The notion of spherical fuzzy sets (SFSs) is one of the most effective ways to model the fuzzy information in decision-making processes. The sum of squares of membership, neutral, and nonmembership degrees in SFSs lies in the interval [0, 1] and accommodates more uncertainties. Henceforth, in this article, the idea of spherical cubic fuzzy sets (SCFSs) is introduced, which is the generalization of SFSs. Spherical cubic fuzzy set is the combination of spherical fuzzy sets and interval-valued spherical fuzzy sets. The membership, neutral, and nonmembership degrees in an SCFS are cubic fuzzy numbers (CFNs). Consequently, this set outperforms the pre-existing structures of fuzzy set theory. Moreover, some fundamental operations for the comparison of two spherical CFNs are defined such as score function and accuracy function. Further, several new operations through Dombi t-norm and Dombi t-conorms are characterized to get the best results during the decision criteria. Furthermore, spherical cubic fuzzy Dombi weighted averaging (SCFDWA), SCFD ordered weighted averaging (SCFDOWA), SCFD hybrid weighted averaging (SCFDHWA), SCFD weighted geometric (SCFDWG), SCFD ordered weighted geometric (SCFDOWG), and the SCFD hybrid weighted geometric (SCFDHGW) aggregated operators are discussed, and their characteristics are examined. In addition, some of the operational laws of these operators are defined. Also, a decision-making approach based on these operators is proposed. Since the proposed methods and operators are the generalizations of the existing methods and operators, therefore, these techniques produce more general, accurate, and precise results as compared with existing ones. Finally, a descriptive example is given in order to describe the validity, practicality, and effectiveness of the proposed methods.

1. Introduction

Multiattribute group decision-making is an investigation of recognizing and choosing the alternatives depending upon the values and priorities of decision makers. Settling on a chance infers that there are alternative decisions to be considered. In such a case, we do not need to recognize the same number of these options as could be allowed to select the best possibility to attain our objectives, targets, or expectations. Zadeh in [1] presented the idea of fuzzy set theory and logic. In the fuzzy set theory, he just examined the membership grade, known as the membership degree. Moreover, Zadeh established the application of fuzzy sets (FSs) in various fields like design, software engineering, and information technology. After numerous uses of FSs, Atanassov [2] saw that there are several deficiencies in FSs so he presented the idea of intuitionistic fuzzy sets (IFSs). Each element in an IFS is described by a pair of mappings, and each of these mappings is categorized by a membership and a nonmembership grade. The IFS was further extended by Yager and Yager [3, 4] who developed the idea of Pythagorean fuzzy sets (PyFSs) by adding constraints on the membership and nonmembership grades as the aggregate of the squares of membership and nonmembership grades must not exceed by 1. In [5, 6], the new approach of decision-making using the concept of picture fuzzy numbers
was presented and further it was extended for picture fuzzy linguistic sets.

An IFS and a PyFS have been effectively implemented in various fields, but in numerous circumstances, these theories fail, for instance, in vote casting, human judgements include more responses like yes, no, abstain, and refusal. In voting station, the chamber issues forms for the applicants. The voting outcomes are distributed into four categories, and the results are as follows: vote in favor, abstain or neutral votes, vote in opposition, and refuse to vote. Here, abstain means blank voting form, i.e., nobody gave the vote in favor or against. Refusal of vote means that a person refuses to give the vote. The applicant is viewed as effective in the light of the fact that the quantity of supportive papers is greater than the vote in opposition. In these sorts of situations where the abstention and rejection occur, the concepts of FSs and IFSs fail to be applied. Hence, the concept of picture fuzzy set (PFS) is presented by Cuong et al. [7–9], that is, the expanded form of the FSs and IFSs. PFS gives three membership grades known as positive membership grade, neutral membership grade, and negative membership grade correspondingly. The issue of voting criteria successfully resolved by picture fuzzy set theory, and this theory is further applied in various fields. By making use of those operations for PFN, plenty of working has been performed by the research workers, combined with aggregated methodology, multiattribute group decision, and information measures. From this overview, it is commented that neither FS nor IFS and PFS theory are useful to tackle the vague conflicting information. For example, if an individual gives their inclination about the item as far as indeed is, no is, and abstained is, at that point, we see that accordingly, IFSs and PFSs may not be able to tackle such circumstances. To overcome these complications, many researchers [10] presented the notion of spherical fuzzy set (SFS) by the additional constraints, i.e., the sum of the squares must not exceed. According to above situation, we see, thus, SFS is the generalization of PFS and IFS to cope with the problems in making decision. Fahmi et al. [11] gave a new idea of trapezoidal cubic fuzzy numbers and their applications in multiattribute group decision making. Garg [12] presented the idea of picture fuzzy aggregation operators and further discussed its applications. Ashraf et al. [13] introduced the collection of spherical weighted aggregated operations for resolving multiattribute decision-making problems under the spherical fuzzy sets. Gündogdu and Kahraman [14] presented the new idea of the spherical fuzzy TOPSIS method.

Dombi operations introduced in 1982 are an important complement to the existing operations. It is characterized by good flexibility for information aggregation. Many scholars presented the t-norm and t-conorm Dombi operations in [5, 15] which have an inclination of fluctuation with the operation of parameters. For this preferred position, Lin et al. utilized the IFSs and combined them with Dombi operations and presented the concept of Dombi Bonferroni mean operator [16] using IFSs to resolve the issues in multiattribute group decision-making. Liu et al. [17] presented new concept of spherical fuzzy sets for Yunnan Baiyao’s R & D project selection problem. In [18], Shi and Ye extended Dombi operation to neutrosophic cubic sets and utilized it in travelling decision-making approaches. To resolve the various issues in multiattribute group decision makers, Lu and Ye [19] firstly defined Dombi aggregated operations and linguistic cubic sets [20–23]. In [24], Jana et al. presented several Dombi bipolar fuzzy aggregated operations under the picture fuzzy data based on averaging, geometric, and various Dombi operations. Jana et al. [25] presented the idea of picture fuzzy Dombi aggregation operators and their applications in multiattribute decision-making process. Rafiq et al. [26] presented the cosine similarity measures of spherical fuzzy sets and their applications in decision-making. Seikh and Mandal [27] gave the idea of intuitionistic fuzzy Dombi aggregation operators and their applications. Wei et al. [28] presented the similarity measure of spherical fuzzy sets using the cosine function and their applications. Muneeza et al. [29, 30] gave the new idea of intuitionistic cubic fuzzy sets and their applications in supplier’s selection and hydropower plant locations. In [31–33], many researchers introduced the idea of Pythagorean cubic fuzzy sets, which is the generalization of Pythagorean fuzzy sets and cubic sets and further discussed its application in multiattribute decision-making. Ayaz et al. [34, 35] introduced the idea of spherical cubic fuzzy sets and defined the various aggregation operators and their applications in decision-making.

In aggregated procedure, the significant method is to characterize the operational laws. The applications of SFSs require several new operations and aggregated operations to be developed. By maintaining the advantages of the SFS, we describe the collection of SFSs. Besides this, by using Dombi norms, the fundamental weighted geometric average operations have been characterized by utilizing the idea of cubic fuzzy set theory as spherical cubic fuzzy Dombi weighted average (SCFDWA), spherical cubic fuzzy Dombi ordered weighted average (SCFOWA), spherical cubic fuzzy Dombi hybrid weighted average (SCFHDWA), spherical cubic fuzzy Dombi weighted geometric (SCFDWG), spherical cubic fuzzy Dombi ordered weighted geometric (SCFOWG), and spherical cubic fuzzy Dombi hybrid weighted geometric (SCFHDWG). We utilized these operations to propose the method for multiattribute group decision-making. At last, we enlighten the practicality of the proposed methods in the selection of spherical cubic fuzzy numbers. In order to get a fair decision during the process, some new operational laws by Dombi t-norm and t-conorm are defined in this manuscript. A new approach based on spherical cubic fuzzy set models via spherical cubic fuzzy Dombi aggregation operators is proposed. A method to deal with decision-making problems using spherical cubic Dombi weighted averaging, Dombi weighted geometric, and Dombi hybrid weighted aggregation operators is established. This model has a stronger capability than existing weighted averaging, weighted geometric, Einstein, logarithmic averaging, and logarithmic geometric aggregation operators for spherical cubic fuzzy information. This study presents the novel decision-making techniques to tackle the uncertainty in decision-making processes through proposed generalized
structure of spherical cubic fuzzy set and well known Dombi norms.

The paper is designed in the following manner. In Section 2, we presented fundamental information of extended fuzzy sets. In Section 3, we have discussed the idea of spherical cubic fuzzy set and various aggregation operators. The Dombi aggregation operations are introduced in Section 4. Section 5 discusses the applications of the proposed method, and some numerical applications are given in Section 6. In Section 7, analysis with the suggested Dombi aggregated operations is carried out, and finally we conclude our work in Section 8.

2. Preliminaries

We support the reader’s interpretation of the standard definitions and outcomes of the spherical fuzzy set theory, but to make this work more introspective, basic ideas used in the literature are described, and we note a portion of the idea and findings used in the rest of the work.

**Definition 1** (see [30]). Let \( X \) be the universe of discourse; a fuzzy intuitionistic cubic set \( I_x \) on \( X \) is presented as

\[
I_x = \{ ( [\bar{u}, \bar{v}], \bar{a}), ([\bar{w}, \bar{v}], \bar{\theta}) \mid x \in X \},
\]

where \( ( [\bar{u}, \bar{v}], \bar{a}) \) and \( ( [\bar{w}, \bar{v}], \bar{\theta}) \) are known as membership and nonmembership of \( I_x \), which satisfy the condition that \( \sup [\bar{u}, \bar{v}] + \sup [\bar{w}, \bar{v}] \leq 1 \) and \( \bar{a} + \bar{\theta} \leq 1 \).

**Definition 2** (see [24]). Let \( X \) be the universe of discourse; a fuzzy Pythagorean cubic set \( P_x \) on \( X \) is presented as

\[
P_x = \{ ( [\bar{u}, \bar{v}], \bar{a}), ([\bar{w}, \bar{v}], \bar{\theta}) \mid x \in X \},
\]

where \( ( [\bar{u}, \bar{v}], \bar{a}) \) and \( ( [\bar{w}, \bar{v}], \bar{\theta}) \) are known as membership and nonmembership of \( I_x \), which satisfy the condition that \( \sup [\bar{u}, \bar{v}]^2 + \sup [\bar{w}, \bar{v}]^2 \leq 1 \) and \( \bar{a}^2 + \bar{\theta} \leq 1 \).

**Definition 3** (see [10]). Let \( X \) be the universe of discourse; a spherical fuzzy set \( S_x \) on \( X \) is presented as

\[
S_x = \{ \langle P_x, I_x, N_x \rangle \mid x \in X \},
\]

where \( P_x : X \rightarrow \theta, I_x : X \rightarrow \theta \), and \( N_x : X \rightarrow \theta \) are known as membership, neutral, and nonmembership degrees, respectively, under the specific condition \( 0 \leq P_x + I_x + N_x \leq 1 \), and the triplet \( S_x = \langle P_x, I_x, N_x \rangle \) is called the spherical fuzzy numbers.

3. Characteristics of Spherical Cubic Fuzzy Sets

The definition of the spherical cubic fuzzy set (SCFS) and its operations are presented in this section. The extension of the spherical fuzzy set is the spherical cubic fuzzy set. The composition of the SCFS defends elements that met or did not fulfill the requirement for values to be from 0 to 1.

The spherical cubic fuzzy set is a direct generalization of the cubical fuzzy set of Pythagoras and the cubic fuzzy set of images. When the pythagorean cubic fuzzy set (PyCFS) and image cubic fuzzy set both could not cope with the situation, a fascinating situation grows. There is a need to describe the concept of a spherical cubic fuzzy set to solve this situation in this way. The principle of the distinction between PyCFSs and SCFSs is that we research the neutral membership in SCFSs, where it does not in PyCFSs. The association of positive, neutral, and negative degrees of an object is defined in the closed unit interval in image cubic fuzzy, but the sum of positive, neutral, and negative degrees of the object is greater than 1. In this situation, we used spherical cubic fuzzy sets.

Each feature of the intuitionist cubic fuzzy set (ICFS) consists of a membership function and a nonmembership function in which the function of membership is cubic fuzzy set and cubic fuzzy set is also nonmembership. We then generalize (ICFS) and describe a fresh definition of the spherical cubic fuzzy set (SCFS) consisting of membership function, neutral membership function, and nonmembership function in which the function of membership is cubic fuzzy set, cubic fuzzy set is the function of neutral membership, and cubic fuzzy set is also nonmembership. The issue is addressed by SCFS in all current systems such as ICFS, PyCFS, and PCFS. So, the SCFS is the generalization of the entire system that exists.

**Definition 4** (see [34]). Let \( X \) be the universe of discourse, then the spherical cubic fuzzy set \( S_x \) in \( X \) is defined as

\[
S_x = \{ x, ([\bar{u}, \bar{v}], \bar{a}), ([\bar{v}, \bar{\theta}], \bar{\beta}), ([\bar{w}, \bar{v}], \bar{\theta}) \mid x \in X \},
\]

where \( ([\bar{u}, \bar{v}], \bar{a}) \) represents the membership degree, \( ([\bar{v}, \bar{\theta}], \bar{\beta}) \) represents neutral, and \( ([\bar{w}, \bar{v}], \bar{\theta}) \) represents the nonmembership degree where \( \bar{a} + \bar{\theta} \leq 1 \), and \( [\bar{v}, \bar{\theta}] \subseteq [0, 1] \), and \( [\bar{u}, \bar{v}] \subseteq [0, 1] \) and \( \bar{a}: X \rightarrow [0, 1], \bar{\beta}: X \rightarrow [0, 1], \bar{\theta}: X \rightarrow [0, 1] \) under the condition

\[
\sup [\bar{u}, \bar{v}] + \sup [\bar{v}, \bar{\theta}] + \sup [\bar{w}, \bar{v}] \leq 1,
\]

\[
\bar{a} + \bar{\beta} \leq 1.
\]

We called \( ([\bar{u}, \bar{v}], \bar{a}), ([\bar{v}, \bar{\theta}], \bar{\beta}), ([\bar{w}, \bar{v}], \bar{\theta}) \) as spherical cubic fuzzy numbers (SCFNs) denoted by \( S_x \). \( S_x = \{ ([\bar{u}, \bar{v}], \bar{a}), ([\bar{v}, \bar{\theta}], \bar{\beta}), ([\bar{w}, \bar{v}], \bar{\theta}) \} \) which is known as spherical cubic fuzzy numbers (SCFNs).

**Definition 5** (see [34]). Let two SCFNs be \( S_1 = \{ ([\bar{u}_1, \bar{v}_1], \bar{a}_1), ([\bar{v}_1, \bar{\theta}_1], \bar{\beta}_1), ([\bar{w}_1, \bar{v}_1], \bar{\theta}_1) \mid x \in X \} \) and \( S_2 = \{ ([\bar{u}_2, \bar{v}_2], \bar{a}_2), ([\bar{v}_2, \bar{\theta}_2], \bar{\beta}_2), ([\bar{w}_2, \bar{v}_2], \bar{\theta}_2) \mid x \in X \} \) and \( y > 0 \) be any constant. Then, the operations are defined as follows:

1. For \( x, \bar{a}, \bar{\theta} \in [0, 1] \)
   \[
   x \cdot \bar{a} = \min \{ \bar{a}, \bar{\theta} \},
   \]

2. For \( x, \bar{a}, \bar{\theta} \in [0, 1] \)
   \[
   x \cdot \bar{a} = \min \{ \bar{a}, \bar{\theta} \},
   \]

3. For \( x, \bar{a}, \bar{\theta} \in [0, 1] \)
   \[
   x \cdot \bar{a} = \min \{ \bar{a}, \bar{\theta} \},
   \]
\[ A(\tilde{S}_x) = \frac{(\tilde{u} + \tilde{u}^* + \tilde{a})^2 + (\tilde{v} + \tilde{v}^* + \tilde{\beta})^2 + (\tilde{w} + \tilde{w}^* + \tilde{\theta})^2}{9} \]  

(8)

Here, \( A(\tilde{S}_x) \in [0, 1] \).

**Definition 10.** For any SCFNs, \( \tilde{S}_x = \{ \vec{P}_x(f), \vec{N}_x(f) \} (p = 1, 2) \) in \( X \). Then, the comparison scheme is defined as follows:

1. \( S_x(\tilde{S}_x) < S_x(\tilde{S}_x) \), then \( \tilde{S}_x < \tilde{S}_x \)
2. \( S_x(\tilde{S}_x) > S_x(\tilde{S}_x) \), then \( \tilde{S}_x > \tilde{S}_x \)
3. \( S_x(\tilde{S}_x) = S_x(\tilde{S}_x) \), then
   a. \( A(\tilde{S}_x) < A(\tilde{S}_x) \), then \( \tilde{S}_x < \tilde{S}_x \)
   b. \( A(\tilde{S}_x) > A(\tilde{S}_x) \), then \( \tilde{S}_x > \tilde{S}_x \)
   c. \( A(\tilde{S}_x) = A(\tilde{S}_x) \), then \( \tilde{S}_x = \tilde{S}_x \)

**Definition 11.** Let \( \bar{S}_x = \{ x, [\bar{u}_x, \bar{v}_x], \bar{a}_x \} \), \( [\bar{v}_x \bar{u}_x], \bar{b}_x \) and \( \bar{S}_x = \{ x, [\bar{v}_x, \bar{w}_x], \bar{a}_x \} \), \( [\bar{v}_x \bar{w}_x], \bar{b}_x \} \) be the collection of SCFNs where \( (p = 1, 2, 3, \ldots, n) \) in \( X \). The spherical cubic fuzzy weighted averaging (SCFWA) operator is illustrated as

\[ \text{SCFWA}(\bar{S}_x; \bar{S}_x; \ldots, \bar{S}_x) = \sum_{p=1}^{n} \gamma, S_p \bar{S}_x, \ldots, \bar{S}_x \]

(9)

\( \gamma_p (p = 1, 2, 3, \ldots, n) \) are weight vectors with \( \gamma_p \geq 0 \) and \( \sum_{p=1}^{n} \gamma_p = 1 \).

**Definition 12.** Let \( \bar{S}_x = \{ x, \bar{u}_x, \bar{v}_x], \bar{a}_x \}, \{ \bar{v}_x \bar{u}_x], \bar{b}_x \} \), \( \{ \bar{v}_x \bar{w}_x], \bar{b}_x \} \) be the collection of SCFNs where \( (p = 1, 2, 3, \ldots, n) \) in \( X \). The spherical cubic fuzzy ordered weighted average (SCFWOA) is defined as

\[ \text{SCFWOA}(\bar{S}_x; \bar{S}_x; \ldots, \bar{S}_x) = \sum_{p=1}^{n} \gamma, S_p \bar{S}_x, \ldots, \bar{S}_x \]

(10)

where \( \gamma_p (p = 1, 2, 3, \ldots, n) \) are weight vectors with \( \gamma_p \in [0, 1], \sum_{p=1}^{n} \gamma_p = 1 \), and the \( p \)-th largest value is \( S_{\gamma(p)} \) therefore, the order is \( \bar{S}_x(1) \geq \bar{S}_x(2) \geq \ldots \geq \bar{S}_x(n) \).

**Definition 13.** Let \( \bar{S}_x = \{ x, [\bar{u}_x, \bar{v}_x], \bar{a}_x \}, \{ \bar{v}_x \bar{w}_x], \bar{b}_x \} \) be the collection of SCFNs where \( (p = 1, 2, 3, \ldots, n) \) in \( X \). The spherical cubic fuzzy hybrid weighted averaging (SCFWHA) operator is defined as follows:

\[ \text{SCFWHA}(\bar{S}_x; \bar{S}_x; \ldots, \bar{S}_x) = \sum_{p=1}^{n} \gamma, S_p \bar{S}_x, \ldots, \bar{S}_x \]

(11)

Here, the weighted vector is represented as \( \gamma, (p = 1, 2, \ldots, n) \) and \( \gamma_p \geq 0 \) and \( \sum_{p=1}^{n} \gamma_p = 1 \), and the \( p \)-th largest weight value is \( S_{\gamma(p)} (\bar{S}_x = \gamma, S_p \bar{S}_x, \ldots, \bar{S}_x) \), and the order is defined as \( \bar{S}_x(1) \geq \bar{S}_x(2) \geq \ldots \geq \bar{S}_x(n) \) and \( w^* = (w^*_1, w^*_2, \ldots) \)
weighted geometric (SCFHWG) operator, and spherical cubic fuzzy Dombi ordered weighted averaging (SCFDOWA) operator, spherical cubic fuzzy Dombi weighted geometric (SCFDWG) operator, spherical cubic fuzzy Dombi ordered weighted geometric (SCFDOWG) operator, and spherical cubic fuzzy Dombi hybrid weighted geometric (SCFHDWG) operator and studied its fundamental properties, i.e., boundary property, idempotency property, and monotonic property.

4. Spherical Cubic Fuzzy Dombi Aggregated Operators

Presently, we proposed the concept of spherical cubic fuzzy Dombi aggregated operations and discussed some of their characteristics in this section on the basis of Definition 7. We will introduce the spherical cubic fuzzy Dombi weighted averaging (SCFDWA) operator, spherical cubic fuzzy Dombi ordered weighted averaging (SCFDOWA) operator, spherical cubic fuzzy Dombi weighted geometric (SCFDWG) operator, spherical cubic fuzzy Dombi ordered weighted geometric (SCFDOWG) operator, and spherical cubic fuzzy Dombi hybrid weighted geometric (SCFHDWG) operator.

\[
\tilde{T}(a, b) = \frac{1}{1 + \left\{ (1 - 0.4/0.4)^5 + (1 - 0.7/0.7)^5 \right\}^{1/5}}
\]

\[
\tilde{S}(a, b) = 1 - \frac{1}{1 + \left\{ (1 - 0.4/0.4)^5 + (1 - 0.7/0.7)^5 \right\}^{1/5}}
\]

(16)

Example 1. Assume \( a = 0.4, b = 0.5 \), and \( r = 5 \). Then,

\[
\tilde{T}(a, b) \quad \text{and} \quad \tilde{S}(a, b)
\]
(3) $P_{DP}\tilde{S}_{x_i} =$
\[
\begin{align*}
&\left\{ \sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))} \right\}.
\end{align*}
\]

(4) $(\tilde{S}_{x_i})^{(p)} =$
\[
\begin{align*}
&\left\{ \sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))}, \\
&\sqrt{1/(1 + \rho((\mu_i^*)^2 - (\overline{\mu}_i^*)^2))} \right\}.
\end{align*}
\]

**Definition 18.** Let two SCFNs be $\tilde{S}_{x_1} = \{x, (\overline{\mu}_1, \overline{\nu}_1), (\alpha_1, \beta_1), (\overline{\mu}_1, \overline{\nu}_1), (\alpha_1, \beta_1)\}$ and $\tilde{S}_{x_2} = \{x, (\overline{\mu}_2, \overline{\nu}_2), (\alpha_2, \beta_2), (\overline{\mu}_2, \overline{\nu}_2), (\alpha_2, \beta_2)\}$ in $X$ and $\gamma \geq 0$. Then, the operations of SCFNs on the basis of Dombi operation are presented as

4.1. Spherical Cubic Dombi Weighted Averaging Operations.
In the view of characterized Dombi operations of SCFNs, we describe the following weighted averaging aggregated operators.

**Definition 19.** For any collection of SCFNs, $\tilde{S}_{x} = \{x, (\overline{\mu}_p, \overline{\nu}_p), (\alpha_p, \beta_p), (\overline{\mu}_p, \overline{\nu}_p), (\alpha_p, \beta_p)\}$ ($p = 1, 2, \ldots, n$) in $X$. Then, structure of spherical cubic fuzzy Dombi weighted averaging (SCFDWA) operator is

$$\text{SCFDWA} \left( \tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n} \right) = \sum_{p=1}^{n} y_p \tilde{S}_{x_p},$$  \hspace{1cm} (17)

where $y_p$ is the weight vector with $(p = 1, 2, \ldots, n)$ and $\sum_{p=1}^{n} y_p = 1$.

**Theorem 1.** For any collections of SCFNs, $\tilde{S}_{x_p} = \{x, (\overline{\mu}_p, \overline{\nu}_p), (\alpha_p, \beta_p), (\overline{\mu}_p, \overline{\nu}_p), (\alpha_p, \beta_p)\}$ ($p = 1, 2, \ldots, n$) in $X$. Then, the spherical cubic Dombi weighted averaging (SCFDWA) operator is defined using the operations on Dombi with some positive constant $\varepsilon > 0$ as follows:
where $\gamma_p$ represents the weight vectors $\gamma_p \geq 0$ with \((p = 1, 2, \ldots, n)\) and $\sum_{p=1}^{n} \gamma_p = 1$.

Proof: We will prove it by mathematical induction, so Theorem 1 is true for $n = 2$.

\[
\text{SCFDWA}\left(\tilde{S}_x + \tilde{S}_{\xi}\right) = \gamma_1 \tilde{S}_x + \gamma_2 \tilde{S}_{\xi}
\]
Now, assume that equation (9) is true.

\[
\text{SCFDWA}^k(S_{x_1}, S_{x_2}, \ldots, S_{x_k}) = 
\begin{bmatrix}
\sqrt{\frac{1}{1 + \left(\sum_{p=1}^{k} y_p \left(\tilde{u}_p \right)^2 / \left(1 - \left(\tilde{u}_p \right)^2\right)^\epsilon\right)}} & \sqrt{\frac{1}{1 + \left(\sum_{p=1}^{k} y_p \left(\tilde{a}_p \right)^2 / \left(1 - \left(\tilde{a}_p \right)^2\right)^\epsilon\right)}} \\
\sqrt{\frac{1}{1 + \left(\sum_{p=1}^{k} y_p \left(1 - \left(\tilde{v}_p \right)^2 / (\tilde{v}_p)^2\right)^\epsilon\right)}} & \sqrt{\frac{1}{1 + \left(\sum_{p=1}^{k} y_p \left(1 - \left(\tilde{w}_p \right)^2 / (\tilde{w}_p)^2\right)^\epsilon\right)}} \\
\sqrt{\frac{1}{1 + \left(\sum_{p=1}^{n} y_p \left(\tilde{u}_p \right)^2 / (\tilde{u}_p)^2\right)^\epsilon\right)}} & \sqrt{\frac{1}{1 + \left(\sum_{p=1}^{n} y_p \left(1 - \left(\tilde{v}_p \right)^2 / (\tilde{v}_p)^2\right)^\epsilon\right)}} \\
\end{bmatrix}
\]

Now, we will prove equation (19) for \(n = k + 1\), i.e.,
So, by the mathematical induction, it is true for all \( n \).
The properties of SCFDWA are as follows:

1) Idempotency. We have the collection of SCFNs 
\[
\bar{S}_x = \{x, \langle \bar{u}_p, \bar{u}_p^*, \bar{\alpha}_p \rangle, \langle \bar{v}_p, \bar{v}_p^*, \bar{\beta}_p \rangle, \langle \bar{w}_p, \bar{w}_p^*, \bar{\theta}_p \rangle \}
\]
\[(p = 1, 2, \ldots, n) \text{ in } X. \] Then, the collection of SCFNs \(\bar{S}_x^p(p = 1, 2, \ldots, n)\) is equal, i.e.,

\[
\begin{align*}
\bar{S}_x^p &= \langle \min_p \bar{u}_p, \min_p \bar{u}_p^*, \min_p \bar{\alpha}_p \rangle, \langle \max_p \bar{v}_p, \max_p \bar{v}_p^*, \max_p \bar{\beta}_p \rangle, \langle \max_p \bar{w}_p, \max_p \bar{w}_p^*, \max_p \bar{\theta}_p \rangle, \\
 \bar{S}_x &= \langle \min_p \bar{u}_p, \min_p \bar{u}_p^*, \min_p \bar{\alpha}_p \rangle, \langle \max_p \bar{v}_p, \max_p \bar{v}_p^*, \max_p \bar{\beta}_p \rangle, \langle \max_p \bar{w}_p, \max_p \bar{w}_p^*, \max_p \bar{\theta}_p \rangle.
\end{align*}
\]

Thus,
\[
\bar{S}_x^p \leq \text{SCFDWA}(\bar{S}_x^1, \bar{S}_x^2, \ldots, \bar{S}_x^n) \leq \bar{S}_x.
\]

2) Boundary. We have the collection of SCFNs \(\bar{S}_x = \{x, \langle \bar{u}_p^*, \bar{u}_p, \bar{\alpha}_p \rangle, \langle \bar{v}_p^*, \bar{v}_p, \bar{\beta}_p \rangle, \langle \bar{w}_p^*, \bar{w}_p, \bar{\theta}_p \rangle \} \) \((p = 1, 2, \ldots, n) \text{ in } X.

3) Monotonicity. We have the collection of SCFNs \(\bar{S}_x = \{x, \langle \bar{u}_p, \bar{u}_p^*, \bar{\alpha}_p \rangle, \langle \bar{v}_p, \bar{v}_p^*, \bar{\beta}_p \rangle, \langle \bar{w}_p, \bar{w}_p^*, \bar{\theta}_p \rangle \} \) \((p = 1, 2, \ldots, n) \text{ in } X. \) \(\bar{S}_x \subseteq \bar{S}_x^p \) for \((p = 1, 2, \ldots, n), \) then

\[
\text{SCFDWA}(\bar{S}_x^1, \bar{S}_x^2, \ldots, \bar{S}_x^n) \subseteq \text{SCFDWA}(\bar{S}_x^1, \bar{S}_x^2, \ldots, \bar{S}_x^n).
\]
ordered weighted average (SCDOWA) operator is defined as

$$\text{SCDOWA}(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}) = \sum_{p=1}^{n} y_p \tilde{S}_{x_p}$$  \hspace{1cm} (28)$$

where \(y_p\) represent the weight vector where \(p = 1, 2, 3, \ldots, n\) and \(\sum_{p=1}^{n} y_p = 1\), and the largest \(y_p\) weighted value is \(\tilde{S}_{x(p)}\), and the total order is \(\tilde{S}_{x_{(1)}} \geq \tilde{S}_{x_{(2)}} \geq \ldots \geq \tilde{S}_{x_{(n)}}\).

**Theorem 2.** We have the collection of SCFNs \(S_{x(p)} = \{x, (\bar{u}_p, \bar{v}_p), \tilde{\alpha}_p\}, (\bar{v}_p, \bar{v}_p), \tilde{\beta}_p\} \) \((p = 1, 2, \ldots, n)\) in X. The spherical cubic fuzzy Dombi ordered weighted average (SCDOWA) operator is defined as 

$$\text{SCDOWA}(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}) = \left\{ \sum_{p=1}^{n} y_p \left( \tilde{u}_p, \tilde{v}_p \right), \tilde{\alpha}_p \right\} \hspace{1cm} (29)$$

where \(y_p\) represent the weight vector where \(p = 1, 2, 3, \ldots, n\) and \(\sum_{p=1}^{n} y_p = 1\), and the largest \(y_p\) weighted value is \(\tilde{S}_{x_{(p)}}\), and the total order is \(\tilde{S}_{x_{(1)}} \geq \tilde{S}_{x_{(2)}} \geq \ldots \geq \tilde{S}_{x_{(n)}}\).

**Proof.** The proof is similar to Theorem 1. \(\square\)

The properties of SCDOWA are as follows:

1. **Idempotency.** We have the collection of SCFNs \(\tilde{S}_{x_p} = \{x, (\bar{u}_p, \bar{v}_p), \tilde{\alpha}_p\}\),

$$\tilde{S}_{x_p} = \left\{ \left( \min_{p}, \tilde{u}_p, \min_{p}, \tilde{v}_p, \max_{p}, \tilde{\alpha}_p \right), \left( \max_{p}, \tilde{u}_p, \max_{p}, \tilde{v}_p, \min_{p}, \tilde{\alpha}_p \right) \right\} \hspace{1cm} (30)$$

2. **Boundary.** We have the collection of SCFNs \(\tilde{S}_{x_p} = \{x, (\bar{u}_p, \bar{u}_p), \tilde{\alpha}_p\}, (\bar{v}_p, \bar{v}_p), \tilde{\beta}_p\} \) \((p = 1, 2, \ldots, n)\) in X.

$$\text{SCDOWA}(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}) = \tilde{S}_{x} \hspace{1cm} (31)$$

Thus,

$$\tilde{S}_{x_p} \leq \text{SCDOWA}(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}) \leq \tilde{S}_{x_p}^{+} \hspace{1cm} (32)$$

3. **Monotonicity.** We have the collection of SCFNs \(\tilde{S}_{x_p} = \{x, (\bar{u}_p, \bar{v}_p), \tilde{\alpha}_p\}, (\bar{v}_p, \bar{v}_p), \tilde{\beta}_p\} \) \((p = 1, 2, \ldots, n)\) in X. \(\tilde{S}_{x_p} \leq \tilde{S}_{x_p}^{k}\) for \((p = 1, 2, \ldots, n)\), then

$$\text{SCDOWA}(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}) \leq \text{SCDOWA}(\tilde{S}_{x_1}^{k}, \tilde{S}_{x_2}^{k}, \ldots, \tilde{S}_{x_n}^{k}) \hspace{1cm} (33)$$
Definition 21. We have the collection of SCFNs

\[ S_{\gamma_p} = \{ x, \langle [\tilde{u}_p, \tilde{u}_p^+], \tilde{\alpha}_p \rangle, \langle [\tilde{v}_p, \tilde{v}_p^+], \tilde{\beta}_p \rangle, \langle [\tilde{w}_p, \tilde{w}_p^+], \tilde{\theta}_p \rangle \} \]

\((p = 1, 2, \ldots, n)\) in \(X\). The spherical cubic fuzzy Dombi hybrid weighted average (SCFDHWA) operator is

\[
SCFDHWA\left( S_{\gamma_1}, S_{\gamma_2}, \ldots, S_{\gamma_n} \right) = \sum_{p=1}^{n} \gamma_p S_{\gamma_p}^*, \quad (34)
\]

where \(\gamma_p (p = 1, 2, 3, \ldots, n)\) represent the weight vectors satisfying \(\sum_{p=1}^{n} \gamma_p = 1\) and \((p = 1, 2, \ldots, n)\), and \(p^{th}\) largest value is \(S_{\gamma_p}^* (S_{\gamma_p}^* = \eta_{p} S_{\gamma_p}^*, \ p \in N)\), and the total order is \(S_{\gamma_n}^* \geq S_{\gamma_{n-1}}^* \geq \ldots \geq S_{\gamma_1}^*\) where \(\eta_{p} \geq 0, \sum_{p=1}^{n} \eta_{p} = 1 \) and \(w_{p}^* (w_{1}^*, w_{2}^*, \ldots, w_{n}^*)\).

Theorem 3. We have the collection of SCFNs

\[ S_{\gamma_p} = \{ x, \langle [\tilde{u}_p, \tilde{u}_p^+], \tilde{\alpha}_p \rangle, \langle [\tilde{v}_p, \tilde{v}_p^+], \tilde{\beta}_p \rangle, \langle [\tilde{w}_p, \tilde{w}_p^+], \tilde{\theta}_p \rangle \} \]

\((p = 1, 2, \ldots, n)\) in \(X\). The spherical cubic fuzzy Dombi hybrid weighted average (SCFDHWA) operator is defined as

\[
SCFDHWA\left( S_{\gamma_1}, S_{\gamma_2}, \ldots, S_{\gamma_n} \right) = \sqrt{\left[ \prod_{p=1}^{n} \left( 1 - \left( \frac{\sum_{p=1}^{n} \eta_{p}^* \left( (\tilde{u}_{\gamma_p(p)}^*)^2 / (\tilde{u}_{\gamma_p(p)}^*)^2 \right)^{(1/\epsilon)} \right) \right) \right]}
\]

\[
= \sqrt{\left[ \prod_{p=1}^{n} \left( 1 - \left( \frac{\sum_{p=1}^{n} \eta_{p}^* \left( (\tilde{\alpha}_{\gamma_p(p)}^*)^2 / (\tilde{\alpha}_{\gamma_p(p)}^*)^2 \right)^{(1/\epsilon)} \right) \right) \right]}
\]

\[
\left[ \prod_{p=1}^{n} \left( 1 - \left( \frac{\sum_{p=1}^{n} \eta_{p}^* \left( (\tilde{\beta}_{\gamma_p(p)}^*)^2 / (\tilde{\beta}_{\gamma_p(p)}^*)^2 \right)^{(1/\epsilon)} \right) \right) \right]}
\]

\[
\left[ \prod_{p=1}^{n} \left( 1 - \left( \frac{\sum_{p=1}^{n} \eta_{p}^* \left( (\tilde{w}_{\gamma_p(p)}^*)^2 / (\tilde{w}_{\gamma_p(p)}^*)^2 \right)^{(1/\epsilon)} \right) \right) \right]}
\]

\[
\left[ \prod_{p=1}^{n} \left( 1 - \left( \frac{\sum_{p=1}^{n} \eta_{p}^* \left( (\tilde{\theta}_{\gamma_p(p)}^*)^2 / (\tilde{\theta}_{\gamma_p(p)}^*)^2 \right)^{(1/\epsilon)} \right) \right) \right]}
\]
where \( y_p \) represent the weight vector where \((p=1, 2, 3, \ldots, n)\) and \( \sum_{p=1}^{n} y_p = 1, y_p \geq 0, \) and \((p=1, 2, \ldots, n)\), and \(p\)th largest value is \( \tilde{S}_{\pi(p)}^{\ast} = \max \{ y_p \tilde{S}_{\pi(p)}, \ p \in N \} \), and the total order is \( \tilde{S}_{\pi(1)}^{\ast} \leq \tilde{S}_{\pi(2)}^{\ast} \leq \ldots \leq \tilde{S}_{\pi(n)}^{\ast} \) where \( w_p = (w_1, w_2, \ldots, w_n) \) and \( w_p \geq 0 \) and \( \sum_{p=1}^{n} w_p = 1 \).

**Proof.** The proof is similar to Theorem 1. \( \square \)

The properties of SCFDHWA are as follows:

\[
\tilde{S}_{\pi(p)}^{\ast} = \left( \left[ \min_{p} \tilde{u}_p, \min_{p} \tilde{v}_p, \min_{p} \tilde{w}_p \right], \left[ \max_{p} \tilde{u}_p, \max_{p} \tilde{v}_p, \max_{p} \tilde{w}_p \right], \left[ \min_{p} \tilde{\beta}_p, \max_{p} \tilde{\beta}_p, \max_{p} \tilde{\beta}_p \right] \right) \tilde{S}_{\pi(p)}^{\ast}
\]

Thus,

\[
\tilde{S}_{\pi(p)}^{\ast} \leq \text{SCFDHWA} \left( \tilde{S}_{\pi(1)}^{\ast}, \tilde{S}_{\pi(2)}^{\ast}, \ldots, \tilde{S}_{\pi(n)}^{\ast} \right) \leq \tilde{S}_{\pi(p)}^{\ast}. \tag{38}
\]

(3) **Monotonicity.** We have the collection of SCFNs \( \tilde{S}_{\pi(p)}^{\ast} = \left\{ p_{\pi}(f), I_{\pi}(f), N_{\pi}(f) \right\} \) \((p=1, 2, \ldots, n)\) in \( X \).

\[
\tilde{S}_{\pi(p)}^{\ast} \leq \tilde{S}_{\pi(p)}^{\ast} \text{ for } (p=1, 2, \ldots, n), \text{ then}
\]

\[
\text{SCFDHWA} \left( \tilde{S}_{\pi(p)}^{\ast}, \tilde{S}_{\pi(1)}^{\ast}, \ldots, \tilde{S}_{\pi(n)}^{\ast} \right) \preceq \text{SCFDHWA} \left( \tilde{S}_{\pi(1)}^{\ast}, \tilde{S}_{\pi(2)}^{\ast}, \ldots, \tilde{S}_{\pi(n)}^{\ast} \right). \tag{39}
\]

### 4.2. Spherical Cubic Dombi Weighted Geometric Operators

On the basis of Dombi operator of SCFNs, we present the weighted geometric aggregated operations as follows.

(1) **Idempotency.** We have the collection of SCFNs \( \tilde{S}_{\pi(p)}^{\ast} = \left\{ x, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix}, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix} \right\} \) \((p=1, 2, \ldots, n)\) in \( X \). Then, we say collection of SCFNs \( \tilde{S}_{\pi(p)}^{\ast} \) \((p=1, 2, \ldots, n)\) is equal, i.e.,

\[
\text{SCFDHWA} \left( \tilde{S}_{\pi(1)}^{\ast}, \tilde{S}_{\pi(2)}^{\ast}, \ldots, \tilde{S}_{\pi(n)}^{\ast} \right) = \tilde{S}_{\pi(p)}^{\ast}. \tag{36}
\]

(2) **Boundary.** We have the collection of SCFNs \( \tilde{S}_{\pi(p)}^{\ast} = \left\{ x, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix}, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix}, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix} \right\} \) \((p=1, 2, \ldots, n)\) in \( X \).

**Definition 22.** We have the collection of SCFNs \( \tilde{S}_{\pi(p)}^{\ast} = \left\{ x, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix}, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix}, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix} \right\} \) \((p=1, 2, \ldots, n)\) in \( X \). The spherical cubic fuzzy Dombi weighted geometric (SCFDWG) operator is defined as

\[
\left( \tilde{S}_{\pi(1)}^{\ast}, \tilde{S}_{\pi(2)}^{\ast}, \ldots, \tilde{S}_{\pi(n)}^{\ast} \right) = \prod_{p=1}^{n} \tilde{y}_p, \tag{40}
\]

where \( y_p \) represent the weight vector with \( y_p \geq 0 \) and \( \sum_{p=1}^{n} y_p = 1 \).

**Theorem 4.** We have the collection of SCFNs \( \tilde{S}_{\pi(p)}^{\ast} = \left\{ x, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix}, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix}, \begin{bmatrix} [\tilde{u}_p, \tilde{v}_p, \tilde{w}_p] & \tilde{\beta}_p \end{bmatrix} \right\} \) \((p=1, 2, \ldots, n)\) in \( X \). Then, the spherical cubic fuzzy Dombi weighted geometric (SCFDWG) operator with \( \varepsilon > 0 \) is defined as

\[
\text{SCFDWG} \left( \tilde{S}_{\pi(1)}^{\ast}, \tilde{S}_{\pi(2)}^{\ast}, \ldots, \tilde{S}_{\pi(n)}^{\ast} \right) = \left\{ \begin{array}{l}
\left( \left[ \frac{1}{1 + \sum_{p=1}^{n} y_p \left( 1 - (\tilde{u}_p)^2 \right) / (\tilde{u}_p)^2 } \right]^{(1/\varepsilon)}, \left( \left[ \frac{1}{1 + \sum_{p=1}^{n} y_p \left( 1 - (\tilde{v}_p)^2 \right) / (\tilde{v}_p)^2 } \right]^{(1/\varepsilon)} \right)
\end{array} \right),
\right.
\]

(41)

\[
\left( \left[ \frac{1}{1 + \sum_{p=1}^{n} y_p \left( 1 - (\tilde{w}_p)^2 \right) / (\tilde{w}_p)^2 } \right]^{(1/\varepsilon)}, \left( \left[ \frac{1}{1 + \sum_{p=1}^{n} y_p \left( 1 - (\tilde{\beta}_p)^2 \right) / (\tilde{\beta}_p)^2 } \right]^{(1/\varepsilon)} \right)
\right).
\]
where $\gamma_p$ ($p = 1, 2, 3, \ldots, n$) represent the weight vector so that $\sum_{p=1}^{n} \gamma_p = 1$ and $\gamma_p \geq 0$.

Proof. The proof is similar to Theorem 1. \square

The properties of SCFDWG are as follows:

1. **Idempotency.** We have the collection of SCFNs $\bar{S}_x = \{x, \langle [\bar{u}_p, \bar{u}_p^+], \bar{\alpha}_p \rangle, \langle [\bar{v}_p, \bar{v}_p^+], \bar{\beta}_p \rangle, \langle [\bar{w}_p, \bar{w}_p^+], \bar{\theta}_p \rangle\}$

   $\bar{S}_x^- = \langle [\min_p \bar{u}_p, \min_p \bar{u}_p^-], \min_p \bar{\alpha}_p \rangle, \langle [\max_p \bar{v}_p, \max_p \bar{v}_p^+], \max_p \bar{\beta}_p \rangle, \langle [\max_p \bar{w}_p, \max_p \bar{w}_p^+], \max_p \bar{\theta}_p \rangle \rangle$

   $\bar{S}_x^+ = \langle [\max_p \bar{u}_p, \max_p \bar{u}_p^+], \max_p \bar{\alpha}_p \rangle, \langle [\min_p \bar{v}_p, \min_p \bar{v}_p^-], \min_p \bar{\beta}_p \rangle, \langle [\min_p \bar{w}_p, \min_p \bar{w}_p^-], \min_p \bar{\theta}_p \rangle \rangle$.

Thus, $\bar{S}_x^- \leq \text{SCFDWG}(\bar{S}_{x_1}, \bar{S}_{x_2}, \ldots, \bar{S}_{x_n}) \leq \bar{S}_x^+$.

2. **Boundary.** We have the collection of SCFNs $\bar{S}_x = \{x, \langle [\bar{u}_p, \bar{u}_p^+], \bar{\alpha}_p \rangle, \langle [\bar{v}_p, \bar{v}_p^+], \bar{\beta}_p \rangle, \langle [\bar{w}_p, \bar{w}_p^+], \bar{\theta}_p \rangle\}$ ($p = 1, 2, \ldots, n$) in $X$.

   $\text{SCFDWG}(\bar{S}_{x_1}, \bar{S}_{x_2}, \ldots, \bar{S}_{x_n}) \leq \text{SCFDWG}(\bar{S}_{x_1}^k, \bar{S}_{x_2}^k, \ldots, \bar{S}_{x_n}^k)$.

Definition 23. We have the collection of SCFNs $\bar{S}_x = \{x, \langle [\bar{u}_p, \bar{u}_p^+], \bar{\alpha}_p \rangle, \langle [\bar{v}_p, \bar{v}_p^+], \bar{\beta}_p \rangle, \langle [\bar{w}_p, \bar{w}_p^+], \bar{\theta}_p \rangle\}$ where ($p = 1, 2, \ldots, n$) in $X$. The spherical cubic fuzzy Dombi ordered weighted geometric (SCFDOWG) operator is

$$\text{SCFDOWG}(\bar{S}_{x_1}, \bar{S}_{x_2}, \ldots, \bar{S}_{x_n}) = \prod_{p=1}^{n} \left( \bar{S}_{x_{v_p}}, \gamma_p \right)^{\gamma_p}.$$
The proof is similar to Theorem 4.

The properties of SCFDOWG are as follows:

1. **Idempotency.** We have the collection of SCFNs 
   \( \tilde{S}_{x_1} = \{x, \{[\hat{u}_p, \hat{v}_p], \tilde{\alpha}_p\}, \{[\tilde{u}_p, \tilde{v}_p], \tilde{\beta}_p\}, \{[\tilde{u}_p, \tilde{v}_p], \tilde{\beta}_p\} \} \)

2. **Boundary.** We have the collection of SCFNs 
   \( \tilde{S}_x = \{x, \{[\hat{u}_p, \hat{v}_p], \tilde{\alpha}_p\}, \{[\tilde{u}_p, \tilde{v}_p], \tilde{\beta}_p\}, \{[\tilde{u}_p, \tilde{v}_p], \tilde{\beta}_p\} \} \) 
   \((p = 1, 2, \ldots, n) \) in \(X\). Then, we say collection of SCFNs \( \tilde{S}_{x(p)} \) \((p = 1, 2, \ldots, n) \) is equal, i.e.,

\[
\text{SCFDOWG}(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}) = \tilde{S}_x. \quad (47)
\]

3. **Monotonicity.** We have the collection of SCFNs 
   \( \hat{S}_{x(p)} = \{x, \{[\hat{u}_p, \hat{v}_p], \tilde{\alpha}_p\}, \{[\tilde{u}_p, \tilde{v}_p], \tilde{\beta}_p\}, \{[\tilde{u}_p, \tilde{v}_p], \tilde{\beta}_p\} \} \) 
   \((p = 1, 2, \ldots, n) \) in \(X\). \( \hat{S}_{x(p)} \subseteq \tilde{S}_{x(p)} \) for \( (p = 1, 2, \ldots, n) \), then

\[
\hat{S}_{x(p)} \subseteq \text{SCFDOWG}(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}) \subseteq \tilde{S}_{x(p)}. \quad (49)
\]
SCFDOWG($S_{x_1}, S_{x_2}, \ldots, S_{x_n}$) $\subseteq$ SCFDOWG($\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}$).

(50)

Definition 24. We have the collection of SCFNs

$S_x = \{x, \{\mu_x, \nu_x, \alpha_x, \beta_x, \gamma_x, \delta_x\}, \{\bar{\mu}_x, \bar{\nu}_x, \bar{\alpha}_x, \bar{\beta}_x, \bar{\gamma}_x, \bar{\delta}_x\}\}$

where $(p = 1, 2, \ldots, n)$ in $X$. The spherical cubic fuzzy Dombi hybrid weighted geometric (SCFDHWG) operator is defined as

$$
\left(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}\right) = \prod_{p=1}^{n} \left(S_{x_p}\right)^{y_p},
$$

(51)

where $y_p$ represents the weight vector with $y_p \geq 0$, and $\sum_{p=1}^{n} y_p = 1$, and the $p^{th}$ largest weight value is $S_{x_p}$ ($S_{x_1} = n y_p S_{x_p}$, $p \in N$), and the total order is $S_{x_{(1)}} \geq S_{x_{(2)}} \geq \ldots \geq S_{x_{(n)}}$, and $w = (w_1, w_2, \ldots, w_n)$ represent the weights with $\sum_{p=1}^{n} w_p = 1$, $w_p \geq 0$.

Theorem 6. We have the collection of SCFNs

$S_x = \{x, \{\mu_x, \nu_x, \alpha_x, \beta_x, \gamma_x, \delta_x\}, \{\bar{\mu}_x, \bar{\nu}_x, \bar{\alpha}_x, \bar{\beta}_x, \bar{\gamma}_x, \bar{\delta}_x\}\}$

where $(p = 1, 2, \ldots, n)$ in $X$. The spherical cubic fuzzy Dombi hybrid weighted geometric (SCFDHWG) operator is defined as

$$
\left(\tilde{S}_{x_1}, \tilde{S}_{x_2}, \ldots, \tilde{S}_{x_n}\right)
$$

(52)

Proof. The proof is similar to Theorem 4.

The properties of SCFDWG are as follows:

1. Idempotency: We have the collection of SCFNs $S_x = \{x, \{\mu_x, \nu_x, \alpha_x, \beta_x, \gamma_x, \delta_x\}, \{\bar{\mu}_x, \bar{\nu}_x, \bar{\alpha}_x, \bar{\beta}_x, \bar{\gamma}_x, \bar{\delta}_x\}\}$
(p = 1, 2, ..., n) in X. Then, we say collection of SCFNs \( S_{x_p} = \{S_{x_1}, S_{x_2}, ..., S_{x_n}\} \) is equal, i.e.,

\[
\text{SCFDHGW}\left(\tilde{S}_{x^+}, \tilde{S}_{x^-}, ..., \tilde{S}_{x^n}\right) = \tilde{S}_{x^+}. 
\]

(2) Boundary. We have the collection of SCFNs \( \tilde{S}_{x_p} = \{x, (\tilde{u}_{p}, \tilde{u}_{p}^+, \tilde{u}_{p}^-), (\tilde{v}_{p}, \tilde{v}_{p}^+, \tilde{v}_{p}^-), (\tilde{w}_{p}, \tilde{w}_{p}^+, \tilde{w}_{p}^-)\} \)\((p = 1, 2, ..., n) in X.

\[
\tilde{S}_{x^+} = \left(\{\min_p \tilde{u}_p, \min_p \tilde{u}_p^+, \min_p \tilde{u}_p^-\}, \max_p \tilde{v}_p, \max_p \tilde{v}_p^+, \max_p \tilde{v}_p^-\}\right), \\
\tilde{S}_{x^-} = \left(\{\max_p \tilde{u}_p, \max_p \tilde{u}_p^+, \max_p \tilde{u}_p^-\}, \min_p \tilde{v}_p, \min_p \tilde{v}_p^+, \min_p \tilde{v}_p^-\}\right). 
\]

Thus,

\[
\tilde{S}_{x^+} \subseteq \text{SCFDHGW}\left(\tilde{S}_{x^+}, \tilde{S}_{x^-}, ..., \tilde{S}_{x^n}\right) \subseteq \tilde{S}_{x^+}. 
\]

(3) Monotonicity. We have the collection of SCFNs \( \tilde{S}_{x_p} = \left(\tilde{P}_{x_p}(f), \tilde{T}_{x_p}(f), \tilde{N}_{x_p}(f)\right) \) \((p = 1, 2, ..., n) in X.

\[
\tilde{S}_{x^+} \subseteq \tilde{S}_{x^-} \subseteq \tilde{S}_{x^+}. 
\]

5. Computation for MAGDM Using Spherical Cubic Fuzzy Sets

Now, we present a new method to decision-making through the idea of spherical cubic fuzzy set. This methodology will utilize the data characterized by the given problem and only need not to bother with any extra data given by the decision makers, so as to avoid the impact of information data on the decision results. In the following, we will introduce a spherical cubic fuzzy set decision-making matrix as indicated below.

Let \( A = (a_1, a_2, ..., a_m) \) be a collection of \( m \) appropriate alternatives and \( B = (b_1, b_2, ..., b_n) \) be a definite collection of \( n \) criterion, where \( a_i \) specify the \( i^{th} \) criterion. Let \( C = (c_1, c_2, ..., c_s) \) be a finite set of \( s \) criteria, where \( c_j \) indicate the \( j^{th} \) expert. The analyst \( c_j \) supplies here evaluation of an alternative \( a_i \) on an attribute \( b_j \) as SCFNs \((i = 1, 2, ..., m; j = 1, 2, ..., n)\). The analyst data are depicted by spherical cubic fuzzy set decision matrix \( D^* = ([E_{ip}^{(c)}, E_{ip}^{(s)}, N_{ip}^{(t)}])_{m \times n} \). Suppose that \( y_p \) represents the weight vector of the attribute \( b_j \) that \( \sum_{p=1}^{n} y_p = 1 \) where \( 0 \leq y_p \leq 1 \) and \( \phi = (\phi_1, \phi_2, ..., \phi_m) \) is the weight vector of the \( c_k \) decision makers so that \( \sum_{k=1}^{m} \phi_k = 1, \phi_k \leq 1 \) as we make the spherical cubic fuzzy decision maker matrices \( D^* = ([E_{ip}^{(c)}, E_{ip}^{(s)}, N_{ip}^{(t)}])_{m \times n} \) for decision. Generally, criteria have two sorts. One is a profit criteria, and other is a cost criteria. Thus, the spherical cubic fuzzy decision matrices having cost criteria matrices \( D^* = ([E_{ip}^{(c)}, E_{ip}^{(s)}, N_{ip}^{(t)}])_{m \times n} \) might be transformed into normalized spherical cubic fuzzy decision matrices \( y^* = \{y_{ip}^{(c)}, y_{ip}^{(s)}, \tilde{y}_{ip}^{(t)}\} \) where \( y_{ip}^{(c)} = \frac{y_{ip}^{(c)}}{\sum_{p=1}^{n} y_{ip}^{(c)}} \).

6. Numerical Application

Suppose that finance administrator Mr. A in a wealth administration is evaluating four feasible investing \( A_1, A_2, A_3, A_4 \) (let \( A = \{a_1, a_2, a_3, a_4\} \). The firm state that the finance administrator has to assess the following three criteria \( B_1, B_2, B_3 \) (let \( B = \{b_1, b_2, b_3\} \) where \( b_1 \) represents the "high-risk," \( b_2 \) represents the "progress," and \( b_3 \) represents the "surrounding affects." For the parameter \( y_i \) is the weight vector of the alternative \( a_i \) is in the following way:

\[
y_i^c = SCFWA_{\gamma_j}(\{\gamma_1, \gamma_2, ..., \gamma_m\}; \gamma \text{ we call the weight vector is represented as } \gamma = (\gamma_1, \gamma_2, ..., \gamma_m)) \text{ we apply the concept \( SCFWA, SCFOWA, SCFWG, SCFHWA \), and SCFHGW operations to MAGDM which are described in the following steps.}
\]

Step 1. Make the spherical cubic fuzzy decision matrix \( D = (E_{ip}^{(c)}, E_{ip}^{(s)}, N_{ip}^{(t)})_{m \times n} \) and then use the idea of SCFWA/SCFWG operator, and the aggregated spherical cubic fuzzy value \( y_i^c \) of the alternative \( a_i \) is next.

Step 2. In view of this, we take the spherical cubic fuzzy data by utilizing the defined Dombi operators to develop the preferable value of the alternative with the weights \( w = (w_1, w_2, ..., w_m) \) with \( \sum_{p=1}^{n} y_p = 1 \) and \( w_p \geq 0 \).

Step 3. We will find the score and accuracy function of overall preference value \( a_i \) \((i = 1, 2, ..., m)\).

Step 4. By definition of score function, rank the alternatives \( a_i \) \((i = 1, 2, ..., m) \) and select the best alternative which has the maximum value of score function.

Here, \( B_1 \) and \( B_2 \) are cost-type and \( B_3 \) represents profit criteria. Now, we have to normalize the matrices. Normalized data are shown in Tables 4–6.

**Step 1.** We will use the concept of SCFWG operator to aggregate all spherical cubic fuzzy decision matrices that are normalized separately. The aggregated of spherical cubic fuzzy matrix is shown in Table 7.

**Step 2**

**Case 1.** We will use SCFDWA to evaluate their efficiency separately according to the weight vectors $y = (0.2, 0.3, 0.5)^T$ and $\varepsilon = 0.5 > 0$ shown in Table 8.

**Case 2.** We will use SCFDOWA to evaluate their efficiency separately according to the weight vectors $y = (0.2, 0.3, 0.5)^T$ and $\varepsilon = 0.5 > 0$ shown in Table 9.

**Case 3.** We will use SCFDHWA to evaluate their efficiency separately according to the weight vectors $y = (0.2, 0.3, 0.5)^T$ and $\varepsilon = 0.5 > 0$ shown in Table 10.
Case 4. We will use SCFDHWG to evaluate their efficiency separately according to the weight vectors $\gamma = (0.2, 0.3, 0.5)^T$ and $\varepsilon = 0.5 > 0$ shown in Table 11.

Case 5. We will use SCFDOWG to evaluate their efficiency separately according to the weight vectors $\gamma = (0.2, 0.3, 0.5)^T$ and $\varepsilon = 0.5 > 0$ shown in Table 12.

Case 6. We will use SCFDHWG to evaluate their efficiency separately according to the weight vectors $\gamma = (0.2, 0.3, 0.5)^T$ and $\varepsilon = 0.5 > 0$ shown in Table 13.

Step 3. The score of each alternative is shown in Table 14.

Step 4. By using the rank criteria $b_i (i = 1, 2, \ldots, m)$, we will select the best one which has the largest score.

7. Comparative Analysis

Here, we provide two comparison analysis that show that our proposed operators reliable and effective to aggregate the spherical cubic data. In Figure 1, ranking of spherical cubic fuzzy Dombi operators is given (Tables 14–20).

In 2019, Jana et al. suggested the picture fuzzy Dombi aggregation operators; in this study, we give comparison between proposed spherical cubic Dombi aggregation operators and existed Dombi aggregation operators as follows.

Now, utilizing spherical cubic fuzzy Dombi weighted averaging operator to chose the best alternative is as follows.

$Q_i$ is the optimal alternative. The findings are similar to those provided by Jana et al. [25]. The methodology
averaging operator to choose the best alternative is as follows.

proposed in this paper is more generalized to deal uncertainties in decision-making problems. Consequently, spherical cubic Dombi aggregation operators are more efficient and accurate in solving group decision-making problems compared with existing Dombi aggregation operators.

Ashraf et al. [5] suggested the spherical fuzzy Dombi aggregated operations to aggregate the spherical fuzzy numbers; in the present section, we give the comparison between proposed and novel spherical cubic Dombi aggregated operators. We get the spherical Dombi information from Ashraf et al. [5] as follows.

The best alternative is $A_2$.

Now, to utilize spherical cubic fuzzy Dombi weighted averaging operator to chose the best alternative is as follows.

The best choice is $A_4$. Results are similar to Ashraf et al. [5]. The methodology proposed by Ashraf et al. [5] dealt with spherical fuzzy set, and we extend it for spherical cubic fuzzy set to get more accurate results. The methodology presented

presented by Jana et al. [25] tackles picture fuzzy set and fails to deal spherical cubic fuzzy set. Therefore, the new method proposed in this paper is more generalized to deal uncertainties in decision-making problems. Therefore, novel spherical cubic Dombi aggregation operators are more efficient and accurate in solving group decision-making problems compared with existing Dombi aggregation operators.

for this article is more comprehensive to tackle the vagueness in decision-making problems. Consequently, spherical cubic Dombi aggregated operations are more reliable and effective to comprehend the decision issues when contrasted to existed Dombi aggregated operations.

The obtained results by using the concept of spherical cubic fuzzy Dombi aggregated operations give nearest results of ranking of spherical Dombi aggregated operations, and more suitable and accurate results of decision-making problems are given in Figure 2.

8. Conclusion

In this paper, the concept of spherical cubic fuzzy set is introduced that is the generalization of the spherical fuzzy set. Further, some spherical cubic fuzzy operational laws are established. Moreover, score and accuracy functions are defined for the comparison of spherical cubic fuzzy numbers. In addition, the idea for Dombi aggregated operations of spherical cubic fuzzy set is presented. Furthermore, the fundamental characteristics of spherical cubic fuzzy Dombi aggregated operations are presented. For the aggregation of spherical cubic fuzzy sets, we proposed SCFDWA, SCFDOWA, SCFDHWA, SCFDWG, SCFDOWG, and SCFDHWG under the spherical cubic fuzzy information. Additionally, some properties like idempotency, boundary, and monotonicity are discussed, and a relation between these established operators is shown. Likewise, a multiattribute decision-making methodology to illustrate the efficiency of the proposed operators is suggested. In addition, we applied the developed aggregation operators to discuss the decision-making problems. A numerical illustration was proposed to demonstrate the efficiency of the suggested operators over alternate methods in decision-making problems. Finally, to determine the validity and efficiency of the novel approach, we carried out the comparative analysis among the existing and the proposed operators.

In future, we will be integrating other approaches with SCFSs like Einstein sum and product to develop the ideas of spherical cubic fuzzy Einstein weighted averaging (SCFEWA), spherical cubic fuzzy Einstein ordered weighted averaging (SCFEOWA), spherical cubic fuzzy Einstein hybrid weighted averaging (SCFEHWA), spherical cubic fuzzy Einstein weighted geometric (SCFEWG), spherical cubic fuzzy Einstein weighted harmonic (SCFEWH).
fuzzy Einstein ordered weighted geometric (SCFEOWG), spherical cubic fuzzy Einstein hybrid weighted geometric (SCFEHWG), and more generalized operators in multi-attribute decision-making problems. We can extend these defined Dombi aggregation operators for Hamacher and Frank norms to deal with uncertainty in the data by using spherical cubic fuzzy information. We can extend this work for power aggregation operators, Dombi Bonferroni mean operators, and their application to multiattribute group decision-making. The application of our proposed model in the future may be used in decision-making theory, risk analysis, and other domains in uncertain environments.
