Materials
Grubbs' initiators G3, N-methylmaleimide, N-ethylmaleimide, 2-Methylfuran, 2-Pentylfuran, dimethyl acetylenedicarboxylate, Furfuryl alcohol, 3-Bromopyridine and 1,3,5-Trimethoxybenzene were purchased from Sigma-Aldrich and used without further purification. 2-Propylfuran and Triisopropylsilyl chloride was purchased from Alfa-Aesar and used without further purification. All other reagents and solvents were purchased from Acros organics or Sigma-Aldrich and used without further purification. Deuterated solvents (CD$_2$Cl$_2$, CDCl$_3$) were purchased from Cambridge Isotope Laboratories, Inc.

Characterization
All $^1$H NMR (400 MHz) and $^{13}$C NMR (100 MHz) spectra were recorded on a Bruker Avance DPX (360 MHz) FT NMR spectrometer. Chemical shifts were given in ppm relative to the residual solvent peak (CDCl$_3$: 7.26 for $^1$H; CDCl$_3$: 77.16 for $^{13}$C and CD$_2$Cl$_2$: 5.32 for $^1$H; CD$_2$Cl$_2$: 53.88). HR MALDI FT-ICR mass spectra were measured on a Bruker FTMS 4.7T BioAPEX II in positive mode using trans-2-[3-(tert-butylphenyl)-2-methyl-2-propenylidene] malononitrile (DCTB) as matrix and silver trifluoroacetate (AgTFA), sodium trifluoroacetate (NaTFA) as counter ion source. HR-MS (ESI+) mass spectra were measured on a Bruker FTMS 4.7T BioAPEX II. Relative molecular weights and molecular weight distributions were measured by gel permeation chromatography (GPC) with tetrahydrofuran as eluent with a flow rate of 1 mL/min at room temperature. The system was calibrated with polystyrene standards in a range from $10^3$ to $3\times10^6$ Da. The instrument is an automated Viscotek GPCmax VE-2001 with a set of two Viscotek T6000M linear columns (300 x 8 mm, 5 µm particle size). Signal detection occurred by use of a Viscotek Smartline 2600 UV detector (set to 254 nm wavelength) and a Viscotek VE 3580 RI detector (refractive index). The Chloroform GPC is an automated PSS SECCurity System (Agilent Technologies 1260 infinity II) with a set two MZ-Gel SDplus linear columns (300 x 8 mm, 5 µm particle size). The Chloroform GPC was calibrated with polystyrene standards in a range from $10^3$ to $3\times10^6$ Da and the samples were run at 40 °C and a flow rate of 1.0 mL/min.
Synthesis of substrates

*N*-methyl-7-oxanorborneneimide (1)

\[
\text{[Diagram showing the reaction of 1 with THF at 40 °C]}
\]

A mixture of *N*-methylmaleimide (10g, 90 mmol, 1eq) and furan (9.19g, 135 mmol, 1.5eq) was dissolved in 5 mL of tetrahydrofuran. The solution was heated to 40 °C until complete disappearance of *N*-methylmaleimide was observed. The reaction was concentrated under vacuum to give a white solid as 57:43 endo-, exo- mixture (15.78g, 98%). The mixture was used for metathesis without any further purifications. The mixture was also purified by column chromatography with hexane: ethyl acetate (75:25) to obtain pure 1-endo (white solid) and 1-exo (crystalline colorless solid). The endo isomer was stored at -20 °C. Endo- isomer: ¹H NMR (400 MHz, CHLOROFORM-δ) δ 6.39 (t, J=0.86 Hz, 2 H), 5.32 (ddd, J=2.69, 1.71, 0.86 Hz, 2 H), 3.52 (dd, J=3.61, 1.65 Hz, 2 H), 2.81 (s, 3 H) ppm. Exo- isomer: ¹H NMR (400 MHz, CHLOROFORM-δ) δ 6.51 (t, J=0.86 Hz, 2 H), 5.26 (t, J=0.86 Hz, 2 H), 2.97 (s, 3 H), 2.85 (s, 2 H) ppm. HR-MS (ESI) calcd. For C₉H₁₀NO₃Na⁺ [M+Na⁺]: 216.0637; Found: 216.0658.

4-Methyl-*N*-methyl-7-oxanorbornene carboximide (2)

\[
\text{[Diagram showing the reaction of 2 with THF at 40 °C]}
\]

A mixture of *N*-methylmaleimide (10g, 90 mmol, 1eq) and 2-methylfuran (14.7g, 180 mmol, 2 eq) was dissolved in 5 mL of tetrahydrofuran. The solution was heated to 40 °C until complete disappearance of *N*-methylmaleimide was observed. The reaction was concentrated under vacuum to give a white solid as 57:43 endo-, exo- mixture (17g, 98%). The mixture was used for metathesis without any further purifications. The mixture was also purified by column chromatography with hexane: ethyl acetate (80:20) to obtain pure 2-endo (white solid) and 2-exo (crystalline colorless solid). The endo isomer was stored at -20 °C. Endo- isomer: ¹H NMR (400 MHz, CHLOROFORM-δ) δ 6.38 (dd, J=5.75, 1.47 Hz, 1 H), 6.21 (d, J=5.75 Hz, 1 H), 5.21 (dd, J=5.56, 1.65 Hz, 1 H), 3.64 (dd, J=7.52, 5.56 Hz, 1 H), 3.11 (d, J=7.58 Hz, 1 H), 2.81 (s, 3 H), 1.83 (s, 3 H) ppm. Exo- isomer: ¹H NMR (400 MHz, CHLOROFORM-δ) δ 6.49 (dd, J=5.62, 1.59 Hz, 1 H), 6.29 (d, J=5.62 Hz, 1 H), 5.16 (d, J=1.71 Hz, 1 H), 2.92 - 3.00 (m, 4 H), 2.70 (d, J=6.48 Hz, 1 H), 1.71 (s, 3 H) ppm. Exo-mixture: ¹³C NMR (101 MHz, CHLOROFORM-δ) δ 176.1, 174.9, 140.4, 136.8, 88, 80.5, 50.6, 49.4, 24.8, 15.6 ppm. MS (ESI) calcd. For C₁₀H₁₇NO₃Na⁺ [M+Na⁺]: 216.0637; Found: 216.0295.

4-Propyl-*N*-methyl-7-oxanorbornenecarboximide (3)

\[
\text{[Diagram showing the reaction of 3 with THF at 40 °C]}
\]

A mixture of *N*-methylmaleimide (10g, 90 mmol, 1eq) and 2-propylfuran (19.8g, 180 mmol, 2 eq) was dissolved in 5 mL of tetrahydrofuran. The solution was heated to 40 °C until complete disappearance of *N*-methylmaleimide was observed. The reaction was concentrated under vacuum to give a white solid as 57:43 endo-, exo- mixture (19.5g, 98%). The mixture was used for metathesis without any further purifications. Endo- isomer: ¹H NMR (300 MHz, CHLOROFORM-δ) δ 6.35 - 6.38 (m, 1 H), 6.25 (d, J=5.69 Hz, 1 H), 5.23 (dd, J=5.55, 1.60 Hz, 1 H), 3.61 (dd, J=7.52, 5.50 Hz, 1 H), 3.16 (d, J=7.61 Hz, 1 H), 2.81 (s, 3 H), 1.88 - 2.12 (m, 2 H), 1.42 - 1.73 (m, 2 H) ppm. Exo- isomer: ¹H NMR (300 MHz, CHLOROFORM-δ) δ 6.50 (dd, J=5.73, 1.60 Hz, 1 H), 6.38 (d, J=5.69 Hz, 1 H), 5.20 (d,
A mixture of N-ethylmaleimide (5g, 40 mmol, 1 eq) and furfuryl alcohol (7.8g, 80 mmol, 2 eq) was dissolved in 2 mL of tetrahydrofuran. The solution was heated to 40 °C until complete disappearance of N-ethylmaleimide was observed. The reaction was concentrated under vacuum to give a yellow liquid as 70:30 endo-, exo- mixture (8.8g, 99%). The mixture was used for next step without any further purifications.

A mixture of crude product (4g, 17.9 mmol, 1 eq) and imidazole (3.6g, 53.8 mmol, 3 eq) were dissolved in 30 mL dry dichloromethane and cooled to 0 °C. To the precooled solution triisopropylsilyl chloride (4.1g, 21.5 mmol, 1.2eq) was added dropwise and the mixture was allowed to warm to room temperature. The reaction mixture was stirred for a further 12 hours at room temperature. The reaction was concentrated under reduced pressure and purified by column chromatography with hexane: ethyl acetate (95:5) to obtain 5 as endo/exo mixture (6.1g, 90%). Endo- isomer: 1H NMR (300 MHz, CHLOROFORM-d) δ 6.40 (dd, J=5.78, 1.56 Hz, 1 H), 6.26 (d, J=5.78 Hz, 1 H), 5.29 (dd, J=5.23, 1.56 Hz, 1 H), 4.27 - 4.40 (m, 2 H), 3.47 - 3.64 (m, 2 H), 3.38 (q, J=7.15 Hz, 2 H), 0.96 - 1.23 (m, 24 H) ppm. Exo- isomer: 1H NMR (300 MHz, CHLOROFORM-d) δ 6.59 (d, J=5.69 Hz, 1 H), 6.50 (dd, J=5.73, 1.60 Hz, 1 H), 5.24 (d, J=1.65 Hz, 1 H), 4.42 (d, J=7.61 Hz, 1 H), 4.08 (d, J=11.28 Hz, 1 H), 3.48 - 3.54 (m, 2 H), 2.94 (d, J=6.42 Hz, 1 H), 2.86 (d, J=6.42 Hz, 1 H), 0.96 - 1.23 (m, 24 H) ppm. MS (ESI) calcd. For C_{20}H_{33}NO_{3}SiNa^{+} [M+Na]+: 402.0277; Found: 402.0018.
Dimethyl-1-pentyl-7-oxabicyclo[2.2.1]hepta-2,5-diene-2,3-dicarboxylate (6)

\[
\text{CO}_2\text{Me} + \begin{array}{c}
\text{CO}_2\text{Me} \\
\end{array} \xrightarrow{\text{Toluene} \ 100 \ ^\circ \text{C}} \begin{array}{c}
\text{CO}_2\text{Me} \\
\end{array}
\]

A mixture of dimethyl acetylenedicarboxylate (1g, 7 mmol, 1eq), 2-pentylfuran (1.2g, 8.4 mmol, 1.2 eq) and 3 mL of toluene was heated to 100 °C for 24h. The reaction was concentrated under reduced pressure and purified by column chromatography with hexane: ethyl acetate (90:10) to obtain monomer 5 as red liquid (1.8g, 94%). HR-MS (ESI) calcd. For C_{15}H_{20}O_{5}Na⁺ [M+Na⁺]: 303.1208 ; Found: 303.1198.

Control ¹H NMR initiation experiments

An equal mixture of endo- and exo- isomer of monomer (1-4) was dissolved in 0.5 mL of dry degassed dichloromethane-d2. The resulting solution was transferred to degassed NMR tube containing internal standard (1, 3, 5 trimethoxybenzene) and ¹H NMR spectra was measured. Separately, 0.4 eq of G3 was dissolved in dry degassed dichloromethane-d2 and quickly added to the NMR tuhbe, ensuring efficient mixing. Then, ¹H NMR spectrum of the reaction mixture was recorded over time.

Polymerization with cyclohexene

The monomer (2-4) and 20eq. of cyclohexene were dissolved in dry degassed dichloromethane to obtain 0.3M monomer solution (with respect to 2-4). Separately, a stock solution of catalyst G3 was prepared. The required amount of G3 solution was quickly added to the monomer solution and ensuring efficient mixing. The reaction mixture was stirred for 12-18 hours (for monomer 2, 12 hours and monomer 3-4, 18 hours) at rt under argon atmosphere. The reactions were quenched with excess ethyl vinyl ether and precipitated into cold methanol to obtain alternating polymers.

Polymerization with cycloheptene and cyclopentene

An equimolar mixture of monomers (2-4) and cycloheptene/ cyclopentene were transfer into vials equipped with a stir bar under argon atmosphere. Separately, a stock solution of catalyst G3 was prepared. The required amount of G3 solution was quickly added to the monomer solution and ensuring efficient mixing. The reaction mixture was stirred for 12-18 hours (for monomer 2, 12 hours and monomer 3-4, 18 hours) at rt under argon atmosphere. The reactions were quenched with excess ethyl vinyl ether and precipitated into cold methanol to obtain alternating polymers.
End capping of ROMP polymer with monomer 6

Monomer MNI (0.5g, 2.8 mmol, 30 eq) was dissolved in 2.5 mL dry degassed dichloromethane. Separately, a stock solution of catalyst G3 was prepared. The required amount of G3 (83 mg, 0.09 mmol, 1eq) solution was quickly added to the monomer solution and ensuring efficient mixing. The reaction mixture was stirred for 10 min and an aliquot was collected for \(^1\)H NMR measurement. A stock solution of monomer 6 was prepared and required amount of monomer 6 (76 mg, 0.27 mmol, 3eq) solution was quickly added to the polymerization mixture was continue stirring for 10 min. A sample was collected for \(^1\)H NMR measurement. Then, the reaction was quenched with excess of ethyl vinyl ether. Finally, the reaction mixture was concentrated under reduced pressure and precipitated into cold methanol to obtain P18 (SEC, THF, Mn=6.1 kDa.; D=1.08).

End functionalization of P18

Polymer P18 (40 mg, 1eq) was dissolved in 0.5 mL of dry THF. Separately, 10eq of thiol derivative was dissolved in 0.5 mL of dry DMF and 0.2eq of NaH (60% dispersed in mineral oil) was added. The resulting mixture was stirred for 20 min and quickly transfer into the polymer solution. The reaction mixture was heated at 40 °C for 12 h. Finally, the reaction mixture was concentrated under reduced pressure and precipitated into cold methanol to obtain polymer P19 (ethanolthiol) or P20 (pentanedithiol).
