+ \frac{Lk}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} \left( \int_0^\tau |x(\tau) - y(\tau)| d\tau \right) ds
where we obtain \( \varepsilon, \delta > 0 \) solutions on initial conditions and we also note that as \( \varepsilon \) involved in the right hand side of Eq. (1). If \( \varepsilon \rightarrow 0 \) then the inequality (14) gives continuous dependence of solutions on initial conditions and we also note that as \( \varepsilon, \delta > 0 \) were arbitrary, by taking \( \varepsilon, \delta \rightarrow 0^+ \), we have \( x \rightarrow y \), where \( x : J \rightarrow \mathbb{R} \) and \( y : J \rightarrow \mathbb{R} \) are the solutions of Eq. (1) and Eq. (12) respectively.

Next, we consider the mixed integro–differential equation of fractional order:

\[
\begin{align*}
^{c}D^\alpha x_1(t) &= \lambda x_1(t) + H(t, x_1(t), \int_0^t h(t,s)x_1(s)ds, \int_0^t k(t,s)x_1(s)ds, \delta_1), \quad x_1(0) = x_0 \\
^{c}D^\alpha x_2(t) &= \lambda x_2(t) + H(t, x_2(t), \int_0^t h(t,s)x_2(s)ds, \int_0^t k(t,s)x_2(s)ds, \delta_2), \quad x_2(0) = x_0
\end{align*}
\]

for \( t \in J \), where \( H : J \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R} \), \( x_0 \in \mathbb{R} \) and \( \delta_1, \delta_2 \) are real parameters.

The next theorem deals with the continuous dependence of solutions of Eq. (1) on parameters.

**Theorem 6.2.** Assume that the function \( H \) satisfies the conditions:

\[
|H(t, x, y, z, \delta_1) - H(t, x, y, z, \delta_1)| \leq L_1(|x - \bar{x}| + |y - \bar{y}| + |z - \bar{z}|),
\]

\[
|H(t, x, y, z, \delta_1) - H(t, x, y, z, \delta_2)| \leq L_2 |\delta_1 - \delta_2|,
\]

where \( L_1, L_2 \geq 0 \). Let \( x_1(t) \) and \( x_2(t) \) be the solutions of Eq. (15) and (16) respectively. Then

\[
|x_1(t) - x_2(t)| \leq \left| \frac{\delta_1 - \delta_2}{\Gamma(a+1)} \right| L_2 T^\alpha \exp\left( \int_0^t A(\tau)d\tau \right),
\]

where

\[
A(t) = \frac{(\lambda + L_1)(T - t)^{\alpha-1}}{\Gamma(a)} \left[ 1 + \int_0^t \frac{L_1T}{\lambda + L_1} d\tau + \int_0^T \frac{L_2T}{\lambda + L_1} d\tau \right]
\]
Proof. Let \( x_1(t) \) and \( x_2(t) \) be the solution of Eq. (15) and (16) respectively, then

\[
\mathcal{D}^\alpha x_1(t) = \lambda x_1(t) + H(t, x_1(t), \int_0^t h(t, s)x_1(s)ds, \int_0^T k(t, s)x_1(s)ds, \delta_1),
\]

\( x_1(0) = x_0 \)

and

\[
\mathcal{D}^\alpha x_2(t) = \lambda x_2(t) + H(t, x_2(t), \int_0^t h(t, s)x_2(s)ds, \int_0^T k(t, s)x_2(s)ds, \delta_2),
\]

\( x_2(0) = x_0 \)

This gives

\[
x_1(t) = x_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1}x_1(s)ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1}H(s, x_1(s), \int_0^s h(s, \tau)x_1(\tau)d\tau, \int_0^T k(s, \tau)x_1(\tau)d\tau, \delta_1)ds
\]

and

\[
x_2(t) = x_0 + \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1}x_2(s)ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1}H(s, x_2(s), \int_0^s h(s, \tau)x_2(\tau)d\tau, \int_0^T k(s, \tau)x_2(\tau)d\tau, \delta_2)ds
\]

Therefore, for any \( t \in J \),

\[
|x_1(t) - x_2(t)| \leq \frac{\lambda}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |H(s, x_1(s), \int_0^s h(s, \tau)x_1(\tau)d\tau, \int_0^T k(s, \tau)x_1(\tau)d\tau, \delta_1)|ds
\]

\[
- \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} |H(s, x_2(s), \int_0^s h(s, \tau)x_2(\tau)d\tau, \int_0^T k(s, \tau)x_2(\tau)d\tau, \delta_2)|ds
\]

\[
- \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds
\]

\[
- \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds
\]

\[
- \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds + \frac{\Gamma(\alpha)}{\Gamma(\alpha+1)} \int_0^t (t-s)^{\alpha-1} |x_1(s) - x_2(s)| ds
\]
where

Finally, we get

we obtain

Applying inequality given in the Theorem 2.8 with

we get

and

we obtain

where

\[
A(t) = \frac{(\lambda + L_1)(T - t)^{n-1}}{\Gamma(\alpha)} \left[ 1 + \int_0^t \frac{L_1 h \tau}{(\lambda + L_1)} d\tau + \int_0^T \frac{L_1 k \tau}{(\lambda + L_1)} d\tau \right]
\]

\[\Box\]

7. Illustrative Example

In this section, we give an example to illustrate the usefulness of our main results.

We consider

Define \( f(t, x(t), H_1 x(t), K_1 x(t)) = \frac{x(t) + 1}{2 + \frac{1}{9}} + \frac{1}{9} H_1 x(t) + \frac{1}{9} K_1 x(t), \ t \in [0, 1], \alpha = \frac{1}{2}, \lambda = 1. \) Where

\[H_1 x(t) = \int_0^t \frac{1}{(2 + t^2)} x(s)ds,\]

\[K_1 x(t) = \int_0^1 \frac{e^{-t}}{(3 + t^2)} x(s)ds.\]

Clearly, the function \( f \) is continuous. For any \( x_1, x_2 \in \mathbb{R} \) and \( t \in [0, 1], \)

\[|f(t, x_1, H_1 x_1, K_1 x_1) - f(t, x_2, H_1 x_2, K_1 x_2)| \leq \frac{1}{9} \left| x_1 - x_2 \right| + |H_1 x_1 - H_1 x_2| + |K_1 x_1 - K_1 x_2|\]

Hence hypothesis (H1) is satisfied with \( L = \frac{1}{9}. \) It follows from Theorem 3.2 that the problem (20) has a unique solution on \([0,1].\)
8. Conclusion

In this paper, we have successfully established an existence and interval of existence of solutions, uniqueness, continuous dependence of the solutions on initial conditions, estimates on solutions and continuous dependence on parameters and functions involved in a nonlinear mixed fractional integro-differential equation with constant coefficient. The important fact of this paper is that with the minimum assumptions on the function \( f \), we have obtained various properties of solutions of a nonlinear mixed fractional integro-differential equation with constant coefficient. In the future, we will extend the results to other fractional derivatives and boundary value problems.
