SOME TRACE INEQUALITIES FOR OPERATORS IN HILBERT SPACES

S. S. DRAGOMIR

Abstract. Some new trace inequalities for operators in Hilbert spaces are provided. The superadditivity and monotonicity of some associated functionals are investigated and applications for power series of such operators are given. Some trace inequalities for matrices are also derived. Examples for the operator exponential and other similar functions are presented as well.

1. Introduction

Let \((H, \langle \cdot, \cdot \rangle)\) be a complex Hilbert space and \(\{e_i\}_{i \in I}\) an orthonormal basis of \(H\). We say that \(A \in B(H)\) is a Hilbert-Schmidt operator if

\[
\sum_{i \in I} \|Ae_i\|^2 < \infty.
\]

It is well known that, if \(\{e_i\}_{i \in I}\) and \(\{f_j\}_{j \in J}\) are orthonormal bases for \(H\) and \(A \in B(H)\) then

\[
\sum_{i \in I} \|Ae_i\|^2 = \sum_{j \in J} \|Af_j\|^2 = \sum_{j \in J} \|A^*f_j\|^2
\]

showing that the definition \((1.1)\) is independent of the orthonormal basis and \(A\) is a Hilbert-Schmidt operator iff \(A^*\) is a Hilbert-Schmidt operator.

Let \(B_2(H)\) the set of Hilbert-Schmidt operators in \(B(H)\). For \(A \in B_2(H)\) we define

\[
\|A\|_2 := \left( \sum_{i \in I} \|Ae_i\|^2 \right)^{1/2}
\]

for \(\{e_i\}_{i \in I}\) an orthonormal basis of \(H\). This definition does not depend on the choice of the orthonormal basis.

Using the triangle inequality in \(l^2(I)\), one checks that \(B_2(H)\) is a vector space and that \(\|\cdot\|_2\) is a norm on \(B_2(H)\), which is usually called in the literature as the Hilbert-Schmidt norm.

Denote the modulus of an operator \(A \in B(H)\) by \(|A| := (A^*A)^{1/2}\).

Because \(\|A\|_2 = \|Ax\|\) for all \(x \in H\), \(A\) is Hilbert-Schmidt iff \(|A|\) is Hilbert-Schmidt and \(\|A\|_2 = \||A||_2\). From \((1.2)\) we have that if \(A \in B_2(H)\), then \(A^* \in B_2(H)\) and \(\|A\|_2 = \||A^*||_2\).

The following theorem collects some of the most important properties of Hilbert-Schmidt operators:

1991 Mathematics Subject Classification. 47A63; 47A99.

Key words and phrases. Trace class operators, Hilbert-Schmidt operators, Trace, Schwarz inequality, Trace inequalities for matrices, Power series of operators.
Theorem 1. We have 
(i) \((B_2(H), \|\cdot\|_2)\) is a Hilbert space with inner product 
\[
\langle A, B \rangle_2 := \sum_{i \in I} \langle Ae_i, Be_i \rangle = \sum_{i \in I} \langle B^* Ae_i, e_i \rangle
\]
and the definition does not depend on the choice of the orthonormal basis \(\{e_i\}_{i \in I}\); 
(ii) We have the inequalities 
\[
\|A\| \leq \|A\|_2
\]
for any \(A \in B_2(H)\) and 
\[
\|AT\|_2, \|TA\|_2 \leq \|T\| \|A\|_2
\]
for any \(A \in B_2(H)\) and \(T \in B(H)\); 
(iii) \(B_2(H)\) is an operator ideal in \(B(H)\), i.e. 
\[
B(H)B_2(H)B(H) \subseteq B_2(H);
\]
(iv) \(B_{fin}(H)\), the space of operators of finite rank, is a dense subspace of \(B_2(H)\); 
(v) \(B_2(H) \subseteq K(H)\), where \(K(H)\) denotes the algebra of compact operators on \(H\). 

If \(\{e_i\}_{i \in I}\) an orthonormal basis of \(H\), we say that \(A \in B(H)\) is trace class if 
\[
\|A\|_1 := \sum_{i \in I} \langle |A| e_i, e_i \rangle < \infty.
\]
The definition of \(\|A\|_1\) does not depend on the choice of the orthonormal basis \(\{e_i\}_{i \in I}\). We denote by \(B_1(H)\) the set of trace class operators in \(B(H)\). 

The following proposition holds: 

Proposition 1. If \(A \in B(H)\), then the following are equivalent:  
(i) \(A \in B_1(H)\);  
(ii) \(|A|^{1/2} \in B_2(H)\);  
(ii) \(A \) (or \(|A|\) ) is the product of two elements of \(B_2(H)\). 

The following properties are also well known: 

Theorem 2. With the above notations: 
(i) We have 
\[
\|A\|_1 = \|A^*\|_1 \quad \text{and} \quad \|A\|_2 \leq \|A\|_1
\]
for any \(A \in B_1(H)\); 
(ii) \(B_1(H)\) is an operator ideal in \(B(H)\), i.e. 
\[
B(H)B_1(H)B(H) \subseteq B_1(H);
\]
(iii) We have 
\[
B_2(H)B_2(H) = B_1(H);
\]
(iv) We have 
\[
\|A\|_1 = \sup \{(A, B)_2 \mid B \in B_2(H), \quad \|B\| \leq 1\};
\]
(v) \((B_1(H), \|\cdot\|_1)\) is a Banach space. 
(iv) We have the following isometric isomorphisms 
\[
B_1(H) \cong K(H)^* \quad \text{and} \quad B_1(H) \cong B(H),
\]
where \(K(H)^*\) is the dual space of \(K(H)\) and \(B_1(H)^*\) is the dual space of \(B_1(H)\).
We define the trace of a trace class operator \( A \in \mathcal{B}_1(H) \) to be

\[
\text{tr} (A) := \sum_{i \in I} \langle Ae_i, e_i \rangle
\]

where \( \{e_i\}_{i \in I} \) an orthonormal basis of \( H \). Note that this coincides with the usual definition of the trace if \( H \) is finite-dimensional. We observe that the series (1.9) converges absolutely and it is independent from the choice of basis.

The following result collects some properties of the trace:

**Theorem 3.** We have

(i) If \( A \in \mathcal{B}_1(H) \) then \( A^* \in \mathcal{B}_1(H) \) and

\[
\text{tr} (A^*) = \overline{\text{tr} (A)};
\]

(ii) If \( A \in \mathcal{B}_1(H) \) and \( T \in \mathcal{B}(H) \), then \( AT, TA \in \mathcal{B}_1(H) \) and

\[
\text{tr} (AT) = \text{tr} (T A) \quad \text{and} \quad |\text{tr} (AT)| \leq \|A\|_1 \|T\|;
\]

(iii) \( \text{tr} (\cdot) \) is a bounded linear functional on \( \mathcal{B}_1(H) \) with \( \|\text{tr}\| = 1 \);

(iv) If \( A, B \in \mathcal{B}_2(H) \) then \( AB, BA \in \mathcal{B}_1(H) \) and \( \text{tr} (AB) = \text{tr} (BA) \);

(v) \( \mathcal{B}_{fin}(H) \) is a dense subspace of \( \mathcal{B}_1(H) \).

Utilising the trace notation we obviously have that

\[
\langle A, B \rangle_2 = \text{tr} (B^* A) = \text{tr} (AB^*) \quad \text{and} \quad \|A\|^2 = \text{tr} (A^* A) = \text{tr} \left( |A|^2 \right)
\]

for any \( A, B \in \mathcal{B}_2(H) \).

Now, for the finite dimensional case, it is well known that the trace functional is submultiplicative, that is, for positive semidefinite matrices \( A \) and \( B \) in \( M_n(\mathbb{C}) \),

\[
0 \leq \text{tr}(AB) \leq \text{tr} (A) \text{ tr} (B).
\]

Therefore

\[
0 \leq \text{tr}(A^k) \leq |\text{tr} (A)|^k,
\]

where \( k \) is any positive integer.

In 2000, Yang [17] proved a matrix trace inequality

\[
\text{tr} \left( (AB)^k \right) \leq (\text{tr} A)^k (\text{tr} B)^k,
\]

where \( A \) and \( B \) are positive semidefinite matrices over \( \mathbb{C} \) of the same order \( n \) and \( k \) is any positive integer. For related works the reader can refer to [9, 7, 12] and [19], which are continuations of the work of Bellman [2].

If \( (H, \langle \cdot, \cdot \rangle) \) is a separable infinite-dimensional Hilbert space then the inequality (1.12) is also valid for any positive operators \( A, B \in \mathcal{B}_1(H) \). This result was obtained by L. Liu in 2007, see [10].

In 2001, Yang et al. [18] improved (1.12) as follows:

\[
\text{tr} \left( (AB)^m \right) \leq \left[ \text{tr} (A^2m) \text{ tr} (B^{2m}) \right]^{1/2},
\]

where \( A \) and \( B \) are positive semidefinite matrices over \( \mathbb{C} \) of the same order and \( m \) is any positive integer.

In [14] the authors have proved many trace inequalities for sums and products of matrices. For instance, if \( A \) and \( B \) are positive semidefinite matrices in \( M_n(\mathbb{C}) \) then

\[
\text{tr} \left( (AB)^k \right) \leq \min \left\{ \|A\|^k \text{ tr} (B^k), \|B\|^k \text{ tr} (A^k) \right\}
\]
for any positive integer \( k \). Also, if \( A, B \in M_n(\mathbb{C}) \) then for \( r \geq 1 \) and \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \) we have the following Young type inequality

\[
\text{tr} (|AB^*|^r) \leq \left( \frac{\|A\|^p}{p} + \frac{\|B\|^q}{q} \right)^r.
\]

Ando \cite{Ando} proved a very strong form of Young’s inequality - it was shown that if \( A \) and \( B \) are in \( M_n(\mathbb{C}) \), then there is a unitary matrix \( U \) such that

\[
|AB^*| \leq U \left( \frac{1}{p} \|A\|^p + \frac{1}{q} \|B\|^q \right) U^*,
\]

where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \), which immediately gives the trace inequality

\[
\text{tr} (|AB^*|) \leq \frac{1}{p} \text{tr} (|A|^p) + \frac{1}{q} \text{tr} (|B|^q).
\]

This inequality can also be obtained from (1.15) by taking \( r = 1 \).

Another Hölder type inequality has been proved by Manjegani in \cite{Manjegani} and can be stated as follows:

\[
\text{tr}(AB) \leq \left( \text{tr}(A^p) \right)^{1/p} \left( \text{tr}(B^q) \right)^{1/q},
\]

where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \) and \( A \) and \( B \) are positive semidefinite matrices.

For the theory of trace functionals and their applications the reader is referred to \cite{TraceFunc}.

For other trace inequalities see \cite{Trace1}, \cite{Trace2}, \cite{Trace3}, \cite{Trace4} and \cite{Trace5}.

In this paper, motivated by the above results, some new inequalities for Hilbert-Schmidt operators in \( B(H) \) are provided. The superadditivity and monotonicity of some associated functionals are investigated and applications for power series of such operators are given. Some trace inequalities for matrices are also derived. Examples for the operator exponential and other similar functions are presented as well.

2. SOME TRACE INEQUALITIES VIA HERMITIAN FORMS

Let \( P \) a selfadjoint operator with \( P \geq 0 \). For \( A \in B_2(H) \) and \( \{e_i\}_{i \in I} \) an orthonormal basis of \( H \) we have

\[
\|A\|_{2,P}^2 := \text{tr} (A^*PA) = \sum_{i \in I} \langle PAe_i, Ae_i \rangle \leq \|P\| \sum_{i \in I} \|Ae_i\|^2 = \|P\| \|A\|_2^2,
\]

which shows that \( \langle \cdot, \cdot \rangle_{2,P} \) defined by

\[
\langle A, B \rangle_{2,P} := \text{tr} (B^*PA) = \sum_{i \in I} \langle PAe_i, Be_i \rangle = \sum_{i \in I} \langle B^*PAe_i, e_i \rangle
\]

is a nonnegative Hermitian form on \( B_2(H) \), i.e. \( \langle \cdot, \cdot \rangle_{2,P} \) satisfies the properties:

(h) \( \langle A, A \rangle_{2,P} \geq 0 \) for any \( A \in B_2(H) \);

(hh) \( \langle \cdot, \cdot \rangle_{2,P} \) is linear in the first variable;

(hhh) \( \langle B, A \rangle_{2,P} = \overline{\langle A, B \rangle_{2,P}} \) for any \( A, B \in B_2(H) \).

Using the properties of the trace we also have the following representations

\[
\|A\|_{2,P}^2 := \text{tr} (PA^*P) = \text{tr} (A^*P) = \text{tr} (B^*PA)
\]

and

\[
\langle A, B \rangle_{2,P} := \text{tr} (PAB^*) = \text{tr} (AB^*P) = \text{tr} (B^*PA).
\]
for any $A, B \in B_2(H)$.

We start with the following result:

**Theorem 4.** Let $P$ a selfadjoint operator with $P \geq 0$, i.e. $\langle Px, x \rangle \geq 0$ for any $x \in H$.

(i) For any $A, B \in B_2(H)$ we have

\[(2.1) \quad |\text{tr} (P A B^*)|^2 \leq \text{tr} \left( P |A^*|^2 \right) \text{tr} \left( P |B^*|^2 \right)\]

and

\[(2.2) \quad \left[ \text{tr} \left( P |A^*|^2 \right) + 2 \text{Re} \text{tr} (P A B^*) + \text{tr} \left( P |B^*|^2 \right) \right]^{1/2} \leq \left[ \text{tr} \left( P |A^*|^2 \right) \right]^{1/2} + \left[ \text{tr} \left( P |B^*|^2 \right) \right]^{1/2}; \]

(ii) For any $A, B, C \in B_2(H)$ we have

\[(2.3) \quad |\text{tr} (P A B^*)| \text{tr} \left( P |C^*|^2 \right) \quad \text{tr} \left( P |A| C \right) \quad \text{tr} \left( P |B| C \right) \quad \text{tr} \left( P |C^*|^2 \right)\]

\[
\leq \left[ \text{tr} \left( P |A^*|^2 \right) \text{tr} \left( P |C^*|^2 \right) - |\text{tr} (P A C^*)|^2 \right] \times \left[ \text{tr} \left( P |B^*|^2 \right) \text{tr} \left( P |C^*|^2 \right) - |\text{tr} (P B C^*)|^2 \right],
\]

\[(2.4) \quad |\text{tr} (P A B^*)| \text{tr} \left( P |C^*|^2 \right) \quad \text{tr} \left( P |A| C \right) \quad \text{tr} \left( P |B| C \right) \quad \text{tr} \left( P |C^*|^2 \right)\]

\[
\leq \left[ \text{tr} \left( P |A^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( P |B^*|^2 \right) \right]^{1/2} \text{tr} \left( P |C^*|^2 \right)\]

and

\[(2.5) \quad |\text{tr} (P A C^*)| \text{tr} \left( P B C^* \right)\]

\[
\leq \frac{1}{2} \left[ \text{tr} \left( P |A^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( P |B^*|^2 \right) \right]^{1/2} + |\text{tr} (P A B^*)| \text{tr} \left( P |C^*|^2 \right)\].

**Proof.** (i) Making use of the Schwarz inequality for the nonnegative hermitian form $\langle \cdot, \cdot \rangle_{2,p}$ we have

\[
\left| \langle A, B \rangle_{2,p} \right|^2 \leq \langle A, A \rangle_{2,p} \langle B, B \rangle_{2,p}
\]

for any $A, B \in B_2(H)$ and the inequality (2.1) is proved.

We observe that $\| \cdot \|_{2,p}$ is a seminorm on $B_2(H)$ and by the triangle inequality we have

\[
\| A + B \|_{2,p} \leq \| A \|_{2,p} + \| B \|_{2,p}
\]

for any $A, B \in B_2(H)$ and the inequality (2.2) is proved.

(ii) Let $C \in B_2(H), C \neq 0$. Define the mapping $\langle \cdot, \cdot \rangle_{2,p} : B_2(H) \times B_2(H) \to \mathbb{C}$ by

\[
\langle A, B \rangle_{2,p} := \langle A, B \rangle_{2,p} \| C \|_{2,p}^2 - \langle A, C \rangle_{2,p} \langle C, B \rangle_{2,p}.
\]
Observe that $\langle \cdot, \cdot \rangle_{2,P,C}$ is a nonnegative Hermitian form on $B_2(H)$ and by Schwarz inequality we have

\begin{equation}
(2.6) \quad \left| \langle A, B \rangle_{2,P} \|C\|_{2,P}^2 - \langle A, C \rangle_{2,P} \langle C, B \rangle_{2,P} \right|^2 \leq \left[ \|A\|_{2,P}^2 \|C\|_{2,P}^2 - \langle A, C \rangle_{2,P} \right] \left[ \|B\|_{2,P}^2 \|C\|_{2,P}^2 - \langle B, C \rangle_{2,P} \right]
\end{equation}

for any $A, B \in B_2(H)$, which proves (2.3).

The case $C = 0$ is obvious.

Utilising the elementary inequality for real numbers $m, n, p, q$

$$(m^2 - n^2) (p^2 - q^2) \leq (mp - nq)^2,$$

we can easily see that

\begin{equation}
(2.7a) \quad \left[ \|A\|_{2,P}^2 \|C\|_{2,P}^2 - \langle A, C \rangle_{2,P} \right] \left[ \|B\|_{2,P}^2 \|C\|_{2,P}^2 - \langle B, C \rangle_{2,P} \right] \leq \left( \|A\|_{2,P} \|B\|_{2,P} \|C\|_{2,P} - \langle A, C \rangle_{2,P} \|B, C \rangle_{2,P} \right)^2
\end{equation}

for any $A, B, C \in B_2(H)$.

Since, by Schwarz’s inequality we have

$$\|A\|_{2,P} \|C\|_{2,P} \geq \langle A, C \rangle_{2,P}$$

and

$$\|B\|_{2,P} \|C\|_{2,P} \geq \langle B, C \rangle_{2,P},$$

then by multiplying these inequalities we have

$$\|A\|_{2,P} \|B\|_{2,P} \|C\|_{2,P} \geq \langle A, C \rangle_{2,P} \|B, C \rangle_{2,P}$$

for any $A, B, C \in B_2(H)$.

Utilizing the inequalities (2.6) and (2.7a) and taking the square root we get

\begin{equation}
(2.8) \quad \left| \langle A, B \rangle_{2,P} \|C\|_{2,P}^2 - \langle A, C \rangle_{2,P} \langle C, B \rangle_{2,P} \right| \leq \|A\|_{2,P} \|B\|_{2,P} \|C\|_{2,P}^2 - \langle A, C \rangle_{2,P} \langle B, C \rangle_{2,P}
\end{equation}

for any $A, B, C \in B_2(H)$, which proves the second inequality in (2.3).

The first inequality is obvious by the modulus properties.

By the triangle inequality for modulus we also have

\begin{equation}
(2.9) \quad \left| \langle A, C \rangle_{2,P} \langle C, B \rangle_{2,P} - \langle A, B \rangle_{2,P} \|C\|_{2,P}^2 \right| \leq \langle A, B \rangle_{2,P} \|C\|_{2,P}^2 - \langle A, C \rangle_{2,P} \langle C, B \rangle_{2,P}
\end{equation}

for any $A, B, C \in B_2(H)$.

On making use of (2.8) and (2.9) we have

$$\left| \langle A, C \rangle_{2,P} \langle C, B \rangle_{2,P} - \langle A, B \rangle_{2,P} \|C\|_{2,P}^2 \right| \leq \|A\|_{2,P} \|B\|_{2,P} \|C\|_{2,P}^2 - \langle A, C \rangle_{2,P} \langle B, C \rangle_{2,P},$$

which is equivalent to the desired inequality (2.5).
Remark 1. By the triangle inequality for the hermitian form \([\cdot, \cdot]_{2,p,C} : \mathcal{B}_2(H) \times \mathcal{B}_2(H) \to \mathbb{C}\),

\[ [A, B]_{2,p,C} := \langle A, B \rangle_{2,p} \|C\|_{2,p}^2 - \langle A, C \rangle_{2,p} \langle B, C \rangle_{2,p} \]

we have

\[
\left( \|A + B\|_{2,p}^2 \|C\|_{2,p}^2 - \left| \langle A + B, C \rangle_{2,p} \right|^2 \right)^{1/2} \\
\leq \left( \|A\|_{2,p}^2 \|C\|_{2,p}^2 - \left| \langle A, C \rangle_{2,p} \right|^2 \right)^{1/2} + \left( \|B\|_{2,p}^2 \|C\|_{2,p}^2 - \left| \langle B, C \rangle_{2,p} \right|^2 \right)^{1/2},
\]

which can be written as

\[
(2.10) \quad \left( \text{tr} \left[ \left| (A + B)^* \right|^2 \right] \right) \left( \text{tr} \left[ \left| C^* \right|^2 \right] \right) - |\text{tr} \left[ (A + B) C^* \right]|^2 \\
\leq \left( \text{tr} \left[ \left| A^* \right|^2 \right] \right) \left( \text{tr} \left[ \left| C^* \right|^2 \right] \right) - |\text{tr} \left( PAC^* \right)|^2 \\
+ \left( \text{tr} \left[ \left| B^* \right|^2 \right] \right) \left( \text{tr} \left[ \left| C^* \right|^2 \right] \right) - |\text{tr} \left( PBC^* \right)|^2
\]

for any \( A, B, C \in \mathcal{B}_2(H) \).

Remark 2. If we take \( B = \lambda C \) in \((2.10)\), then we get

\[
(2.11) \quad 0 \leq \text{tr} \left[ \left| (A + \lambda C)^* \right|^2 \right] \text{tr} \left[ \left| C^* \right|^2 \right] - |\text{tr} \left[ (A + \lambda C) C^* \right]|^2 \\
\leq \text{tr} \left[ \left| A^* \right|^2 \right] \text{tr} \left[ \left| C^* \right|^2 \right] - |\text{tr} \left( C^* PA \right)|^2
\]

for any \( \lambda \in \mathbb{C} \) and \( A, C \in \mathcal{B}_2(H) \).

Therefore, we have the bound

\[
\sup_{\lambda \in \mathbb{C}} \left\{ \text{tr} \left[ \left| (A + \lambda C)^* \right|^2 \right] \text{tr} \left[ \left| C^* \right|^2 \right] - |\text{tr} \left[ (A + \lambda C) C^* \right]|^2 \right\} = \text{tr} \left[ \left| A^* \right|^2 \right] \text{tr} \left[ \left| C^* \right|^2 \right] - |\text{tr} \left( PAC^* \right)|^2.
\]

We also have the inequalities

\[
(2.13) \quad 0 \leq \text{tr} \left[ \left| (A \pm C)^* \right|^2 \right] \text{tr} \left[ \left| C^* \right|^2 \right] - |\text{tr} \left[ (A \pm C) C^* \right]|^2 \\
\leq \text{tr} \left[ \left| A^* \right|^2 \right] \text{tr} \left[ \left| C^* \right|^2 \right] - |\text{tr} \left( PAC^* \right)|^2
\]

for any \( A, C \in \mathcal{B}_2(H) \).

Remark 3. We observe that, by replacing \( A^* \) with \( A, B^* \) with \( B \) etc...above, we can get the dual inequalities, like, for instance

\[
(2.14) \quad |\text{tr} \left( PA^* C \right) \text{tr} \left( PC^* B \right)| \\
\leq \frac{1}{2} \left[ \text{tr} \left[ \left| A \right|^2 \right] \right]^{1/2} \left[ \text{tr} \left[ \left| B \right|^2 \right] \right]^{1/2} + |\text{tr} \left( PA^* B \right)| \text{tr} \left[ \left| C \right|^2 \right],
\]

that holds for any \( A, B, C \in \mathcal{B}_2(H) \).

Since

\[
|\text{tr} \left( PA^* C \right)| = |\overline{\text{tr} \left( PA^* C \right)}| = |\text{tr} \left( \left( PA^* C \right)^* \right)| = |\text{tr} \left( C^* AP \right)| = |\text{tr} \left( PC^* A \right)|,
\]

\[
|\text{tr} \left( PC^* B \right)| = |\text{tr} \left( PB^* C \right)|
\]
and

$$|\text{tr} (PA^*B)| = |\text{tr} (PB^*A)|$$

then the inequality (2.14) can be also written as

$$(2.15) \quad |\text{tr} (PC^*A) \text{tr} (PB^*C)|$$

$$\leq \frac{1}{2} \left[ \left| \text{tr} \left( P |A|^2 \right) \right|^{1/2} \left[ \left| \text{tr} \left( P |B|^2 \right) \right|^{1/2} + \left| \text{tr} (PB^*A) \right| \right] \text{tr} (P |C|^2) \right],$$

that holds for any $A, B, C \in B_2 (H)$.

If we take in (2.15) $B = A^*$ then we get the following inequality

$$(2.16) \quad |\text{tr} (PC^*A) \text{tr} (PAC)|$$

$$\leq \frac{1}{2} \left[ \left| \text{tr} \left( P |A|^2 \right) \right|^{1/2} \left[ \left| \text{tr} \left( P |A^*|^2 \right) \right|^{1/2} + \left| \text{tr} (PA^2) \right| \right] \text{tr} (P |C|^2) \right],$$

for any $A, B, C \in B_2 (H)$.

If $A$ is a normal operator, i.e. $|A|^2 = |A^*|^2$ then we have from (2.10) that

$$(2.17) \quad |\text{tr} (PC^*A) \text{tr} (PAC)| \leq \frac{1}{2} \left[ \left| \text{tr} \left( P |A|^2 \right) + \left| \text{tr} (PA^2) \right| \right] \text{tr} (P |C|^2) \right],$$

In particular, if $C$ is selfadjoint and $C \in B_2 (H)$, then

$$(2.18) \quad |\text{tr} (PAC)|^2 \leq \frac{1}{2} \left[ \left| \text{tr} \left( P |A|^2 \right) + \left| \text{tr} (PA^2) \right| \right] \text{tr} (PC^2) \right],$$

for any $A \in B_2 (H)$ a normal operator.

We notice that (2.18) is a trace operator version of de Bruijn inequality obtained in 1960 in [1], which gives the following refinement of the Cauchy-Bunyakovsky-Schwarz inequality:

$$\left(2.19\right) \quad \left| \sum_{i=1}^{n} a_i z_i \right|^2 \leq \frac{1}{2} \sum_{i=1}^{n} a_i^2 \left[ \sum_{i=1}^{n} |z_i|^2 + \sum_{i=1}^{n} |z_i| \right],$$

provided that $a_i$ are real numbers while $z_i$ are complex for each $i \in \{1, ..., n\}$.

We notice that, if $P \in B_1 (H), P \geq 0$ and $A, B \in B (H)$, then

$$\langle A, B \rangle_{2, P} := \text{tr} (PAB^*) = \text{tr} (AB^*P) = \text{tr} (B^*PA)$$

is a nonnegative Hermitian form on $B (H)$ and all the inequalities above will hold for $A, B, C \in B (H)$. The details are left to the reader.

3. SOME FUNCTIONAL PROPERTIES

We consider now the convex cone $B_+ (H)$ of nonnegative operators on the complex Hilbert space $H$ and, for $A, B \in B_2 (H)$ define the functional $\sigma_{A,B} : B_+ (H) \to [0, \infty)$ by

$$(3.1) \quad \sigma_{A,B} (P) := \left[ \text{tr} \left( P |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( P |B|^2 \right) \right]^{1/2} - |\text{tr} (PA^*B)| (\geq 0).$$

The following theorem collects some fundamental properties of this functional.

**Theorem 5.** Let $A, B \in B_2 (H)$.

(i) For any $P, Q \in B_+ (H)$ we have

$$(3.2) \quad \sigma_{A,B} (P + Q) \geq \sigma_{A,B} (P) + \sigma_{A,B} (Q) (\geq 0),$$

namely, $\sigma_{A,B}$ is a superadditive functional on $B_+ (H)$;
(ii) For any $P, Q \in \mathcal{B}_+ (H)$ with $P \geq Q$ we have
\[
(3.3) \quad \sigma_{A,B} (P) \geq \sigma_{A,B} (Q) (\geq 0),
\]
and the triangle inequality for the modulus, we have
\[
\sigma_{A,B} (P) \geq \sigma_{A,B} (Q) (\geq 0),
\]
\[\text{namely, } \sigma_{A,B} \text{ is a monotonic nondecreasing functional on } \mathcal{B}_+ (H);\]
(iii) If $P, Q \in \mathcal{B}_+ (H)$ and there exist the constants $M > m > 0$ such that $MQ \geq P \geq mQ$ then
\[
(3.4) \quad M \sigma_{A,B} (Q) \geq \sigma_{A,B} (P) \geq m \sigma_{A,B} (Q) (\geq 0).
\]
Proof. (i) Let $P, Q \in \mathcal{B}_+ (H)$. On utilizing the elementary inequality
\[
(a^2 + b^2) (c^2 + d^2) \geq ac + bd, \quad a, b, c, d \geq 0
\]
and the triangle inequality for the modulus, we have
\[
\sigma_{A,B} (P + Q)
\]
\[= \left[ \text{tr} \left( (P + Q) |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( (P + Q) |B|^2 \right) \right]^{1/2} - |\text{tr} ((P + Q) A^*B)|
\]
\[= \left[ \text{tr} \left( P |A|^2 + Q |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( P |B|^2 + Q |B|^2 \right) \right]^{1/2}
\]
\[- |\text{tr} (PA^*B + QA^*B)|
\]
\[\geq \left[ \text{tr} \left( P |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( P |B|^2 \right) \right]^{1/2} + \left[ \text{tr} \left( Q |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( Q |B|^2 \right) \right]^{1/2}
\]
\[- |\text{tr} (PA^*B) - |\text{tr} (QA^*B)|
\]
\[= \sigma_{A,B} (P) + \sigma_{A,B} (Q)
\]
and the inequality (3.3) is proved.
(ii) Let $P, Q \in \mathcal{B}_+ (H)$ with $P \geq Q$. Utilising the superadditivity property we have
\[
\sigma_{A,B} (P) = \sigma_{A,B} ((P - Q) + Q) \geq \sigma_{A,B} (P - Q) + \sigma_{A,B} (Q)
\]
\[\geq \sigma_{A,B} (Q)
\]
and the inequality (3.3) is obtained.
(iii) From the monotonicity property we have
\[
\sigma_{A,B} (P) \geq \sigma_{A,B} (mQ) = m \sigma_{A,B} (Q)
\]
and a similar inequality for $M$, which prove the desired result (3.4). \hfill \Box

Corollary 1. Let $A, B \in \mathcal{B}_2 (H)$ and $P \in \mathcal{B} (H)$ such that there exist the constants $M > m > 0$ with $M1_H \geq P \geq m1_H$. Then we have
\[
(3.5) \quad M \left[ \text{tr} \left( |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |B|^2 \right) \right]^{1/2} - |\text{tr} (A^*B)|
\]
\[\geq \left[ \text{tr} \left( P |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( P |B|^2 \right) \right]^{1/2} - |\text{tr} (PA^*B)|
\]
\[\geq m \left[ \text{tr} \left( |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |B|^2 \right) \right]^{1/2} - |\text{tr} (A^*B)|.\]
Let $P = |V|^2$ with $V \in \mathcal{B}(H)$. If $A, B \in \mathcal{B}_2(H)$ then

$$
\sigma_{A,B}(|V|^2) = \left[ \text{tr} \left( |V|^2 |A|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |V|^2 |B|^2 \right) \right]^{1/2} - \left| \text{tr} \left( |V|^2 A^*B \right) \right|
$$

$$= \left[ \text{tr} \left( V^*VA^*A \right) \right]^{1/2} \left[ \text{tr} \left( V^*VB^*B \right) \right]^{1/2} - \left| \text{tr} \left( V^*VA^*B \right) \right|
$$

$$= \left[ \text{tr} \left( VA^*AV^* \right) \right]^{1/2} \left[ \text{tr} \left( VB^*BV^* \right) \right]^{1/2} - \left| \text{tr} \left( VA^*BV^* \right) \right|
$$

$$= \left[ \text{tr} \left( (AV^*)^*AV^* \right) \right]^{1/2} \left[ \text{tr} \left( (BV^*)^*BV^* \right) \right]^{1/2} - \left| \text{tr} \left( (AV^*)^*BV^* \right) \right|
$$

$$= \left[ \text{tr} \left( |AV^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |BV^*|^2 \right) \right]^{1/2} - \left| \text{tr} \left( (AV^*)^*BV^* \right) \right|.\]

On utilizing the property for $P = |V|^2, Q = |U|^2$ with $V, U \in \mathcal{B}(H)$, then we have for any $A, B \in \mathcal{B}_2(H)$ the following trace inequality

\begin{equation}
\left[ \text{tr} \left( |AV^*|^2 + |AU^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |BV^*|^2 + |BU^*|^2 \right) \right]^{1/2} - \left| \text{tr} \left( (AV^*)^*BV^* \right) \right|
\end{equation}

\begin{equation}
\geq \left[ \text{tr} \left( |AV^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |BV^*|^2 \right) \right]^{1/2} - \left| \text{tr} \left( (AV^*)^*BV^* \right) \right|
\end{equation}

\begin{equation}
+ \left[ \text{tr} \left( |AU^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |BU^*|^2 \right) \right]^{1/2} - \left| \text{tr} \left( (AU^*)^*BU^* \right) \right| \left( \geq 0 \right).
\end{equation}

Also, if $|V|^2 \geq |U|^2$ with $V, U \in \mathcal{B}(H)$, then we have for any $A, B \in \mathcal{B}_2(H)$ that

\begin{equation}
\left[ \text{tr} \left( |AV^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |BV^*|^2 \right) \right]^{1/2} - \left| \text{tr} \left( (AV^*)^*BV^* \right) \right|
\end{equation}

\begin{equation}
\geq \left[ \text{tr} \left( |AU^*|^2 \right) \right]^{1/2} \left[ \text{tr} \left( |BU^*|^2 \right) \right]^{1/2} - \left| \text{tr} \left( (AU^*)^*BU^* \right) \right| \left( \geq 0 \right).
\end{equation}

If $U \in \mathcal{B}(H)$ is invertible, then

$$\frac{1}{\|U^{-1}\|} \|x\| \leq \|Ux\| \leq \|U\| \|x\| \text{ for any } x \in H,$$

which implies that

$$\frac{1}{\|U^{-1}\|^2} \|x\| \leq \|U\|^2 \|x\| \leq \|U\|^2 \|x\| \text{ for any } x \in H.$$
4. Inequalities for Sequences of Operators

For \( n \geq 2 \), define the Cartesian products \( \mathcal{B}^{(n)}(H) := \mathcal{B}(H) \times \cdots \times \mathcal{B}(H) \), \( \mathcal{B}_2^{(n)}(H) := \mathcal{B}_2(H) \times \cdots \times \mathcal{B}_2(H) \) and \( \mathcal{B}_+^{(n)}(H) := \mathcal{B}_+(H) \times \cdots \times \mathcal{B}_+(H) \) where \( \mathcal{B}_+(H) \) denotes the convex cone of nonnegative selfadjoint operators on \( H \), i.e. \( P \in \mathcal{B}_+(H) \) if \( \langle Px, x \rangle \geq 0 \) for any \( x \in H \).

**Proposition 2.** Let \( P = (P_1, \ldots, P_n) \in \mathcal{B}_+^{(n)}(H) \) and \( A = (A_1, \ldots, A_n), B = (B_1, \ldots, B_n) \in \mathcal{B}_2^{(n)}(H) \) and \( z = (z_1, \ldots, z_n) \in \mathbb{C}^n \) with \( n \geq 2 \). Then

\[
(4.1) \quad \left| \sum_{k=1}^{n} z_k P_k A_k^* B_k \right|^2 \leq \text{tr} \left( \sum_{k=1}^{n} |z_k| P_k |A_k|^2 \right) \text{tr} \left( \sum_{k=1}^{n} |z_k| P_k |B_k|^2 \right).
\]

**Proof.** Using the properties of modulus and the inequality (2.1) we have

\[
\left| \sum_{k=1}^{n} z_k P_k A_k^* B_k \right| = \sum_{k=1}^{n} |z_k| \text{tr} (P_k A_k^* B_k) \\
\leq \sum_{k=1}^{n} |z_k| \text{tr} (P_k A_k^* B_k) \\
\leq \sum_{k=1}^{n} |z_k| \left[ \text{tr} (P_k |A_k|^2) \right]^{1/2} \left[ \text{tr} (P_k |B_k|^2) \right]^{1/2}.
\]

Utilizing the weighted discrete Cauchy-Bunyakovsky-Schwarz inequality we also have

\[
\sum_{k=1}^{n} |z_k| \left[ \text{tr} (P_k |A_k|^2) \right]^{1/2} \left[ \text{tr} (P_k |B_k|^2) \right]^{1/2} \\
\leq \left( \sum_{k=1}^{n} |z_k| \left( \text{tr} (P_k |A_k|^2) \right)^{1/2} \right)^2 \left( \sum_{k=1}^{n} |z_k| \left( \text{tr} (P_k |B_k|^2) \right)^{1/2} \right)^2 \\
= \left( \sum_{k=1}^{n} |z_k| \text{tr} (P_k |A_k|^2) \right)^{1/2} \left( \sum_{k=1}^{n} |z_k| \text{tr} (P_k |B_k|^2) \right)^{1/2} \\
= \left( \text{tr} \left( \sum_{k=1}^{n} |z_k| P_k |A_k|^2 \right) \right)^{1/2} \left( \text{tr} \left( \sum_{k=1}^{n} |z_k| P_k |B_k|^2 \right) \right)^{1/2},
\]

which is equivalent to the desired result (4.1). \( \square \)

We consider the functional for \( n \)-tuples of nonnegative operators as follows:

\[
(4.2) \quad \sigma_{A,B}(P) := \left[ \text{tr} \left( \sum_{k=1}^{n} P_k |A_k|^2 \right) \right]^{1/2} \left[ \text{tr} \left( \sum_{k=1}^{n} P_k |B_k|^2 \right) \right]^{1/2} \\
- \left| \text{tr} \left( \sum_{k=1}^{n} P_k A_k^* B_k \right) \right|.
\]

Utilising a similar argument to the one in Theorem 5 we can state:

**Proposition 3.** Let \( A = (A_1, \ldots, A_n), B = (B_1, \ldots, B_n) \in \mathcal{B}_2^{(n)}(H) \).
(i) For any \( P, Q \in \mathcal{B}_+^{(n)}(H) \) we have
\[
\sigma_{A,B}(P + Q) \geq \sigma_{A,B}(P) + \sigma_{A,B}(Q) \geq 0,
\]
namely, \( \sigma_{A,B} \) is a superadditive functional on \( \mathcal{B}_+^{(n)}(H) \):

(ii) For any \( P, Q \in \mathcal{B}_+^{(n)}(H) \) with \( P \geq Q \), namely \( P_k \geq Q_k \) for all \( k \in \{1, ..., n\} \) we have
\[
\sigma_{A,B}(P) \geq \sigma_{A,B}(Q) \geq 0,
\]
namely, \( \sigma_{A,B} \) is a monotonic nondecreasing functional on \( \mathcal{B}_+^{(n)}(H) \):

(iii) If \( P, Q \in \mathcal{B}_+^{(n)}(H) \) and there exist the constants \( M > m > 0 \) such that \( MQ \geq P \geq mQ \) then
\[
M \sigma_{A,B}(Q) \geq \sigma_{A,B}(P) \geq m \sigma_{A,B}(Q) \geq 0.
\]

If \( P = (p_11_H, ..., p_n1_H) \) with \( p_k \geq 0 \), \( k \in \{1, ..., n\} \) then the functional of non-negative weights \( p = (p_1, ..., p_n) \) defined by
\[
\sigma_{A,B}(P) := \left[ \text{tr} \left( \sum_{k=1}^{n} p_k |A_k|^2 \right) \right]^{1/2} \left[ \text{tr} \left( \sum_{k=1}^{n} p_k |B_k|^2 \right) \right]^{1/2}
- \text{tr} \left( \sum_{k=1}^{n} p_k A_k^* B_k \right)
\]
has the same properties as in (4.3)-(4.5).

Moreover, we have the simple bounds:
\[
\max_{k \in \{1, ..., n\}} \{ p_k \} \left\{ \left[ \text{tr} \left( \sum_{k=1}^{n} |A_k|^2 \right) \right]^{1/2} \left[ \text{tr} \left( \sum_{k=1}^{n} |B_k|^2 \right) \right]^{1/2}
- \text{tr} \left( \sum_{k=1}^{n} A_k^* B_k \right) \right\}^{1/2}
\geq \left[ \text{tr} \left( \sum_{k=1}^{n} p_k |A_k|^2 \right) \right]^{1/2} \left[ \text{tr} \left( \sum_{k=1}^{n} p_k |B_k|^2 \right) \right]^{1/2}
- \text{tr} \left( \sum_{k=1}^{n} p_k A_k^* B_k \right)
\geq \min_{k \in \{1, ..., n\}} \{ p_k \} \left\{ \left[ \text{tr} \left( \sum_{k=1}^{n} |A_k|^2 \right) \right]^{1/2} \left[ \text{tr} \left( \sum_{k=1}^{n} |B_k|^2 \right) \right]^{1/2}
- \text{tr} \left( \sum_{k=1}^{n} A_k^* B_k \right) \right\}.
\]

5. Inequalities for Power Series of Operators

Denote by:
\[
D(0, R) = \begin{cases}
\{ z \in \mathbb{C} : |z| < R \}, & \text{if } R < \infty \\
\mathbb{C}, & \text{if } R = \infty,
\end{cases}
\]
and consider the functions:
\[
\lambda \mapsto f(\lambda) : D(0, R) \to \mathbb{C}, \quad f(\lambda) := \sum_{n=0}^{\infty} \alpha_n \lambda^n
\]
and

\[ \lambda \mapsto f_a(\lambda) : D(0, R) \to \mathbb{C}, \quad f_a(\lambda) := \sum_{n=0}^{\infty} |\alpha_n| \lambda^n. \]

As some natural examples that are useful for applications, we can point out that, if

(5.1)

\[ f(\lambda) = \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \lambda^n = \ln \frac{1}{1 + \lambda}, \quad \lambda \in D(0, 1); \]

\[ g(\lambda) = \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n)!} \lambda^{2n} = \cos \lambda, \quad \lambda \in \mathbb{C}; \]

\[ h(\lambda) = \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)!} \lambda^{2n+1} = \sin \lambda, \quad \lambda \in \mathbb{C}; \]

\[ l(\lambda) = \sum_{n=0}^{\infty} (-1)^n \frac{\lambda^n}{1^2} = \frac{1}{1 + \lambda}, \quad \lambda \in D(0, 1); \]

then the corresponding functions constructed by the use of the absolute values of the coefficients are

(5.2)

\[ f_a(\lambda) = \sum_{n=1}^{\infty} \frac{1}{n} \lambda^n = \ln \frac{1}{1 - \lambda}, \quad \lambda \in D(0, 1); \]

\[ g_a(\lambda) = \sum_{n=0}^{\infty} \frac{1}{(2n)!} \lambda^{2n} = \cosh \lambda, \quad \lambda \in \mathbb{C}; \]

\[ h_a(\lambda) = \sum_{n=0}^{\infty} \frac{1}{(2n+1)!} \lambda^{2n+1} = \sinh \lambda, \quad \lambda \in \mathbb{C}; \]

\[ l_a(\lambda) = \sum_{n=0}^{\infty} \lambda^n = \frac{1}{1 - \lambda}, \quad \lambda \in D(0, 1). \]

Other important examples of functions as power series representations with non-negative coefficients are:

(5.3)

\[ \exp(\lambda) = \sum_{n=0}^{\infty} \frac{1}{n!} \lambda^n, \quad \lambda \in \mathbb{C}, \]

\[ \frac{1}{2} \ln \left( \frac{1 + \lambda}{1 - \lambda} \right) = \sum_{n=1}^{\infty} \frac{1}{2n-1} \lambda^{2n-1}, \quad \lambda \in D(0, 1); \]

\[ \sin^{-1}(\lambda) = \sum_{n=0}^{\infty} \frac{\Gamma(n + \frac{1}{2})}{\sqrt{\pi} (2n + 1) n!} \lambda^{2n+1}, \quad \lambda \in D(0, 1); \]

\[ \tanh^{-1}(\lambda) = \sum_{n=1}^{\infty} \frac{1}{2n-1} \lambda^{2n-1}, \quad \lambda \in D(0, 1); \]

\[ _2F_1(\alpha, \beta, \gamma, \lambda) = \sum_{n=0}^{\infty} \frac{\Gamma(n + \alpha) \Gamma(n + \beta) \Gamma(\gamma)}{n! \Gamma(\alpha) \Gamma(\beta) \Gamma(n + \gamma)} \lambda^n, \quad \alpha, \beta, \gamma > 0, \lambda \in D(0, 1); \]

where \( \Gamma \) is Gamma function.
Proposition 4. Let \( f(\lambda) := \sum_{n=0}^{\infty} \alpha_n \lambda^n \) be a power series with complex coefficients and convergent on the open disk \( D(0, R), \ R > 0 \). If \( (H, \langle \cdot, \cdot \rangle) \) is a separable infinite-dimensional Hilbert space and \( A, B \in \mathcal{B}_1(H) \) are positive operators with \( \text{tr} (A), \text{tr} (B) < R^{1/2}, \) then

\[
(5.4) \quad \left| \text{tr} (f(AB)) \right|^2 \leq f_2^2 (\text{tr} A \text{tr} B) \leq f_{\alpha} ((\text{tr} A)^2) f_{\alpha} ((\text{tr} B)^2).
\]

Proof. By the inequality (1.12) for the positive operators \( A, B \in \mathcal{B}_1(H) \) we have

\[
(5.5) \quad \left| \text{tr} \left( \sum_{k=0}^{n} \alpha_k (AB)^k \right) \right| = \left| \sum_{k=0}^{n} \alpha_k \text{tr} [(AB)^k] \right|
\]

\[
\leq \sum_{k=0}^{n} |\alpha_k| \left| \text{tr} [(AB)^k] \right| = \sum_{k=0}^{n} |\alpha_k| \text{tr} [(AB)^k]
\]

\[
\leq \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} A \right)^k \left( \text{tr} B \right)^k = \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} A \text{tr} B \right)^k.
\]

Utilising the weighted Cauchy-Bunyakovsky-Schwarz inequality for sums we have

\[
(5.6) \quad \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} A \right)^k \left( \text{tr} B \right)^k \leq \left( \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} A \right)^{2k} \right)^{1/2} \left( \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} B \right)^{2k} \right)^{1/2}.
\]

Then by (5.5) and (5.6) we have

\[
(5.7) \quad \left| \text{tr} \left( \sum_{k=0}^{n} \alpha_k (AB)^k \right) \right|^2 \leq \left| \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} A \text{tr} B \right)^k \right|^2 \leq \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} A \right)^k \sum_{k=0}^{n} |\alpha_k| \left( \text{tr} B \right)^k.
\]

for \( n \geq 1. \)

Since \( 0 \leq \text{tr} (A), \text{tr} (B) < R^{1/2}, \) the numerical series

\[
\sum_{k=0}^{\infty} |\alpha_k| \left( \text{tr} A \text{tr} B \right)^k, \sum_{k=0}^{\infty} |\alpha_k| \left( \text{tr} A \right)^k \text{ and } \sum_{k=0}^{\infty} |\alpha_k| \left( \text{tr} B \right)^k
\]

are convergent.

Also, since \( 0 \leq \text{tr}(AB) \leq \text{tr} (A) \text{tr} (B) < R, \) the operator series \( \sum_{k=0}^{\infty} \alpha_k(AB)^k \) is convergent in \( \mathcal{B}_1(H). \)

Letting \( n \to \infty \) in (5.4) and utilizing the continuity property of \( \text{tr} (\cdot) \) on \( \mathcal{B}_1(H) \) we get the desired result (5.4). \( \square \)

Example 1. a) If we take in (5.4) \( f(\lambda) = (1 \pm \lambda)^{-1}, \ |\lambda| < 1 \) then we get the inequality

\[
(5.8) \quad \left| \text{tr} \left( (1_H \pm AB)^{-1} \right) \right|^2 \leq \left( 1 - (\text{tr} A)^2 \right)^{-1} \left( 1 - (\text{tr} B)^2 \right)^{-1}
\]

for any \( A, B \in \mathcal{B}_1(H) \) positive operators with \( \text{tr} (A), \text{tr} (B) < 1. \)

b) If we take in (5.4) \( f(\lambda) = \ln (1 \pm \lambda)^{-1}, \ |\lambda| < 1, \) then we get the inequality

\[
(5.9) \quad \left| \text{tr} \left( \ln (1_H \pm AB)^{-1} \right) \right|^2 \leq \ln \left( 1 - (\text{tr} A)^2 \right)^{-1} \ln \left( 1 - (\text{tr} B)^2 \right)^{-1}
\]

for any \( A, B \in \mathcal{B}_1(H) \) positive operators with \( \text{tr} (A), \text{tr} (B) < 1. \)
We have the following result as well:

**Theorem 6.** Let \( f(\lambda) := \sum_{n=0}^{\infty} \alpha_n \lambda^n \) be a power series with complex coefficients and convergent on the open disk \( D(0, R) \), \( R > 0 \). If \( A, B \in \mathcal{B}_2(H) \) are normal operators with \( A^*B = BA^* \) and \( \text{tr} \left( |A|^2 \right) \), \( \text{tr} \left( |B|^2 \right) < R \) then we have the inequality

\[
|\text{tr} (f(A^*B))|^2 \leq \text{tr} \left( f_\alpha \left( |A|^2 \right) \right) \text{tr} \left( f_\alpha \left( |B|^2 \right) \right).
\]

**Proof.** From the inequality (4.1) we have

\[
|\text{tr} \left( \sum_{k=0}^{n} \alpha_k (A^*)^k B^k \right) |^2 \leq \text{tr} \left( \sum_{k=0}^{n} |\alpha_k| |A|^k \right) \text{tr} \left( \sum_{k=0}^{n} |\alpha_k| |B|^k \right).
\]

Since \( A, B \) are normal operators, then we have \( |A|^k = |A|^{2k} \) and \( |B|^k = |B|^{2k} \) for any \( k \geq 0 \). Also, since \( A^*B = BA^* \) then we also have \( (A^*)^k B^k = (A^*B)^k \) for any \( k \geq 0 \).

Due to the fact that \( A, B \in \mathcal{B}_2(H) \) and \( \text{tr} \left( |A|^2 \right) , \text{tr} \left( |B|^2 \right) < R \), it follows that \( \text{tr} (A^*B) \leq R \) and the operator series

\[
\sum_{k=0}^{\infty} \alpha_k (A^*B)^k , \sum_{k=0}^{\infty} |\alpha_k| |A|^{2k} \text{ and } \sum_{k=0}^{\infty} |\alpha_k| |B|^{2k}
\]

are convergent in the Banach space \( \mathcal{B}_1(H) \).

Taking the limit over \( n \to \infty \) in (5.11) and using the continuity of the \( \text{tr} (\cdot) \) on \( \mathcal{B}_1(H) \) we deduce the desired result (5.10).

**Example 2.**  

a) If we take in (5.10) \( f(\lambda) = (1 \pm \lambda)^{-1} \), \( |\lambda| < 1 \) then we get the inequality

\[
|\text{tr} \left( (1_H \pm A^*B)^{-1} \right) |^2 \leq \text{tr} \left( (1 - |A|^2)^{-1} \right) \text{tr} \left( (1 - |B|^2)^{-1} \right)
\]

for any \( A, B \in \mathcal{B}_2(H) \) normal operators with \( A^*B = BA^* \) and \( \text{tr} \left( |A|^2 \right) , \text{tr} \left( |B|^2 \right) < 1 \).

b) If we take in (5.10) \( f(\lambda) = \exp(\lambda) \), \( \lambda \in \mathbb{C} \) then we get the inequality

\[
|\text{tr} (\exp(A^*B))^2 | \leq \text{tr} \left( \exp \left( |A|^2 \right) \right) \text{tr} \left( \exp \left( |B|^2 \right) \right)
\]

for any \( A, B \in \mathcal{B}_2(H) \) normal operators with \( A^*B = BA^* \).

**Theorem 7.** Let \( f(z) := \sum_{j=0}^{\infty} p_j z^j \) and \( g(z) := \sum_{j=0}^{\infty} q_j z^j \) be two power series with nonnegative coefficients and convergent on the open disk \( D(0, R) \), \( R > 0 \). If \( T \) and \( V \) are two normal and commuting operators from \( \mathcal{B}_2(H) \) with \( \text{tr} \left( |T|^2 \right) , \text{tr} \left( |V|^2 \right) < R \), then

\[
\left[ \text{tr} \left( f \left( |T|^2 \right) + g \left( |T|^2 \right) \right) \right]^{1/2} \left[ \text{tr} \left( f \left( |V|^2 \right) + g \left( |V|^2 \right) \right) \right]^{1/2}
\]

\[
- \left[ \text{tr} \left( f \left( T^*V \right) + g \left( T^*V \right) \right) \right]
\]

\[
\geq \left[ \text{tr} \left( f \left( |T|^2 \right) \right) \right]^{1/2} \left[ \text{tr} \left( f \left( |V|^2 \right) \right) \right]^{1/2} - \left[ \text{tr} \left( f \left( T^*V \right) \right) \right]
\]

\[
+ \left[ \text{tr} \left( g \left( |T|^2 \right) \right) \right]^{1/2} \left[ \text{tr} \left( g \left( |V|^2 \right) \right) \right]^{1/2} - \left[ \text{tr} \left( g \left( T^*V \right) \right) \right] \left( \geq 0 \right).
\]
Moreover, if \( p_j \geq q_j \) for any \( j \in \mathbb{N} \), then, with the above assumptions on \( T \) and \( V \), we have

\[
(5.15) \quad \left[ \begin{array}{c}
\left( \sum_{k=0}^{n} (p_k + q_k) |T|^{2k} \right)^{1/2} \left( \sum_{k=0}^{n} (p_k + q_k) |V|^{2k} \right)^{1/2} \\
- \left| \left( \sum_{k=0}^{n} (p_k + q_k) (T^*V)^{2k} \right) \right|
\end{array} \right] \geq \left[ \begin{array}{c}
\left( \sum_{k=0}^{n} p_k |T|^{2k} \right)^{1/2} \left( \sum_{k=0}^{n} p_k |V|^{2k} \right)^{1/2} \\
- \left| \left( \sum_{k=0}^{n} p_k (T^*V)^{2k} \right) \right|
\end{array} \right] + \left[ \begin{array}{c}
\left( \sum_{k=0}^{n} q_k |T|^{2k} \right)^{1/2} \left( \sum_{k=0}^{n} q_k |V|^{2k} \right)^{1/2} \\
- \left| \left( \sum_{k=0}^{n} q_k (T^*V)^{2k} \right) \right|
\end{array} \right]
\]

for any \( n \geq 1 \).

Since all the series whose partial sums are involved in (5.16) are convergent in \( B_1 (H) \), by letting \( n \to \infty \) in (5.16) we get (5.14).

The inequality (5.15) follows by the monotonicity property of \( \sigma_{A,B} (\cdot) \) and the details are omitted. \( \square \)

**Example 3.** Now, observe that if we take

\[
f (\lambda) = \sinh \lambda = \sum_{n=0}^{\infty} \frac{1}{(2n+1)!} \lambda^{2n+1}
\]

and

\[
g (\lambda) = \cosh \lambda = \sum_{n=0}^{\infty} \frac{1}{(2n)!} \lambda^{2n}
\]

then

\[
f (\lambda) + g (\lambda) = \exp \lambda = \sum_{n=0}^{\infty} \frac{1}{n!} \lambda^{n}
\]

for any \( \lambda \in \mathbb{C} \).

If \( T \) and \( V \) are two normal and commuting operators from \( B_2 (H) \), then by (2.11) we have

\[
(5.17) \quad \left[ \begin{array}{c}
\left( \sum \left( \exp \left( |T|^{2} \right) \right)^{1/2} \left( \sum \left( \exp \left( |V|^{2} \right) \right)^{1/2} - |\operatorname{tr} (\exp (T^*V))| \\
- \left| \left( \sum \left( \exp \left( |T|^{2} \right) \right)^{1/2} \left( \sum \left( \exp \left( |V|^{2} \right) \right)^{1/2} - |\operatorname{tr} (\exp (T^*V))| \right) \right| \\
+ \left( \sum \left( \cosh \left( |T|^{2} \right) \right)^{1/2} \left( \sum \left( \cosh \left( |V|^{2} \right) \right)^{1/2} - |\operatorname{tr} (\cosh (T^*V))| \right) \right)
\end{array} \right] \geq \left( \sum \left( \sinh \left( |T|^{2} \right) \right)^{1/2} \left( \sum \left( \sinh \left( |V|^{2} \right) \right)^{1/2} - |\operatorname{tr} (\sinh (T^*V))| \right) \right)
\]

for any \( \lambda \in \mathbb{C} \).
Now, consider the series \( \frac{1}{\lambda} = \sum_{n=0}^{\infty} \lambda^n \), \( \lambda \in D(0, 1) \) and define \( p_n = 1, n \geq 0, q_n = 0, n > 1 \), then we observe that for any \( n \geq 0 \) we have \( p_n \geq q_n \).

If \( T \) and \( V \) are two normal and commuting operators from \( B_2(H) \) with \( \text{tr} \left( |T|^2 \right) \), \( \text{tr} \left( |V|^2 \right) < 1 \), then by (2.12) we have

\[
\left[ \text{tr} \left( (1_H - |T|^2)^{-1} \right) \right]^{1/2} \left[ \text{tr} \left( (1_H - |V|^2)^{-1} \right) \right]^{1/2} - \left| \text{tr} \left( (1_H - T^*V)^{-1} \right) \right| \geq \left[ \text{tr} \left( (1_H - T^*V)^{-1} \right) \right] \geq 0.
\]

6. Inequalities for Matrices

We have the following result for matrices.

**Proposition 5.** Let \( f(\lambda) := \sum_{n=0}^{\infty} \alpha_n \lambda^n \) be a power series with complex coefficients and convergent on the open disk \( D(0, R) \), \( R > 0 \). If \( A \) and \( B \) are positive semidefinite matrices in \( M_n(\mathbb{C}) \) with \( \text{tr} \left( A^2 \right), \text{tr} \left( B^2 \right) < R \), then we have the inequality

\[
|\text{tr} \left[ f(AB) \right]|^2 \leq \text{tr} \left[ f_a \left( A^2 \right) \right] \text{tr} \left[ f_a \left( B^2 \right) \right].
\]

If \( \text{tr} \left( A \right), \text{tr} \left( B \right) < \sqrt{R} \), then also

\[
|\text{tr} \left[ f(AB) \right]| \leq \min \left\{ \text{tr} \left( f_a \left( \| A \| B \right) \right), \text{tr} \left( f_a \left( \| B \| A \right) \right) \right\}.
\]

**Proof.** We observe that (1.13) holds for \( m = 0 \) with equality.

By utilizing the generalized triangle inequality for the modulus and the inequality (1.13) we have

\[
|\text{tr} \left[ \sum_{n=0}^{m} \alpha_n (AB)^n \right]| \leq \sum_{n=0}^{m} |\alpha_n| \left| \text{tr} \left[ (AB)^n \right] \right| \leq \sum_{n=0}^{m} |\alpha_n| \left[ \text{tr} \left( (AB)^n \right) \right],
\]

for any \( m \geq 1 \).
Applying the weighted Cauchy-Bunyakowsky-Schwarz discrete inequality we also have

\[
(6.4) \quad \sum_{n=0}^{m} |\alpha_n| \left[ \text{tr} (A^{2n}) \right]^{1/2} \left[ \text{tr} (B^{2n}) \right]^{1/2} \\
\leq \left( \sum_{n=0}^{m} |\alpha_n| \left[ \left[ \text{tr} (A^{2n}) \right]^{1/2} \right]^{2} \right)^{1/2} \left( \sum_{n=0}^{m} |\alpha_n| \left[ \left[ \text{tr} (B^{2n}) \right]^{1/2} \right]^{2} \right)^{1/2} \\
= \left( \sum_{n=0}^{m} |\alpha_n| \left[ \text{tr} (A^{2n}) \right] \right)^{1/2} \left( \sum_{n=0}^{m} |\alpha_n| \left[ \text{tr} (B^{2n}) \right] \right)^{1/2} \\
= \left[ \text{tr} \left( \sum_{n=0}^{m} |\alpha_n| A^{2n} \right) \right]^{1/2} \left[ \text{tr} \left( \sum_{n=0}^{m} |\alpha_n| B^{2n} \right) \right]^{1/2}
\]

for any \( m \geq 1 \).

Therefore, by (6.3) and (6.4) we get

\[
(6.5) \quad \left[ \text{tr} \left( \sum_{n=0}^{m} |\alpha_n| (AB)^{2n} \right) \right]^{2} \leq \text{tr} \left( \sum_{n=0}^{m} |\alpha_n| A^{2n} \right) \text{tr} \left( \sum_{n=0}^{m} |\alpha_n| B^{2n} \right)
\]

for any \( m \geq 1 \).

Since \( \text{tr} (A^2) \), \( \text{tr} (B^2) < R \), then \( \text{tr} (AB) \leq \sqrt{\text{tr} (A^2) \text{tr} (B^2)} < R \) and the series

\[
\sum_{n=0}^{\infty} |\alpha_n| (AB)^{2n}, \quad \sum_{n=0}^{\infty} |\alpha_n| A^{2n} \text{ and } \sum_{n=0}^{\infty} |\alpha_n| B^{2n}
\]

are convergent in \( M_n (\mathbb{C}) \).

Taking the limit over \( m \to \infty \) in (6.5) and utilizing the continuity property of \( \text{tr} (\cdot) \) on \( M_n (\mathbb{C}) \) we get (6.1).

The inequality (6.2) follows from (1.14) in a similar way and the details are omitted.

\[ \square \]

Example 4. a) If we take \( f(\lambda) = (1 + \lambda)^{-1} \), \( |\lambda| < 1 \) then we get the inequality

\[
(6.6) \quad |\text{tr} \left( \sum_{n=0}^{\min} |\alpha_n| (I_n + AB)^{-2n} \right)|^{2} \leq \text{tr} \left[ \left( I_n - A^{-2} \right) \right] \text{tr} \left[ \left( I_n - B^{-2} \right) \right] \\
\]

for any \( A \) and \( B \) positive semidefinite matrices in \( M_n (\mathbb{C}) \) with \( \text{tr} (A^2), \text{tr} (B^2) < 1 \). Here \( I_n \) is the identity matrix in \( M_n (\mathbb{C}) \).

We also have the inequality

\[
(6.7) \quad |\text{tr} \left( \sum_{n=0}^{\min} |\alpha_n| (I_n + AB)^{-2n} \right)| \leq \min \left\{ \text{tr} \left( (I_n - \|A\| B)^{-1} \right), \text{tr} \left( (I_n - \|B\| A)^{-1} \right) \right\}
\]

for any \( A \) and \( B \) positive semidefinite matrices in \( M_n (\mathbb{C}) \) with \( \text{tr} (A), \text{tr} (B) < 1 \).

b) If we take \( f(\lambda) = \exp \lambda \), then we have the inequalities

\[
(6.8) \quad (\text{tr} \left[ \exp (AB) \right])^{2} \leq \text{tr} \left[ \exp (A^{2}) \right] \text{tr} \left[ \exp (B^{2}) \right]
\]

and

\[
(6.9) \quad \text{tr} \left[ \exp (AB) \right] \leq \min \{ \text{tr} (\exp (\|A\| B)), \text{tr} (\exp (\|B\| A)) \}
\]

for any \( A \) and \( B \) positive semidefinite matrices in \( M_n (\mathbb{C}) \).
Proposition 6. Let \( f(\lambda) := \sum_{n=0}^{\infty} \alpha_n \lambda^n \) be a power series with complex coefficients and convergent on the open disk \( D(0, R), R > 0 \). If \( A \) and \( B \) are matrices in \( M_n(\mathbb{C}) \) with \( \text{tr} (|A|^p), \text{tr} (|B|^q) < R \), where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \), then

\[
(6.10) \quad |\text{tr} (f(|AB^*|))| \leq \text{tr} \left[ f_a \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right) \right] \\
\leq \text{tr} \left[ \frac{1}{p} f_a (|A|^p) + \frac{1}{q} f_a (|B|^q) \right].
\]

Proof. The inequality (6.10) holds with equality for \( r = 0 \).

By utilizing the generalized triangle inequality for the modulus and the inequality (6.15) we have

\[
(6.11) \quad \left| \text{tr} \left( \sum_{n=0}^{m} \alpha_n |AB^*|^n \right) \right| = \left| \sum_{n=0}^{m} \alpha_n \text{tr} (|AB^*|^n) \right| \\
\leq \sum_{n=0}^{m} |\alpha_n| |\text{tr} (|AB^*|^n)| = \sum_{n=0}^{m} |\alpha_n| \text{tr} (|AB^*|^n) \\
\leq \sum_{n=0}^{m} |\alpha_n| \text{tr} \left( \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right)^n \right) \\
= \text{tr} \left[ \sum_{n=0}^{m} |\alpha_n| \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right)^n \right]
\]

for any \( m \geq 1 \) and \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).

It is known that if \( f : [0, \infty) \to \mathbb{R} \) is a convex function, then \( \text{tr} f(\cdot) \) is convex on the cone \( M_n^+ (\mathbb{C}) \) of positive semidefinite matrices in \( M_n (\mathbb{C}) \). Therefore, for \( n \geq 1 \) we have

\[
(6.12) \quad \text{tr} \left[ \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right)^n \right] \leq \frac{1}{p} \text{tr} (|A|^pn) + \frac{1}{q} \text{tr} (|B|^qn)
\]

where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).

The inequality reduces to equality if \( n = 0 \).

Then we have

\[
(6.13) \quad \sum_{n=0}^{m} |\alpha_n| \text{tr} \left[ \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right)^n \right] \leq \sum_{n=0}^{m} |\alpha_n| \left[ \frac{1}{p} \text{tr} (|A|^pn) + \frac{1}{q} \text{tr} (|B|^qn) \right] \\
= \text{tr} \left[ \frac{1}{p} \sum_{n=0}^{m} |\alpha_n| |A|^pn + \frac{1}{q} \sum_{n=0}^{m} |\alpha_n| |B|^qn \right]
\]

for any \( m \geq 1 \) and \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).

From (6.11) and (6.13) we get

\[
(6.14) \quad \left| \text{tr} \left( \sum_{n=0}^{m} \alpha_n |AB^*|^n \right) \right| \leq \text{tr} \left[ \sum_{n=0}^{m} |\alpha_n| \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right)^n \right] \\
\leq \text{tr} \left[ \frac{1}{p} \sum_{n=0}^{m} |\alpha_n| |A|^pn + \frac{1}{q} \sum_{n=0}^{m} |\alpha_n| |B|^qn \right]
\]

for any \( m \geq 1 \) and \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).
Since \( \operatorname{tr}(|A|^p) \), \( \operatorname{tr}(|B|^q) < R \), then all the series whose partial sums are involved in (6.14) are convergent, then by letting \( m \to \infty \) in (6.14) we deduce the desired inequality (6.10). \qed

Example 5. a) If we take \( f(\lambda) = (1 \pm \lambda)^{-1} \), \( |\lambda| < 1 \) then we get the inequalities

\[
(6.15) \quad \left| \operatorname{tr} \left( (I_n \pm |AB^*|)^{-1} \right) \right| \leq \operatorname{tr} \left( \left[ I_n - \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right) \right]^{-1} \right) \leq \operatorname{tr} \left[ \frac{1}{p} (I_n - |A|^p)^{-1} + \frac{1}{q} (I_n - |B|^q)^{-1} \right],
\]

where \( A \) and \( B \) are matrices in \( M_n(\mathbb{C}) \) with \( \operatorname{tr}(|A|^p) \), \( \operatorname{tr}(|B|^q) < 1 \) and \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).

b) If we take \( f(\lambda) = \exp \lambda \), then we have the inequalities

\[
(6.16) \quad \operatorname{tr} (\exp(|AB^*|)) \leq \operatorname{tr} \left[ \exp \left( \frac{|A|^p}{p} + \frac{|B|^q}{q} \right) \right] \leq \operatorname{tr} \left[ \frac{1}{p} \exp(|A|^p) + \frac{1}{q} \exp(|B|^q) \right],
\]

where \( A \) and \( B \) are matrices in \( M_n(\mathbb{C}) \) and \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).

Finally, we can state the following result:

**Proposition 7.** Let \( f(\lambda) := \sum_{n=0}^{\infty} \alpha_n \lambda^n \) be a power series with complex coefficients and convergent on the open disk \( D(0,R) \), \( R > 0 \). If \( A \) and \( B \) are commuting positive semidefinite matrices in \( M_n(\mathbb{C}) \) with \( \operatorname{tr}(A^p) \), \( \operatorname{tr}(B^q) < R \), where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \), then we have the inequality

\[
(6.17) \quad \left| \operatorname{tr} (f(AB)) \right| \leq \left[ \operatorname{tr}(f_n(A^p)) \right]^{1/p} \left[ \operatorname{tr}(f_n(B^q)) \right]^{1/q}.
\]

**Proof.** Since \( A \) and \( B \) are commuting positive semidefinite matrices in \( M_n(\mathbb{C}) \), then by (1.17) we have for any natural number \( n \) including \( n = 0 \) that

\[
(6.18) \quad \operatorname{tr}((AB)^n) = \operatorname{tr}(A^n B^n) \leq \left[ \operatorname{tr}(A^n) \right]^{1/p} \left[ \operatorname{tr}(B^n) \right]^{1/q},
\]

where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).
By (6.18) and the weighted Hölder discrete inequality we have
\[
\left| \operatorname{tr} \left( \sum_{n=0}^{m} \alpha_n (AB)^n \right) \right| = \left| \sum_{n=0}^{m} \alpha_n \operatorname{tr}(A^n B^n) \right| \leq \sum_{n=0}^{m} |\alpha_n| \left| \operatorname{tr}(A^n B^n) \right| \\
\leq \sum_{n=0}^{m} |\alpha_n| \left( \operatorname{tr}(A^n) \right)^{1/p} \left( \operatorname{tr}(B^n) \right)^{1/q} \\
\leq \left( \sum_{n=0}^{m} |\alpha_n| \left( \operatorname{tr}(A^n) \right)^{1/p} \right)^{1/p} \left( \sum_{n=0}^{m} |\alpha_n| \left( \operatorname{tr}(B^n) \right)^{1/q} \right)^{1/q} \\
= \left( \operatorname{tr} \left( \sum_{n=0}^{m} |\alpha_n| A^n \right) \right)^{1/p} \left( \operatorname{tr} \left( \sum_{n=0}^{m} |\alpha_n| B^n \right) \right)^{1/q}
\]
where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).

The proof follows now in a similar way with the ones from above and the details are omitted. \( \square \)

**Example 6.**

a) If we take \( f(\lambda) = (1 \pm \lambda)^{-1} \), \( |\lambda| < 1 \) then we get the inequality
\[
(6.19) \quad \left| \operatorname{tr} \left( (I_n \pm AB)^{-1} \right) \right| \leq \left[ \operatorname{tr}( (I_n - A^p)^{-1} ) \right]^{1/p} \left[ \operatorname{tr}( (I_n - B^q)^{-1} ) \right]^{1/q},
\]
for any \( A \) and \( B \) commuting positive semidefinite matrices in \( M_n(\mathbb{C}) \) with \( \operatorname{tr}(A^p) \), \( \operatorname{tr}(B^q) < 1 \), where \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).

b) If we take \( f(\lambda) = \exp \lambda \), then we have the inequality
\[
(6.20) \quad \operatorname{tr} \left( \exp(AB) \right) \leq \left( \operatorname{tr} \left( \exp(A^p) \right) \right)^{1/p} \left( \operatorname{tr} \left( \exp(B^q) \right) \right)^{1/q},
\]
for any \( A \) and \( B \) commuting positive semidefinite matrices in \( M_n(\mathbb{C}) \) and \( p, q > 1 \) with \( \frac{1}{p} + \frac{1}{q} = 1 \).
