ASYMPTOTIC LOG-HARNACK INEQUALITY FOR THE STOCHASTIC CONVECTIVE BRINKMAN-FORCHHEIMER EQUATIONS WITH DEGENERATE NOISE

MANIL T. MOHAN¹*

Abstract. In this work, we consider the two and three dimensional stochastic convective Brinkman-Forchheimer (SCBF) equations and examine some asymptotic behaviors of its strong solution. We establish the asymptotic log-Harnack inequality for the transition semigroup associated with the SCBF equations driven by additive as well as multiplicative degenerate noise via the asymptotic coupling method. As applications of the asymptotic log-Harnack inequality, we derive the gradient estimate, asymptotic irreducibility, asymptotic strong Feller property, asymptotic heat kernel estimate and ergodicity. Whenever the absorption exponent \( r \in (3, \infty) \), the asymptotic log-Harnack inequality is obtained without any restriction on the Brinkman coefficient (effective viscosity) \( \mu > 0 \), the Darcy coefficient \( \alpha > 0 \) and the Forchheimer coefficient \( \beta > 0 \).

1. Introduction

The convective Brinkman-Forchheimer (CBF) equations describe the motion of incompressible viscous fluid through a rigid, homogeneous, isotropic, porous medium. Let \( \mathcal{O} \subset \mathbb{R}^n \) \((n = 2, 3)\) be a bounded domain with a smooth boundary \( \partial \mathcal{O} \). Let \( u(t, x) \in \mathbb{R}^n \) denotes the velocity field at time \( t \in [0, T] \) and position \( x \in \mathcal{O} \), \( p(t, x) \in \mathbb{R} \) represents the pressure field, \( f(t, x) \in \mathbb{R}^n \) stands for an external forcing. Let the constant \( \mu \) represents the positive Brinkman coefficient (effective viscosity), the positive constants \( \alpha \) and \( \beta \) denote the Darcy (permeability of porous medium) and Forchheimer (proportional to the porosity of the material) coefficients, respectively. The CBF equations are given by (see [22] for Brinkman-Forchheimer equations with fast growing nonlinearities)

\[
\begin{aligned}
\frac{\partial u}{\partial t} - \mu \Delta u + (u \cdot \nabla)u + \alpha u + \beta |u|^{r-1}u + \nabla p &= f, \quad \text{in} \quad \mathcal{O} \times (0, T), \\
\nabla \cdot u &= 0, \quad \text{in} \quad \mathcal{O} \times (0, T), \\
u &= 0 \quad \text{on} \quad \partial \mathcal{O} \times (0, T), \\
u(0) &= x \quad \text{in} \quad \mathcal{O}. 
\end{aligned}
\]

As mentioned earlier, the CBF equations (1.1) describe the motion of incompressible fluid flows in a saturated porous medium. In order to obtain the uniqueness of the pressure $p$, one can impose the condition $\int_{\Omega} p(x,t)dx = 0$, for $t \in (0,T)$ also. The absorption exponent $r \in [1, \infty)$ and the case $r = 3$ is known as the critical exponent. Note that for $\alpha = \beta = 0$, we obtain the classical 3D Navier-Stokes equations (see [16, 21, 34, 38, 39], etc).

The Navier-Stokes problem in bounded domains with compact boundary, modified by the absorption term $|u|^{r-2}u$, for $r > 2$ is considered in [1]. The authors proved the existence of weak solutions in the Layr-Hopf sense, for any dimension $n \geq 2$ and its uniqueness for $n = 2$. But in three dimensions, the authors were not able to establish the energy equality satisfied by the weak solutions. The existence of regular dissipative solutions and global attractors for the system (1.1) in three dimensions with $r > 3$ is established in [22]. For $r > 3$, as a global smooth solution exists, the energy equality is satisfied by the weak solutions. Recently, the authors in [15] were able to construct functions that can approximate functions defined on smooth bounded domains by elements of eigenspaces of linear operators (e.g., the Laplacian or the Stokes operator) in such a way that the approximations are bounded and converge in both Sobolev and Lebesgue spaces simultaneously. As a simple application of this result, they proved that all weak solutions of the critical CBF equations ($r = 3$) in three dimensions posed on a bounded domain in $\mathbb{R}^3$ satisfy the energy equality (see [19] for the case of periodic domains). The author in [31] proved the existence and uniqueness of a global weak solution in the Leray-Hopf sense satisfying the energy equality to the system (1.1) (in three dimensions, for all values of $\beta$ and $\mu$, whenever the absorption exponent $r > 3$ and $2\beta \mu \geq 1$, for the critical case $r = 3$). The monotonicity as well as the demicontinuity properties of the linear and nonlinear operators and the Minty-Browder technique were exploited in the proofs.

Let us now discuss some results available in the literature for the stochastic counterpart for the system (1.1). The authors in [37] showed the existence and uniqueness of strong solutions to the stochastic 3D tamed Navier-Stokes equations on bounded domains with Dirichlet boundary conditions. They also proved a small time large deviation principle for the solution. By using classical Faedo-Galerkin approximation and compactness method, the existence of martingale solutions for the stochastic 3D Navier-Stokes equations with nonlinear damping is obtained in [25]. Recently, the author in [32] established the existence of a pathwise unique strong solution satisfying the energy equality (Itô’s formula) to the stochastic convective Brinkman-Forchheimer (SCBF) equations perturbed by multiplicative Gaussian noise, by exploiting the monotonicity property of the linear and nonlinear operators as well as a stochastic generalization of the Minty-Browder technique. The author has also proved the existence of a unique ergodic and strongly mixing invariant measure for the SCBF equations (1.1) subject to multiplicative Gaussian noise (non-degenerate), by making use of the exponential stability of strong solutions. For a sample literature on stochastic tamed 3D Navier-Stokes equations and related models on periodic domains as well as on whole space, interested readers are referred to see [5, 6, 29, 30, 35, 36], etc and references therein.

To examine the diffusion semigroup on the Riemannian manifolds, the dimension-free Harnack inequality was introduced by Wang in [40]. As this inequality was not available in many situations, he introduced log-Harnack inequality in [42]. Later, these two inequalities were widely used by many researchers in the context of stochastic partial differential equations (SPDEs) to obtain the gradient estimates (and thus strong Feller property), irreducibility, heat kernel estimates, uniqueness of invariant probability measures, etc for the associated
transition semigroups (cf. [27, 28, 33, 41, 43, 44, 45], etc and references therein). It is observed that the strong Feller property may not hold for highly degenerate noise case. The authors in [18] introduced the concept of asymptotically strong Feller property to examine the ergodic properties of the 2D Navier-Stokes equations perturbed by degenerate noise. The author in [46] showed by an asymptotic coupling that the 2D stochastic Navier-Stokes equation driven by highly degenerate but essentially elliptic noise satisfies the asymptotic log-Harnack inequality, which implies the asymptotically strong Feller property. The asymptotic log-Harnack inequality for several kinds of models on stochastic differential systems like non-degenerate SDEs, neutral SDEs, semi-linear SPDEs, and stochastic Hamiltonian systems with infinite memory is obtained in [4]. By using the asymptotic coupling method, the asymptotic log-Harnack inequality for the transition semigroup associated to the 3D Leray-α model with fractional dissipation driven by highly degenerate noise is established in [26].

The asymptotic log-Harnack inequality and some of its consequent properties for a class of stochastic 2D hydrodynamical-type systems driven by degenerate noise are established in [20]. In [21], the authors established asymptotic log-Harnack inequality and discussed its applications for semilinear SPDEs with degenerate multiplicative noise by the coupling method. For a sample literature on the ergodic theory for the 2D stochastic Navier-Stokes equations subjected to degenerate noise, we refer the interested readers to [7, 12, 13, 14, 17], etc. In this work, we consider the SCBF equations perturbed by additive as well as multiplicative degenerate noise and establish the asymptotic log-Harnack inequality via the asymptotic coupling method. Then applying the results available in [4], as applications of the asymptotic log-Harnack inequality, we also derive the gradient estimate, asymptotic irreducibility, asymptotic strong Feller property, asymptotic heat kernel estimate and ergodicity results. For \(n = 2, 3\) and \(r \in (3, \infty)\), we establish the asymptotic log-Harnack inequality and ergodic properties of the transition semigroup associated with the SCBF equations perturbed additive, highly degenerate but essentially elliptic noise is established in section 3. For \(n = 2, 3\) and \(r \in [1, 3]\), we establish the asymptotic log-Harnack inequality for \(\lambda_1 \mu^3 \geq 8 \text{Tr}(\sigma \sigma^*)\), where \(\lambda_1\) is the first eigenvalue of the Stokes operator and \(\sigma\) is the noise coefficient (Theorem 3.2). Regarding the applications of asymptotic log-Harnack inequality, we derive the gradient estimate, asymptotic irreducibility, asymptotic strong Feller property, asymptotic heat kernel estimate and also the existence of a unique invariant measure (Corollary 3.3). For the case \(n = 2, 3\) and \(r \in (3, \infty)\), we obtain the asymptotic log-Harnack inequality for the transition semigroup associated with the SCBF equations for any \(\mu, \beta > 0\) and for the critical case \((n = r = 3)\), it has been established for \(\beta \mu > 1\) (Theorem 3.7). In the final section, we consider the SCBF equations subjected to multiplicative degenerate noise and establish the
asymptotic log-Harnack inequality for \( n = 2, 3 \) and \( r \in [3, \infty) \) \((\beta, \mu > 0 \text{ for } r \in (3, \infty)\) and \( \beta \mu > 1 \text{ for } r = 3\) (Theorem 4.3).

2. Stochastic convective Brinkman-Forchheimer equations

We discuss about the global solvability of the SCBF equations perturbed by additive degenerate noise in this section. We first provide the necessary function spaces needed to obtain the existence and uniqueness of strong solution. In our analysis, the parameter \( \alpha \) does not play a major role and we set \( \alpha \) to be zero in \((\square)\) in the entire paper.

2.1. Function spaces. Let \( C_0^\infty(\mathcal{O}; \mathbb{R}^n) \) be the space of all infinitely differentiable functions (\( \mathbb{R}^n\)-valued) with compact support in \( \mathcal{O} \subset \mathbb{R}^n \). Let us define

\[
\mathcal{V} := \{ u \in C_0^\infty(\mathcal{O}; \mathbb{R}^n) : \nabla \cdot u = 0 \},
\]

\[
\mathbb{H} := \text{the closure of } \mathcal{V} \text{ in the Lebesgue space } L^2(\mathcal{O}) = L^2(\mathcal{O}; \mathbb{R}^n),
\]

\[
\mathcal{V} := \text{the closure of } \mathcal{V} \text{ in the Sobolev space } H_0^1(\mathcal{O}) = H_0^1(\mathcal{O}; \mathbb{R}^n),
\]

\[
\tilde{L}^p := \text{the closure of } \mathcal{V} \text{ in the Lebesgue space } L^p(\mathcal{O}) = L^p(\mathcal{O}; \mathbb{R}^n),
\]

for \( p \in (2, \infty) \). Then under some smoothness assumptions on the boundary, we characterize the spaces \( \mathbb{H}, \mathcal{V} \) and \( \tilde{L}^p \) as \( \mathbb{H} = \{ u \in L^2(\mathcal{O}) : \nabla \cdot u = 0, u \cdot n |_{\partial\mathcal{O}} = 0 \} \), with norm \( \| u \|_\mathbb{H} := \int_\mathcal{O} |u(x)|^2 dx \), where \( n \) is the outward normal to \( \partial\mathcal{O} \), \( \mathcal{V} = \{ u \in H_0^1(\mathcal{O}) : \nabla \cdot u = 0 \} \), with norm \( \| u \|_\mathcal{V} := \int_\mathcal{O} |\nabla u(x)|^2 dx \), and \( \tilde{L}^p = \{ u \in L^p(\mathcal{O}) : \nabla \cdot u = 0, u \cdot n |_{\partial\mathcal{O}} = 0 \} \), with norm \( \| u \|_{\tilde{L}^p} := \int_\mathcal{O} |u(x)|^p dx \), respectively. Let \((\cdot, \cdot)\) represents the inner product in the Hilbert space \( \mathbb{H} \) and \((\cdot, \cdot)\) denotes the induced duality between the spaces \( \mathcal{V} \) and its dual \( \mathcal{V}' \) as well as \( \tilde{L}^p \) and its dual \( \tilde{L}^p' \), where \( \frac{1}{p} + \frac{1}{p'} = 1 \). Note that \( \mathbb{H} \) can be identified with its dual \( \mathbb{H}' \). We endow the space \( \mathcal{V} \cap \tilde{L}^p \) with the norm \( \| u \|_\mathcal{V} + \| u \|_{\tilde{L}^p} \), for \( u \in \mathcal{V} \cap \tilde{L}^p \) and its dual \( \mathcal{V}' + \tilde{L}^p' \) with the norm

\[
\inf \left\{ \max\left(\| v_1 \|_\mathcal{V}, \| v_1 \|_{\tilde{L}^p} \right) : v = v_1 + v_2, v_1 \in \mathcal{V}, v_2 \in \tilde{L}^p \right\}.
\]

Furthermore, we have the continuous embedding

\[
\mathcal{V} \cap \tilde{L}^p \hookrightarrow \mathbb{H} \hookrightarrow \mathcal{V}' + \tilde{L}^p'.
\]

2.2. Linear operator. Let \( P_{\mathbb{H}} : L^2(\mathcal{O}) \rightarrow \mathbb{H} \) denotes the Helmholtz-Hodge orthogonal projection. We define

\[
\begin{cases}
    Au := -P_{\mathbb{H}} \Delta u, \quad u \in D(A), \\
    D(A) := \mathcal{V} \cap H^2(\mathcal{O}).
\end{cases}
\]

It can be easily seen that the operator \( A \) is a non-negative self-adjoint operator in \( \mathbb{H} \) with \( \mathcal{V} = D(A^{1/2}) \) and

\[
\langle Au, u \rangle = \| u \|_\mathcal{V}^2, \quad \text{for all } u \in \mathcal{V}, \quad \text{so that } \| Au \|_{\mathcal{V}'} \leq \| u \|_\mathcal{V}.
\]

For a bounded domain \( \mathcal{O} \), the operator \( A \) is invertible and its inverse \( A^{-1} \) is bounded, self-adjoint and compact in \( \mathbb{H} \). Thus, using spectral theorem, the spectrum of \( A \) consists of an infinite sequence \( 0 < \lambda_1 \leq \lambda_2 \leq \ldots \leq \lambda_k \leq \ldots \) with \( \lambda_k \rightarrow \infty \) as \( k \rightarrow \infty \) of eigenvalues. Moreover, there exists an orthogonal basis \( \{ e_k \}_{k=1}^\infty \) of \( \mathbb{H} \) consisting of eigenvectors of \( A \).
such that $Ae_k = \lambda_k e_k$, for all $k \in \mathbb{N}$. We know that any $u \in H^1$ can be expressed as $u = \sum_{k=1}^{\infty} \langle u, e_k \rangle e_k$ and $Au = \sum_{k=1}^{\infty} \lambda_k \langle u, e_k \rangle e_k$, for $u \in D(A)$. Thus, it is immediate that

$$\|\nabla u\|_{H^1}^2 = \langle Au, u \rangle = \sum_{k=1}^{\infty} \lambda_k |\langle u, e_k \rangle|^2 \geq \lambda_1 \sum_{k=1}^{\infty} |\langle u, e_k \rangle|^2 = \lambda_1 \|u\|_{H^1}^2, \quad \text{for } u \in V. \quad (2.2)$$

2.3. Bilinear operator. Let us define the trilinear form $b(\cdot, \cdot, \cdot) : V \times V \times V \to \mathbb{R}$ by

$$b(u, v, w) = \int_{\Omega} (u(x) \cdot \nabla)v(x) \cdot w(x) \, dx = \sum_{i,j=1}^{n} \int_{\Omega} u_i(x) \frac{\partial v_j(x)}{\partial x_i} w_j(x) \, dx.$$ 

If $u, v$ are such that the linear map $b(u, v, \cdot)$ is continuous on $V$, the corresponding element of $V'$ is denoted by $B(u, v)$. We also denote (with an abuse of notation) $B(u) = B(u, u) = P_H(u \cdot \nabla)u$. An integration by parts gives

$$\begin{align*}
\left\{ \begin{array}{l}
b(u, v, v) = 0, \quad \text{for all } u, v \in V, \\
b(u, v, w) = -b(u, w, v), \quad \text{for all } u, v, w \in V.
\end{array} \right. \quad (2.3)
\end{align*}$$

In the trilinear form, an application of Hölder’s inequality yields

$$|b(u, v, w)| = |b(u, v, w)| \leq \|u\|_{L^{r+1}} \|v\|_{L^{2(r+1)/r}} \|w\|_{V'},$$

for all $u \in V \cap \tilde{L}^{r+1}$, $v \in V \cap \tilde{L}^{2(r+1)/r}$ and $w \in V$, so that we get

$$\|B(u, v)\|_{V'} \leq \|u\|_{L^{r+1}} \|v\|_{L^{2(r+1)/r}}. \quad (2.4)$$

Hence, the trilinear map $b : V \times V \times V \to \mathbb{R}$ has a unique extension to a bounded trilinear map from $(V \cap \tilde{L}^{r+1}) \times (V \cap \tilde{L}^{2(r+1)/r}) \times V$ to $\mathbb{R}$. It can also be seen that $B$ maps $V \cap \tilde{L}^{r+1}$ into $V' + \tilde{L}^{2(r+1)/r}$ and using interpolation inequality, we get

$$|\langle B(u, v), v \rangle| = |b(u, v, u)| \leq \|u\|_{L^{r+1}} \|u\|_{L^{2(r+1)/r}} \|v\|_{V'} \leq \|u\|_{L^{r+1}} \|u\|_{H^1} \|v\|_{V'}, \quad (2.5)$$

for all $v \in V \cap \tilde{L}^{r+1}$. Thus, we have

$$\|B(u)\|_{V' + \tilde{L}^{2(r+1)/r}} \leq \|u\|_{L^{r+1}} \|u\|_{H^1} \|u\|_{L^{2(r+1)/r}}. \quad (2.6)$$

for $r \geq 3$.

For $n = 2$ and $r \in [1, 3]$, using Hölder’s and Ladyzhenskaya’s inequalities, we obtain

$$|\langle B(u, v), w \rangle| = |\langle B(u, w), v \rangle| \leq \|u\|_{\tilde{L}^4} \|v\|_{\tilde{L}^4} \|w\|_{V'},$$

for all $u, v \in \tilde{L}^4$ and $w \in V$, so that we get $\|B(u, v)\|_{V'} \leq \|u\|_{\tilde{L}^4} \|v\|_{\tilde{L}^4}$. Furthermore, we have

$$\|B(u, u)\|_{V'} \leq \|u\|_{\tilde{L}^4}^2 \leq \sqrt{2} \|u\|_H \|u\|_V \leq \sqrt{2} \|u\|_H \|u\|_V \leq \sqrt{2} \|u\|_V^2,$$

for all $u \in V$. 

ASYMPTOTIC LOG-HARNACK INEQUALITY FOR SCBF EQUATIONS 5
2.4. Nonlinear operator. Let us now consider the operator \( C(u) := P_H(|u|^{-1}u) \). It is immediate that \( \langle C(u), u \rangle = \|u\|_{L^{r+1}}^{r+1} \). For any \( r \in [1, \infty) \), we have

\[
\langle P_H(u|u|^{-1}) - P_H(v|v|^{-1}), u - v \rangle = \int_{\mathcal{O}} (u(x)|u(x)|^{-1} - v(x)|v(x)|^{-1}) \cdot (u(x) - v(x)) dx
\]

\[
= \int_{\mathcal{O}} (|u(x)|^{r+1} - |u(x)|^{-1}u(x) \cdot v(x) - |v(x)|^{r-1}u(x) \cdot v(x) + |v(x)|^{r+1}) dx
\]

\[
\geq \int_{\mathcal{O}} (|u(x)|^{r+1} - |u(x)|^{-1}|v(x)| - |v(x)|^{r-1}|u(x)| + |v(x)|^{r+1}) dx
\]

\[
= \int_{\mathcal{O}} (|u(x)|^{r} - |v(x)|^{r})(|u(x)| - |v(x)|) dx \geq 0. \tag{2.7}
\]

Furthermore, we find

\[
\langle P_H(u|u|^{-1}) - P_H(v|v|^{-1}), u - v \rangle
\]

\[
= \langle |u|^{-1}, u - v \rangle + \langle |v|^{-1}, u - v \rangle + \langle v|u|^{-1} - u|v|^{-1}, u - v \rangle
\]

\[
= \| |u|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2 + \| |v|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2
\]

\[
+ \langle u \cdot v, |u|^{-1} + |v|^{-1} \rangle - \langle |u|^2, |v|^{-1} \rangle - \langle |v|^2, |u|^{-1} \rangle. \tag{2.8}
\]

But, we know that

\[
\langle u \cdot v, |u|^{-1} + |v|^{-1} \rangle - \langle |u|^2, |v|^{-1} \rangle - \langle |v|^2, |u|^{-1} \rangle
\]

\[
= -\frac{1}{2}\| |u|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2 - \frac{1}{2}\| |v|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2 + \frac{1}{2}\langle (|u|^{-1} - |v|^{-1}), (|u|^2 - |v|^2) \rangle
\]

\[
\geq -\frac{1}{2}\| |u|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2 - \frac{1}{2}\| |v|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2.
\]

From (2.8), we finally have

\[
\langle P_H(u|u|^{-1}) - P_H(v|v|^{-1}), u - v \rangle \geq \frac{1}{2}\| |u|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2 + \frac{1}{2}\| |v|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2 \geq 0, \tag{2.9}
\]

for \( r \geq 1 \). It is important to note that

\[
\| u - v \|_{L^{r+1}}^{r+1} = \int_{\mathcal{O}} |u(x) - v(x)|^{r-1}|u(x)| - |v(x)| dx
\]

\[
\leq 2^{r-2} \int_{\mathcal{O}} (|u(x)|^{r-1} + |v(x)|^{r-1})|u(x)| - |v(x)|^2 dx
\]

\[
\leq 2^{r-2}\| |u|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2 + 2^{r-2}\| |v|^{-\frac{r+1}{2}}(u - v) \|_{L^2}^2. \tag{2.10}
\]

Combining (2.9) and (2.10), we obtain

\[
\langle C(u) - C(v), u - v \rangle \geq \frac{1}{2^{r-1}}\| u - v \|_{L^{r+1}}^{r+1}, \tag{2.11}
\]

for \( r \geq 1 \).
2.5. Monotonicity. In this subsection, we discuss about the monotonicity as well as the hemicontinuity properties of the linear and nonlinear operators.

**Definition 2.1 (31).** Let $X$ be a Banach space and let $X'$ be its topological dual. An operator $G : D \to X$, $D = D(G) \subset X$ is said to be monotone if

$$\langle G(x) - G(y), x - y \rangle \geq 0, \text{ for all } x, y \in D.$$ 

The operator $G(\cdot)$ is said to be hemicontinuous, if for all $x, y \in X$ and $w \in X'$,

$$\lim_{\lambda \to 0} \langle G(x + \lambda y), w \rangle = \langle G(x), w \rangle.$$ 

The operator $G(\cdot)$ is called demicontinuous, if for all $x \in D$ and $y \in X$, the functional $x \mapsto \langle G(x), y \rangle$ is continuous, or in other words, $x_k \to x$ in $X$ implies $G(x_k) \rightharpoonup G(x)$ in $X'$. Clearly demicontinuity implies hemicontinuity.

**Theorem 2.2 (Theorem 2.2, 31).** Let $u, v \in V \cap \tilde{L}^{r+1}$, for $r > 3$. Then, for the operator $G(u) = \mu Au + B(u) + \beta C(u)$, we have

$$\langle (G(u) - G(v)), u - v \rangle + \eta \|u - v\|_{H}^2 \geq 0,$$

where

$$\eta = \frac{r - 3}{2\mu(r - 1)} \left( \frac{2}{\beta \mu(r - 1)} \right)^{\frac{2}{r-3}}.$$ 

That is, the operator $G + \eta I$ is a monotone operator from $V \cap \tilde{L}^{r+1}$ to $V' + \tilde{L}^{-\frac{2}{r+1}}$.

**Theorem 2.3 (Theorem 2.3, 31).** For the critical case $r = 3$ with $2\beta \mu \geq 1$, the operator $G(\cdot) : V \cap \tilde{L}^{r+1} \to V' + \tilde{L}^{-\frac{2}{r+1}}$ is globally monotone, that is, for all $u, v \in V$, we have

$$\langle (G(u) - G(v)), u - v \rangle \geq 0.$$ 

**Theorem 2.4 (Remark 2.4, 31).** Let $n = 2$, $r \in [1, 3]$ and $u, v \in V$. Then, for the operator $G(u) = \mu Au + B(u) + \beta C(u)$, we have

$$\langle (G(u) - G(v)), u - v \rangle + \frac{27}{32 \mu^3} N^4 \|u - v\|_{H}^2 \geq 0,$$

for all $v \in B_N$, where $B_N$ is an $\tilde{L}^4$-ball of radius $N$, that is, $B_N := \{ z \in \tilde{L}^4 : \|z\|_{\tilde{L}^4} \leq N \}$.

**Lemma 2.5 (Lemma 2.5, 31).** The operator $G : V \cap \tilde{L}^{r+1} \to V' + \tilde{L}^{-\frac{2}{r+1}}$ is demicontinuous.

2.6. Stochastic convective Brinkman-Forchheimer equations. Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a complete probability space equipped with an increasing family of sub-sigma fields $\{\mathcal{F}_t\}_{0 \leq t \leq T}$ of $\mathcal{F}$ satisfying:

(i) $\mathcal{F}_0$ contains all elements $F \in \mathcal{F}$ with $\mathbb{P}(F) = 0$,
(ii) $\mathcal{F}_t = \bigcap_{s>t} \mathcal{F}_s$, for $0 \leq t \leq T$. 

We consider the following stochastic convective Brinkman-Forchheimer equations perturbed by additive degenerate Gaussian noise:

\[
\begin{cases}
    d\mathbf{u}(t) - \mu \Delta \mathbf{u}(t) + (\mathbf{u}(t) \cdot \nabla) \mathbf{u}(t) + \beta |\mathbf{u}(t)|^{r-1}\mathbf{u}(t) + \nabla p(t) \\
    \quad = \sigma dW(t), \quad \text{in } \mathcal{O} \times (0, T), \\
    \nabla \cdot \mathbf{u}(t) = 0, \quad \text{in } \mathcal{O} \times (0, T), \\
    \mathbf{u}(t) = 0, \quad \text{on } \partial \mathcal{O} \times (0, T), \\
    \mathbf{u}(0) = \mathbf{x}, \quad \text{in } \mathcal{O},
\end{cases}
\]

(2.16)

where \(W(\cdot)\) is a cylindrical Wiener process defined on \((\Omega, \mathcal{F}, \{\mathcal{F}_t\}_{t \geq 0}, \mathbb{P})\) taking values in the Hilbert space \(\mathbb{H}\). On taking orthogonal projection \(P_\mathbb{H}\) onto the first equation in (2.16), we get

\[
\begin{cases}
    d\mathbf{u}(t) + [\mu A\mathbf{u}(t) + B(\mathbf{u}(t))] + \beta C(\mathbf{u}(t))]dt = \sigma dW(t), \quad t \in (0, T), \\
    \mathbf{u}(0) = \mathbf{x},
\end{cases}
\]

(2.17)

where \(\mathbf{x} \in \mathbb{H}\). For any given \(N \in \mathbb{N}\), we define the projection \(P_N : \mathbb{H} \rightarrow \mathbb{H}_N\) by

\[
P_N \mathbf{u} := \sum_{k=1}^{N} (\mathbf{u}, e_k)e_k, \quad \mathbf{u} \in \mathbb{H},
\]

where \(\{e_k\}_{k=1}^{\infty}\) is an orthonormal basis in \(\mathbb{H}\) and \(\mathbb{H}_N = \text{span}\{e_1, \ldots, e_N\}\). In this section, we assume that the noise co-efficient \(\sigma\) satisfies the following highly degenerate but essentially elliptic condition provided in Section 4.5 of [18].

**Assumption 2.6.** There exists a sufficiently large but fixed \(N_0 \in \mathbb{N}\) such that \(\text{Range}(\sigma) = P_{N_0}\mathbb{H}\) and \(\sigma \mathbf{u} = 0\) if \(\mathbf{u} \in (I - P_{N_0})\), where \(I\) is the identity mapping.

For the fixed \(N_0\) defined in the Assumption 2.6 we separate the Hilbert space \(\mathbb{H}\) into the low and high frequency parts as

\[
\mathbb{H} = P_{N_0}\mathbb{H} + (I - P_{N_0})\mathbb{H},
\]

and we denote \(\mathbb{H}^l := P_{N_0}\mathbb{H}\) and \(\mathbb{H}^h := (I - P_{N_0})\mathbb{H}\). For any \(\mathbf{u} \in \mathbb{H}\), we define \(\mathbf{u}^l := P_{N_0}\mathbf{u}\) and \(\mathbf{u}^h := (I - P_{N_0})\mathbf{u}\). The following lemma is easy to prove and one can get a proof from Lemma 3.2, [20].

**Lemma 2.7.** For any \(\alpha > 0\), we have

\[
\|\mathbf{u}^l\|_V \leq \lambda_{N_0}^{1/2}\|\mathbf{u}^l\|_H, \quad \|\mathbf{u}^h\|_V \geq \lambda_{N_0}^{1/2}\|\mathbf{u}^h\|_H.
\]

(2.18)

From the Assumption 2.6 it is clear that \(\text{Tr}(\sigma\sigma^*) < \infty\) and \(\sigma : \mathbb{H}^l \rightarrow \mathbb{H}^l\) is invertible, that is, there exists a constant \(C_\sigma > 0\) such that

\[
\|\sigma^{-1}\mathbf{u}\|_H \leq C_\sigma\|\mathbf{u}\|_H, \quad \text{for all } \mathbf{u} \in \mathbb{H}^l.
\]

(2.19)

In this work, we choose a large (but fixed) \(N_0\) to make the noise has essential ellipticity effect (see Section 4.5, [18]).
2.7. Global strong solution. In this subsection, we give the definition of a unique global strong solution in the probabilistic sense to the system (2.17).

**Definition 2.8** (Global strong solution). Let \( x \in \mathbb{H} \) be given. An \( \mathbb{H} \)-valued \((\mathcal{F}_t)_{t \geq 0}\)-adapted stochastic process \( u(\cdot) \) is called a strong solution to the system (2.17) if the following conditions are satisfied:

(i) the process \( u \in L^2(\Omega; L^\infty(0, T; \mathbb{H}) \cap L^2(0, T; V)) \cap L^{r+1}(\Omega; L^{r+1}(0, T; \widetilde{L}^{r+1})) \) and \( u(\cdot) \) has a \( \mathbb{V} \cap \widetilde{L}^{r+1} \)-valued modification, which is progressively measurable with continuous paths in \( \mathbb{H} \) and \( u \in C([0, T]; \mathbb{H}) \cap L^2(0, T; V) \cap L^{r+1}(0, T; \widetilde{L}^{r+1}), \mathbb{P}\)-a.s.,

(ii) the following equality holds for every \( t \in [0, T] \), as an element of \( \mathbb{V}' + \widetilde{L}^{r+1} \), \( \mathbb{P}\)-a.s.

\[
\mathbb{u}(t) = \mathbb{u}_0 - \int_0^t [\mu \mathbb{A}(s) + \mathbb{B}(\mathbb{u}(s)) + \beta \mathbb{C}(\mathbb{u}(s))]ds + \int_0^t \sigma d\mathbb{W}(s), \quad (2.20)
\]

(iii) the following Itô formula (energy equality) holds true:

\[
\|\mathbb{u}(t)\|_\mathbb{H}^2 + 2\mu \int_0^t \|\mathbb{u}(s)\|_V^2 ds + 2\beta \int_0^t \|\mathbb{u}(s)\|_{L^{r+1}}^2 ds \\
= \|\mathbb{u}_0\|_\mathbb{H}^2 + \text{Tr}(\sigma\sigma^*)t + 2 \int_0^t (\sigma d\mathbb{W}(s), \mathbb{u}(s)), \quad (2.21)
\]

for all \( t \in [0, T] \), \( \mathbb{P}\)-a.s.

An alternative version of condition (2.20) is to require that for any \( v \in \mathbb{V} \cap \widetilde{L}^{r+1} \):

\[
(\mathbb{u}(t), \mathbb{v}) = (\mathbb{u}_0, \mathbb{v}) - \int_0^t \langle \mu \mathbb{A}(s) + \mathbb{B}(\mathbb{u}(s)) + \beta \mathbb{C}(\mathbb{u}(s)), \mathbb{v} \rangle ds + \int_0^t (\sigma d\mathbb{W}(s), \mathbb{v}), \mathbb{P}\)-a.s. \quad (2.22)

**Definition 2.9.** A strong solution \( \mathbb{u}(\cdot) \) to (2.17) is called a pathwise unique strong solution if \( \hat{\mathbb{u}}(\cdot) \) is an another strong solution, then

\[
\mathbb{P}\{\omega \in \Omega : \mathbb{u}(t) = \hat{\mathbb{u}}(t), \text{ for all } t \in [0, T]\} = 1.
\]

**Theorem 2.10** (Theorem 3.7, [32]). Let \( x \in \mathbb{H} \), for \( r \geq 3 \) be given \((2\beta\mu \geq 1, \text{ for } n = r = 3)\). Then there exists a pathwise unique strong solution \( \mathbb{u}(\cdot) \) to the system (2.17) such that

\[
\mathbb{u} \in L^2(\Omega; L^\infty(0, T; \mathbb{H}) \cap L^2(0, T; V)) \cap L^{r+1}(\Omega; L^{r+1}(0, T; \widetilde{L}^{r+1})),
\]

with \( \mathbb{P}\)-a.s., continuous trajectories in \( \mathbb{H} \) satisfying

\[
\mathbb{E}\left[ \sup_{t \in [0,T]} \|\mathbb{u}(t)\|_\mathbb{H}^2 + 2\mu \int_0^T \|\mathbb{u}(t)\|_V^2 dt + 2\beta \int_0^T \|\mathbb{u}(t)\|_{L^{r+1}}^2 dt \right] \leq C(\|x\|_\mathbb{H}^2 + \text{Tr}(\sigma\sigma^*)T). \quad (2.23)
\]

**Remark 2.11** ([9], [32]). For \( n = 2 \) and \( r \in [1, 3] \), we know that \( \mathbb{V} \cap \widetilde{L}^{r+1} = \mathbb{V} \) and using Gagliardo-Nirenberg interpolation inequality, we get \( C([0, T]; \mathbb{H}) \cap L^2(0, T; V) \subset L^{r+1}(0, T; \widetilde{L}^{r+1}) \).

In this case, the regularity of \( \mathbb{u}(\cdot) \) given in Theorem 2.10 becomes

\[
\mathbb{u} \in L^4(\Omega; L^\infty(0, T; \mathbb{H})) \cap L^2(0, T; V)) \cap L^{r+1}(\Omega; L^{r+1}(0, T; \widetilde{L}^{r+1})),
\]
with a $\nabla \cap \tilde{\mathbb{L}}^{r+1}$-valued modification having paths in $u \in C([0, T]; \mathbb{H}) \cap L^2(0, T; \mathbb{V})$, $\mathbb{P}$-a.s., satisfying
\[
\mathbb{E}\left[\sup_{t \in [0, T]}\|u(t)\|^2_H + 4\mu \int_0^T \|u(t)\|^2_H \|u(t)\|^2_V dt + 4\beta \int_0^T \|u(t)\|^2_H \|u(t)\|_{L^{r+1}} dt\right] 
\leq C(\|x\|^4_H + \text{Tr}(\sigma\sigma^*)^2 T^2).
\]

(2.24)

3. Asymptotic log-Harnack inequality

In this section, we establish the asymptotic log-Harnack inequality for the transition semigroup associated with the stochastic convective Brinkman-Forchheimer equations (2.17) and discuss about its consequences. Asymptotic log-Harnack inequality for stochastic 2D hydrodynamical-type systems with degenerate noise is obtained in [20] and we mainly follow this work to obtain our main results.

For any $x, y \in \mathbb{H}$ and $f : \mathbb{H} \to \mathbb{R}$, we denote
\[
\|\nabla f(x)\|_H := \limsup_{\|x - y\|_H \to 0} \frac{|f(x) - f(y)|}{\|x - y\|_H}, \quad \text{and} \quad \|f\|_\infty := \sup_{x \in \mathbb{H}} \|\nabla f(x)\|_H.
\]

We define
\[
\text{Lip}(\mathbb{H}) := \{f : \mathbb{H} \to \mathbb{R} : \|\nabla f\|_\infty < \infty\},
\]

as the set of all Lipschitz continuous functions on $\mathbb{H}$. We denote $u(t, x)$ as the unique strong solution of (2.17) with the initial data $x \in \mathbb{H}$, and the associated Markov semigroup as
\[
P_t f(x) := \mathbb{E}[f(u(t, x))], \quad t \geq 0,
\]

where $f$ is a bounded measurable function on $\mathbb{H}$. We denote $\mathcal{B}_b(\mathbb{H}) := \{f : \mathbb{H} \to \mathbb{R} : f \text{ is bounded measurable}\}$ and $\mathcal{B}_b^+(\mathbb{H}) := \{f \in \mathcal{B}_b(\mathbb{H}) : f \geq 0\}$ (see [11]). Let us now give the definition of asymptotically strong Feller semigroup introduced Hairer and Mattingly in [18] (see Definition 3.8). We denote $\mathcal{U}_x$ as the collection of all open sets $U$ containing $x$ and indicator function as $\chi_A(\cdot)$, for any measurable set $A \subset \mathbb{H}$.

**Definition 3.1.** A Markov transition semigroup $P_t$ on a Polish space $X$ is asymptotically strong Feller at $x \in X$, if there exists a totally separating system of pseudo-metrics $\{d_n\}_{n \geq 1}$ for $X$ and a sequence $t_n > 0$ such that
\[
\inf_{U \in \mathcal{U}_x} \limsup_{n \to \infty} \sup_{y \in U} d_n(P_{t_n}(x, \cdot), P_{t_n}(y, \cdot)) = 0,
\]

where $P_{t}(x, A) = P_{t}\chi_A(x)$, for any $x \in X$ and measurable set $A \subset X$. The semigroup $P_t$ is called asymptotically strong Feller if it is asymptotically strong Feller at any $x \in X$.

For the definition of totally separating system of pseudo-metrics, interested readers are referred to see [18]. From Definition 2.2, [11], we know that the following inequality is called an asymptotic log-Harnack inequality for the transition semigroup $P_t$:
\[
P_t \log f(y) \leq P_t \log f(x) + \Phi(x, y) + \Psi_t(x, y)\|\nabla \log f\|_\infty, \quad t > 0,
\]

for any $f \in \mathcal{B}_b^+(\mathbb{H})$ with $\|\nabla \log f\|_\infty < \infty$, where $\Phi, \Psi_t : \mathbb{H} \times \mathbb{H} \to (0, \infty)$ are measurable with $\Psi_t \downarrow 0$ as $t \uparrow \infty$. 
3.1. The case \( n = 2 \) and \( r \in [1, 3] \). Let us now state and prove our main result on the asymptotic log-Harnack inequality for the transition semigroup \( P_t \) associated with the SCBF equations (2.17) for the case \( n = 2 \) and \( r \in [1, 3] \).

**Theorem 3.2.** Let \( n = 2 \) and \( r \in [1, 3] \) and \( u(t, x) \) be the unique strong solution to the system (2.17) with the initial data \( x \in \mathbb{H} \). Suppose that the noise co-efficient \( \sigma \) satisfies Assumption 2.6 and

\[
\lambda_1 \mu^3 \geq 8 \text{Tr}(\sigma \sigma^*).
\]

Then, for any \( x, y \in \mathbb{H} \) and for any \( f \in \mathcal{B}^+_n(\mathbb{H}) \) with \( \|\nabla \log f\|_\infty < \infty \), we have the following asymptotic log-Harnack inequality:

\[
P_t \log f(y) \leq \log P_t f(x) + \gamma e^{k \|y\|_\mathbb{H}^2} \|x - y\|_\mathbb{H}^2 + 2e^{-\theta t} e^{k \|y\|_\mathbb{H}^2} \|x - y\|_\mathbb{H} \|\nabla \log f\|_\infty, \quad t > 0,
\]

where the constants \( k \leq \frac{\lambda_1 \mu}{4 \text{Tr}(\sigma \sigma^*)} \), \( \theta = \frac{\mu \lambda_0 - k \text{Tr}(\sigma \sigma^*)}{2} \) and \( \gamma = \frac{\mu^2 C_0^2 \lambda_0^2}{4 \mu \lambda_0 - k \text{Tr}(\sigma \sigma^*)} \).

Applying Theorem 2.1, [4], similar results obtained in Corollary 3.1, [20], we have the following corollary.

**Corollary 3.3.** Under the assumptions of Theorem 3.2, we have

1. **Gradient estimate.** For any \( y \in \mathbb{H} \), \( t > 0 \) and \( f \in \text{Lip}_b(\mathbb{H}) := \text{Lip}(\mathbb{H}) \cap \mathcal{B}_b(\mathbb{H}) \), we have

\[
\|\nabla P_t f(y)\|_\mathbb{H} \leq \sqrt{2 \gamma e^{k \|y\|_\mathbb{H}^2}\sqrt{P_t f^2(y) - (P_t f)^2(y)} + 2e^{-\theta t + k \|y\|_\mathbb{H}^2} \|\nabla f\|_\infty}.
\]

In particular, \( P_t \) is asymptotically strong Feller.

2. **Asymptotic irreducibility.** Let \( y \in \mathbb{H} \) and \( A \subset \mathbb{H} \) be a measurable set such that

\[
\delta(y, A) := \lim_{t \to \infty} \inf P_t(y, A) > 0.
\]

Then, we have

\[
\lim_{t \to \infty} \inf P_t(x, A_\varepsilon) > 0, \quad \text{for any } x \in \mathbb{H}, \ varepsilon > 0,
\]

where \( A_\varepsilon := \{ x \in \mathbb{H} : \rho(x, A) < \varepsilon \} \) with \( \rho(x, A) := \inf \|x - z\|_\mathbb{H} \). Furthermore, for any \( \varepsilon_0 \in (0, \delta(y, A)) \), there exists a constant \( t_0 > 0 \) such that

\[
P_t(x, A_\varepsilon) > 0, \quad \text{provided } t \geq t_0 \text{ and } 2e^{-\theta t + k \|y\|_\mathbb{H}^2} \|x - y\|_\mathbb{H} < \varepsilon \varepsilon_0.
\]

3. **Asymptotic heat kernel estimate.** If \( P_t \) has an invariant probability measure \( \nu \), then for any \( f \in \mathcal{B}^+_b(\mathbb{H}) \) with \( \|\nabla f\|_\infty < \infty \), we have

\[
\limsup_{t \to \infty} P_t f(y) \leq \log \left( \frac{\nu(e_f)}{\int_\mathbb{H} e^{-\gamma e^{k \|y\|_\mathbb{H}^2} \|x - y\|_\mathbb{H}^2} \nu(dx)} \right), \quad y \in \mathbb{H}.
\]

Consequently, for any closed set \( A \subset \mathbb{H} \) with \( \nu(A) = 0 \), we have

\[
\lim_{t \to \infty} P_t \chi_A(y) = 0, \quad \text{for all } y \in \mathbb{H}.
\]

4. **Uniqueness of invariant probability measure.** The Markovian transition semigroup \( P_t \) has at most one invariant probability measure.
As discussed in [20], we prove Theorem 3.2 and Corollary 3.3 via coupling method by change of measures in infinite dimensional spaces. Given any \( y \in \mathbb{H} \), let us construct an auxiliary process \( v(\cdot) \) by the following equation:

\[
\begin{aligned}
    dv(t) + [\mu A v(t) + B(v(t)) + \beta C(v(t))]dt &= \sigma dW(t) + \frac{\mu \lambda N_0}{2}(u(t) - v(t))^t dt, \\
v(0) &= y.
\end{aligned}
\] (3.3)

The system (3.3) can be interpreted as the system (2.17) with an additional control term. Or in other words, one can treat the system (3.3) as an analogue of the system (2.17) with the operator \( A \) replaced by \( A := A + \frac{\mu \lambda N_0}{2} P_{N_0} \), and an additional term \(-\frac{\mu \lambda N_0}{2} P_{N_0} u\). Using similar arguments as in Remark 8, [23], we can use Girsanov’s theorem to prove that the strong solution of the system (3.3) is uniquely defined. Furthermore, one can write the system (3.3) in the form (2.17) with \( x \) changed to \( y \) and \( W(t) \) changed to

\[
\tilde{W}(t) := W(t) + \int_0^t h(s)ds, \quad h(t) := \frac{\mu \lambda N_0}{2}\sigma^{-1}(u(t) - v(t))^t, \quad t \geq 0,
\]

where \( \sigma \) is defined in the Assumption 2.6. Let us now define

\[
\Phi(t) := \exp\left\{ -\int_0^t (h(s), dW(s)) - \frac{1}{2} \int_0^t \|h(s)\|_H^2ds \right\}. \tag{3.4}
\]

Using Girsanov’s theorem, we conclude that \( \{\tilde{W}(t)\}_{t \geq 0} \) is a Wiener process on \( \mathbb{H} \) under the weighted probability measure \( \tilde{P} \) and is uniquely defined by

\[
\frac{d\tilde{P}}{dP}|_{\mathcal{F}_t} := \Phi(t), \quad t \geq 0. \tag{3.5}
\]

Next, we rewrite the systems (2.17) and (3.3) as

\[
\begin{aligned}
    du(t) + [\mu A u(t) + B(u(t)) + \beta C(u(t))]dt &= \sigma dW(t), \\
v(t) + [\mu A v(t) + B(v(t)) + \beta C(v(t))]dt &= \sigma dW(t) + \frac{\mu \lambda N_0}{2}(u(t) - v(t))^t dt, \tag{3.6}
\end{aligned}
\]

with initial values \( u(0) = x \) and \( v(0) = y \), respectively. With the above setting, we have the following estimate:

**Lemma 3.4.** For any \( k \leq \frac{\lambda \mu}{4 \Gamma (\sigma^*)} \), we have

\[
\begin{aligned}
    \mathbb{E}\left\{ \exp \left[ k \sup_{t \geq 0} \left( \|u(t)\|_H^2 + \mu \int_0^t \|u(s)\|_H^2 ds + 2\beta \int_0^t \|u(s)\|_{L_{t+1}}^{r+1} ds - \operatorname{Tr}(\sigma \sigma^*) t \right) \right] \right\} \\
    &\leq 2 \exp \left( k \|x\|_H^2 \right), \tag{3.7}
\end{aligned}
\]

and

\[
\begin{aligned}
    \mathbb{E}_{\tilde{P}}\left\{ \exp \left[ k \sup_{t \geq 0} \left( \|v(t)\|_H^2 + \mu \int_0^t \|v(s)\|_H^2 ds + 2\beta \int_0^t \|v(s)\|_{L_{t+1}}^{r+1} ds - \operatorname{Tr}(\sigma \sigma^*) t \right) \right] \right\} \\
    &\leq 2 \exp \left( k \|y\|_H^2 \right). \tag{3.8}
\end{aligned}
\]

**Proof.** Let us define

\[
M(t) := 2 \int_0^t (\sigma dW(s), u(s)). \tag{3.9}
\]
Then, it can be easily seen that $M(t)$ is a continuous martingale and a bound for its quadratic variation process is given by

$$
\langle M \rangle(t) = 4 \int_0^t \text{Tr}(\sigma\sigma^* u(s) \otimes u(s)) ds \leq 4 \text{Tr}(\sigma\sigma^*) \int_0^t \|u(s)\|_{H^2}^2 ds
$$

$$
\leq \frac{4}{\lambda_1} \text{Tr}(\sigma\sigma^*) \int_0^t \|u(s)\|_{H^2}^2 ds,
$$

(3.10)

where we used Poincaré’s inequality. Let us set $k_0 := \frac{\lambda_1 \mu}{2 \text{Tr}(\sigma\sigma^*)}$ and $M_{k_0}(t) := M(t) - \frac{k_0}{2} \langle M \rangle(t)$. An application of the infinite dimensional Itô formula to the process $\|u(\cdot)\|_{H^2}^2$ (see [32]) yields

$$
\|u(t)\|_{H^2}^2 + 2\mu \int_0^t \|u(s)\|_{H^2}^2 ds + 2\beta \int_0^t \|u(s)\|_{L^{r+1}}^2 ds
$$

$$
= \|x\|_{H^2}^2 + \text{Tr}(\sigma\sigma^*) t + 2 \int_0^t (u(s), \sigma dW(s)),
$$

(3.11)

for all $t \in [0, T]$, $\mathbb{P}$-a.s. From (3.11), we infer that

$$
\|u(t)\|_{H^2}^2 + \mu \int_0^t \|u(s)\|_{H^2}^2 ds + 2\beta \int_0^t \|u(s)\|_{L^{r+1}}^2 ds
$$

$$
= \|x\|_{H^2}^2 - \mu \int_0^t \|u(s)\|_{H^2}^2 ds + \text{Tr}(\sigma\sigma^*) t + M(t)
$$

$$
= \|x\|_{H^2}^2 + \text{Tr}(\sigma\sigma^*) t + M_{k_0}(t) + \frac{k_0}{2} \langle M \rangle(t) - \mu \int_0^t \|u(s)\|_{H^2}^2 ds
$$

$$
\leq \|x\|_{H^2}^2 + \text{Tr}(\sigma\sigma^*) t + M_{k_0}(t) + \left( \frac{2k_0}{\lambda_1} \text{Tr}(\sigma\sigma^*) - \mu \right) \int_0^t \|u(s)\|_{H^2}^2 ds
$$

$$
\leq \|x\|_{H^2}^2 + \text{Tr}(\sigma\sigma^*) t + M_{k_0}(t),
$$

(3.12)

where we used (3.10). Note that $e^{k_0 M_{k_0}(\cdot)}$ is a supermartingale and using the maximal supermartingale inequality, we get

$$
\mathbb{P}\left\{ \sup_{t \geq 0} M_{k_0}(t) \geq y \right\} = \mathbb{P}\left\{ \sup_{t \geq 0} \exp(k_0 M_{k_0}(t)) \geq e^{k_0 y} \right\} \leq e^{-k_0 y} \mathbb{E}\{ \exp(k_0 M_{k_0}(T)) \} = e^{-k_0 y}.
$$

(3.13)

For $k \leq \frac{k_0}{2}$, the above inequality implies

$$
\mathbb{E}\left\{ \exp\left( k \sup_{t \geq 0} M_{k_0}(t) \right) \right\} = 1 + k \int_0^\infty e^{ky} \mathbb{P}\left\{ \sup_{t \geq 0} M_{k_0}(t) \geq y \right\} dy \leq 2,
$$

(3.14)

using (3.13). Thus, from (3.12), it is immediate that

$$
\mathbb{E}\left\{ \exp\left[ k \sup_{t \geq 0} \left( \|u(t)\|_{H^2}^2 + \mu \int_0^t \|u(s)\|_{H^2}^2 ds + 2\beta \int_0^t \|u(s)\|_{L^{r+1}}^2 ds \right) \right] \right\}
$$

$$
\leq \exp(k \|x\|_{H^2}^2) \exp\left( k \sup_{t \geq 0} \text{Tr}(\sigma\sigma^*) t \right) \mathbb{E}\left\{ \exp\left( k \sup_{t \geq 0} M_{k_0}(t) \right) \right\},
$$

(3.15)

and the inequality (3.7) follows by using (3.14). The inequality (3.8) can be obtained in a similar way.
Lemma 3.5. Let us assume that $\lambda_1\mu^3 \geq 8 \text{Tr}(\sigma\sigma^*)$. Then, there exists a constant $k \leq \frac{\lambda_1}{4 \text{Tr}(\sigma\sigma^*)}$ such that the asymptotic coupling $(u(\cdot), v(\cdot))$ given in (3.6) satisfies:

$$\mathbb{E}_x \|u(t) - v(t)\|_{H^2}^2 \leq 2e^{-\theta t}e^{|\|
u\|_{H^2}|} \|x - y\|_{H^2}^2, \quad t \geq 0,$$

(3.16)

where $\theta = \frac{1}{2}(\lambda N_0 - k \text{Tr}(\sigma\sigma^*))$.

Proof. Note that $w(\cdot) := u(\cdot) - v(\cdot)$ satisfies the following Itô stochastic differential:

$$\begin{align*}
dw(t) + [\mu w(t) + B(u(t)) - B(v(t)) + \beta(C(u(t)) - C(v(t)))]dt &= -\frac{\mu N_0}{2} (w(t))^t dt, \\
w(0) &= x - y.
\end{align*}$$

(3.17)

Taking inner product with $w(\cdot)$ to the first equation in (3.17), we find

$$\begin{align*}
\frac{d}{dt} \|w(t)\|_{H^2}^2 + 2\mu \|w(t)\|_{V}^2 &= -2\langle B(u(t)) - B(v(t)), w(t) \rangle - 2\beta \langle C(u(t)) - C(v(t)), w(t) \rangle - \mu N_0 \langle P_{N_0} w(t), w(t) \rangle,
\end{align*}$$

(3.18)

for a.e. $t \in [0, T]$. Using Ladyzhenskaya’s, H"older’s and Young’s inequalities, we estimate

$$-2\langle B(u) - B(v), w \rangle = -2\langle B(w), w \rangle \leq 2\|v\|_V \|w\|_{L^2} \leq 2\sqrt{2}\|v\|_V \|w\|_H \|w\|_V$$

$$\leq \mu \|w\|_V^2 + \frac{2}{\mu} \|v\|_V^2 \|w\|_H^2. \quad (3.19)$$

Using (2.11), we have

$$-2\beta \langle C(u) - C(v), w \rangle \leq -\frac{\beta}{2r-2} \|w\|_{L^{r+1}}^r, \quad \text{for } r \geq 1. \quad (3.20)$$

Substituting (3.19) and (3.20) in (3.18), we obtain

$$\begin{align*}
\frac{d}{dt} \|w(t)\|_{H^2}^2 + \frac{\beta}{2r-2} \|w(t)\|_{H^{r+1}}^r &\leq \frac{2}{\mu} \|v(t)\|_V^2 \|w(t)\|_{H^2}^2 - (\mu \|w(t)\|_V^2 + \mu N_0 \|P_{N_0} w(t)\|_H^2).
\end{align*}$$

(3.21)

Using (2.18), we estimate the final term from the right hand side of the inequality (3.21) as

$$\begin{align*}
\mu \|w\|_V^2 + \mu N_0 \|P_{N_0} w\|_H^2 &\geq \mu \|I - P_{N_0}\| \|w\|_V^2 + \mu N_0 \|P_{N_0} w\|_H^2 \\
&\geq \mu N_0 \|(I - P_{N_0}) w\|_H^2 + \mu N_0 \|P_{N_0} w\|_H^2 \\
&= \mu N_0 \|w\|_{H}^2. \quad (3.22)
\end{align*}$$

Applying (3.22) in (3.21), we obtain

$$\begin{align*}
\frac{d}{dt} \|w(t)\|_{H^2}^2 + \mu N_0 \|w(t)\|_H^2 &\leq \frac{2}{\mu} \|v(t)\|_V^2 \|w(t)\|_{H^2}^2.
\end{align*}$$

(3.23)

An application of Gronwall’s inequality yields

$$\|w(t)\|_{H^2}^2 \leq \|w(0)\|_{H^2}^2 e^{-\mu N_0 t} \exp \left( \frac{2}{\mu} \int_0^t \|v(s)\|_V^2 \, ds \right),$$

(3.24)
for all $t \in [0, T]$. Since $\lambda_1 \mu^3 \geq 8 \text{Tr}(\sigma^*)$, there exists a constant $k \leq \frac{\lambda_1 \mu}{4 \text{Tr}(\sigma^*)}$ such that

$$
\mathbb{E}_P \|w(t)\|_H^2 \leq \|x - y\|_H^2 e^{-\lambda N_0 t} \mathbb{E}_P \left[ \exp \left( \frac{2}{\mu} \int_0^t \|v(s)\|_H^2 ds \right) \right] 
\leq 2\|x - y\|_H^2 e^{k \|y\|_H^2} \exp \left\{ - (\mu \lambda N_0 - k \text{Tr}(\sigma^*)) t \right\},
$$

where we used Lemma 3.6 (see (3.8)). It should be noted that $\{\lambda_k\}_{k=1}^\infty$ is an unbounded increasing sequence, and thus we can choose $N_0$ large enough so that $\mu \lambda N_0 > k \text{Tr}(\sigma^*)$. Hence, the estimate (3.16) follows.

In order to prove our main Theorem (see Theorem 3.2), we need the following inequality (see Lemma 2.4, [2]).

**Lemma 3.6.** Let $f \geq 0$ with $\mathbb{E}[f] > 0$. Then, for any measurable function $g$, we have

$$
\mathbb{E}[fg] \leq \mathbb{E}[f] \log \mathbb{E}[e^g] + \mathbb{E}[f \log f] - \mathbb{E}[f] \log \mathbb{E}[f].
$$

**Proof of Theorem 3.2.** Using the uniqueness of strong solution to the system (3.3), we have

$$
P_t[f(y)] = \mathbb{E}_P[f(v(t, y))], \quad t \geq 0, \quad y \in \mathbb{H},
$$

for all $f \in \mathcal{B}_b(\mathbb{H})$. Thus, for any $f \in \mathcal{B}_b^+(\mathbb{H})$ with $\|\nabla \log f\|_\infty < \infty$, by using the definition of $\|\nabla \log f\|_\infty$, (3.26) and (3.16), we get

$$
P_t[\log f(y)] = \mathbb{E}_P[\log f(v(t, y))] = \mathbb{E}_P[\log f(u(t, x))] + \mathbb{E}_P[\log f(v(t, y)) - \log f(u(t, x))] 
\leq \mathbb{E}[\Phi(t) \log f(u(t, x))] + \|\nabla \log f\|_\infty \mathbb{E}_P[\|u(t, x) - v(t, y)\|_H] 
\leq \mathbb{E}[\Phi(t) \log f(u(t, x))] + \|\nabla \log f\|_\infty \mathbb{E}_P[\|u(t, x) - v(t, y)\|_H^2]^{1/2} 
\leq \mathbb{E}[\Phi(t) \log f(t)] + \log P_t f(x) + 2e^{\theta t} e^{k \|y\|_H^2} \|x - y\|_H \|\nabla \log f\|_\infty. \tag{3.28}
$$

Using Fubini's theorem, (2.19) and (3.16), we estimate $\mathbb{E}[\Phi(t) \log f(t)]$ as

$$
\mathbb{E}[\Phi(t) \log f(t)] = \mathbb{E}_P[\log f(t)] = \frac{\mu^2 \lambda^2 N_0}{8} \mathbb{E}_P \left[ \int_0^t \|\sigma^{-1}(u(s) - v(s))\|_H^2 ds \right] 
\leq \frac{C^2 \mu^2 \lambda^2 N_0}{8} \int_0^t \mathbb{E}_P[\|u(s) - v(s)\|_H^2] ds 
\leq \frac{C^2 \mu^2 \lambda^2 N_0}{4(\mu \lambda N_0 - k \text{Tr}(\sigma^*))} e^{k \|y\|_H^2} \|x - y\|_H^2. \tag{3.29}
$$

Hence (3.1) follows by applying (3.28) in (3.29). \qed

**Proof of Corollary 3.3.** Let us define

$$
\Theta(x, y) = \gamma e^{k \|y\|_H^2} \|x - y\|_H^2 \quad \text{and} \quad \Psi_t(x, y) = 2e^{-\theta t} e^{k \|y\|_H^2} \|x - y\|_H.
$$

From Theorem 2.1, [4], we know that if $P_t$ satisfies (3.1) and $\Theta, \Psi_t : \mathbb{H} \times \mathbb{H} \to \mathbb{R}^+$ are symmetric with $\Psi_t \downarrow 0$ as $t \to \infty$, then we arrive at the assertions given in Corollary 3.3 provided we prove the existence of an invariant measure for the transition semigroup $\{P_t\}_{t \geq 0}$. We use the standard Krylov-Bogoliubov approach to obtain the existence of an invariant measure (see [10]). Let us define

$$
\nu_n := \frac{1}{n} \int_0^n \delta_0 P_t dt, \quad n \geq 1,
$$
where \( \delta_0 \) is a Dirac measure at \( 0 \in \mathbb{H} \). It is clear that each \( \mu_n \) is a probability measure. Let \( u(t, x) \) be the unique strong solution of the system \((2.17)\) with the initial data \( x \in \mathbb{H} \). Then, a calculation similar to \((3.21)\) yields
\[
\frac{d}{dt} \|u(t, x) - u(t, y)\|_E^2 + \mu \|u(t, x) - u(t, y)\|_H^2 + \frac{\beta}{2r-2} \|u(t, x) - u(t, y)\|_{E^{r+1}}^{r+1}
\leq \frac{2}{\mu} \|u(t, x)\|_H^2 \|u(t, x) - u(t, y)\|_H^2.
\]
(3.30)

An application of Gronwall’s inequality in \((3.30)\) yields
\[
\|u(t, x) - u(t, y)\|_E^2 \leq \|x - y\|_E^2 \exp \left( \frac{2}{\mu} \int_0^t \|u(s, x)\|_H^2 ds \right).
\]
(3.31)

From Theorem 2.10, we infer that \( \mathbb{E} \left( \int_0^t \|u(s, x)\|_H^2 ds \right) < \infty \), which together with \((3.31)\) implies that the transition semigroup \( \{P_t\}_{t \geq 0} \) is a Feller semigroup. Thus, in order to prove the existence of an invariant measure for \( \{P_t\}_{t \geq 0} \), we only need to prove the tightness of the measure \( \{\nu_n : n \geq 1\} \). Applying the infinite dimensional Itô formula to the process \( \|u(\cdot, x)\|_E^2 \) and then taking expectation, we obtain
\[
\mathbb{E} \left[ \|u(t)\|_E^2 + 2\mu \int_0^t \|u(s)\|_H^2 ds + 2\beta \int_0^t \|u(s)\|_{E^{r+1}}^{r+1} ds \right] = \|x\|_E^2 + \text{Tr}(\sigma\sigma^*)t,
\]
(3.32)

for all \( t \in [0, T] \). Thus, it is immediate that
\[
\nu_n(\|\cdot\|_E^2) = \frac{1}{n} \int_0^n \mathbb{E}[\|u(t, 0)\|_E^2] dt = \frac{\text{Tr}(\sigma\sigma^*)}{2\mu}.
\]
(3.33)

Note also that \( \nu_n(\|\cdot\|_{E^{r+1}}^{r+1}) = \frac{\text{Tr}(\sigma\sigma^*)}{2\mu} \). We know that the embedding of \( V \subset \mathbb{H} \) is compact and hence for any \( K \in (0, \infty) \), the set \( \{x \in \mathbb{H} : \|x\|_V \leq K\} \) is relatively compact in \( \mathbb{H} \). Thus, the inequality \((3.33)\) implies that \( \{\nu_n\}_{n \geq 1} \) is tight. Hence, using Prohorov’s theorem there exists a probability measure \( \nu \) and a subsequence \( \{\nu_{n_k}\}_{k \in \mathbb{N}} \) such that \( \nu_{n_k} \rightharpoonup \nu \), as \( k \to \infty \). One can easily show that \( \nu \) is an invariant probability measure for \( \{P_t\}_{t \geq 0} \). Thus, by the Krylov-Bogoliubov theorem (or by a result of Chow and Khasminskii see [8]), \( \nu \) results to be an invariant measure for the transition semigroup \( \{P_t\}_{t \geq 0} \), defined by \( P_t \varphi(x) = \mathbb{E}[\varphi(u(t, x))] \), for all \( \varphi \in C_b(\mathbb{H}) \), where \( u(\cdot) \) is the unique strong solution of the system \((2.17)\) with the initial condition \( x \in \mathbb{H} \).

\( \square \)

3.2. The cases \( n = 2, 3 \) and \( r \in (3, \infty) \). In this subsection, we state and prove the results analogous to Theorem 3.2 and Corollary 3.3 for the cases \( n = 2, 3 \) and \( r \in (3, \infty) \). The main results of this subsection are the following:

**Theorem 3.7.** Let \( n = 2, 3 \), \( r \in (3, \infty) \) and \( u(t, x) \) be the unique strong solution to the system \((2.17)\) with the initial data \( x \in \mathbb{H} \). Suppose that the noise co-efficient \( \sigma \) satisfies the Assumption 2.0. Then, for any \( x, y \in \mathbb{H} \) and for any \( f \in \mathcal{B}_b^r(\mathbb{H}) \) with \( \|\nabla \log f\|_\infty < \infty \), we have the following asymptotic log-Harnack inequality:
\[
P_t \log f(y) \leq \log P_t f(x) + \tilde{\gamma} \|x - y\|_H + e^{-\theta t} \|x - y\|_H \|\nabla \log f\|_\infty, \quad t > 0,
\]
(3.34)

where the constants \( \tilde{\theta} = \frac{1}{2} \left( \mu \lambda N_0 - \frac{r-3}{\mu(r-1)} \left( \frac{2}{\beta \mu(r-1)} \right)^{r-3} \right) \) and \( \tilde{\gamma} = \frac{C_0^2 \mu^2 \lambda N_0}{s \left( \mu \lambda N_0 - \frac{r-3}{\mu(r-1)} \left( \frac{2}{\beta \mu(r-1)} \right)^{r-3} \right)} \).
For $n = 3$, $r = 3$ and $\beta \mu > 1$, we have the following asymptotic log-Harnack inequality:

$$P_t \log f(y) \leq \log P_t f(x) + \frac{C_n^2 \mu \lambda N_0}{8} \|x - y\|_H^2 + e^{-\frac{\mu \lambda N_0 t}{2}} \|x - y\|_H \|\nabla \log f\|_\infty, \quad t > 0, \quad (3.35)$$

Analogous to Corollary 3.3, we have the following result for $n = 2, 3$ and $r \in (3, \infty)$. For the case $n = 3$, $r = 3$ and $\beta \mu > 1$, one has to replace $\tilde{\theta}$ with $\frac{\mu \lambda N_0}{2}$ and $\tilde{\gamma}$ with $\frac{C_n^2 \mu \lambda N_0}{8}$ in the Corollary given below.

**Corollary 3.8.** Under the assumptions of Theorem 3.2, we have

1. **Gradient estimate.** For any $y \in \mathbb{H}$, $t > 0$ and $f \in \text{Lip}_b(\mathbb{H}) := \text{Lip}(\mathbb{H}) \cap B_b(\mathbb{H})$, we have

   $$\|\nabla P_t f(y)\|_H \leq \sqrt{\tilde{\gamma}} \sqrt{P_t f^2(y) - (P_t f)^2(y)} + e^{-\tilde{\theta} t} \|\nabla f\|_\infty. \quad (3.36)$$

   In particular, $P_t$ is asymptotically strong Feller.

2. **Asymptotic irreducibility.** Let $y \in \mathbb{H}$ and $A \subset \mathbb{H}$ be a measurable set such that

   $$\delta(y, A) := \liminf_{t \to \infty} P_t(y, A) > 0.$$  

   Then, we have

   $$\liminf_{t \to \infty} P_t(x, A_\varepsilon) > 0, \quad \text{for any } x \in \mathbb{H}, \varepsilon > 0,$$

   where $A_\varepsilon := \{x \in \mathbb{H} : \rho(x, A) < \varepsilon\}$ with $\rho(x, A) := \inf_{z \in A} \|x - z\|_H$. Furthermore, for any $\varepsilon_0 \in (0, \delta(y, A))$, there exists a constant $t_0 > 0$ such that

   $$P_t(x, A_\varepsilon) > 0, \quad \text{provided } t \geq t_0 \quad \text{and} \quad e^{-\tilde{\theta} t} \|x - y\|_H < \varepsilon_0.$$  

3. **Asymptotic heat kernel estimate.** If $P_t$ has an invariant probability measure $\nu$, then for any $f \in B_b^+(\mathbb{H})$ with $\|\nabla f\|_\infty < \infty$, we have

   $$\limsup_{t \to \infty} P_t f(y) \leq \log \left( \frac{\nu(e^f)}{\int_{\mathbb{H}} e^{-\tilde{\gamma} \|x - y\|_H^2} \nu(dx)} \right), \quad y \in \mathbb{H}.$$  

   Consequently, for any closed set $A \subset \mathbb{H}$ with $\nu(A) = 0$, we have

   $$\lim_{t \to \infty} P_t \chi_A(y) = 0, \quad \text{for all } y \in \mathbb{H}.$$  

4. **Uniqueness of invariant probability measure.** The Markovian transition semi-group $P_t$ has at most one invariant probability measure.

We begin with the following Lemma, which is analogous to Lemma 3.5.

**Lemma 3.9.** For $n = 2, 3$ and $r \in (3, \infty)$, the asymptotic coupling $(u(\cdot), v(\cdot))$ given in (3.6) satisfies:

$$\mathbb{E}_x \left[ \|u(t) - v(t)\|_H^2 \right] \leq e^{-\tilde{\theta} t} \|x - y\|_H^2, \quad t \geq 0, \quad (3.37)$$

where $\tilde{\theta} = \left( \mu \lambda N_0 - \frac{r-3}{\mu(r-1)} \left( \frac{2}{\beta \mu(r-1)} \right)^{\frac{r-3}{2}} \right)$.  

For $n = 3$, $r = 3$ and $\beta \mu > 1$, we have

$$\mathbb{E}_x \left[ \|u(t) - v(t)\|_H^2 \right] \leq e^{-\mu \lambda N_0 t} \|x - y\|_H^2, \quad t \geq 0. \quad (3.38)$$
Proof. The case of \( n = 2, 3 \) and \( r \in (3, \infty) \) follows similarly as in the proof of Lemma \( 3.5 \) except for the estimates (3.20) and (3.19). It is important to note that, in these cases, we are not using Lemma \( 3.4 \). From (2.9), we have

\[
-2\beta \langle C(u) - C(v), w \rangle \leq -\beta \|v\|_H^{r-1} \|w\|_H^2. \tag{3.39}
\]

Using Hölder’s and Young’s inequalities, we estimate the term \( 2|\langle (B(u) - B(v)), w \rangle| = 2|\langle B(w, u), w \rangle| \) as

\[
2|\langle B(w, u), w \rangle| \leq 2\|w\|_V \|uw\|_V \leq \mu \|w\|_V^2 + \frac{1}{\mu} \|uw\|_H^2. \tag{3.40}
\]

We take the term \( \|uw\|_H^2 \) from (3.40) and use Hölder’s and Young’s inequalities to estimate it as

\[
\|uw\|_H^2 = \int_\omega |u(x)|^2 |w(x)|^2 \, dx
\]

\[
= \int_\omega |u(x)|^2 |w(x)| \cdot |w(x)| \cdot |w(x)|^{\frac{2(r-3)}{r-1}} \, dx
\]

\[
\leq \left( \int_\omega |u(x)|^r |w(x)|^{\frac{r-1}{r}} \, dx \right)^{\frac{r-1}{r}} \left( \int_\omega |w(x)|^2 \, dx \right)^{\frac{r-1}{2}}
\]

\[
\leq \beta \mu \left( \int_\omega |u(x)|^r |w(x)|^{\frac{r-1}{r}} \, dx \right) + \frac{r-3}{r-1} \left( \frac{2}{\beta \mu (r-1)} \right)^{\frac{r-3}{r-1}} \left( \int_\omega |w(x)|^2 \, dx \right), \tag{3.41}
\]

for \( r > 3 \). Combining (3.39), (3.40) and (3.41), we obtain

\[
-2\beta \langle C(u) - C(v), w \rangle - 2 \langle B(w, u), w \rangle \leq \frac{r-3}{\mu (r-1)} \left( \frac{2}{\beta \mu (r-1)} \right)^{\frac{r-3}{r-1}} \|w\|_V^2, \tag{3.42}
\]

Thus, a calculation similar to (3.23) yields

\[
\frac{d}{dt} \|w(t)\|_H^2 + \mu \lambda_{N_0} \|w(t)\|_H^2 \leq \frac{r-3}{\mu (r-1)} \left( \frac{2}{\beta \mu (r-1)} \right)^{\frac{r-3}{r-1}} \|w(t)\|_H^2, \tag{3.43}
\]

for a.e. \( t \in [0, T] \). For \( \mu^2 \lambda_{N_0} > \frac{r-3}{r-1} \left( \frac{2}{\beta \mu (r-1)} \right)^{\frac{r-3}{r-1}} \), we obtain

\[
\|w(t)\|_H^2 \leq \|w(0)\|_H^2 \exp \left\{ - \left( \mu \lambda_{N_0} - \frac{r-3}{\mu (r-1)} \left( \frac{2}{\beta \mu (r-1)} \right)^{\frac{r-3}{r-1}} \right) t \right\}, \tag{3.44}
\]

for all \( t \in [0, T] \). Taking expectation with respect to \( \mathbb{P} \), we get

\[
\mathbb{E}_\mathbb{P}[\|w(t)\|_H^2] \leq \mathbb{E}_\mathbb{P}[\|w(0)\|_H^2] \exp \left\{ - \left( \mu \lambda_{N_0} - \frac{r-3}{\mu (r-1)} \left( \frac{2}{\beta \mu (r-1)} \right)^{\frac{r-3}{r-1}} \right) t \right\}, \tag{3.45}
\]

and the estimate (3.37) follows. Note that \( \{\lambda_k\}_{k=1}^\infty \) is an unbounded increasing sequence, and thus we can choose \( N_0 \) large enough so that \( \lambda_{N_0} > \frac{(r-3)}{\mu^2 (r-1)} \left( \frac{2}{\beta \mu (r-1)} \right)^{\frac{r-3}{r-1}} \), which completes the proof for \( n = 2, 3 \) and \( r \in (3, \infty) \).

For \( n = r = 3 \), from (2.9), we have

\[
-2\beta \langle C(u) - C(v), w \rangle \leq -\beta \|uw\|_H^2, \tag{3.46}
\]
and a calculation similar to (3.40) gives
\[
2|\langle B(w, u), w \rangle| \leq 2\|w\|_V\|uw\|_H \leq \frac{1}{\beta}\|w\|^2_V + \beta\|uw\|^2_H. \quad (3.47)
\]
Combining (3.46) and (3.47), we obtain
\[
-2\mu\langle A_w, w \rangle - 2\beta\langle C(u) - C(v), w \rangle - 2\langle B(w, u), w \rangle \leq \left(2\mu - \frac{1}{\beta}\right)\|w\|^2_V. \quad (3.48)
\]
Similar to (3.22), we estimate
\[
\left(2\mu - \frac{1}{\beta}\right)\|w\|^2_V + \mu\lambda N_0\|P_{N_0}w\|^2_H \geq \mu\lambda N_0\|\mathbf{I} - P_{N_0}\|w\|^2_H \geq \mu\lambda N_0\|w\|^2_H,
\]
for \(\beta\mu > 1\). Thus, a calculation similar to (3.23) gives
\[
\frac{d}{dt}\|w(t)\|^2_H + \mu\lambda N_0\|w(t)\|^2_H \leq 0,
\]
for a.e. \(t \in [0, T]\) and hence we get
\[
\|w(t)\|^2_H \leq \|w(0)\|^2_H e^{-\mu\lambda N_0 t},
\]
for all \(t \in [0, T]\) and the estimate (3.34) follows. \(\square\)

We are now ready to prove Theorem 3.7 and Corollary 3.8.

**Proof of Theorem 3.7.** For \(n = 2, 3\) and \(r \in (3, \infty)\), one can get a proof in a similar way as that of the proof of Theorem 3.2 except for the estimate
\[
\mathbb{E}[\Phi(t) \log \Phi(t)] \leq \frac{C^2_{\alpha} \mu^2 \lambda^2_{N_0}}{8\left(\mu\lambda N_0 - \frac{r-3}{\mu(r-1)}\right)}\|x - y\|^2_H, \quad (3.52)
\]
for \(\mu^2 \lambda N_0 > \frac{r-3}{\mu(r-1)}\|x - y\|^2_H\) and hence the estimate (3.34) follows. For \(n = r = 3\) and \(\beta\mu > 1\), the above estimate has to be replaced by
\[
\mathbb{E}[\Phi(t) \log \Phi(t)] \leq \frac{C^2_{\alpha} \mu \lambda N_0}{8}\|x - y\|^2_H, \quad (3.53)
\]
and one can easily get the estimate (3.34). \(\square\)

**Proof of Corollary 3.8.** For the cases \(n = 2, 3\) and \(r \in (3, \infty)\), we define
\[
\Theta(x, y) = \tilde{\gamma}\|x - y\|^2_H \quad \text{and} \quad \Psi_t(x, y) = e^{-\tilde{\gamma}t}\|x - y\|_H.
\]
In order to prove the existence of an invariant measure for the transition semigroup \( \{P_t\}_{t \geq 0} \), we can follow similar arguments as in the proof of Corollary 3.3. Here we sketch important steps only. A calculation similar to (3.43) yields
\[
\frac{d}{dt} \| u(t, x) - u(t, y) \|_H^2 + \mu \| u(t, x) - u(t, y) \|_V^2 \\
\leq \frac{r - 3}{\mu (r - 1)} \left( \frac{2}{\beta \mu (r - 1)} \right)^{\frac{2}{r - 3}} \| u(t, x) - u(t, y) \|_H^2,
\]
for a.e. \( t \in [0, T] \). An application Gronwall’s inequality yields
\[
\| u(t, x) - u(t, y) \|_H^2 \leq \| x - y \|_H^2 \exp \left\{ \left( \frac{r - 3}{\mu (r - 1)} \left( \frac{2}{\beta \mu (r - 1)} \right)^{\frac{2}{r - 3}} \right) t \right\},
\]
and proceeding similarly in the proof of Corollary 3.3 we get the required result.

For the case \( n = 3, r = 3 \) and \( \beta \mu > 1 \), we obtain
\[
\| u(t, x) - u(t, y) \|_H^2 \leq e^{-\mu \lambda_1 t} \| x - y \|_H^2,
\]
and the existence of an invariant measure for the transition semigroup \( \{P_t\}_{t \geq 0} \) can be proved in a similar way as in the case of \( n = 2 \) and \( r \in [1, 3] \). \( \square \)

4. The SCBF equations perturbed by multiplicative noise

In this section, we consider the following stochastic convective Brinkman-Forchheimer equations perturbed by degenerate multiplicative Gaussian noise:
\[
\begin{align*}
\frac{d}{dt} & \{ (\mu A u(t) + B(u(t)) + \beta C(u(t))) dt = \sigma(u) dW(t), \ t \in (0, T), \\
u(0) & = x,
\end{align*}
\]
where \( x \in \mathbb{H} \). Due to technical difficulties, we consider the cases \( n = 2, 3 \) and \( r \in [3, \infty) \) only. In the degenerate multiplicative noise case, the asymptotic log-Harnack inequality for several kinds of models on stochastic differential systems with infinite memory is established in [4] and for a class of semilinear SPDEs is obtained in [21].

Let \( \mathcal{L}_2(\mathbb{H}) = \mathcal{L}_2(\mathbb{H}, \mathbb{H}) \) be the space of all Hilbert-Schmidt operators from \( \mathbb{H} \) to \( \mathbb{H} \). We need the following assumptions on the noise coefficient to obtain our main results.

**Assumption 4.1.** (A1) The mapping \( \sigma : \mathbb{V} \to \mathcal{L}_2(\mathbb{H}) \) is bounded and Lipschitz, that is,
\[
\sup_{u \in \mathbb{V}} \| \sigma(u) \|_{\mathcal{L}_2(\mathbb{H})} < \infty,
\]
and for all \( u_1, u_2 \in \mathbb{H} \), there exists a constant \( L > 0 \) such that
\[
\| \sigma(u_1) - \sigma(u_2) \|_{\mathcal{L}_2(\mathbb{H})}^2 \leq L \| u_1 - u_2 \|_{\mathbb{H}}^2.
\]

(A2) The exists a constant \( N_0 \in \mathbb{N} \) so that for all \( u \in \mathbb{H} \), we have \( P_{N_0, \mathbb{H}} \subset \text{Range}(\sigma(u)) \) and \( \sigma(u)v = 0 \) if \( v \in (I - P_{N_0})\mathbb{H} \). Furthermore, the corresponding pseudo-inverse operator \( \sigma(u)^{-1} : P_{N_0, \mathbb{H}} \to P_{N_0, \mathbb{H}} \) is uniformly bounded, that is, there exists a constant \( \tilde{K} > 0 \) such that
\[
\sup_{u \in \mathbb{H}} \| \sigma(u)^{-1} \|_{\mathcal{L}(P_{N_0}(\mathbb{H}))} \leq \tilde{K},
\]
where \( \mathcal{L}(P_{N_0}(\mathbb{H})) = \mathcal{L}(P_{N_0}(\mathbb{H}), P_{N_0}(\mathbb{H})) \) is the space of all bounded linear operators from \( P_{N_0}(\mathbb{H}) \) to \( P_{N_0}(\mathbb{H}) \).
Under the above assumptions, we have the following existence and uniqueness of strong solution to the system (2.17).

**Theorem 4.2** (Theorem 3.7, [32]). Let \( x \in \mathbb{H} \), for \( n = 2, 3 \) and \( r \geq 3 \) be given \((2\beta\mu \geq 1, \text{ for } n = r = 3)\). Then there exists a pathwise unique strong solution \( u(\cdot) \) to the system (2.17) such that

\[
\mathbf{u} \in L^2(\Omega; L^\infty(0, T; \mathbb{H}) \cap L^2(0, T; V)) \cap L^{r+1}(\Omega; L^{r+1}(0, T; \mathbb{L}^{r+1})),
\]

with \( \mathbb{P} \)-a.s., continuous modification with trajectories in \( \mathbb{H} \) (that is, \( \mathbf{u} \in C([0, T]; \mathbb{H}) \cap L^2(0, T; V)) \cap L^{r+1}(\Omega; L^{r+1}(0, T; \mathbb{L}^{r+1}), \mathbb{P} \)-a.s.) satisfying

\[
\mathbb{E} \left[ \sup_{t \in [0, T]} \| u(t) \|_H^2 + 2\mu \int_0^T \| u(t) \|_V^2 \, dt + 2\beta \int_0^T \| u(t) \|_{L^{r+1}_v}^2 \, dt \right] \leq C(L, T)\| x \|_H^2.
\]

Moreover, the strong solution \( u(\cdot) \) satisfies the following Itô formula:

\[
\| u(t) \|_H^2 + 2\mu \int_0^t \| u(s) \|_V^2 \, ds + 2\beta \int_0^t \| u(s) \|_{L^{r+1}_v} \, ds
\]

\[
= \| u_0 \|_H^2 + \int_0^t \text{Tr}(\sigma(u)\sigma^*(u)) \, ds + 2 \int_0^t (\sigma(u) \, dW(s), u(s)),
\]

for all \( t \in [0, T], \mathbb{P} \)-a.s.

The main results of this section are the following:

**Theorem 4.3.** Let \( u(t, x) \) be the unique strong solution to the system (2.17) with the initial data \( x \in \mathbb{H} \). Suppose that the noise co-efficient \( \sigma(\cdot) \) satisfies Assumption 4.1. Let \( n = 2, 3, r \in (3, \infty) \) and \( \lambda_{N_0} > \left( \frac{r-3}{\mu(r-1)} \left( \frac{2}{\beta \mu(r-1)} \frac{r-3}{2} + L \right) \right) \). Then, for any \( x, y \in \mathbb{H} \) and for any \( f \in \mathcal{B}_b^+(\mathbb{H}) \) with \( \| \nabla \log f \|_\infty < \infty \), we have the following asymptotic log-Harnack inequality:

\[
\mathbb{P}_t \log f(y) \leq \log \mathbb{P}_t f(x) + \hat{\gamma} \| x - y \|_H^2 + e^{-\hat{\theta}t} \| x - y \|_H \| \nabla \log f \|_\infty, \quad t > 0,
\]

where the constants

\[
\hat{\theta} = \frac{1}{2} \left[ \mu \lambda_{N_0} - \left( \frac{r-3}{\mu(r-1)} \left( \frac{2}{\beta \mu(r-1)} \frac{r-3}{2} + L \right) \right) \right]
\]

\[
\hat{\gamma} = \frac{K^2 \mu^2 \lambda_{N_0}^2}{8 \left[ \mu \lambda_{N_0} - \left( \frac{r-3}{\mu(r-1)} \left( \frac{2}{\beta \mu(r-1)} \frac{r-3}{2} + L \right) \right) \right]}.
\]

For \( n = 2, 3, r = 3, \beta \mu > 1 \) and \( \lambda_{N_0} > \frac{L}{\mu} \), we have the following asymptotic log-Harnack inequality:

\[
\mathbb{P}_t \log f(y) \leq \log \mathbb{P}_t f(x) + \frac{K^2 \mu^2 \lambda_{N_0}^2}{8 (\mu \lambda_{N_0} - L)} \| x - y \|_H^2 + e^{-\frac{\mu \lambda_{N_0} - L}{2} t} \| x - y \|_H \| \nabla \log f \|_\infty, \quad (4.8)
\]

for \( t > 0 \).

Analogous to Corollaries 3.3 and 3.8, we have the following result for \( n = 2, 3 \) and \( r \in (3, \infty) \). For the case \( n = 2, 3, r = 3 \) and \( \beta \mu > 1 \), one has to replace \( \hat{\theta} \) with \( \frac{\mu \lambda_{N_0} - L}{2} \) and \( \hat{\gamma} \) with \( \frac{K^2 \mu^2 \lambda_{N_0}^2}{8 (\mu \lambda_{N_0} - L)} \) in the Corollary given below.
Corollary 4.4. Under the assumptions of Theorem 3.2, we have

1. **Gradient estimate.** For any \( y \in \mathbb{H}, \ t > 0 \) and \( f \in \text{Lip}_b(\mathbb{H}) := \text{Lip}(\mathbb{H}) \cap \mathcal{B}_b(\mathbb{H}), \) we have

\[
\| \nabla P_t f(y) \|_\mathbb{H} \leq \sqrt{\gamma} \sqrt{P_t f^2(y) - (P_t f)^2(y)} + e^{-\tilde{a}t} \| \nabla f \|_\infty. \tag{4.9}
\]

In particular, \( P_t \) is asymptotically strong Feller.

2. **Asymptotic irreducibility.** Let \( y \in \mathbb{H} \) and \( A \subset \mathbb{H} \) be a measurable set such that

\[
\delta(y, A) := \liminf_{t \to \infty} P_t(y, A) > 0.
\]

Then, we have

\[
\liminf_{t \to \infty} P_t(x, A_\varepsilon) > 0, \quad \text{for any } \ x \in \mathbb{H}, \ \varepsilon > 0,
\]

where \( A_\varepsilon := \{ x \in \mathbb{H} : \rho(x, A) < \varepsilon \} \) with \( \rho(x, A) := \inf_{z \in A} \| x - z \|_\mathbb{H}. \) Furthermore, for any \( \varepsilon_0 \in (0, \delta(y, A)) \), there exists a constant \( t_0 > 0 \) such that

\[
P_t(x, A_\varepsilon) > 0, \quad \text{provided } t \geq t_0 \ \text{and} \ e^{-\tilde{a}t}\|x - y\|_\mathbb{H} < \varepsilon\varepsilon_0.
\]

3. **Asymptotic heat kernel estimate.** If \( P_t \) has an invariant probability measure \( \nu \), then for any \( f \in \mathcal{B}_b^+(\mathbb{H}) \) with \( \| \nabla f \|_\infty < \infty \), we have

\[
\limsup_{t \to \infty} P_t f(y) \leq \log \left( \frac{\nu(f)}{\int_\mathbb{H} e^{-\gamma\|x - y\|_\mathbb{H}} \nu(dx)} \right), \ y \in \mathbb{H}.
\]

Consequently, for any closed set \( A \subset \mathbb{H} \) with \( \nu(A) = 0 \), we have

\[
\lim_{t \to \infty} P_t \chi_A(y) = 0, \quad \text{for all } \ y \in \mathbb{H}.
\]

4. **Uniqueness of invariant probability measure.** The Markovian transition semigroup \( P_t \) has at most one invariant probability measure.

As in the case of additive Gaussian noise, we use the coupling method to prove Theorem 4.3. Given a \( y \in \mathbb{H} \), we consider the following systems:

\[
\begin{aligned}
\frac{du(t)}{dt} &= -[\mu A u(t) + B(u(t)) + \beta C(u(t))] dt + \sigma(u(t)) dW(t), \ u(0) = x \in \mathbb{H}, \\
\frac{dv(t)}{dt} &= -[\mu A v(t) + B(v(t)) + \beta C(v(t))] dt + \sigma(v(t)) dW(t) \\
\quad &\quad + \frac{\mu \lambda N_0}{2} \sigma(v(t)) \sigma(u(t))^{-1}(u(t) - v(t))^t dt, \ v(0) = y \in \mathbb{H}.
\end{aligned}
\tag{4.10}
\]

Under the Assumption 4.1 (A1) and (A2), one can easily see that the additional drift term \( \sigma(v(t)) \sigma(u(t))^{-1}(u(t) - v(t))^t \) satisfies the local monotonicity as well as hemicontinuity properties. Hence the coupling \( (u(\cdot), v(\cdot)) \) is well-defined. In order to investigate that \( v(t) \) has a transition semigroup \( P_t \) under the weighted probability measure \( \overline{P} \), we let

\[
\tilde{W}(t) := W(t) + \int_0^t \tilde{h}(s) ds, \ \tilde{h}(t) := \frac{\mu \lambda N_0}{2} \sigma(u(t))^{-1}(u(t) - v(t))^t, \ t \geq 0. \tag{4.11}
\]

We also define

\[
\tilde{\Phi}(t) := \exp \left\{ - \int_0^t (\tilde{h}(s), dW(s)) - \frac{1}{2} \int_0^t \| \tilde{h}(s) \|_\mathbb{H}^2 ds \right\}, \ t \geq 0. \tag{4.12}
\]

Then, we have the following result.
Lemma 4.5. For \( n = 2, 3 \) and \( r \in (3, \infty) \), \( \lambda_{N_0} > \frac{r^{-3}}{\mu^2(r-1)} \left( \frac{2}{\beta(r-1)} \right)^{r-3} + \frac{L}{\mu} \), and any \( T > 0 \), we have

\[
\mathbb{E} \left[ \tilde{\Phi}(t) \log \tilde{\Phi}(t) \right] \leq \frac{\mu^2 \lambda_{N_0}^2 \tilde{K}^2}{8(\mu \lambda_{N_0} - (\eta + L))} \| \mathbf{x} - \mathbf{y} \|^2_{H}, \quad \text{for all } 0 \leq t \leq T, \tag{4.13}
\]

where \( \eta = \frac{r^{-3}}{\mu^2(r-1)} \left( \frac{2}{\beta(r-1)} \right)^{r-3} \). For \( r = 3, \mu \beta > 1 \) and \( \lambda_{N_0} > \frac{L}{\mu} \), we have

\[
\mathbb{E} \left[ \tilde{\Phi}(t) \log \tilde{\Phi}(t) \right] \leq \frac{\mu^2 \lambda_{N_0}^2 \tilde{K}^2}{8(\mu \lambda_{N_0} - L)} \| \mathbf{x} - \mathbf{y} \|^2_{H}, \quad \text{for all } 0 \leq t \leq T. \tag{4.14}
\]

Proof. For any \( N \geq \| \mathbf{x} \|_H + \| \mathbf{y} \|_H \), we define a sequence of stopping times by

\[
\tau_N := \inf \{ t : \| \mathbf{u}(t) \|_H + \| \mathbf{v}(t) \|_H > N \}. \tag{4.15}
\]

From the definition of \( \tau_N \), it is clear that \( \tau_N \uparrow \infty \) as \( N \uparrow \infty \), and \( \{ \| \mathbf{u}(t) \|_H \}_{t \in [0, T \wedge \tau_N]} \) and \( \{ \| \mathbf{v}(t) \|_H \}_{t \in [0, T \wedge \tau_N]} \) are bounded. The Assumption 4.1 (A2) implies

\[
\mathbb{E} \left[ \int_0^{T \wedge \tau_N} \| \mathbf{h}(t) \|^2_H dt \right] \leq \frac{\mu^2 \lambda_{N_0}^2 \tilde{K}^2}{4} \mathbb{E} \left[ \int_0^{T \wedge \tau_N} \| \sigma(\mathbf{u}(t))^{-1} \|_{L^2(\mathbb{P}_{N_0}(H))}^2 \| (\mathbf{u}(t) - \mathbf{v}(t))^t \|^2_{L^2(N_0(H))} dt \right]
\]

\[
\leq \frac{\mu^2 \lambda_{N_0}^2 \tilde{K}^2}{2} \mathbb{E} \left[ \int_0^{T \wedge \tau_N} \| \mathbf{u}(t) \|^2_H dt \right] + \mathbb{E} \left[ \int_0^{T \wedge \tau_N} \| \mathbf{v}(t) \|^2_H dt \right]
\]

\[
\leq \frac{\mu^2 \lambda_{N_0}^2 \tilde{K}^2}{2} N^2 T < \infty,
\]

which implies Novikov’s condition on \([0, T \wedge \tau_N]\). Then, applying Girsanov’s theorem, we infer that \( \{ \tilde{W}(t) \}_{t \in [0, T \wedge \tau_N]} \) is a cylindrical Wiener process under the weighted probability measure \( \mathbb{P}_{T, N} = \tilde{\Phi}(T \wedge \tau_N) \mathbb{P} \). Thus, we rewrite the coupling \((\mathbf{u}(\cdot), \mathbf{v}(\cdot))\) given in (4.10) as

\[
\begin{aligned}
\mathbf{d} \mathbf{u}(t) &= - \left[ \mu \mathbf{A} \mathbf{u}(t) + \mathbf{B}(\mathbf{u}(t)) + \beta \mathbf{C}(\mathbf{u}(t)) + \frac{\mu \lambda_{N_0}}{2} (\mathbf{u}(t) - \mathbf{v}(t))^t \right] dt \\
&\quad + \sigma(\mathbf{u}(t)) \mathbf{d} \tilde{W}(t), \quad t \in [0, T \wedge \tau_N],
\end{aligned}
\]

\[
\begin{aligned}
\mathbf{d} \mathbf{v}(t) &= - [\mu \mathbf{A} \mathbf{v}(t) + \mathbf{B}(\mathbf{v}(t)) + \beta \mathbf{C}(\mathbf{v}(t))] dt + \sigma(\mathbf{v}(t)) \mathbf{d} \tilde{W}(t), \quad t \in [0, T \wedge \tau_N],
\end{aligned}
\]

with the corresponding initial values \( \mathbf{u}(0) = \mathbf{x} \) and \( \mathbf{v}(0) = \mathbf{y} \). Using the infinite dimensional Itô formula to the process \( \| \mathbf{w}(\cdot) \|^2_H = \| \mathbf{u}(\cdot) - \mathbf{v}(\cdot) \|^2_H \) under the probability measure \( \mathbb{P}_{T, N} \) and for \( t \in [0, T \wedge \tau_N] \), we obtain

\[
\begin{aligned}
\| \mathbf{w}(t) \|^2_H &= 2 \mu \int_0^t \| \mathbf{w}(s) \|^2_H ds \\
&\quad + \| \mathbf{w}(0) \|^2_H - 2 \int_0^t (\mathbf{B}(\mathbf{u}(s)) - \mathbf{B}(\mathbf{v}(s)), \mathbf{w}(s)) ds - 2\beta \int_0^t \langle \mathbf{C}(\mathbf{u}(s)) - \mathbf{C}(\mathbf{v}(s)), \mathbf{w}(s) \rangle ds \\
&\quad + \mu \lambda_{N_0} \int_0^t (\mathbf{w}(s))^t \mathbf{w}(s) ds + \int_0^t \| \sigma(\mathbf{u}(s)) - \sigma(\mathbf{v}(s)) \|^2_{L^2(\mathbb{H})} ds \\
&\quad + 2 \int_0^t ((\sigma(\mathbf{u}(s)) - \sigma(\mathbf{v}(s))) \mathbf{d} \tilde{W}(s), \mathbf{w}(s)), \mathbb{P}_{T, N}\text{-a.s.}, \tag{4.17}
\end{aligned}
\]
for all $t \in [0, T \wedge \tau_N]$. For $n = 2, 3$ and $r(3, \infty)$, using (3.22) and (3.42) in (4.17), we find
\[
\|w(t)\|_H^2 + \mu \lambda_N \int_0^t \|w(s)\|_H^2 ds \\
\leq \|x - y\|_H^2 + \frac{r - \frac{\sqrt{2}}{\mu(r - 1)}}{\beta \mu(r - 1)} \left( \int_0^t \|w(s)\|_H^2 ds + L \int_0^t \|w(s)\|_H^2 ds \right) \\
+ 2 \int_0^t ((\sigma(u(s)) - \sigma(v(s))) \tilde{d}W(s), w(s)),
\]
(4.18)
for all $t \in [0, T \wedge \tau_N]$. Taking expectation in (4.18) and using the fact that final term appearing in the right hand side of the inequality (4.18) is a local martingale with zero expectation, we deduce that
\[
\mathbb{E}_{\tilde{P}_{T,N}}[\|w(t)\|_H^2] \\
\leq \|x - y\|_H^2 + \frac{r - 3}{\mu(r - 1)} \left( \frac{2}{\beta \mu(r - 1)} \right) \frac{1}{r - 1} + L - \mu \lambda_N \int_0^t \mathbb{E}_{\tilde{P}_{T,N}}[\|w(s)\|_H^2] ds,
\]
(4.19)
where we used (3.22) and Fubini’s theorem. Applying Gronwall’s inequality, we get
\[
\mathbb{E}_{\tilde{P}_{T,N}}[\|w(t)\|_H^2] \leq \|x - y\|_H^2 e^{-\mu \lambda_N (\eta + L)t}, \text{ for all } t \in [0, T \wedge \tau_N],
\]
(4.20)
where $\eta = \frac{-3}{\mu(r-1)} \left( \frac{2}{\beta \mu(r-1)} \right)^{1/r}$. Using the definition of $\tilde{\Phi}(\cdot), \tilde{W}(\cdot)$ and the Assumption 4.1 (A2), we have
\[
\mathbb{E} \left[ \tilde{\Phi}(t \wedge \tau_N) \log \tilde{\Phi}(t \wedge \tau_N) \right] = \mathbb{E}_{\tilde{P}_{T,N}} \left[ \log \tilde{\Phi}(t \wedge \tau_N) \right] \\
= \frac{1}{2} \mathbb{E}_{\tilde{P}_{T,N}} \left[ \int_{0}^{t \wedge \tau_N} \|\tilde{h}(s)\|_H^2 ds \right] \\
\leq \frac{\mu^2 \lambda_N^2 K^2}{8} \int_0^t \mathbb{E}_{\tilde{P}_{T,N}}[\|u(s) - v(s)\|_H^2] ds,
\]
(4.21)
where we used Fubini’s theorem in the final step. For $\mu \lambda_N > \eta + L$, using (1.20) in (1.21), we deduce that
\[
\mathbb{E} \left[ \tilde{\Phi}(t \wedge \tau_N) \log \tilde{\Phi}(t \wedge \tau_N) \right] \leq \frac{\mu^2 \lambda_N^2 K^2}{8[\mu \lambda_N - (\eta + L)]} \|x - y\|_H^2, 0 \leq t \leq T.
\]
(4.22)
For $0 \leq s < t \leq T$, using the dominated convergence theorem and the martingale property of $\{\tilde{\Phi}(t \wedge \tau_N)\}_{t \in [0, T]}$, we get
\[
\mathbb{E} \left( \tilde{\Phi}(t) \mid \mathcal{F}_s \right) = \mathbb{E} \left( \lim_{n \to \infty} \tilde{\Phi}(t \wedge \tau_N) \mid \mathcal{F}_s \right) = \lim_{n \to \infty} \mathbb{E} \left( \tilde{\Phi}(t \wedge \tau_N) \mid \mathcal{F}_s \right) = \tilde{\Phi}(s),
\]
(4.23)
so that $\{\tilde{\Phi}(t)\}_{t \in [0, T]}$ is a martingale. Let us define $\tilde{P}_T := \tilde{\Phi}(T)\tilde{P}$. Since $\{\tilde{\Phi}(t)\}_{t \in [0, T]}$ is a martingale, we obtain $\tilde{P}_T(\Lambda) = \tilde{P}_{T,N}(\Lambda)$, if $\Lambda \in \mathcal{F}_{T \wedge \tau_N}$. Note also that $\{\tilde{W}(t)\}_{t \in [0, T]}$ is a cylindrical Wiener process under the probability measure $\tilde{P}_T$. Applying Fatou’s lemma, we obtain
\[
\lim_{N \to \infty} \mathbb{E}_{\tilde{P}_{T,N}}[\log \tilde{\Phi}(t \wedge \tau_N)] = \lim_{N \to \infty} \mathbb{E}_{\tilde{P}_T}[\log \tilde{\Phi}(t \wedge \tau_N)]
\]
(4.22)
which completes the proof of (4.13).

From (4.13), we have the estimate

\[ \| f \|_{H^1} \leq C_{\mu, \lambda} \log \left( \frac{t}{\lambda_{\mu, \lambda}} \right), \]

for any \( t \in [0, T] \). Combining (4.22) and (4.24), we further have

\[
\mathbb{E} \left[ \Phi(t) \log \Phi(t) \right] = \mathbb{E}_{\tilde{\beta}_T} \left[ \log \Phi(t) \right] = \frac{1}{2} \mathbb{E}_{\tilde{\beta}_T} \left[ \int_0^t \| \tilde{h}(s) \|^2_{H^2} ds \right]
\]

\[
\leq \liminf_{N \to \infty} \mathbb{E}_{\tilde{\beta}_{T,N}} \left[ \log \Phi(t \wedge \tau_N) \right]
\]

\[
\leq \frac{\mu^2 \lambda_{\mu, \lambda}^2}{8(\mu \lambda_{\mu, \lambda} - (\eta + L))} \| x - y \|^2_{H^1}, \quad 0 \leq t \leq T,
\]

which completes the proof of (4.13).

For \( r = 3 \) and \( \beta \mu > 1 \), calculation similar to (3.49) and (3.48) gives

\[
\mathbb{E}_{\tilde{\beta}_{T,N}} \left[ \| \mathbf{w}(t) \|^2_{\dot{H}^1} \right] + (\mu \lambda_{\mu, \lambda} - L) \int_0^t \mathbb{E}_{\tilde{\beta}_{T,N}} \left[ \| \mathbf{w}(s) \|^2_{\dot{H}^1} \right] ds \leq \| x - y \|^2_{\dot{H}^1},
\]

for all \( t \in [0, T \wedge \tau_N] \) and the estimate (4.14) follows for \( \mu > \frac{L}{\lambda_{\mu, \lambda}} \), by proceeding similarly as in the previous case.

**Proof of Theorem 4.3.** For \( n = 2, 3 \) and \( r \in (3, \infty) \), one can obtain a proof in a similar way as that of the proof of Theorems 3.2 and 3.7. From (4.13), we have the estimate

\[
\mathbb{E} \left[ \Phi(t) \log \Phi(t) \right] \leq \frac{\tilde{K}^2 \mu^2 \lambda_{\mu, \lambda}^2}{8(\mu \lambda_{\mu, \lambda} - (\eta + L))} \| x - y \|^2_{\dot{H}^1},
\]

for \( \mu \lambda_{\mu, \lambda} > \frac{r^2 - 3}{2r - 3} \left( \frac{2}{\beta(r - 1)} \right)^{\frac{r - 3}{r - 1}} + L \). Using similar arguments to (4.20), we can get the following estimate:

\[
\mathbb{E}_{\tilde{\beta}_{T}} \left[ \| \mathbf{u}(t, x) - \mathbf{v}(t, x) \|^2_{\dot{H}^1} \right] \leq \| x - y \|^2_{\dot{H}^1} e^{-\left( \frac{\mu \lambda_{\mu, \lambda} - (\frac{r^3 - 3}{2r - 3}(\frac{2}{\beta(r - 1)}))^{\frac{r - 3}{r - 1}} + L \right)} t, \quad \text{for all } t \in [0, T].
\]

Hence, for any \( f \in \mathcal{B}_0^+ (H) \) with \( \| \nabla \log f \|_\infty < \infty \), using (3.26), (4.27) and (4.28), we have

\[
P_t[\log f(y)] = \mathbb{E}_{\tilde{\beta}_{T}} \left[ \log f(\mathbf{u}(t, x)) \right] + \mathbb{E}_{\tilde{\beta}_{T}} \left[ \log f(\mathbf{v}(t, y)) - \log f(\mathbf{u}(t, x)) \right]
\]

\[
\leq \mathbb{E} \left[ \Phi(t) \log f(\mathbf{u}(t, x)) \right] + \| \nabla \log f \|_\infty \mathbb{E}_{\tilde{\beta}_{T}} \left[ \| \mathbf{u}(t, x) - \mathbf{v}(t, x) \|_{\dot{H}^1} \right]
\]

\[
\leq \mathbb{E} \left[ \Phi(t) \log \Phi(t) \right] + \log P_t f(x) + \| \nabla \log f \|_\infty \left( \mathbb{E}_{\tilde{\beta}_{T}} \left[ \| \mathbf{u}(t, x) - \mathbf{v}(t, x) \|_{\dot{H}^1} \right] \right)^{1/2}
\]

\[
\leq \frac{\tilde{K}^2 \mu^2 \lambda_{\mu, \lambda}^2}{8(\mu \lambda_{\mu, \lambda} - (\eta + L))} \| x - y \|^2_{\dot{H}^1} + \log P_t f(x)
\]

\[
eq \frac{\mu \lambda_{\mu, \lambda} - (\frac{r^3 - 3}{2r - 3} \left( \frac{2}{\beta(r - 1)} \right)^{\frac{r - 3}{r - 1}} + L)}{2} \| x - y \|^2_{\dot{H}^1},
\]

(4.29)
and we obtain estimate \((4.7)\).

For \(n = 2, 3, r = 3\) and \(\beta \mu > 1\), the estimate \((4.27)\) needs to be replaced by

\[
\mathbb{E}[\Phi(t) \log \Phi(t)] \leq \frac{\tilde{K} \mu^2 \lambda_{N_0}}{8(\mu \lambda_{N_0} - L)} \|x - y\|_H^2, \tag{4.30}
\]

and the estimate \((4.8)\) follows.

**Proof of Corollary** \([4.4]\). For the case \(n = 2, 3\) and \(r \in (3, \infty)\), we define

\[
\Theta(x, y) = \gamma \|x - y\|_H^2 \quad \text{and} \quad \Psi_t(x, y) = e^{-\theta t} \|x - y\|_H.
\]

In order to prove the existence of an invariant measure for the transition semigroup \(\{P_t\}_{t \geq 0}\), we can follow similar arguments as in the proof of Corollary \([3.3]\). For \(n = 2, 3\) and \(r \in (3, \infty)\), using the infinite dimensional Itô formula to the process \(\|u(\cdot, x) - u(\cdot, y)\|_H^2\), we obtain

\[
\|u(t, x) - u(t, y)\|_H^2 = \|x - y\|_H^2 + 2\mu \int_0^t \|u(s, x) - u(s, y)\|_H^2 \, ds
\]

\[
- 2\beta \int_0^t \langle C(u(s, x)) - C(u(s, y)), u(s, x) - u(s, y) \rangle \, ds
\]

\[
\leq \|x - y\|_H^2 + \left[\frac{r - 3}{\mu(r - 1)} \left(\frac{2}{\beta \mu(r - 1)}\right) \frac{1}{r - 3} + L\right] \int_0^t \|u(s, x) - u(s, y)\|_H^2 \, ds
\]

\[
+ 2 \int_0^t \langle (\sigma(u(s, x)) - \sigma(u(s, y))), dW(s) \rangle \, ds,
\]

\[(4.31)\]

\(\mathbb{P}\)-a.s., for all \(t \in [0, T]\), where we used a calculation similar to \((4.18)\). Taking expectation, and then by using Fubini’s theorem and Gronwall’s lemma, we get

\[
\mathbb{E}[\|u(t, x) - u(t, y)\|_H^2] \leq \|x - y\|_H^2 e^{\left[\frac{r - 3}{\mu(r - 1)} \left(\frac{2}{\beta \mu(r - 1)}\right) \frac{1}{r - 3} + L\right] t}, \tag{4.32}
\]

for all \(t \in [0, T]\), which implies that \(\{P_t\}_{t \geq 0}\) is a Feller semigroup. Therefore, for the existence of an invariant measure, we only need to prove the tightness of \(\{\nu_n : \, n \geq 1\}\). Using the infinite dimensional Itô formula to the process \(\|u(\cdot)\|_H^2\), we find

\[
\|u(t)\|_H^2 + 2\mu \int_0^t \|u(s)\|_H^2 \, ds + 2\beta \int_0^t \|u(s)\|_H^{r+1} \, ds
\]

\[
= \|x\|_H^2 + \int_0^t \|\sigma(u(s))\|_{L^2(\mathbb{R})}^2 \, ds + 2 \int_0^t \langle \sigma(u(s))dW(s), u(s) \rangle \, ds
\]

\[
\leq \|x\|_H^2 + C \int_0^t (1 + \|u(s)\|_H^2) \, ds + 2 \int_0^t \langle \sigma(u(s))dW(s), u(s) \rangle,
\]

\[(4.33)\]

\(\mathbb{P}\)-a.s., for all \(t \in [0, T]\). Thus, from \((4.33)\), it is immediate that

\[
\|u(t)\|_H^2 \leq \|x\|_H^2 + \int_0^t \left[\left(C + \frac{2L}{\lambda_1} + \frac{C \lambda_1}{\lambda_1} \|u(s)\|_H^2\right) \right] \, ds + 2 \int_0^t \langle \sigma(u(s))dW(s), u(s) \rangle. \tag{4.34}
\]

For \(L < \frac{2\mu \lambda_1}{C}\), proceeding similarly in the proof of Corollary \([3.3]\), we get the required result.
For the case $n = 2, 3$, $r = 3$ and $\beta \mu > 1$ and $L < \mu \lambda_1$, we obtain
\[ E\left[\|u(t, x) - u(t, y)\|_{H}^2\right] \leq e^{-(\mu \lambda_1 - L)t}\|x - y\|_{H}^2, \tag{4.35} \]
and the existence of an invariant measure for the transition semigroup $\{P_t\}_{t \geq 0}$ can be proved in a similar way as in the previous case. \hfill \Box
