Abstract
Thirty-one species of Nearctic Perlesta Banks, 1906 (Plecoptera: Perlidae) are recognized. A new species is described from western Arkansas and eastern Oklahoma, USA, Perlesta sublobata South & DeWalt, sp. nov., from the adult male, adult female, and egg. Perlesta sublobata males are differentiated from other congeners by a combination of a prominent ventral caecum and a distinct dorsal extension of the lateral sclerites of the aedeagus. A preliminary molecular phylogenetic hypothesis is proposed for Perlesta based on 17 congeners and three outgroup taxa using partial mitochondrial cytochrome c oxidase subunit I sequence data. Illustrations, stereomicroscope images, and scanning electron micrographs support the description and comparison to other Perlesta.

Introduction
Needham and Claassen (1925) described Perlesta Banks, 1906 as a Nearctic genus of small, brown, triocellate stoneflies with yellow costal wing margins, long cerci, and highly variable coloration of the head and wing membrane. For over a century, the
name of the type species of the genus, *Perlesta placida* (Hagen, 1861), has been used for innumerable specimens that once critically reviewed, were revealed to encompass many cryptic species (Stark 1989, DeWalt et al. 2001). Stark (1989) revised the genus, removing several species from synonymy, describing seven new species, recognizing a total of 12 species, and providing the first useful key to the *P. placida* complex. Stark's revision prompted additional work, with eight new species described over the next 14 years (Poulton and Stewart 1991, Kirchner and Kondratieff 1997, Stark and Rhodes 1997, DeWalt et al. 1998, Kondratieff and Baumann 1999, Kondratieff and Kirchner 2002, 2003). Subsequently, a revised taxonomic key was necessary, in which was included 21 Nearctic species (Stark 2004). The genus has since expanded to 31 Nearctic species through the works of Kondratieff et al. (2006, 2008, 2011), Kondratieff and Myers (2011), and Grubbs and DeWalt (2011, 2012, 2018).

Two species are recognized from China (Murányi and Li 2016) and undetermined nymphs have been reported from Costa Rica (Gutiérrez-Fonseca and Springer 2011). Described species could easily surpass 40, given the amount of presumed new, undescribed *Perlesta* material currently present in North American collections (Grubbs and DeWalt 2018).

At least eight species of *Perlesta* co-occur in the United States Interior Highlands, a mountainous region defined by the United States Geological Survey as encompassing southern Missouri, western Arkansas, eastern Oklahoma, and extreme southeastern Kansas (Omernik 1987). This area of the central United States was extensively examined for stoneflies by Poulton and Stewart (1991). Surprisingly, a remarkably distinct and undescribed *Perlesta* species from the Interior Highlands was revealed through recent examination of undetermined Arkansas material donated to the Illinois Natural History Survey (INHS) Insect Collection by the late Kenneth W. Stewart (DeWalt et al. 2018) and from eastern Oklahoma material borrowed from the K. C. Emerson Entomological Museum, Oklahoma State University (OKSU) at Stillwater. Using freshly collected and properly prepared specimens, we describe this new species, *Perlesta sublobata* sp. nov., and compare it to similar regional congeners. Moreover, we provide the first comparative molecular study of the genus by exploring partial mitochondrial cytochrome c oxidase subunit I (COI) DNA sequence data to examine monophyly of the new species, delimit congeners, and construct a preliminary phylogeny.

The holotype male and all paratypes are deposited in the Illinois Natural History Survey (INHS) Insect Collection. Other material is deposited in the INHS Insect Collection with the exception of nine vials borrowed and returned to the OKSU Insect Collection.

**Materials and methods**

**Collection and morphological analyses**

Terminology of all stages follows Stark (1989). Fresh specimens of the new species (108 males and 40 females) were collected from six Arkansas stream systems, 13–19 June
A new stonefly species (Plecoptera, Perlidae) from the Interior Highlands USA...

Methods included sweep netting during the day and ultraviolet light trapping at night. Live male specimens were anesthetized in a dry ice CO$_2$ chamber and subsequently squeezed with forceps to evert the aedeagus, the source of the most informative morphological characteristics distinguishing species. All specimens were preserved in 95% EtOH. Select individuals of the fresh material and several related species were stack photographed and processed with a Zeiss AxioCam HRC Rev. 3 digital camera and Helicon Focus 6 software in the Sam W. Heads laboratory, INHS. The aedeagus and paraproct were sketched from the stereomicroscope images using Adobe Illustrator CC 2018. Scanning electron micrographs (SEM) of eggs and female terminalia were prepared at the Beckman Institute Microscopy Suite, University of Illinois by critical point drying, placing on an aluminum carbon disk, sputter coating with gold-palladium alloy, and imaged with a Thermo-Fisher FEI Quanta FEG 450 ESEM.

Molecular studies

Genomic DNA from 20 *P. sublobata* specimens, 17 congeners, and three outgroup taxa was extracted using the Qiagen DNeasy Kit, amplified for a fragment of the
Table 1. Haplotypes. Description of COI haplotypes for 18 *Perlesta* species and three outgroup taxa. Number of specimens (N) and GenBank accession number are listed for each corresponding haplotype. Multiple specimens sharing the same haplotype are listed consecutively. All specimens collected from the USA except *P. nelsoni* Stark, 1989 (Canada). State or province is listed by standard postal abbreviation. Sequences obtained from GenBank are denoted with *.* INHS = Illinois Natural History Survey Insect Collection record number.

|                               |      |           |     |       |                             |                      |              | et al.       |
mitochondrial gene encoding for the COI subunit via polymerase chain reaction using either primers LCO1490 and HCO2198 (Folmer et al. 1994) or jgLCO1490 and jgHCO2198 (Geller et al. 2013), and sequenced with Sanger technology at the University of Illinois W. M. Keck Core Sequencing Facility. Thermocycling conditions consisted of one 94 °C for 5 min denaturation cycle, 40 cycles at 94 °C for 45 s, 50 or 53 °C for 1 min, 72 °C for 1.5 min, and one 72 °C for 5 min extension cycle. Amplification success was verified with gel electrophoresis. Forward and reverse sequences were aligned to create contigs, and all 63 aligned contigs were truncated to a uniform length of 606 nucleotides, visually edited with Sequencher 5.4, aligned in MUSCLE 3.8, and the sequences and supporting data deposited in GenBank (Table 1). Sequences were tested to determine the model of evolution in jModelTest2 (Darriba et al. 2012), and a gamma distribution with a proportion of invariable sites was used to model rate variation across sites (invgamma). Akaike Information Criterion (AIC) results indicated that the General Time Reversible nucleotide substitution model (GTR+I+G) was best for the Maximum Likelihood and Bayesian analyses. These models were applied in subsequent phylogenetic tree generation analyses.

We generated a maximum likelihood tree using MEGA 7.0 (Kumar et al. 2016) and calculated pairwise genetic distances for both sequences generated for this study, as well as additional sequences accessioned from GenBank, using the Kimura 2-parameter model (K2P) (Kimura 1980), the de facto standard for measuring mitochondrial pairwise distances (Collins et al. 2012). A Bayesian analysis was performed for all haplotypes using MrBayes 3.2.6 (Huelsenbeck and Ronquist 2001) with a burn-in length of 500,000, subsampling frequency of 500, and a chain length of 5,100,000.

Figs 1–6

**Diagnosis.** Males are distinguished by a combination of a prominent ventral caecum with a broad ventral setal patch and a distinct dorsal extension of the lateral sclerites of the aedeagus. Females possess a subgenital plate with a deep V-shaped notch and truncate lobes. Eggs have a smooth chorion and a well-developed, distally flanged collar.

**Male.** Habitus moderately dark (Fig. 2A). **Wings:** Membrane brown with dark brown venation and pale intercostal margin (Fig. 2B, C). **Forewing:** Length 8–9 mm (mean = 8.3 ± 0.3 SD, n = 95); membrane with two lightly pigmented longitudinal bands: one posterior to the posterior cubital vein and a second anterior to the median vein (Fig. 2B). **Head:** Pale with dark brown quadrangular patch covering interocellar

region; brown subtriangular patches anterolateral and anteromedial to median ocellus (Fig. 2D, E); diffuse brown pigmentation posterior to ecdysial suture (Fig. 2D); ecdysial suture extends slightly to moderately beyond ocelli as a distinct dark line; antenna darkly pigmented on ca. distal 2/3 of flagellum and dorsomedian region of scape; proximal antennal segments pale with tan dorsal pigmentation. **Thorax**: Pronotum brown with vermiculated rugosities and faint, pale median stripe (Fig. 2D, E); mesothoracic
and metathoracic nota brown; mesothoracic and metathoracic basisterna pale; femur and tibia pale, brown dorsally. Abdomen: Sterna pale; terga pale medially and light brown laterally, or uniformly brown. Terminalia: Tergum 10 with dark subquadrate pigment patch (Fig. 3A) and 10–20 small, sensilla basiconica (visible at 80× magnification); cercus long (holotype = 15 segments), pale proximally and dark brown distally; paraprocts broad basally and narrowed distally in caudal aspect (Fig. 3B); anteapi-

cal paraproct spine and carina directed anteromedially—best visible in oblique lateral view of unextruded individuals (Fig. 3C, D). **Aedeagus**: Dorsal caecum moderately produced, ca. as long as wide and broad apically (Fig. 4A, B); dorsal patch broad over sac, moderately expanded proximally, constricted subapically, and broadly expanded over caecum; prominent lateral sclerites merge dorsally to form a distinct V-shaped pattern extending more than 1/2 tube length (Fig. 4C, D); prominent ventral caecum, narrowed apically, with a broad patch of fine seta-like spines covering venter and apex, length ca. 2/5 sac width; sac with fine seta-like spines covering venter (Fig. 4E, F).
Female. Female habitus similar to male, but of larger size and wings of lighter pigmentation (Fig. 5A). Pronotum tan with brown vermiculated rugosities and pale median stripe (Fig. 5B). Wings with subhyaline membrane, tan venation, and pale intercostal margin (Fig. 5C, D). Forewing length 9–11 mm (mean = 9.8 ± 0.6 SD, n = 40); often with two unpigmented longitudinal bands: one posterior to the posterior cubital vein and a second anterior to the median vein (Fig. 5C). Subgenital plate lobes truncate medially and truncate to slightly rounded laterally, slightly to moderately pigmented, covered with long bristle-like hairs, and separated by a deep V-shaped notch (Fig. 5E, F).

Molecular analyses. *Perlesta sublobata* formed a monophyletic group with strong support (ML bootstrap support = 97%, Bayesian posterior probability = 92%). The nearest neighbor species to *P. sublobata* was *P. decipiens* (Walsh, 1862) at 1.8% sequence divergence. Maximum intraspecific COI genetic distances were less than minimum interspecific distances within all tested *Perlesta* (Table 2). All intraspecific distances were less than the arbitrary threshold of 3.5%, suggesting that the new species was monophyletic without other cryptic species present within the new taxon (Hebert et al. 2003, Zhou et al. 2010). All haplotypes (total = 47) were confined to their respective genera and presumptive species in the ML and Bayesian analyses (Figs 7, 8, respectively). The three tested species within the *P. frisoni* group, consisting of five Nearctic species that lack an aedeagal dorsal caecum, formed a monophyletic grouping. Four of the five “dark” species studied in Grubbs and DeWalt (2018) also formed a monophyletic grouping. The placement of *P. adena* Stark, 1989 outside this group may be spurious, indicating additional genes or populations are needed for further refinement. The relatively distant placement of *P. golconda* DeWalt & Stark, 1998 from *P. sublobata* is congruent with the species’ distinctly different morphologies, apart from the male genitalic similarities.

Remarks. The shape and armature of the aedeagus are the most distinct morphological features of *P. sublobata*. Stark (1989) illustrated a lateral view of an undetermined species from Arkansas (*P. sublobata*), demonstrating spinule patterns and shape of the aedeagal telescoping sections: envelope, tube, and sac. He noted that lateral sclerites of the tube joined dorsally. This dorsal extension of the lateral sclerites was not illustrated or specified in the literature for any other *Perlesta*. Furthermore,

### Table 2. Intra and interspecific distance. Maximum intraspecific and minimum interspecific (nearest neighbor) Kimura 2-parameter values for COI within *Perlesta*. Key: N = number of specimens, *P. WI-1* is an undescribed species from Wisconsin.

| Species       | N | Maximum intraspecific distance (%) | Nearest neighbor | Nearest neighbor distance (%) |

Figure 7. Maximum Likelihood phylogenetic reconstruction of 44 unique *Perlesta* CO1 haplotypes using the GTR+I+G nucleotide substitution model. Haplotypes represented by more than one specimen are indicated in parentheses beside corresponding GenBank accession numbers. Outgroup taxa: *Beloneuria georgiana*, *Perlinella drymo*, and *Perlinella ephyre*. Bootstrap scores from 1,000 replicates are displayed at nodes. Scale bar represents the estimated number of nucleotide substitutions per site.

A ventral caecum is present in *P. sublobata* and only one other described congener, *P. golconda*. However, the ventral caecum of *P. golconda* is less prominent and without a distinct ventral patch of fine seta-like spines. Additionally, the dorsal caecum of *P. sublobata* is moderately developed, compared to the poorly developed dorsal caecum of *P. golconda* (Fig. 9).

The known distribution of *P. golconda*, originally limited to Illinois (DeWalt and Stark 1998), has expanded to include Iowa, Indiana, Michigan, and Nebraska (DeWalt et al. 2019), as well as Missouri (Stark 2004) and Louisiana (INHS Insect Collection 564765). Arkansas is bordered by Missouri to the north and Louisiana to the south. A sympatric distribution with *P. sublobata* is expected due to this geographic adjacency and overlap of the Interior Highlands’ habitat. Consequently, re-examination of some museum specimens may be required. The male and female habitus easily distinguish *P. golconda* from *P. sublobata* (Fig. 9).
A new stonefly species (Plecoptera, Perlidae) from the Interior Highlands USA...

Figure 8. Bayesian phylogenetic reconstruction of 44 unique Perlesta CO1 haplotypes using the GTR+I+G nucleotide substitution model. Haplotypes represented by more than one specimen are indicated in parentheses beside corresponding GenBank accession numbers. Outgroup taxa: Beloneuria georgiana, Perlinella drymo, and Perlinella ephyre. Posterior probabilities are indicated at nodes. Scale bar represents the estimated number of nucleotide substitutions per site.

tinguished by a very short egg collar (Grubbs and DeWalt 2008, their fig. 17) and rounded subgenital plate lobes (Fig. 11A, B).

The female habitus of *P. sublobata* resembles two Interior Highlands congeners, *P. decipiens* and *P. ephelida* Grubbs and DeWalt, 2012. However, *P. sublobata* differs from *P. decipiens* and *P. ephelida* by subgenital plate morphology. *Perlesta decipiens* has a deep U-shaped notch bordered by truncate lobes, typically with darker pigmentation on the posterior margins (Fig. 12). *Perlesta ephelida* has a shallow V-shaped notch enclosed by truncate lobes, usually pale to lightly pigmented with posteromedially upturned margins (Fig. 13; Grubbs and DeWalt 2012, their fig. 7). These characters are contrasted to the deep V-shaped notch and moderately pigmented, truncate lobes of *P. sublobata*. Furthermore, *P. sublobata* has a shorter forewing length than *P. decipiens* (*P. sublobata*...
= 9–11 mm; *P. decipiens* = 12–13 mm, Stark 2004). Egg chorion and collar are similar to *P. decipiens* (Stark 2004, his figs 7.397–7.399) and *P. ephelida* (Grubbs and DeWalt 2012, their figs 14–21).

**Habitat.** With the exception of one locality (OK, Washington Co., Caney River), all collection sites for *P. sublobata* are within or closely adjacent to the Interior Highlands, a region containing four contiguous U. S. Environmental Protection Agency (EPA) Level III Ecoregions: Ozark Highlands, Boston Mountains, Arkansas Valley, and Ouachita Mountains. Collection sites for *P. sublobata* within the Interior Highlands are partially canopied, hardwood forested, wadeable, low gradient streams (ca. 15–20 m wide) with substrata composed mostly of sand, gravel, and cobble. The type

Figure 11. *Perlesta golconda*, subgenital plates of females from Missouri River, Nebraska A notch indicated by arrow (INHS Insect Collection 658788) B (INHS Insect Collection 658789). Scale bars: 200 µm.
locality is a low gradient run (ca. 25 m wide) of the Little Missouri River (Fig. 14), located 45 km downstream of Lake Greeseon and 65 km upstream from its confluence with the Ouachita River in the extreme north EPA Level III Ecoregion 35 (South Central Plains). The substrate is primarily gravel and sand, with some large woody debris. Other stonfly species collected with the new species at the type locality included *Acroneuria frisoni* Stark & Brown, 1991, *Acroneuria nr. ozarkensis* Poulton & Stewart,
A new stonefly species (Plecoptera, Perlidae) from the Interior Highlands USA...

1991, *Agnetina flavescens* (Walsh, 1862), *Neoperla falayah* Stark & Lentz, 1988, *N. robisoni* Poulton & Stewart, 1986, *P. decipiens*, and *Perlinella ephyre* (Newman, 1839).

**Etymology.** The specific epithet is derived from *sub*, Latin for under, and *lobata*, the feminine adjectival form of *lobus*, Latin for a rounded projection or protuberance (Brown 1956). The name references the ventral caecum of the aedeagus, a character shared by only one other described congener, *P. golconda*, though it is most prominent in *P. sublobata*.

**Material examined: Perlesta sublobata**

**Holotype:** ♀, in 95% ethanol, **USA: Arkansas:** Pike Co., Little Missouri River, 10.0 km SSE Delight at AR-19, 33.95608, -93.44362, 15.vi.2016, E. J. South (INHS Insect Collection 793224).

**Paratypes. USA: Arkansas:** Clark Co., Caddo River, 6.7 km NNW Arkadelphia at Super 8 Motel at US-67, 34.17985, -93.07021, 14.vi.2016, E. J. South, 6♂ (INHS Insect Collection 793213–793218); Franklin Co., Mulberry River, 2.3 km SSW Cass at AR-23, 35.66984, -93.82962, 13.vi.2016, E. J. South, 3♂ (INHS Insect Collection 793209–793211); Madison Co., War Eagle Creek, 5.8 km NE Huntsville at AR-412, 36.12076,
-93.69354, 13.vi.2016, E. J. South, 3♂ (INHS Insect Collection 793206–793208), same but 16.vi.2016, E. J. South, ♂ (INHS Insect Collection 793228), same but 17.vi.2016, E. J. South, 4♂ (INHS Insect Collection 793229–792232); Pike Co., Antoine River, Antoine at AR-26, 34.03899, -93.41803, 14.vi.2016, E. J. South, ♂ (INHS Insect Collection 793212). Same data as holotype, E. J. South 10♂ (INHS Insect Collection 793219–793227), same but 18.vi.2016, E. J. South, 71♂, 20♀ (INHS Insect Collection 793261–793343); Sevier Co., Cossatot River, 5.1 km W Lockesburg at AR-24, 33.97145, -94.22274, 18.vi.2016, E. J. South, 9♂, 19♀ (INHS Insect Collection 793233–793260).

Other material examined. USA: Arkansas: Franklin Co., Mulberry River, Hwy 23 at Turner's Bend, 35.66984, -93.82962, 5.vii.1986, B. C. Poulton, 4♂ (INHS Insect Collection 795241); Howard Co., Cossatot River, 12.9 km W Umpire at Hwy 4, 34.29584, -94.17787, 26.vi.1981, H. W. A new stonefly species (Plecoptera, Perlidae) from the Interior Highlands USA...

Material examined: *Perlesta golconda*

**USA: Illinois:** Carroll Co., Mississippi River, Savanna, 42.09622, -90.16227, 19.vi.1999, R. E. DeWalt, ♂ (INHS Insect Collection 566462). **Indiana:** Ohio Co., Arnold Creek, 6.9 km WSW Rising Sun at IN-262 and White Rd., 38.93676, -84.93167, 14.v.2018, E. A. Newman, ♀ (INHS Insect Collection 660320). **Iowa:** Cedar Co., Cedar River, Cedar Bluff at Hwy F28, 41.78790, -91.19184, 12.vi.1992, R. E. DeWalt, ♂, ♀ (INHS Insect Collection 564765). **Louisiana:** East Baton Rouge Co., Mississippi River, Baton Rouge at Centroplex Pier N I-10Br., 30.44532, -91.19184, 12.vi.1992, R. E. DeWalt, ♂, ♀ (INHS Insect Collection 577372). **Minnesota:** Winona Co., Mississippi River, 3.6 km N La Crescent, rest stop at I-90, 43.85981, -91.30351, 18.vi.2012, R. E. DeWalt, ♀ (INHS Insect Collection 660253, 660254), same but 24.vi.2018, R. E. DeWalt, 8♂, 10♀ (INHS Insect Collection 660209–660220).

**Modified key to first couplet in Stark (2004) for identification of males of *Perlesta sublobata* and *P. golconda***

1  Fully everted aedeagus with dorsal caecum (fig. 7.273) ....................... 1a
   – Fully everted aedeagus without dorsal caecum (fig. 7.361) .................. 17
1a Aedeagus with ventral caecum ....................................................... 1b
   – Aedeagus without ventral caecum ................................................... 2
1b Ventral caecum prominent, length ca. 2/5 aedeagal sac width, fine ventral seta-like spines present; dorsal caecum moderately developed (Fig. 4A); distinct dorsal extension of the aedeagal lateral sclerites with proximal V-shaped pattern (Fig. 4C); ocellar area with dark subquadrate patch ..... *P. sublobata*
   – Ventral caecum less prominent, length ca. 1/3 aedeagal sac width, without distinct fine ventral seta-like spines; dorsal caecum poorly developed; dorsal aedeagal patch with lateral margins darker than mesal field, appearing as two tracks (fig.7.364); ocelli usually connected by V-shaped area with pale center .......... ................................................................. *P. golconda*
Acknowledgements

We thank Dr. Sam W. Heads (INHS) for use of his high-resolution imaging equipment, Catherine L. Wallace (Beckman ITG Microscopy Suite) for preparing SEM images, Aron D. Katz (University of Illinois) for assistance with laboratory procedures, and Daniel R. Swanson (University of Illinois) for assistance developing the specific epithet. We also thank Dr. Marco Gottardo (University of Siena), Dr. Scott A. Grubbs (Western Kentucky University), and Dr. Antonio Carapelli (University of Siena) for their comments and revisions that substantially improved this manuscript.
