Original Research Article

Abstract

Introduction: Ageing is a complex process that has been defined as the accumulation of molecular damage over time. Signs of ageing skin are atrophy, laxity, wrinkling, sagging, dryness, yellowness, a multiplicity of pigmented and other blemishes and sparse grey hair. More than 90% of age-associated cosmetic problems are caused by ultraviolet (UV) radiation on exposed skin, which damages telomeres, generates free-radicals and whose effects are largely proportionate to skin type. Skin tumours develop as a result of proliferation of a single or multile components of the skin. Skin tumours are a challenging group of conditions that can be categorized into epidermal and dermal tumors depending on their origin. Skin tumours in ageing skin are challenging because of wide variations in clinical presentations, the occurrence, behaviour and variety of the epidermal and dermal tumours makes it worthwhile to study this topic.

Aim: The aim of this study was to study the clinical features and epidemiology of epidermal and dermal tumours of skin over face in ageing.

Materials and Methods: Fifty patients with Epidermal and Dermal skin tumors over face in ageing skin attending the OPD of department of dermatology.

Results: The highest age prevalances was in 5th decade (50%), The female: male ratio was 1.2: 1. The commonest skin tumours recorded were epidermal tumours (74%), followed by dermal tumors (26%). Amongst Epidermal tumours the most common was seborrheic keratosis – 28 cases (75.07%), followed by basal cell carcinoma (28.57%), followed by actinic keratoses (26%). Among Dermal tumours the most common was compound nevus – 5 cases (38.46%), followed by pigmented naevus (33.33%), followed by dermatofibroma (20%).

Discordance seen in 02 cases (33.33%), clinically suspected as sebaceoma and dermal nevus turned out to be dermal nevus and dermatofibroma histopathologically.

1. Source of Data

50 patients of Epidermal and Dermal skin tumors of both sexes over face with age more than 50 years. Attending the department of Dermatology

1.1. Exclusion criteria

Cutaneous infections like warts, erysipelas. Skin lesions other than tumors. Melanocytic nevus those not fulfilling tumor criteria (>5mm in size) i.e flat lesions like junctional nevus, dysplastic nevus and small lesions like DPN.

1.2. Method of collection of data

Informed consent was taken from all the patients included in the study.

References
All patients in our study undergone a detailed history taking, general physical, systemic and dermatological examination and a set of routine investigations. Skin biopsy routinely not done for all patients as the lesions were present over the face and patients were not willing due to cosmetic concerns.

However 15 cases were subjected to skin biopsy when there was a diagnostic dilemma and patients who were willing. For smaller lesions, excisional biopsy and for larger lesions incisional biopsy was done Special stains like mason fontana for melanin were used whenever diagnostic dilemma in histopathology.

Clinical photographs were taken in all cases of facial tumors. Patient was referred to oncosurgeon in case of suspected malignant epidermal, dermal tumors for biopsy and further necessary management.

1.3. Evaluation

For the study, a proforma was prepared to record the relevant details of the patient like age, sex, occupation, socioeconomic status, number of lesions, site, symptoms, and clinical examinations which include presenting lesion, consistency etc. In clinically doubtful cases and those willing for biopsy skin biopsy was done. Results were correlated for concordance and discordance.

Records were maintained and data analyzed, variables was tested using appropriate statistical tool .(SPSS Software version 16).

2. Results

The highest age prevalence was in the age group of 51 – 60 years, 25 cases (50%), followed by 61-70 years 13 cases (26 %) and 71-80 years 10 cases (20 %), 81- 90 years 02 cases (4 %), The least prevalence was observed in 81-90 years.

Among males, maximum numbers of cases were in the age group of 51-60 years, 9 cases (18%) and least was in the age group of 81-90 years 02 cases (4%). Among females, maximum numbers of cases were in the age group of 51-60 years, 16 cases (32 %) and least was in the age group of 71-80 years, 04 cases (8 %). Out of 50 cases, 28 were females and 22 were males.

The female: male ratio being 1.27: 1. Patients from Urban area (76%) outnumbered those from rural areas (24%). Most frequently affected individuals were housewives (54%) followed by clerks (16%), business and agriculturists (12% each), Labourer, supervisor and anm(2% each). Out of 50 patients studied 04 patients belongs to lower class (8%), 42 patients belongs to middleclass (84%) and 04 patients belongs to upper class (8%).

Commonest skin tumors were epidermal tumors (74%) followed by dermal tumors (36%). Commonest among Epidermal tumours were seborrhoeic keratosis – 28 cases (75.07%), observed pvalue -0.014 < 0.05 followed by epidermoid cyst 4 cases (10.81%), acrochordons 3 cases (8.1) and keratoacanthoma, basal cell carcinoma 1 case each (2.75%).

The commonest tumours in this study among dermal tumors were compound nevus – 5 cases (38.46%), observed pvalue -0.09 < 0.05 followed by syringoma and sebaceous hyperplasia 3 cases each (23.07%), and Dermal nevus, Dermatofibroma 01 case each (7.6 %). Tables 1 and 4.

It is observed from the above table, the calculated p-value (.009) is lesser than the level of significance i.e. 0.05. (p <0.05) So, we reject the null hypothesis and concluded that there is association between most common dermal tumors and compound nevus.

Most of the patients with epidermal tumors suffered for years (86.48%), compared to those with months (13.5%), most commonly seborrhoeic keratosis presented for years (observed p value 0.01 < 0.05). Among dermal tumors most patients suffered for years (46.15%), compared to those with months (30.76%) at birth (23.07%). Majority of the epidermal tumors presented with multiple lesions 22cases (59.45%) and 15 cases with single lesions (40.54%). Majority of the dermal tumors presented with multiple lesions 9 cases (69.23%) and 4 cases with single lesions (30.76%).

Commonest presenting symptoms among epidermal tumours was itching (8.1%), pain (2.7%), bleeding (2.7%) most of the patients among dermal tumours were asymptomatic (100%). Commonest site in face among epidermal tumors were cheeks (67.56%), followed by forehead (16.21%), eyelids (8.1), chin (5.4%) and nose (2.7%).

Table 9 B shows, that among dermal tumors commonest site in face is cheeks (46.15%), followed by eyelids (15.38%), chin (15..38%) Table 5 A&B.

2.1. Morphology

Commonest presenting lesions among epidermal tumors were papule (56.7%) followed by plaque (32.43%), nodule (10.8%). Commonest presenting lesions among dermal tumors were nodule (53.84%), followed by papule (46.15%).

Among epidermal tumors majority of the lesions were firm in consistency (81.08%), soft (10.81%) and cystic (8.1). Among dermal tumors all the lesions presented with firm consistency(100%). Among epidermal tumors, 09 cases were biopsied. Clinical diagnosis concordance with histopathological diagnosis was seen in 08 cases(88%). Discordance seen in 01 case (12%), clinically confirmed as melanocytic nevus turned out to be dysplastic nevus histopathologically.
Table 1: Prevalance of various types of epidermal skin tumors

| Group | Type of epidermal tumour | No. of cases | Percentage (% in epidermal tumours) | Percentage (% of total tumours) |
|-------|--------------------------|--------------|-------------------------------------|---------------------------------|
| I     | Benign keratinocyte tumors | 36           | 97.29                               | 72                              |
|       | A) Seborrhoeic keratosis  | 28           | 75.07                               | 56                              |
|       | B) Keratoacanthoma       | 1            | 2.7                                 | 2                               |
|       | C) Acrochordons          | 3            | 8.1                                 | 6                               |
|       | D) Epidermoid cyst       | 4            | 10.81                               | 8                               |
| II    | Malignant epidermal tumors | 1            | 2.7                                 | 2                               |
|       | A) Basal cell carcinoma  | 1            | 2.7                                 | 2                               |

Fig. 7: 7A Dermal Naevus, B Histopathology of intradermal nevi10 X) nevus cells arranged in nests in dermis.

The epidermis overlying the dermal tumor is acanthotic and papillomatous with a central ‘dell’.
3. Discussion

3.1. Age

In the present study more number of patients belonged to the age group of 51 – 60 years, 25 cases (50%), followed by 61-70 years 13 cases (26 %) and 71-80 years 10 cases (20 %) 81- 90 years 02 cases (4 %) . The least prevalence was observed in 81-90 years.

3.2. Sex

Among males, maximum numbers of cases were in the age group of 51-60 years, 9cases (18%) and least was in the age group of 81-90 years 02 cases (4 %). Out of 50 cases, 28 were females and 22 were males.

The female: male ratio being 1.27: 1. In the present study 38 patients (76 %) belonged to urban area and only 12 patients (24%) belongs to rural area. Though lot of people attend our hospital from rural areas the lower prevalence among them reflects their ignorance regarding the cosmetic orientation and also due to the asymptomatic nature of the lesions.

In the present study among the occupational group, housewives constituted the majority (54%), followed by clerks (16 %), Business and agriculture (12% each ), not

applicable in (2%), labourer (2%), supervisor and nurse (2% each). This reflects the degree of cosmetic orientation in these various occupational groups. In the present study 42 patients (84%) belonged to the middle socio-economic status whereas 04 patients each (08%) belonged to the upper and lower socioeconomic status. This is in concurrence with the observation that the majority of the patients attending our hospital belonged to middle socio-economic status. The lower prevalence among higher and lower socioeconomic status can be attributed to the fact that these patients as they are capable of attending private consultants remain out of record and thus add to a probable low prevalence.

3.3. Prevalence

In the present study among dermal tumors were compound nevus – 5 cases (38.46%), (p value = 0.09 , <0.05) followed by seborrheic keratosis – 28 cases (75.07%) (p value = 0.014 , <0.05) , followed by epidermoid cyst 4 cases (10.81%), and acrochordons 3 cases (8.1%), keratoacanthoma & basal cell carcinoma 1 case each (2.7%).

The commonest tumours in this study among dermal tumors were compound nevus – 5 cases (38.46%), (p value = 0.09 , <0.05) followed by sebaceous hyperplasia 3 cases each (23.07%) , dermal nevus, and dermatofibroma 01 case each (7.6%). Table-1&4 / 2&3 chi square charts

3.4. Duration

Most of the patients with epidermal tumors suffered for years (86.48%), compared to those with months (13.5%) . In epidermal tumors SK most commonly presented for years (p value = 0.02 , < 0.05) Among dermal tumors most patients suffered for years (46.15%), compared to those with months (30.76%) at birth (23.07%) . In dermal tumors, compound nevus most commonly presented for years (p value = 0.01 , < 0.05)

3.5. Number of lesions

Most of the patients with epidermal tumors presented with multiple lesions 22 cases(59.45%) and 15 cases with single lesions (40.55%). Majority of the dermal tumors presented with multiple lesions 9 cases (69.23%) and 4 cases with single lesions (30.76%).

3.6. Symptoms

Commonest presenting symptoms among epidermal tumours was itching in 3 cases (8.1%), pain in 1 case (2.7 %), bleeding in 1 case (2.7 %). All the patients with dermal
tumours were asymptomatic (100%).

3.7. Site and distribution of lesions over face

Commonest site in face among epidermal tumors were cheeks in 25 cases (67.56%), followed by forehead in 06 cases (16.21%) eyelids & chin in 02 cases each (5.4%) , and nose in 1 case (2.7%). Among dermal tumors commonest site in face is cheeks in 06 cases (46.15%), followed by eyelids 03 cases (23.07%), forehead and chin in 02 cases each (15.38%), Table 5 A, B.

3.8. Morphology

Commonest presenting lesions among epidermal tumors were papules in 21 cases (56.7 %), followed by plaques in 12 cases (32.4%), nodule in 04 cases (10.8%). Commonest presenting lesions among dermal tumors were nodule in 7 cases (53.84 %), followed by papules in 06 cases (46.15%).

3.9. Consistency of lesions

Among epidermal tumors majority of the leisons were firm in consistency in 30 cases (81.08%), cystic in 04 cases (10.81), soft in 03 cases (8.1 %). Among dermal tumors all the leisons were firm in consistency (100%).

3.10. Clinico pathological correlation

Among epidermal tumors, 09 cases were biopsied. Clinical diagnosis concordance with histopathogical diagnosis was seen in 09 cases(100%). No discordance seen.

Among dermal tumors, 06 cases were biopsied. Clinical diagnosis concordance with histopathogical diagnosis was seen in 04 cases(66.66%). Discordance seen in 02 cases (33.33%), clinically suspected as sebaceoma and dermal nevus turned out to be dermal nevus and dermatofibroma histopathogically. Table 6 A, B.

3.11. Associated diseases

Most patients did not have any associated conditions 34 cases (68%), associated conditions seen were diabetes mellitus in 07 cases (14%) and hypertension 9 cases (18 %).

3.12. Discussion of individual tumours

3.13. Benign tumours of epidermis

3.14. Seborrhoiec keratosis

In the present study, most common among epidermal tumors were seborrhoiec keratosis seen in 28 pateints (56%) (pvalue 0.014 < 0.05) out of which there were 15 females and 13 males. The female male ratio was 1.15:1. According to Quinn et al 1 the males and females are equally affected. The highest age of onset was 87 years and least being 51 years. With mean age of onset was 67.42 years. This correlates well with statement by Jain et al 8 that, seborrhoiec keratosis is common in the middle aged and elderly person.

Most commonly seborrhoiec keratosis presented for years. (pvalue 0.02 < 0.05). In our study, 25 patients were asymptomatic (pvalue 0.01 < 0.05), while 3 patients had itching, lesions were located over cheek in each of the patients, they were diagnosed as inflamed seborrhoiec keratosis.

Most commonly it presented as papules in 17 patients The commonest site found was on the cheek (pvalue 0.02 <0.05) and forehead. Other sites were chin. observations in the present study are almost identical to the observations mentioned in the literature.1–3

In our study, only 6 patients were biopsied, and the remaining 22 patients did not agree for biopsy as the lesions were located over cosmeticly concerned areas. Out of 6 patients, three showed features of irritated type, two showed features of hyperkeratotic type, and one showed features of pigmented type. Observations in the present study are almost identical to the observations mentioned in the literature.1,4

3.15. Epidermal cyst (Epidermoid cyst)

In the present study, there were 4 cases of epidermal cysts (8 %), 2 male and 2 females. According to Quinn et al 5 it is commonly seen in young and middle aged adults. In this study the mean age of onset was 55.33 years. According to kirkham, 2 the commonest site of involvement is face, scalp, neck and trunk but in our study all lesions were seen over the face.

In our study, only 1 patient were biopsied and the remaining 3 patients did not agree for biopsy. One patient showed features of typical histopathogical features which were consistent with the findings of Quinn et al 1 Kirkham. 2

3.16. Acrochordons

In the present study, acrochordons were seen in 03 pateints (6%). of which 2 were males and 1 were females. According to Quinn et al, 5 females were more commonly affected than males. The mean age of onset was 63.63 years, which is similar to the study by Zaher et al. 6 Majority of lesions were multiple, small pedunculated papules (9%) located over periorbital, cheek.

According to Kumar et al, 7 acrochordons are associated with diabetes mellitus, obesity, hyperlipidemia, acromegaly
and intestinal polyps, however in our study diabetes mellitus and hypertension was not associated with acrochordon. The observations made in the present study with regard to the clinical features of lesions are not in concurrence with the observations made in other studies.\textsuperscript{1,7}

3.17. Benign Tumours of Melanocyte

3.18. Compound nevus

In the present study, most common among dermal tumors were compound nevi seen in 5 patients (10 \%) (pvalue 0.009 <0.05) ,3 females and 02 males they belonged to 50-70 years of age group. Most commonly presented as single lesions observed in 3 patients (p value 0.05 = 0.05 ) and asymptomatic in all 05 patients ( pvalue 0.009 < 0.05). All the lesions were located over the face. Observations in the present study are almost identical to the observations made in the literature.\textsuperscript{8,9} In our study, two patients were biopsied and the others did not agree for biopsy as the lesion was located over cosmetically concerned area. Histopathological features showed junctional activity of nevus cells and superficial dermis was composed predominantly of type a nevus cells arranged in nests. The observations in the present study are in concurrence with the observation mentioned in the literature.\textsuperscript{8,10}

3.19. Intradermal nevi

In the present study, intradermal nevi were seen in 1 female patient. The lesion was single and situated over the cheek. In our study, initially thought of sebaceoma clinically but confirmed as dermal nevus with typical histopathological features of intradermal nevus which were consistent with the findings of Elder\textsuperscript{10} , Newton Bishop \textsuperscript{8} Katarkar.\textsuperscript{11}

3.20. Appendageal tumours

In the present study, appendageal tumours were seen in 5 patients (10\%). Out of which three patient had syringoma (6\%) and two patient had sebaceous hyperplasia (4\%). In our study, 2 male and 1 female patient (6\%) had syringoma of onset 50-60 years of age concordant with study by Ramaswamy et al.,\textsuperscript{12} which showed that it was common in middle aged males. All cases presented with multiple lesions (p value 0.01 < 0.05) were seen around the eyelids (p value 0.01 <0.05). According to Calonje,\textsuperscript{13} commonest site involved is head and neck, rarely over trunk and extremities. Histopathological findings were typical as described Ramaswamy et al\textsuperscript{12} Calonje16Ahmed.17In the present study, 01 male and 02 female patient (4%) had sebaceous hyperplasia. The lesions were multiple, yellow to skin coloured papules and nodules over forehead, nose and cheek. Observations in the present study are almost identical to the observations mentioned in the literature.\textsuperscript{12} 16, Histopathological findings were typical as described by Ahmed.\textsuperscript{14} Kumar et al.\textsuperscript{15}

3.21. Benign soft tissue tumours

In the present study, benign soft tissue tumours was seen in 1 patient (2\%), had dermatofibroma (2\%). In our study, there was 1 Dermatofibroma male patient (2\%), Lesions were multiple over face, however according to calonje et al,\textsuperscript{16} they are common in young adults, however in our study found in old age. clinically thought of intradermal nevus initially but after histopathology diagnosed as dermatofibroma. Histopathology showed cellular type of dermatofibroma. Observations made in the present study are almost identical to the observations mentioned in the literature.\textsuperscript{14}

3.22. Basal cell carcinoma

In the present study, basal cell carcinoma were seen in 01 patient (2\%) According to minnesota study,\textsuperscript{16} males were more commonly affected than females. In our study, 01 female patient had basal cell carcinoma. with age of onset was 69 years. According to australian case–control study by Kricker et al.\textsuperscript{17} presence of large number of naevi, freckles and solar elastosis all add to the BCC risk, however in our study large number of nevi, freckles was not as oicated. It is more common in sun exposed areas like head and neck. The observations made in the present study with regard to the clinical features of lesions are in concurrence with the observations made in by purnima et al.\textsuperscript{18}

In our study, 1 case (2\%) was biopsied by oncosurgeon, showed typical features of Noduloulcerative type basal cell carcinoma. which were consistent with the features described by purnima et al\textsuperscript{18}. Immunohistohistochemistry was not done as this patient lost her follow up in our hospital.

3.23. Summary

Fifty patients presented with epidermal and dermal skin tumours attending the Department of Dermatology, Venereology and Leprology. The higheest age prevalances was in 5\textsuperscript{th} decade (50\%), followed by 6\textsuperscript{th} decade (26\%) 7\textsuperscript{th} decade (20\%), least prevalence was observed in 8th decade (6\%). The female: male ratio was 1.2: 1.Patients from urban area (76\%) outnumbered those from rural areas (24\%). Patients most frequently affected were housewives (54\%), clerks (16\%), business and agriculturists (12\% each). Most patients belonged to middle class (84\%).

The commonest skin tumours recorded were epidermal tumours (74\%), followed by dermal tumors (26\%). Commonest among Epidermal tumours were seborheic
keratosis – 28 cases (75.07%), followed by epidermoid cyst 4 cases (10.81%), acrochordons 3 cases (8.1%), keratoacanthoma & basal cell carcinoma 1 case each (2.7%). Most of the patients with epidermal tumors suffered for years (86.48%), followed by months (13.5%). Majority of the epidermal tumors presented with multiple lesions 22 cases (59.45%) and 15 cases with single lesions (40.55%). Commonest presenting symptoms among epidermal tumors was itching in 3 cases (8.1%), pain in 1 case (2.7%), bleeding in 1 case (2.7%). Commonest site in face among epidermal tumors were cheeks in 25 cases (67.56%), followed by forehead in 06 cases (16.21%) and nose in 02 cases each (5.4%). Among epidermal tumors most patients suffered for years (86.48%), followed by months (30.76%) and at birth (23.07%). Majority of the epidermal tumors were asymptomatic (100%). Among epidermal tumors commonest presenting symptoms among epidermal tumors was itching (8.1%), followed by pain and bleeding (2.7% each). Commonest site in face among epidermal tumors were cheeks (67.56%), followed by forehead (16.21%) and chin (5.4%), and nose (2.7%). Commonest presenting lesions among epidermal tumors were papules in 21 cases (56.7%), followed by plaques in 12 cases (32.4%), nodule in 04 cases (10.8%). Among epidermal tumors majority of the lesions were firm in consistency (81.08%), cystic (10.81), soft (8.1%). Among epidermal tumors, 09 cases were biopsied. Clinical diagnosis concordance with histopathological diagnosis was seen in 09 cases (100%). No discordance seen.

Commonest among dermal tumors were compound nevus – 5 cases (38.46%), followed by syringoma and sebaceous hyperplasia 3 cases each (23.07%), dermal nevus, and dermatofibroma 01 case each (7.6%). Among dermal tumors most patients suffered for years (46.15%), followed by months (30.76%) and at birth (23.07%). Majority of the dermal tumors presented with multiple lesions 9 cases (69.23%) and 4 cases with single lesions (30.76%). All the patients with dermal tumors were asymptomatic (100%). Among dermal tumors commonest presenting symptoms among dermal tumors was itching (8.1%), followed by pain and bleeding (2.7% each). Commonest presenting lesions among dermal tumors were nodule in 7 cases (53.84%), followed by plaques in 06 cases (46.15%). Among dermal tumors all the lesions were firm in consistency (100%). Among dermal tumors, 06 cases were biopsied. Clinical diagnosis concordance with histopathological diagnosis was seen in 04 cases (66.66%). Discordance seen in 02 cases (33.33%), clinically suspected as sebaceoma and dermal nevus turned out to be dermal nevus and dermatofibroma histopathologically.

4. Conclusion

1. In ageing skin over face Epidermal and dermal skin tumors highest age prevalence was observed in 5th decade (50%), and least prevalence was observed in 8th decade (6%). The female: male ratio was 1.2: 1. The commonest skin tumours recorded were epidermal tumours (74%), followed by dermal tumours (26%).

2. Commonest among Epidermal tumours were seborrheic keratosis (75.07%), followed by epidermoid cyst (10.81%). Most of the patients with epidermal tumors suffered for years (86.48%), followed by months (13.5%). Majority of the epidermal tumors presented with multiple lesions (59.45%) and single lesions (40.55%). Commonest presenting symptoms among epidermal tumours was itching (8.1%), followed by pain and bleeding (2.7% each). Commonest site in face among epidermal tumors were cheeks (67.56%), followed by forehead (16.21%) and chin (5.4%), and nose (2.7%). Commonest presenting lesions among epidermal tumors were papules (56.7%), followed by plaques (32.4%), nodules (10.8%). Among epidermal tumors majority of the lesions were firm in consistency (81.08%), cystic (10.81), soft (8.1%). Among epidermal tumors, 09 cases were biopsied. Clinical diagnosis concordance with histopathological diagnosis was seen in 09 cases (100%). No discordance seen.

3. Commonest among dermal tumors were compound nevus (38.46%), followed by syringoma and sebaceous hyperplasia each (23.07%), dermal nevus, and dermatofibroma each (7.6%). Among dermal tumors most patients suffered for years (46.15%), followed by months (30.76%) and at birth (23.07%). Majority of the dermal tumors presented with multiple lesions (69.23%) and single lesions (30.76%). All the patients with dermal tumors were asymptomatic (100%). Among dermal tumors commonest site in face was cheeks (46.15%), followed by eyelids (23.07%), forehead and chin in each (15.38%). Commonest presenting lesions among dermal tumors were nodule in 53.84%, followed by papules in 46.15%. Among dermal tumors all the lesions were firm in consistency (100%). Among dermal tumors, 06 cases were biopsied. Clinical diagnosis concordance with histopathological diagnosis was seen in 04 cases (66.66%). Discordance seen in 02 cases (33.33%), clinically suspected as sebaceoma and dermal nevus turned out to be dermal nevus and dermatofibroma histopathologically.

4. To conclude that in ageing skin over face most common skin tumors were epidermal tumors followed by dermal tumors. Prevalence of malignant epidermal tumors in patients were (2%). Whenever in diagnostic dilemma histopathology should be supplemented to get unambiguous results.

5. Source of funding

None.
6. Conflict of interest
None.
