Abstract: The paper deals with the existence of at least two non zero weak solutions to a new class of impulsive fractional boundary value problems via Brezis and Nirenberg’s Linking Theorem. Finally, an example is presented to illustrate our results.

Keywords: weak solutions; impulsive fractional boundary value problems; Brezis and Nirenberg’s Linking Theorem

1. Introduction

The paper deals with the existence of weak solutions to the following boundary value problems for impulsive fractional Hamiltonian differential equations:

\[
\begin{align*}
\dot{D}_1^\alpha \left( \frac{1}{\Gamma(\alpha)} \sum_{i=1}^{N} D_t^{-\alpha} u_i(t) \right) &= -\nabla F(t, u), \quad t \in [0, T], \\
\Delta \left( t D_t^{\alpha-1} \left( \frac{1}{\Gamma(\alpha)} \sum_{i=1}^{N} D_t^{-\alpha} u_i(t) \right) \right) &= \frac{1}{2} I_{ij} \left( u_i(t_j) \right), \quad i \in A, j \in B \\
u(0) &= u(T) = 0,
\end{align*}
\]

where \( 0 \leq \alpha < 1 \), \( \dot{D}_1^\alpha \) and \( t D_t^\alpha \) denote the left Caputo fractional derivative and the right Riemann–Liouville fractional derivative of order \( \alpha \), respectively,

\( T > 0, A := \{1, \ldots, N\}, B := \{1, \ldots, L\}, \)

\( u(t) = (u^1(t), u^2(t), \ldots, u^N(t)), \)

\( 0 = t_0 < t_1 < t_2 < \cdots < t_L < t_{L+1} = T, \)

\( \nabla F(t, x) \) denotes the gradient of \( F(t, x) \) in \( x \), and \( \Delta \) the operator is defined as

\[
\Delta \left( t D_t^{\alpha-1} \left( \frac{1}{\Gamma(\alpha)} \sum_{i=1}^{N} D_t^{-\alpha} u_i(t) \right) \right) = t D_t^{\alpha-1} \left( \frac{1}{\Gamma(\alpha)} \sum_{i=1}^{N} D_t^{-\alpha} u_i(t) \right) - t D_t^{\alpha-1} \left( \frac{1}{\Gamma(\alpha)} \sum_{i=1}^{N} D_t^{-\alpha} u_i(t) \right) \left( t_j^+ \right) - t D_t^{\alpha-1} \left( \frac{1}{\Gamma(\alpha)} \sum_{i=1}^{N} D_t^{-\alpha} u_i(t) \right) \left( t_j^- \right),
\]
where
\[
\begin{align*}
_iD_t^{\alpha-1} \left( _0D_t^\alpha u^i \right) \left( t_j^+ \right) &= \lim_{t \rightarrow t_j^+} iD_t^{\alpha-1} \left( _0D_t^\alpha u^i \right) (t), \\
iD_t^{\alpha-1} \left( _0D_t^\alpha u^i \right) \left( t_j^- \right) &= \lim_{t \rightarrow t_j^-} iD_t^{\alpha-1} \left( _0D_t^\alpha u^i \right) (t)
\end{align*}
\]
and \(_0D_t^\alpha \) is the left Caputo fractional derivatives of order \( \alpha \). \( I_{ij} : \mathbb{R} \rightarrow \mathbb{R}, i \in A, j \in B \) are continuous with \( F : [0, T] \times \mathbb{R}^N \rightarrow \mathbb{R} \) satisfies the following condition:

\( \text{(A)} \) \( F(t, u) \) is measurable according to \( t \) for any \( u \in \mathbb{R}^N \) and continuously differentiable according \( u \) for a.e. \( t \in [0, T] \). However, there exist \( a \in C \left( \mathbb{R}^+, \mathbb{R}^+ \right) \) and \( b \in L^1 \left( [0, T], \mathbb{R}^+ \right) \), such that

\[
|F(t, u)| \leq a(|u|) b(t), \quad |\nabla F(t, u)| \leq a(|u|) b(t)
\]
for any \( u \in \mathbb{R}^N \) and a.e. \( t \in [0, T] \).

Fractional differential equations have recently proved to be valuable tools for modeling many phenomena in various fields of science and engineering. Indeed, one can find many applications in viscoelasticity, electrochemistry, control, porous media, electromagnetic, etc., for example, see [1–19]. Moreover, recently, the existence of solutions of boundary value problems for Fractional differential equations have widely been studied in many papers and we refer the reader to the papers [3–18] and the references therein. For instance, in [3], the authors created a variable structure and, using the critical point theory, investigated the existence of multiple solutions for a class of fractional advection–dispersion equations derived from symmetric mass flow transmission. In [20], Torres consider the fractional Hamiltonian system given by

\[
\begin{align*}
-\alpha D_T^\alpha \left( _0D_t^\alpha u \right) (t) &= \nabla F \left( t, u \left( t \right) \right), \quad t \in [0, T], \\
u(0) &= u(T) = 0,
\end{align*}
\]

where \( \alpha \in \left( \frac{1}{2}, 1 \right) \), \( u \in \mathbb{R}^N \), and \( F : [0, T] \times \mathbb{R}^N \rightarrow \mathbb{R} \) satisfies some conditions. In addition by using a modified version of mountain pass theorem for functional bounded from below due to Bonanno [21], the author studied the existence of at least three different solutions for problem (2) (see Theorems 1 and 2). In addition, under certain conditions and using some critical point theorems in [22] Zhou et al. proved the following fractional Hamiltonian system with impulsive effects has at least one weak solution:

\[
\begin{align*}
\alpha D_T^\alpha \left( _0D_t^\alpha u \right) (t) &= \nabla F \left( t, u \left( t \right) \right), \quad t \in [0, T], \\
u(0) &= u(T) = 0,
\end{align*}
\]

\[
\triangle \left( \alpha D_T^\alpha \left( _0D_t^\alpha u^i \right) (t_j) \right) = I_{ij} \left( u^i \left( t_j \right) \right), \quad i = 1, \ldots, N, j = 1, \ldots, p.
\]

The outline of the paper is as follows: In Section 2, we lay down preliminaries and assumptions, some of which will be needed in the body of the paper. Then, in Section 3, the main result is obtained, which gives the result of the existence of at least two non zero weak solutions to problem (1) via Brezis and Nirenberg’s Linking theorem (see Lemma 2 in [23]).

2. Preliminaries and Assumptions

In this section, we present some assumptions, definitions and basic properties of fractional computing, used later in this article. For omitted evidence, we refer the reader to ([24]) or other texts on the basic fractional calculation.
To state our main results, we set
\[ \omega := \frac{2\pi}{T}, \quad \zeta := \frac{T^{\alpha - \frac{1}{2}}}{\Gamma(\alpha) \sqrt{2\alpha - 1}} \quad \text{and} \quad t \in [0,T], \tag{3} \]
where \( \Gamma \) is the standard gamma function given by
\[ \Gamma(z) = \int_{0}^{+\infty} z^{a-1} e^{-z} dz. \]

Now, we assume that \( I_{ij}(s) \) and \( F(t,u) \) satisfy the following assumptions:

(h1) There exists a constant \( \gamma > 0 \), such that
\[ \lim_{|u| \to \infty} \inf_{|t|} \frac{F(t,u)}{|u|^2} \geq \gamma \quad \text{uniformly for a.e.} \quad t \in [0,T]. \]

(h2) There exist constants \( \rho > 0, \lambda > 0 \) and \( k \geq 1 \) verify
\[ F(t,u) \leq -\frac{1}{2} \lambda k^2 \omega^2 \left( \frac{1}{\Gamma(2-\alpha)} \right)^2 |u|^2, \]
for all \( |u| \leq \rho \) and a.e. \( t \in [0,T] \).

(h3) There exist constants \( \gamma_{ij} \in [0,1) \) for any \( i \in A, j \in B \), satisfying
\[ \gamma_{ij} \int_{0}^{\tau} I_{ij}(s) \, ds \leq I_{ij}(\tau) \, \tau, \quad \text{for every} \quad \tau \in \mathbb{R}. \]

(h4) \( I_{ij} \) satisfy \( c_{ij} := \inf_{|s|=1} \int_{0}^{\tau} I_{ij}(s) \, ds > 0. \)

(h5) There exist constants \( \mu_{ij} > 0 \) with an integer \( k \geq 1 \), which is defined in (h2) for all \( i \in A, \quad j \in B \), satisfying
\[ 0 < \int_{0}^{\tau} I_{ij}(s) \, ds \leq \mu_{ij} k^2 \omega^2 |z|^2, \quad \text{for every} \quad z \in \mathbb{R}. \]

**Theorem 1.** Suppose condition (A) is satisfied. Suppose that one of the following two conditions is true:

(H1) (h1), (h3) and (h4) hold with \( \gamma > \frac{1}{2} \);

(H2) (h1), (h3) and (h4) hold with
\[ \xi^2 \sum_{i=1}^{N} \sum_{j=1}^{L} c_{ij} \leq \gamma \leq \frac{1}{2}. \]

In addition, we assume also that the following condition holds:

(H3) (h2), (h3) and (h5) hold with
\[ \lambda \geq 4 \frac{T^{2-2\alpha}}{3-2\alpha} + LN\mu^2 + 4k^2 \omega^2 \mu_2^2 \frac{T^{2-2\alpha}}{3-2\alpha}, \]
where \( \mu = \max_{i \in A, j \in B} \{ \mu_{ij} \} \). Then, problem (1) has at least two nonzero weak solutions.
Lemma 1. ([22]) Let \( u \) be a function defined on interval \([a, b]\). Left and right Riemann-Liouville fractional integrals of order \( \alpha > 0 \) for a function \( u \) denoted by \( {}_aD_t^{-\alpha}u(t) \) and \( {}_bD_t^{-\alpha}u(t) \), respectively, are defined by

\[
{}_aD_t^{-\alpha}u(t) = \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} u(s) \, ds, \quad t \in [a, b]
\]

and

\[
{}_bD_t^{-\alpha}u(t) = \frac{1}{\Gamma(\alpha)} \int_t^b (s-t)^{\alpha-1} u(s) \, ds, \quad t \in [a, b],
\]

Definition 2. ([24]) Let \( u \) be a function defined on \([a, b]\). The left and right Riemann–Liouville fractional derivatives of order \( \alpha \) for a function \( u \) denoted by \( {}_aD_t^\alpha u(t) \) and \( {}_bD_t^\alpha u(t) \) are defined by

\[
{}_aD_t^\alpha u(t) = \frac{d^n}{dt^n} {}_aD_t^{\alpha-n} u(t) = \frac{1}{\Gamma(n-\alpha)} \frac{d^n}{dt^n} \left( \int_a^t (t-s)^{\alpha-n-1} u(s) \, ds \right), \quad t \in [a, b]
\]

and

\[
{}_bD_t^\alpha u(t) = (-1)^n \frac{d^n}{dt^n} {}_bD_t^{\alpha-n} u(t) = \frac{1}{\Gamma(n-\alpha)} \frac{d^n}{dt^n} \left( \int_t^b (s-t)^{\alpha-n-1} u(s) \, ds \right), \quad t \in [a, b],
\]

where \( n - 1 \leq \alpha < 1 \) and \( n \in \mathbb{N} \). In particular, if \( 0 \leq \alpha < 1 \), then

\[
{}_aD_t^\alpha u(t) = \frac{d}{dt} {}_aD_t^{\alpha-1} u(t) = \frac{1}{\Gamma(1-\alpha)} \frac{d}{dt} \left( \int_a^t (t-s)^{-\alpha} u(s) \, ds \right), \quad t \in [a, b]
\]

and

\[
{}_bD_t^\alpha u(t) = -\frac{d}{dt} {}_bD_t^{\alpha-1} u(t) = -\frac{1}{\Gamma(1-\alpha)} \frac{d}{dt} \left( \int_t^b (s-t)^{-\alpha} u(s) \, ds \right), \quad t \in [a, b]
\]

Definition 3. ([24]) Let \( a \geq 0 \) and \( n \in \mathbb{N} \), we have:

(i) If \( \alpha \in [n-1, 1) \) and \( u \in AC^n([a, b], \mathbb{R}^n) \), then the left and right Caputo fractional derivatives of order \( \alpha \) for a function \( u \) denoted by \( {}_a^C\xi D_t^\alpha u \) and \( {}_b^C\xi D_t^\alpha u \) respectively, are represented by

\[
{}_a^C\xi D_t^\alpha u = \frac{1}{\Gamma(n-\alpha)} \int_a^t (t-s)^{n-\alpha-1} u^{(n)}(s) \, ds, \quad t \in [a, b],
\]

and

\[
{}_b^C\xi D_t^\alpha u = \frac{(-1)^n}{\Gamma(n-\alpha)} \int_t^b (t-s)^{n-\alpha-1} u^{(n)}(s) \, ds, \quad t \in [a, b],
\]

respectively.

(ii) If \( \alpha = n-1 \) and \( u \in AC^n([a, b], \mathbb{R}^n) \), then \( {}_a^C\xi D_t^{n-1} u(t) \) and \( {}_b^C\xi D_t^{n-1} u(t) \) are represented by

\[
{}_a^C\xi D_t^{n-1} u(t) = u^{(n-1)}(t) \quad \text{and} \quad {}_b^C\xi D_t^{n-1} u(t) = (-1)^{n-1} u^{(n-1)}(t).
\]

Lemma 1. ([22], Proposition 3.2) Let \( 0 < \alpha \leq 1 \), and \( 1 < p < \infty \). For all \( u \in L^p([0, T], \mathbb{R}^N) \). Then

\[
\left\| D_t^{-\alpha}u \right\|_{L^p([0,T])} \leq \frac{\Gamma(\alpha+1)}{\Gamma(\alpha+1)} \left\| u \right\|_{L^p([0,T])} \quad \text{for} \quad \xi \in [0, t], \quad t \in [0, T],
\]

(8)
where \( aD^\alpha_b \) is left Riemann–Liouville fractional integral of order \( \alpha \).

**Proposition 1.** ([24]) We have the following property of fractional integration

\[
\int_0^T \left[ aD^\alpha_t u(t) \right] v(t) \, dt = \int_0^T \left[ D^\alpha_b v(t) \right] u(t) \, dt, \quad \alpha > 0
\]

provided that \( u \in L^p([0,T],\mathbb{R}), v \in L^q([0,T],\mathbb{R}) \) and \( p \geq 1, \frac{1}{p} + \frac{1}{q} \leq 1 + \alpha \) or \( p \neq 1, q \neq 1, \frac{1}{p} + \frac{1}{q} = 1 + \alpha \).

**Proposition 2.** ([24]) Let \( n \in \mathbb{N} \) and \( n - 1 < \alpha \leq n \). If \( u \in AC^n([a,b],\mathbb{R}^N) \) or \( u \in C^n([a,b],\mathbb{R}^N) \), then

\[
aD^\alpha_t \left( aD^\beta_t u(t) \right) = u(t) - \sum_{k=0}^{n-1} \frac{u^{(k)}(a)}{k!} (t - a)^k
\]

and

\[
iD^\alpha_b \left( iD^\beta_b u(t) \right) = u(t) - \sum_{k=0}^{n-1} \frac{(-1)^k u^{(k)}(b)}{k!} (b - t)^k
\]

and for \( t \in [a,b] \). In particular, if \( 0 < \alpha \leq 1 \) and \( u \in AC([a,b],\mathbb{R}^N) \) or \( u \in C^1([a,b],\mathbb{R}^N) \), then

\[
aD^\alpha_t \left( aD^\beta_t u(t) \right) = u(t) - u(a), \quad \text{and} \quad iD^\alpha_b \left( iD^\beta_b u(t) \right) = u(t) - u(b).
\]

The Riemann–Liouville fractional derivative and the Caputo fractional derivative are related to one another by the following relationships.

**Proposition 3.** ([24]) Let \( n - 1 < \alpha < n \) for any \( n \in \mathbb{N} \). If \( u \) is a function defined on interval \([a,b]\) for which the derivatives of Caputo fractional \( iD^\alpha_t u(t) \) and \( iD^\beta_b u(t) \) of order \( \alpha \) exist together with the Riemann–Liouville fractional derivatives \( aD^\alpha_t u(t) \) and \( iD^\beta_b u(t) \), thus

\[
iD^\alpha_t u(t) = \sum_{k=0}^{n-1} \frac{u^{(k)}(a)}{\Gamma(k + 1 - \alpha)} (t - a)^{k-\alpha}
\]

and

\[
iD^\beta_b u(t) = \sum_{k=0}^{n-1} \frac{u^{(k)}(b)}{\Gamma(k + 1 - \alpha)} (b - t)^{k-\alpha},
\]

where \( t \in [a,b] \). In particular, when \( 0 < \alpha < 1 \), we have

\[
iD^\alpha_t u(t) = \frac{u(a)}{\Gamma(1 - \alpha)} (t - a)^{-\alpha}
\]

and

\[
iD^\beta_b u(t) = \frac{u(b)}{\Gamma(1 - \alpha)} (b - t)^{-\alpha}.
\]

**Definition 4.** ([25]) Let \( 0 < \alpha \leq 1 \) and \( 1 < p < \infty \). The space of fractional derivative \( H^{\alpha,p}_0 \) is defined by the closure of \( C_0^\infty([0,T],\mathbb{R}^N) \), that is

\[
H^{\alpha,p}_0 = C_0^\infty([0,T],\mathbb{R}^N)
\]

with respect to the weighted norm

\[
\|u\|_{\alpha,p} = \left( \int_0^T |u(t)|^p \, dt + \int_0^T |D^\alpha u(t)|^p \, dt \right)^{1/p}
\]
for every \( u \in H_0^{\alpha,p} \).

**Proposition 4.** ([25], Proposition 3.1) Let \( 0 < \alpha \leq 1 \), and \( 1 < p < \infty \). The fractional derivative space \( H_0^{\alpha,p} \) is a reflexive and separable Banach space.

**Proposition 5.** ([25], Proposition 3.2) Let \( 0 < \alpha \leq 1 \), and \( 1 < p < \infty \). For all \( u \in H_0^{\alpha,p} \), we have

\[
\| u \|_{L^p} \leq \frac{T^\alpha}{\Gamma(\alpha + 1)} \| D_1^\alpha u (t) \|_{L^p}
\]

Moreover, if \( \alpha > \frac{1}{p} \), then

\[
\| u \|_\infty \leq \frac{T^{\alpha - \frac{1}{p}}}{\Gamma(\alpha)((\alpha - 1)q + 1)^{\frac{1}{q}}} \| D_1^\alpha u (t) \|_{L^p}
\]

**Proposition 6.** ([25], Proposition 3.3) Let \( 0 < \alpha \leq 1 \) and \( 1 < p < \infty \). Assume that \( \alpha > \frac{1}{p} \) and the sequence \( \{ u_k \} \) converges weakly to \( u \) in \( H_0^{\alpha,p} \), i.e., \( u_k \rightharpoonup u \). Then \( u_k \to u \) in \( C_0^\infty ([0,T],\mathbb{R}^N) \), i.e., \( \| u - u_k \|_\infty \to 0 \), as \( k \to \infty \).

In our study in this paper, we use Hilbert space \( H^\alpha = H_0^{\alpha,2} \) with the inner product and the following corresponding norm

\[
\langle u, v \rangle = \int_0^T (u(t), v(t)) \, dt + \int_0^T \langle D_1^\alpha u(t), D_1^\alpha v(t) \rangle \, dt, \quad \forall u, v \in H^\alpha
\]

and

\[
\| u \|_\alpha = \| u \|_{\alpha,2} = \left( \int_0^T |u(t)|^2 \, dt + \int_0^T \| D_1^\alpha u(t) \|^2 \, dt \right)^{\frac{1}{2}}, \quad \forall u \in H^\alpha
\]

In view of (11), we have that, for \( t \in [0,T] \) and \( p = q = 2 \)

\[
\| u \|_\infty \leq C \| D_1^\alpha u \|_{L^2} \leq C \| u \|_\alpha
\]

**Definition 5.** Let \( X \) be a Banach space with \( J : X \to \mathbb{R} \) differentiable. It can be said that \( J \) satisfies the Palais–Smale (PS)-condition if for all sequence \( \{ u_n \} \) in \( X \) which \( J(u_n) \) is bounded and \( J'(u_n) \to 0 \) as \( n \to \infty \) possesses a convergent subsequence.

**Definition 6.** Let \( X \) be a Banach space and \( J : X \to \mathbb{R} \) differentiable and \( c \in \mathbb{R} \). It can be said that \( J \) satisfies the \((PS)_c\)-condition if the existence of a sequence \( \{ u_n \} \) in \( X \) such that

\[
J(u_n) \to c, \quad J'(u_n) \to 0
\]

as \( n \to \infty \), implies that \( c \) is a critical value of \( J \).

**Remark 1.** It can be remarked the (PS)-condition implies the \((PS)_c\) condition for each \( c \in \mathbb{R} \).

**Lemma 2.** [23] Let \( X \) be a Banach space with a direct sum decomposition \( X = X_1 \oplus X_2 \) and \( k := \dim X_2 < \infty \). Let \( J \in C^1 (X, \mathbb{R}) \) with \( J(0) = 0 \), satisfying the (PS)-condition, we assume that, for \( \rho > 0 \),
\[ J(u) \leq 0, u \in X_2, \|u\|_\alpha \leq \rho, \quad (14) \]
\[ J(u) \geq 0, u \in X_1, \|u\|_\alpha \leq \rho, \]

In addition, we assume also that \( J \) is bounded below and \( \inf_X J < 0 \). Thus \( J \) has at least two non zero critical points.

3. Main Result

We establish the existence of at least two non zero weak solutions to problem (1) via Brezis and Nirenberg’s Linking Theorem.

**Definition 7.** A function \( u \in H^\alpha \) is said to be a weak solution of problem (1) if the identity

\[
\int_0^T (\partial_t c_0 D^\alpha_0 u(t) c_0 D^\alpha_0 v(t)) \, dt + \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L I_{ij} (u^i(t_j)) v^i(t_j) \, dt + \int_0^T (\nabla F(t, u(t)), v(t)) \, dt = 0
\]

holds for any \( v \in H^\alpha \).

Consider the functional \( J : H^\alpha \to \mathbb{R} \) defined by

\[
J(u) = \frac{1}{2} \int_0^T |c_0 D^\alpha_0 u(t)|^2 \, dt + \int_0^T F(t, u(t)) \, dt + \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L I_{ij} (s) \, ds
\]

where

\[
J_1(u) = \frac{1}{2} \int_0^T |c_0 D^\alpha_0 u(t)|^2 \, dt + \int_0^T F(t, u(t)) \, dt
\]

and

\[
J_2(u) = \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L I_{ij} (s) \, dt
\]

**Proposition 7.** The functional \( J \) is continuously differentiable on \( H^\alpha \) and

\[
\langle J'(u), v \rangle = \int_0^T c_0 D^\alpha_0 u(t) c_0 D^\alpha_0 v(t) \, dt + \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L I_{ij} (u^i(t_j)) v^i(t_j) \, dt + \int_0^T (\nabla F(t, u(t)), v(t)) \, dt
\]

**Proof.** The proof of this proposition is very simple, we omit it. \( \square \)

It is clear that, the critical points of \( J \) are weak solutions of (1). Now, we give the proof of our main results.

**Proof of Theorem 1.** We apply Lemma 1 to \( J \). Knowing that \( H^\alpha \) is a Banach space and \( J \in C^1(H^\alpha, \mathbb{R}) \) (see Proposition 5). By (15), it can be easily checked that functional \( J \) satisfies \( J(0) = 0 \). We decompose the proof of the theorem into the following three steps.

**Step 1** We get (h1) or (h2) implies that

\[
\lim_{\|u\|_\alpha \to \infty} J(u) = +\infty,
\]

(19)
and $J(u)$ is bounded below on $H^1$. To this end, for any $0 < \varepsilon < \gamma$, (h1) implies that there exists $\delta > 0$ such that

$$F(t, u(t)) \geq (\gamma - \varepsilon) |u|^2, \quad \forall u \in \mathbb{R}^N \text{ with } |u| \geq \delta \text{ and a.e. } t \in [0, T]. \quad (20)$$

Let $a_\delta = \max_{|u| \leq \delta} a(|u|); \text{ in view of (A), one can get}$

$$F(t, u) \geq -a(|u|) b(t) \geq -a_\delta b(t) + (\gamma - \varepsilon) |u|^2 - (\gamma - \varepsilon) \delta^2, \quad \forall u \in \mathbb{R}^N \text{ with } |u| \geq \delta \text{ and a.e. } t \in [0, T]. \quad (21)$$

Then it follows from (20) and (21) that

$$F(t, u) \geq (\gamma - \varepsilon) |u|^2 - (\gamma - \varepsilon) \delta^2 - a_\delta b(t), \quad \forall u \in \mathbb{R}^N \text{ with } |u| \geq \delta \text{ and a.e. } t \in [0, T]. \quad (22)$$

Thus, by (16) and (22), we have

$$J_1(u) = \frac{1}{2} \int_0^T |\partial_t^2 u(t)|^2 dt + \int_0^T d(t) \int_0^T |u(t)|^2 dt - (\gamma - \varepsilon) \delta^2 \int_0^T b(t) dt \geq \min \left\{ \frac{1}{2}, (\gamma - \varepsilon) \right\} \|u\|_N^2 - (\gamma - \varepsilon) \delta^2 T - a_\delta \int_0^T b(t) dt \geq \min \left\{ \frac{1}{2}, (\gamma - \varepsilon) \right\} \|u\|_N^2 \quad (23)$$

for all $u \in H^1_0$. For any $z \in \mathbb{R}$, we set

$$K(\tau) := \left( \int_0^{\tau^{-1}z} I_{ij}(s) \, ds \right)^{\gamma_{ij}}, \text{ for all } \tau \geq 1.$$
\[ J(u) \geq \min \left\{ \frac{1}{2}, (\gamma - \epsilon) \right\} \left\| u \right\|_a^2 - (\gamma - \epsilon) \delta^2 T - a_\delta \int_0^T b(t) \, dt + \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L u_i(t_j) \]

\[ \geq \min \left\{ \frac{1}{2}, (\gamma - \epsilon) \right\} \left\| u \right\|_a^2 - (\gamma - \epsilon) \delta^2 T - a_\delta \int_0^T b(t) \, dt + \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma \left\| u^i(t_j) \right\| \]

\[ \geq \min \left\{ \frac{1}{2}, (\gamma - \epsilon) \right\} \left\| u \right\|_a^2 - \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma \left\| u^i(t_j) \right\| \]

\[ \geq \min \left\{ \frac{1}{2}, (\gamma - \epsilon) \right\} \left\| u \right\|_a^2 - \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma (\gamma - \epsilon) \delta^2 T - a_\delta \int_0^T b(t) \, dt \]

Then in view of (25), for any \( \gamma > 0 \), choosing \( 0 < \epsilon < \gamma \). The following two cases may occur.

Case 1 \( \gamma > \frac{1}{2} \) choosing \( \epsilon = \frac{\gamma - \frac{1}{2}}{2} \), we can get \( \gamma - \epsilon > \frac{1}{2} \), so

\[ \min \left\{ \frac{1}{2}, (\gamma - \epsilon) \right\} = \frac{1}{2}. \]

Thus, it follows from (25) that

\[ J(u) \geq \frac{1}{2} \left\| u \right\|_a^2 - \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma \left\| u^i(t_j) \right\| \]

\[ \geq \min \left\{ \frac{1}{2}, (\gamma - \epsilon) \right\} \left\| u \right\|_a^2 - \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma (\gamma - \epsilon) \delta^2 T - a_\delta \int_0^T b(t) \, dt. \]

So (H1) yields that (19) holds, i.e.,

\[ J(u) \to \infty, \text{ as } \left\| u \right\|_a \to \infty. \]

Case 2 \( \gamma \leq \frac{1}{2} \) choosing \( \epsilon = \frac{\gamma - \frac{1}{2}}{2} \) It follows from (H2) that

\[ \gamma - \epsilon = \frac{1}{2} \left( \gamma + \frac{1}{2} \delta^2 \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma \right) > \frac{1}{2} \delta^2 \sum_{i=1}^N \sum_{j=1}^L c_{ij} > 0 \]

and \( \epsilon > 0 \). Since \( \gamma - \epsilon \leq \frac{1}{2} - \epsilon < \frac{1}{2} \), we have

\[ \min \left\{ \frac{1}{2}, (\gamma - \epsilon) \right\} = (\gamma - \epsilon). \]

Thus, it follows from (19) and (20) that

\[ J(u) \geq (\gamma - \epsilon) \left\| u \right\|_a^2 - \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma \left\| u^i(t_j) \right\| \]

\[ \geq (\gamma - \epsilon) \left\| u \right\|_a^2 - \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L c_{ij}^\gamma (\gamma - \epsilon) \delta^2 T - a_\delta \int_0^T b(t) \, dt \]

\[ -a_\delta \int_0^T b(t) \, dt, \]

which combined with (H2) yields that (19) holds, i.e.,

\[ J(u) \to \infty, \text{ as } \left\| u \right\|_a \to \infty. \]

Therefore, (H1) or (H2) implies (19). Thus, \( J(u) \) is bounded below on \( H^a \).
Step 2 We prove that (H1) or (H2) implies that $J(u)$ satisfies the (PS) condition. Suppose that  
\{u_n\} is a sequence in $H^s$ such that $J(u_n)$ is bounded and $J'(u_n) \to 0$ as $n \to \infty$. Then \{u_n\} is bounded 
on $H^s_0$. In fact, if \{u_n\} is an unbounded sequence, without loss of generality we assume that $\|u_n\|_s \to \infty$ 
as $n \to \infty$. By Step 1, we know that (H1) or (H2) implies (19). Thus $J(u_n) \to \infty$, which contradicts the 
boundedness of $J(u_n)$. Since $u_n \subset H^s$ is bounded and $H^s$ is a reflexive Banach space and so by 
passing to a subsequence (for simplicity denoted again by $\{u_n\}$) if necessary, by Proposition 6, we may 

assume that  
\[
\begin{cases}
  u_n \to u, \text{ weakly in } H^s, \\
  u_n \to u, \text{ strongly in } C([0,T], \mathbb{R}^N)
\end{cases} \tag{27}
\]

By (18), we have  
\[
\langle J'(u_n) - J'(u), u_n - u \rangle = \int_0^T \|\overline{\partial}^s_i u_n (t) - \overline{\partial}^s_i u (t)\|^2 dt 
+ \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L \left[ I_{ij} \left( u_n' (t_j) \right) - I_{ij} \left( u' (t_j) \right) \right] \left( u_n (t_j) - u (t_j) \right) dt 
+ \int_0^T (\nabla F (t, u_n (t)) - \nabla F (t, u (t))) , u_n (t) - u (t) \rangle dt,
\]
\[
\geq \int_0^T \|\overline{\partial}^s_i u_n (t) - \overline{\partial}^s_i u (t)\|^2 dt 
+ \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L \left[ I_{ij} \left( u_n' (t_j) \right) - I_{ij} \left( u' (t_j) \right) \right] \left( u_n (t_j) - u (t_j) \right) dt 
+ \int_0^T (\nabla F (t, u_n (t)) - \nabla F (t, u (t))) , u_n (t) - u (t) \rangle dt,
\]

One has  
\[
\int_0^T \|\overline{\partial}^s_i u_n (t) - \overline{\partial}^s_i u (t)\|^2 dt \leq \langle J'(u_n) - J'(u), u_n - u \rangle 
- \frac{1}{2} \sum_{i=1}^N \sum_{j=1}^L \left[ I_{ij} \left( u_n' (t_j) \right) - I_{ij} \left( u' (t_j) \right) \right] \left( u_n (t_j) - u (t_j) \right) dt 
- \int_0^T (\nabla F (t, u_n (t)) - \nabla F (t, u (t))) , u_n (t) - u (t) \rangle dt \tag{28}
\]

By (27), we know that  
\[
\int_0^T \|u_n (t) - u (t)\|^2 dt \to 0, \text{ as } n \to \infty \tag{29}
\]

and for any $i \in A, j \in B$, we have that $u_n' (t_j) \to u' (t_j)$, as $n \to \infty$. In fact  
\[
\left| u_n' (t_j) - u' (t_j) \right| \leq \left| u_n (t_j) - u (t_j) \right| \text{ for any } i \in A, j \in B,
\]

Thus, it follows from the continuity of all $I_{ij}$ that  
\[
\sum_{i=1}^N \sum_{j=1}^L \left[ I_{ij} \left( u_n' (t_j) \right) - I_{ij} \left( u' (t_j) \right) \right] \left( u_n (t_j) - u (t_j) \right) \to 0, \text{ as } n \to \infty. \tag{30}
\]
In view of (A) and (27), we have
\[ \int_0^T (\nabla F(t, u_n(t)) - \nabla F(t, u(t)))\cdot (u_n(t) - u(t))\, dt \to 0, \text{ as } n \to \infty. \] (31)

Since \( f'(u_n) \to 0 \), then using (28), (30) and (31), we have that
\[ \int_0^T |\xi^2 u_n(t) - \xi^2 u(t)|^2 \, dt \to 0, \text{ as } n \to \infty. \] (32)

By (29) and (32), one has \( \|u_n - u\|_{\alpha} \to 0 \), which means that \( f(u) \) satisfies the \((PS)\)–condition.

**Step 3** We prove that \((H3)\) implies that (14) holds for some \( \rho > 0 \). To this end, it follows from (13), (17) and (h5), that
\[ 0 \leq J_2(u) = \frac{1}{2} \sum_{i,j=1}^{N} l_{ij}(s) \int_0^T u_i'(t_j) \, dt \]
\[ \leq \frac{1}{2} \sum_{i,j=1}^{N} \sum_{k=1}^{L} k^2 \alpha^2 \mu_{ij} |u_i'(t_j)|^2 \]
\[ \leq \frac{1}{2} \sum_{i,j=1}^{N} \sum_{k=1}^{L} k^2 \alpha^2 \mu \|u\|^2_{\infty} \]
\[ \leq \frac{1}{2} \sum_{i,j=1}^{N} \sum_{k=1}^{L} k^2 \alpha^2 \mu \xi^2 \|u\|^2_{\alpha} \]
\[ = \frac{1}{2} NLk^2 \alpha^2 \mu \xi^2 \|u\|^2_{\alpha} \] (33)
where \( \mu = \max_{j \in A, j \in B} \{ \mu_{ij} \} \).

Let
\[ X_2 = \left\{ \sum_{m=0}^{k} a_m \sin(m \omega t) ; a_m \in \mathbb{R}^N \right\}, \]
where \( a_m = (a_m^1, a_m^2, \ldots, a_m^N) \) with \( a_m^i = 1 \) for \( i = 1, \ldots, N \). and \( X_1 \) be the orthogonal complement of \( X_2 \) in \( H^\alpha \). Then \( \dim X_2 < \infty \) and \( H^\alpha = X_1 \oplus X_2 \).

If \((H3)\) holds, we will consider \( X_2 \) with \( k \geq 1 \). When \( u \in X_2 \), we have
\[ \frac{1}{2} \sum_{i=1}^{N} \left\| u_i'(t) \right\|^2 \, dt = \int_0^T \left( \sum_{m=0}^{k} a_m^i \sin(m \omega t) \right)^2 \, dt \]
\[ = \int_0^T \left( \sum_{m=0}^{k} (a_m^i)^2 \sin^2(m \omega t) + \sum_{m=0}^{k} \sum_{j=0, j \neq m}^{k} a_m^i a_j^i \sin(m \omega t) \sin(j \omega t) \right) \, dt \] (34)

On the other hand, one has
\[ \int_0^T \sin(m \omega t) \sin(j \omega t) \, dt = \begin{cases} \frac{T}{\omega} & m = j \\ 0, & \text{otherwise.} \end{cases} \] (35)
So, in view of (34) and (35), we have
\[ \int_{0}^{T} |u(t)|^2 \, dt = \frac{T}{2} \sum_{i=1}^{N} \sum_{m=0}^{k} (a_m^i)^2 = \frac{N(k+1)T}{2} \] (36)

Also, For all \( u \in X_2 \) and by Proposition 3, one has \( \partial_0 \partial_t^a u(t) = \partial_0 u(t) \) and
\[
\partial_0 \partial_t^a u(t) = \frac{1}{\Gamma(1-a)} \frac{d}{dt} \left( \int_{0}^{T} (t-s)^{-a} \sum_{m=0}^{k} a_m^i \sin (m\omega s) \, ds \right)
\]
\[
\leq \frac{1}{\Gamma(1-a)} \frac{d}{dt} \left( \int_{0}^{T} (t-s)^{-a} \sum_{m=0}^{k} a_m^i \, ds \right)
\]
\[
= \frac{1}{\Gamma(1-a)} \frac{d}{dt} \sum_{m=0}^{k} a_m^i \, (m\omega) \left( \frac{t^{1-a}}{1-a} \right)
\]
\[
= \frac{1}{\Gamma(2-a)} \sum_{m=0}^{k} a_m^i \, (m\omega) t^{1-a}
\]
which implies
\[
\int_{0}^{T} \left| \partial_0 \partial_t^a u(t) \right|^2 \, dt \leq \left( \frac{1}{\Gamma(2-a)} \right)^2 \int_{0}^{T} \left( \sum_{m=0}^{k} a_m^i \right)^2 \, dt \leq \left( \frac{1}{\Gamma(2-a)} \right)^2 (2k+1) k^2 \omega^2 \frac{T^{3-2a}}{3-2a}
\] (37)

By (16) and (h2), for all \( \|u\|_a \leq \rho \), we have
\[ J_1(u) = \frac{1}{2} \int_{0}^{T} \left| \partial_0 \partial_t^a u(t) \right|^2 \, dt + \int_{0}^{T} F(t, u(t)) \, dt \] (38)
\[
\leq \frac{1}{2} \int_{0}^{T} \left| \partial_0 \partial_t^a u(t) \right|^2 \, dt - \frac{1}{2} \lambda k^2 \omega^2 \left( \frac{1}{\Gamma(2-a)} \right)^2 \int_{0}^{T} |u(t)|^2 \, dt.
\]

By (15), (33), (36)–(38), we have
\[ J(u) \leq \frac{1}{2} \int_{0}^{T} \left| \partial_0 \partial_t^a u(t) \right|^2 \, dt - \frac{1}{2} \lambda k^2 \omega^2 \left( \frac{1}{\Gamma(2-a)} \right)^2 \int_{0}^{T} |u(t)|^2 \, dt
\]
\[
+ \frac{1}{2} NLk^2 \omega^2 \mu \xi^2 \|u\|^2_a
\]
\[
\leq \frac{1}{2} \left( \frac{1}{\Gamma(2-a)} \right)^2 (2k+1) k^2 \omega^2 \frac{T^{3-2a}}{3-2a} - \frac{1}{2} \lambda k^2 \omega^2 N(k+1) T \left( \frac{1}{\Gamma(2-a)} \right)^2
\]
\[
+ \frac{1}{2} NLk^2 \omega^2 \mu \xi^2 \|u\|^2_a
\]
for all \( u \in X_2 \). Therefore, by the fact \( 1 < \left( \frac{1}{\Gamma(2-a)} \right)^2 \) for \( a \in (\frac{1}{2}, 1], 2k+1 < 2k+2, N > 1 \), (36), (37) and (39), we have
The proof of Theorem 1 is complete.

Thus, for all least two nonzero critical points. Therefore, problem (1) has at least two nonzero weak solutions in $H$

Moreover, it follows from (H3) implies that $J (u) \leq 0$ for all $u \in X_2$ with $\| u \|_a \leq \rho$.

In view of (22) by choosing $\varepsilon = \frac{1}{2}$, we get

$$
J_{1} (u) = \frac{1}{2} \int_{0}^{T} \left| \frac{d}{dt} u (t) \right|^2 dt + \frac{1}{2} \int_{0}^{T} F (t, u (t)) dt
$$

for all $u \in H^a$. Since $b \in L^1 ([0, T], \mathbb{R}^+)$, then $J (u) \geq 0$ for all $u \in X_1$ with $\| u \|_a \leq \rho$ for $\rho$ large enough. Thus, (H3) implies that (14) holds for $\rho$ large enough.

Moreover, it follows from (h2) that $F (t, 0) = 0$ for a.e. $t \in [0, T]$. Thus, (h2) implies $J (0) = 0$. Now if $\inf_{u \in X_1} J (u) \geq 0$, by Step 3 we have that all $u \in X_2$ with $\| u \|_a \leq \rho$ are minima of $J$, which implies that $J$ has infinitely many critical points. If $\inf_{u \in X_1} J (u) \leq 0$, then it follows from Lemma 2 that $J$ has at least two nonzero critical points. Therefore, problem (1) has at least two nonzero weak solutions in $H^a$.

The proof of Theorem 1 is complete.
Example 1. Let $\alpha = \frac{3}{4}$, $T = 2\pi$, $N = 1$ and $k = 1$. Consider the boundary value problem of the fractional differential equation with impulsive effects

$$
\begin{cases}
\left(D_t^\frac{3}{2}\left(\frac{\varrho}{\varrho} D_t D_t^\frac{3}{2} u(t)\right) = -\nabla F(t,u), \quad t \in [0,2\pi), \\
\Delta \left(D_t^\frac{3}{4}\left(\frac{\varrho}{\varrho} D_t D_t^\frac{3}{4} u(t_i)\right) (t_j)\right) = \frac{1}{2} I_{ij} (u_i(t_j)), \quad i = 1, j = 1
\end{cases}
$$

(42)

where $I_{ij}(s) = \frac{1}{5} (0.0005) s$. Direct computation shows that $\xi = \frac{(2\pi)^{\frac{3}{4}} \sqrt{2}}{\Gamma\left(\frac{3}{2}\right)} \approx 1.8$, $\omega = 1$, $(h3)$, $(h4)$ and $(h5)$ hold with $\gamma_{ij} = \frac{1}{2}$ and $\mu = 0.0005$.

**Case 1** Assume that $F$ of (42) is

$$
F(t,u) = \begin{cases}
\frac{1}{2} (t + 2) \left(|u|^2 - |u|\right), & |u| > 1, \\
5.71187 (t + 1) \left(|u|^4 - |u|^2\right), & |u| \leq 1,
\end{cases}
$$

where $t \in [0,2\pi]$. In this case, we have that condition (A) holds with $a(|u|) = \max \left\{|u|^4 + |u|^2, 2 |u|^2 + 2 |u|, 4 |u|^3 + 2 |u|, 4 |u| + 2\right\}$ and $b(t) = 7 (t + 2)$. Direct computation shows that $(h1)$ holds with $\gamma = 1$ since, we have

$$
\lim_{|u| \to \infty} \inf_{|u|} \frac{F(t,u)}{|u|^2} = \frac{1}{2} (t + 2) \geq \gamma > \frac{1}{2}
$$

Moreover, direct computation shows that $(h2)$ holds with $\lambda = 9.46$ and

$$
\lambda \geq 9.45 + 24.89 \mu \approx 9.46,
$$

where $\Gamma(2 - \alpha) = \Gamma\left(\frac{5}{4}\right) \approx 0.91$. Since $\lim_{|u| \to 0} \frac{F(t,u)}{|u|^2} = -5.71187 (t + 1)$, then by choosing $\epsilon = \frac{1}{100}$ such that $F(t,u) \leq -5.71187 |u|^2$.

Thus, by $F(t,0) = 0$, $(H1)$ and $(H3)$ holds. According to Theorem 1, the problem (42) has at least two non zero weak solutions.

**Case 2** Assume that $F$ of (42) is

$$
F(t,u) = \begin{cases}
\left(t + \frac{1}{2}\right) \left(|u|^2 - |u|\right), & |u| > 1, \\
9.77 (t + 0.605) \left(|u|^4 - |u|^2\right), & |u| \leq 1,
\end{cases}
$$

where $t \in [0,2\pi]$. In this case, we have that condition (A) holds with $a(|u|) = \max \left\{|u|^4 + |u|^2, 2 |u|^2 + 2 |u|, 4 |u|^3 + 2 |u|, 4 |u| + 2\right\}$ and $b(t) = 10 (t + 1)$. Direct computation shows that $(h1)$ holds with $\gamma = \frac{1}{3}$ since

$$
\lim_{|u| \to \infty} \inf_{|u|} \frac{F(t,u)}{|u|^2} = t + \frac{1}{3} \geq \gamma,
$$
\[ 0.06593 \approx \xi^2 \sum_{i=1}^{\gamma} \frac{1}{2} \sum_{j=1}^{\gamma} c_{ij} \leq \frac{1}{2}. \]

Moreover, direct computation shows that \((H2)\) holds. Since
\[
\lim_{|u| \to 0} \frac{F(t,u)}{|u|^2} = -9.77 (t + 0.605).
\]
Therefore, by choosing \(\varepsilon = \frac{132}{1000}\), we have \(F(t,0) \leq -5.71187 |u|^2\). Then, by \(F(t,0) = 0\), \((H2)\) and \((H3)\) holds. According to Theorem 1, the problem \((42)\) admits at least two nonzero weak solutions.

4. Conclusions

Fractional differential equations have recently proved to be valuable tools for modeling many phenomena in various fields of science and engineering. Indeed, one can find many applications in viscoelasticity, electrochemistry, control, porous media, electromagnetic, etc., for example, see [1–19]. Moreover, recently, the existence of solutions of boundary value problems for fractional differential equations have widely been studied in many papers and we refer the reader to the papers [3–18]. In this work, we can extend the previous mentioned works for proving the existence of at least two non zero weak solutions to a new class of impulsive fractional boundary value problems via Brezis and Nirenberg’s Linking Theorem. Finally, an example is presented to illustrate our results. In the next work, we will try to prove the existence of three different weak solutions of the \(p\)-Laplacian fractional for an overdetermined nonlinear fractional partial Fredholm–Volterra integro-differential system by using variational methods combined with a critical point theorem due to Bonanno and Marano.
