1. General

$^1$H NMR spectra were recorded on a Bruker Avance 400, 500, or JEOL ECA400SL spectrometer in CDCl$_3$ [using TMS (for $^1$H, δ = 0.00) as internal standard] or C$_6$D$_6$ [using C$_6$D$_6$ (for $^1$H, δ = 7.16) as internal standard]. $^{13}$C NMR spectra were recorded on a Bruker Avance 400, 500, or JEOL ECA400SL spectrometer in CDCl$_3$ [using CDCl$_3$ (for $^{13}$C, δ = 77.00) as internal standard] or C$_6$D$_6$ [using C$_6$D$_6$ (for $^{13}$C, δ = 128.06) as internal standard]. The following abbreviations were used to explain the multiplicities: s = singlet, d = doublet, t = triplet, q = quartet, br = broad. High-resolution mass spectra were obtained with a Waters Q-Tof Premier mass spectrometer. Melting points are uncorrected and were recorded on a MPA 100 OptiMelt Automated Melting Point System. Flash chromatography was performed using Merck silica gel 60 with distilled solvents. The blue LED strip (1.5 m, 15 W/m, $\lambda_{max}$ = 469 nm) was purchased from Leomay Technology Co., Ltd (http://leomay.com/upload/file/LM5730-60D-20161119093733.pdf) and attached on a crystallizing dish (diameter 115 mm). The Analytic Jena high intensity UV lamp B-100AP/R ($\lambda$ = 365 nm, 100 W) was employed for the control experiment (Table 1, entry 8). Theoretical calculation on xanthate 1a was performed with Gaussian 09 (Rev. E.01) programs. Geometry optimization was conducted by B3LYP functional. The Def2-SVP basis set was employed for the elements H, C, N, O and Def2-TZVP basis set was used for S. To calculate the excitation energy, the first triplet excited state geometry was optimized with the same method. [Ir{dF(CF$_3$)ppy$_2$(dtbbpy)}(PF$_6$)] (8) (CAS: 870987-63-6) was purchased from Sigma-Aldrich and used as received.

2. Emission spectrum of employed blue LED

Figure S1: Emission spectrum of blue LED obtained from Leomay Technology Co., Ltd (http://leomay.com/upload/file/LM5730-60D-20161119093733.pdf).
3. Cyclic voltammetry

The cyclic voltammetry experiments were conducted with a computer-controlled Eco Chemie Autolab PGSTAT302N potentiostat in a three-electrode cell. All electrochemical measurements were carried out under an argon atmosphere and the samples were bubbled with argon before measurement. Cyclic voltammograms of 1.2 mM xanthate 1a with 0.1 M n-Bu₄NPF₆ as the supporting electrolyte were recorded at a scan rate of 100 mV/s with a planar glassy carbon disc (1 mm diameter) as working electrode, a platinum wire as counter electrode and an Ag wire (in 0.5 M n-Bu₄NPF₆ in MeCN) as a pseudo-reference electrode at 298 ± 2 K. Ferrocene was added to the sample solution as an internal reference (the ferrocene/ferrocenium couple appeared at $E_{1/2}(\text{Fc/Fc}^+) = 0.583$ V vs. Ag wire). Using this ferrocene redox couple, the potential $E$ vs. SCE (saturated calomel electrode) was calculated by the following equation, based on $E_{1/2}(\text{Fc/Fc}^+) = 0.400$ V vs. SCE [1]:

$$E (\text{vs. SCE}) = E (\text{vs. Ag wire}) - 0.183 V$$

![Figure S2: Cyclic voltammogram of 1.2 mM xanthate 1a in MeCN.](image)

Peak potential of xanthate 1a: $E_p = -1.97$ V vs. SCE
Half-peak potential of xanthate 1a: $E_{p/2} = -1.78$ V vs. SCE

1. Dong, T.-Y.; Hwang, M.-Y.; Hsu, T.-L.; Schei, C.-C.; Yeh, S.-K. Inorg. Chem. 1990, 29, 80–84.
4. Stern–Volmer emission quenching

Emission intensities were measured using a fluorescence spectrometer (Eclipse, Varian). All samples were excited at 410 nm and the emission intensities were collected at 480 nm. In a typical experiment, to a 25 μM solution of [Ir{dF(CF₃)ppy₂(dtbbpy)}](PF₆) (8) in DMSO was added the appropriate amount of a quencher in a screw-top cuvette to obtain a total volume of 2.0 mL. After degassing the sample with bubbling of argon for 15 minutes, the emission of the sample was collected.

Because both 1a and 2a can absorb light at 410 nm, it is necessary to do the correction so that the photocatalyst 8 in the presence of 1a or 2a and 8 alone absorb equal incident light intensity [2]. The fraction of intensity of the light absorbed by the photocatalyst 8 ($F_8$) in the systems of 8/1a and 8/2a is obtained using the following equation:

$$F_8 = \frac{A_8}{A_8 + A_{1a/2a}} \left(1 - 10^{-(A_8 + A_{1a/2a})}ight)$$

where $A_8$ and $A_{1a/2a}$ are the absorbances of 8 and 1a (or 2a) at 410 nm.

![Stern–Volmer quenching experiment](image)

**Figure S3:** Stern–Volmer quenching experiment of [Ir{dF(CF₃)ppy₂(dtbbpy)}](PF₆) (8) (25 μM in DMSO) with xanthate 1a. Average of two runs.

2. Yeow, E. K. L.; Ziolek, M.; Karolczak, J.; Shevyakov, S. V.; Asato, A. E.; Maciejewski, A.; Steer, R. P. *J. Phys. Chem. A* 2004, 108, 10980–10988.
The quenching rate \( k_q \) was determined using Stern–Volmer kinetics.

\[
\frac{I_0}{I} = k_q \cdot \tau \cdot [\text{quencher}]
\]

Where \( I_0 \) is the luminescence intensity without the quencher, \( I \) is the intensity with the quencher, and \( \tau \) is the lifetime of \([\text{Ir}\{\text{dF(CF}_3\text{)}\text{ppy}\}_2(\text{dtbbpy})]\)(PF_6) \((8)\) at 410 nm (1.40 ms, see section 5). The quenching rate \( k_q \) of xanthate \( 1a \) is determined to be \( 1.25 \times 10^7 \text{M}^{-1}\text{s}^{-1} \).

\[
k_q = \frac{\text{slope}}{\tau} = \frac{17.5}{1.40 \cdot 10^{-6} \text{s}} = 1.25 \times 10^7 \text{M}^{-1}\text{s}^{-1}
\]

5. **Time-resolved photoluminescence lifetime decay profile of 8**

The excited-state lifetimes of sole \([\text{Ir}\{\text{dF(CF}_3\text{)}\text{ppy}\}_2(\text{dtbbpy})]\)(PF_6) \((8)\), and \(8\) with xanthate \( 1a \) or 1-octene \( 2a \) were measured using a laser flash photolysis spectrometer (LKS.60, Applied Photophysics), equipped with a Q-Switched Nd:YAG laser (Brilliant B, Quantel) and a R928 photomultiplier. Samples were excited at 410 nm (for Figure 1C) or 355 nm (for Figure 2B) and each time-resolved emission decay curves were acquired at 480 nm. In a typical experiment, to a 25 μM solution of \([\text{Ir}\{\text{dF(CF}_3\text{)}\text{ppy}\}_2(\text{dtbbpy})]\)(PF_6) \((8)\) in DMSO was added a quencher (40 mM) in a screw-top cuvette to obtain a total volume of 2.0 mL. After degassing the sample with bubbling of argon for 15 min, the photoluminescence lifetime of the sample was collected.

**Photoluminescence lifetime in DMSO (Excitation at 410 nm) [for Figure 1C]**

- \(8\) (25 μM): 1.40 μs
- \(8\) (25 μM) + xanthate \( 1a \) (40 mM): 1.03 μs
- \(8\) (25 μM) + 1-octene \( 2a \) (40 mM): 1.37 μs

**Photoluminescence lifetime in DMSO (Excitation at 355 nm) [for Figure 2B]**

- \(8\) (25 μM): 1.73 μs
- \(8\) (25 μM) + xanthate \( 1a \) (40 mM): 1.27 μs
6. Transient absorption spectroscopy

ns-Transient absorption spectroscopy measurements were performed using a laser flash photolysis spectrometer (LKS.60, Applied Photophysics), equipped with a Q-Switched Nd:YAG laser (Brilliant B, Quantel), a 150 W Xe lamp and a R928 photomultiplier, to record ns-difference absorption (ΔOD) spectra. Samples were excited at 355 nm and each time-resolved trace was acquired by averaging 20 laser shots at a repetition rate of 1 Hz. In a typical experiment, to a 25 μM solution of [Ir{dF(CF₃)ppy}₂(dtbbpy)](PF₆) (8) in DMSO was added a quencher (40 mM) in a screw-top cuvette to obtain a total volume of 2.0 mL. After degassing the sample with bubbling of argon for 15 min, a transient absorption spectrum was measured. For the transient absorption spectroscopy of 1a alone (for Figure 2C), a 10 mM solution of 1a (total volume: 2.0 mL) was prepared.

As shown in Figure S4, when comparing the normalized TA spectra of photocatalyst 8 in the absence (Figure 2A) and presence of xanthate 1a (Figure 2D), an additional contribution from a broad ΔOD band that stretches from 500 nm to 800 nm is seen for the latter which is attribute to absorption of the xanthic acid radical. In this case, the xanthic acid radical is formed from the homolytic bond cleavage of the excited triplet state of 1a formed by direct 355 nm laser light excitation and triplet-triplet energy transfer involving the excited photocatalyst 8.

**Figure S4:** Normalized ns-TA spectra of photocatalyst 8 in the absence and presence of xanthate 1a in degassed DMSO.
7. Determination of quantum yield
We utilized the protocol reported by Yoon and co-workers to determine the photon flux of the blue LED [3]. All solutions were stored in the dark when not in use. Measurements were performed with the lights off to protect the samples from ambient light as much as possible. Potassium ferrioxalate trihydrate, [K$_3$Fe$^{III}$(C$_2$O$_4$)$_3$]•3H$_2$O (CAS: 5936-11-8) was recrystallized three times from H$_2$O. 1,10-Phenanthroline (CAS: 5144-89-8) was recrystallized once from benzene.

Preparation of stock solutions
A 0.15 M solution of ferrioxalate was obtained by dissolving potassium ferrioxalate trihydrate ([K$_3$Fe$^{III}$(C$_2$O$_4$)$_3$]•3H$_2$O; 1.11 g, 2.26 mmol) in 0.05 M H$_2$SO$_4$ (prepared by fresh deionized water) (15 mL total volume).
A buffered phenanthroline solution was obtained by dissolving 1,10-phenanthroline (10.0 mg) and sodium acetate (2.25 g) in 0.5 M H$_2$SO$_4$ (prepared by fresh deionized water) (10 mL total volume).

Determination of background Fe$^{2+}$ concentration
3 mL of the ferrioxalate solution was added to a 4 mL vial. Next, 0.525 mL of the phenanthroline solution was added and the mixture was stored in the dark for 1 hour. Then the solution was transferred to a cuvette and a UV–vis spectrum was measured using UV–vis absorption spectrometer (Cary 100, Varian). The absorbance value at 510 nm was recorded. This process was repeated twice.
Average value: 0.523766855

Determination of photon flux
Three mL of the ferrioxalate solution was added to a 4 mL vial. The vial was immediately irradiated with blue LED ($\lambda_{max}$ = 469 nm) for 90 seconds and removed from the blue LED. Then, 0.525 mL of the phenanthroline solution was added to the ferrioxalate solution, and the resulting mixture was stored in the dark for 1 hour. Then the solution was transferred to a cuvette and the UV–vis spectrum was measured. The absorbance value at 510 nm was recorded. This process was repeated twice.
Average value: 2.045735439

3. Cismesia, M. A.; Yoon, T. P. Chem. Sci. 2015, 6, 5426–5434.
Calculations

The amount of Fe$^{2+}$ formed was calculated according to the following equation:

$$\text{mol Fe}^{2+} = \frac{V \cdot \Delta A}{l \cdot \varepsilon}$$

where $V$ is the volume of the sample analyzed (3.53 mL), $\Delta A$ is the difference in average absorbances (between irradiated and unirradiated ferrioxalate solutions) at 510 nm, $l$ is the path length, and $\varepsilon$ is the molar absorptivity at 510 nm [4].

$$\text{mol Fe}^{2+} = \frac{(0.00353 \, \text{L}) \cdot (1.521968583)}{(1.00 \, \text{cm}) \cdot (11100 \, \text{L/mol cm})} = 4.83 \cdot 10^{-7} \, \text{mol}$$

The fraction of light absorbed by the ferrioxalate actinometer was calculated by the following equation:

$$f = 1 - 10^{-A}$$

where $A$ is the absorbance at 468 nm of the ferrioxalate actinometer solution prior to irradiation and addition of phenanthroline (vide infra).

$$f = 1 - 10^{-A} = 1 - 10^{-0.4890742302} = 0.676$$

The photon flux was calculated using the following equation:

$$\text{photon flux} = \frac{\text{mol Fe}^{2+}}{\Phi \cdot t \cdot f}$$

where $\Phi$ is the quantum yield for the ferrioxalate actinometer at 468 nm [4], $t$ is the time and $f$ is the fraction of light absorbed by the ferrioxalate actinometer solution.

$$\text{photon flux} = \frac{\text{mol Fe}^{2+}}{\Phi \cdot t \cdot f} = \frac{4.83 \cdot 10^{-7} \, \text{mol}}{(0.92) \cdot (90 \, \text{s}) \cdot (0.676)} = 8.64 \cdot 10^{-9} \, \text{einstein/s}$$

---

4. Hatchard, C. G.; Parker, C. A. *Proc. R. Soc. London Ser. A* **1956**, *235*, 518–536.
**Determination of fraction of light absorbed at 468 nm for the ferrioxalate solution**

The absorbance at 468 nm of the ferrioxalate actinometer solution prior to irradiation and addition of phenanthroline was measured to be 0.4890742302 (Figure S5).

![UV–vis absorption spectrum of ferrioxalate actinometer solution](image)

**Figure S5:** UV–vis absorption spectrum of ferrioxalate actinometer solution prior to irradiation and addition of phenanthroline.

**Determination of quantum yield**

A 4 mL vial was charged with xanthate 1a (458 mg, 2.20 mmol), alkene 2b (480 µL, 4.45 mmol), 8 (12.2 mg, 0.0109 mmol), and degassed anhydrous DMSO (2.2 mL). The vial was fitted with a cap and sealed with parafilm. The mixture was stirred and irradiated with blue LED ($\lambda_{\text{max}} = 469$ nm) for 4 hours (14400 s). After irradiation, the vial was removed from the blue LED and the reaction mixture was purified as detailed below (section 9.1, page S14) to provide the desired product (391 mg, 1.27 mmol) in 58% yield.

The quantum yield ($\Phi$) was calculated using the following equation:

$$
\Phi = \frac{\text{mol product}}{\text{flux} \cdot t \cdot f}
$$

where $t$ is the reaction time and $f$ is the fraction of light absorbed by 8 that was calculated using the following equation:
\[ f = 1 - 10^{-A} = 1 - 10^{-0.811556876} = 0.846 \]

where \( A \) is the absorbance at 468 nm of the 8 solution (5 mM in DMSO) (vide infra).

\[ \Phi = \frac{mol \text{ product}}{flux \cdot t \cdot f} = \frac{0.00127 \text{ mol}}{(8.64 \cdot 10^{-9} \text{ einstein/s}) \cdot (14400 \text{ s}) \cdot (0.846)} = 12 \]

**Absorbance of photocatalyst 8**

The absorbance of 8 in DMSO was measured at the reaction concentration of 5 mM or a dilute concentration of 25 \( \mu \text{M} \) (Figure S6). The absorbance at 468 nm for a 5 mM is 0.811556876.

**Figure S6:** UV–vis absorption spectra of \([\text{Ir}\{\text{dF(CF}_3\text{)ppy}\}_2(\text{dtbbpy})\}\text{]}(\text{PF}_6) \) (8) (black line: 5 mM in DMSO, red line: 25 \( \mu \text{M} \) in DMSO).
8. Synthesis of starting materials

Xanthates 1a,b [5], 1c [6], 1d [7], 1e [5], 1f [8], 1g [9], 1h [10], 1i-1j [11], and 1k [12] were synthesized based on the corresponding literature procedures. Their spectra data are identical to those reported.

Alkenes 2a [CAS: 111-66-0], 2b [CAS: 591-87-7], 2c [CAS: 109-75-1], 2d [CAS: 762-72-1], 2e [CAS: 557-31-3], 2g [CAS: 72824-04-5], 2h [CAS: 821-41-0], 2i [CAS: 2695-47-8], 2k [CAS: 1120-56-5], 2l [CAS: 1528-30-9], and 2m [CAS: 498-66-8] were commercially available and used as received. Alkenes 2f [13], 2j [14], 2n [15], and 2o [16] were synthesized based on the corresponding literature procedures. Their spectra data are identical to those reported.

8.1. Synthesis of \((3R,5S,8R,9S,10S,13S,14S)-10,13\text{-dimethyl-17-oxohexadeca-hydro-1}H\text{-cyclopenta}[a]phenanthren-3\text{-yl pent-4-enoate (2p)}\)

To a solution of 4-pentenoic acid (702 \(\mu\)L, 6.88 mmol) in CH\(_2\)Cl\(_2\) (20 mL) was added oxalyl chloride (590 \(\mu\)L, 6.90 mmol) and 5 drops of DMF slowly at 0 °C under a N\(_2\) atmosphere. After stirring at 23 °C for 2 h, a solution of androsterone (CAS: 53-41-8, 1.00 g, 3.44 mmol) in CH\(_2\)Cl\(_2\) (20 mL) and Et\(_3\)N (1.44 mL, 10.3 mmol) were added slowly at 0 °C under a N\(_2\) atmosphere. The reaction mixture was stirred at 23 °C for 20 h and quenched with saturated aqueous NH\(_4\)Cl. The organic materials were extracted thrice with CH\(_2\)Cl\(_2\) and the combined organic extracts were washed with water and brine, dried over MgSO\(_4\), filtered and concentrated in vacuo. The resulting crude material was purified by flash column chromatography (silica gel: hexane/EtOAc 95:5) to yield alkene 2p (924 mg, 2.48 mmol) in 72% yield based on androsterone as a white solid.

\textbf{mp:} 91-92 °C.

9. Photocatalytic degenerative xanthate transfer to olefins

9.1. Synthesis of ethyl 4-((ethoxycarbonothioyl)thio)decanoate (3aa) (Table 1, entry 3) (a typical procedure)

\[
\begin{align*}
&\text{EtO}_2\text{C} & \text{S} & \text{OEt} \\
&\text{1a} & \text{S} & \text{OEt} \\
&\text{2a (2 equiv)} & \text{S} & \text{OEt} \\
&\text{EtO}_2\text{C} & \text{S} & \text{OEt} \\
&\text{3aa} & \text{S} & \text{OEt} \\
\end{align*}
\]

To a 10 mL sealed tube was added ethyl 2-((ethoxycarbonothioyl)thio)acetate (1a, 61.3 mg, 0.294 mmol), [Ir\{dF(CF_3)ppy\}_2(dtbbpy)](PF_6) (8, 1.6 mg, 0.00143 mmol), and 1-octene (2a) (90 µL, 0.573 mmol). Degassed anhydrous DMSO (290 µL) was added and the reaction was sparged with Ar. The tube was sealed and surrounded by blue LEDs for 20 h. The reaction mixture was diluted with EtOAc and water. The aqueous layer was separated and extracted twice with EtOAc. The combined organic extracts were washed with brine, dried over MgSO_4, filtered and concentrated in vacuo. The resulting crude material was purified by flash column chromatography (silica gel; hexane/EtOAc 200:1) to give 3aa (84.3 mg, 0.263 mmol) in 89% yield as a colorless oil.
**9.2. Synthesis of ethyl 5-acetoxy-4-((ethoxycarbonothioyl)thio)pentanoate (3ab)**

Prepared using xanthate 1a (61.8 mg, 0.297 mmol) and alkene 2b (70 μL, 0.649 mmol) with 8 (1.6 mg, 0.00143 mmol) for 18 h.

Purification: Hexane:EtOAc = 10:1

Yield: 80.8 mg (0.262 mmol, 88% yield) as a colorless oil.

**1H NMR (400 MHz, CDCl₃):** δ 4.65 (2H, q, J = 7.2 Hz), 4.31 (1H, dd, J = 11.4, 5.0 Hz), 4.24 (1H, dd, J = 11.4, 6.0 Hz), 4.14 (2H, q, J = 7.2 Hz), 4.05-3.99 (1H, m), 2.57-2.42 (2H, m), 2.20-2.12 (1H, m), 2.08 (3H, s), 1.98-1.89 (1H, m), 1.43 (3H, t, J = 7.2 Hz), 1.26 (3H, t, J = 7.2 Hz).

**13C NMR (100 MHz, CDCl₃):** δ 212.8, 172.5, 170.6, 70.3, 65.5, 60.6, 48.8, 31.5, 26.0, 20.7, 14.2, 13.7.

**9.3. Synthesis of ethyl 5-cyano-4-((ethoxycarbonothioyl)thio)pentanoate (3ac)**

Prepared using xanthate 1a (63.1 mg, 0.303 mmol) and alkene 2c (50 μL, 0.622 mmol) with 8 (1.7 mg, 0.00152 mmol) for 45 h.

Purification: Hexane:EtOAc = 7:1

17. Ollivier, C.; Renaud, P. J. Am. Chem. Soc. 2000, 122, 6496–6497.
Yield: 61.1 mg (0.222 mmol, 73% yield) as a pale yellow oil.

\( ^1\)H NMR (400 MHz, CDCl\(_3\)): \( \delta \) 4.66 (2H, q, \( J = 7.2 \) Hz), 4.16 (2H, q, \( J = 7.2 \) Hz), 4.00-3.93 (1H, m), 2.97-2.85 (2H, m), 2.59-2.46 (2H, m), 2.27-2.19 (1H, m), 2.11-2.02 (1H, m), 1.44 (3H, t, \( J = 7.2 \) Hz), 1.27 (3H, t, \( J = 7.2 \) Hz).

\( ^{13}\)C NMR (100 MHz, CDCl\(_3\)): \( \delta \) 212.0, 172.0, 116.8, 70.6, 60.8, 45.9, 31.4, 27.6, 24.1, 14.2, 13.7.

9.27. Synthesis of 4-acetamido-2-((ethoxycarbonothioyl)thio)-5,5,5-trifluoropentyl acetate (3kb) [12] (Table 3, entry 10)

Prepared using xanthate 1k (78.5 mg, 0.300 mmol) and alkene 2b (70 μL, 0.649 mmol) with 8 (1.6 mg, 0.00143 mmol) for 24 h.

Purification: Hexane:EtOAc = 3:1

Yield: 79.8 mg (0.221 mmol, 74% yield) as a pale yellow oil (dr = 63:37, determined by $^{19}$F NMR analysis. Two diastereomers were separated partially for characterization).

$^1$H NMR (400 MHz, CDCl$_3$): δ 6.03-5.97 (1H + 1H×0.57, s br), 4.95-4.78 (1H + 1H×0.57, m), 4.69-4.62 (2H, q, $J$ = 7.2 Hz + 2H×0.57, q, $J$ = 7.2 Hz), 4.43 (1H×0.57, dd, $J$ = 12.0, 4.4 Hz), 4.32-4.25 (2H, m + 1H×0.57, dd, $J$ = 12.0, 4.8 Hz), 4.18-4.11 (1H, m), 4.00-3.94 (1H×0.57, m), 2.31-2.24 (1H×0.57, m), 2.20-1.93 (3H, s + 3H, s + 2H, m + 3H×0.57, s + 3H×0.57, s + 1H×0.57, m), 1.45-1.40 (3H, t, $J$ = 7.2 Hz + 3H×0.57, t, $J$ = 7.2 Hz).

$^{19}$F NMR (377 MHz, CDCl$_3$): δ -76.0 (3F, d, $J$ = 7.5 Hz), -76.1 (3F×0.57, d, $J$ = 7.5 Hz).

Major-3kb

$^1$H NMR (400 MHz, CDCl$_3$): δ 6.00 (1H, s br), 4.94-4.88 (1H, m), 4.64 (2H, q, $J$ = 7.2 Hz), 4.33-4.25 (2H, m), 4.18-4.11 (1H, m), 2.19-2.12 (1H, m), 2.10 (3H, s), 2.04 (3H, s), 2.02-1.95 (1H, m), 1.42 (3H, t, $J$ = 7.2 Hz).

$^{13}$C NMR (100 MHz, CDCl$_3$): δ 212.3, 170.7, 170.0, 124.9 (q, $J$ = 280.4 Hz), 70.8, 65.8, 48.3 (q, $J$ = 30.8 Hz), 45.9, 29.2, 23.0, 20.7, 13.6.

$^{19}$F NMR (377 MHz, CDCl$_3$): δ -76.0 (3F, d, $J$ = 7.5 Hz).

Minor-3kb

$^1$H NMR (400 MHz, CDCl$_3$): δ 5.88 (1H, s br), 4.86-4.78 (1H, m), 4.66 (2H, q, $J$ = 7.2 Hz), 4.43 (1H, dd, $J$ = 12.0, 4.4 Hz), 4.29 (1H, dd, $J$ = 12.0, 4.8 Hz), 4.00-3.94
(1H, m), 2.31-2.24 (1H, m), 2.12 (3H, s), 2.10 (3H, s), 2.01-1.93 (1H, m), 1.43 (3H, t, \( J = 7.2 \) Hz).

\textbf{\( ^{13}C \text{ NMR (100 MHz, CDCl}_3) \)}: \( \delta \) 213.2, 170.4, 170.2, 124.7 (q, \( J = 280.3 \) Hz), 70.7, 63.9, 48.5 (q, \( J = 30.8 \) Hz), 45.6, 30.4, 23.1, 20.6, 13.7.

\textbf{\( ^{19}F \text{ NMR (377 MHz, CDCl}_3 \)}: \( \delta \) -76.2 (d, \( J = 7.2 \) Hz).
