Products of Greek letter elements dug up from the third Morava stabilizer algebra

RYO KATO
KATSUMI SHIMOMURA

In [3], Oka and the second author considered the cohomology of the second Morava stabilizer algebra to study nontriviality of the products of beta elements of the stable homotopy groups of spheres. In this paper, we use the cohomology of the third Morava stabilizer algebra to find nontrivial products of Greek letters of the stable homotopy groups of spheres: \( \alpha_1 \gamma_t, \beta_2 \gamma_t, \langle \alpha_1, \alpha_1, \beta_{p/p}^p \rangle \gamma_t \beta_1 \) and \( \langle \beta_1, p, \gamma_t \rangle \) for \( t \) with \( p \nmid (t^2 - 1) \) for a prime number \( p > 5 \).

55Q45; 55Q51

1 Introduction

Greek letter elements are well known generators of the stable homotopy groups of spheres localized at a prime \( p \). Studying products among these elements is an interesting subject, and studied by several authors. For example, at an odd prime \( p \), all products of alpha elements are trivial. In [3], we used \( H^*S(2) \) to study nontriviality of the product of beta elements. In this paper, we use \( H^*S(3) \) to find relations of Greek letters. The multiplicative structure of \( H^*S(3) \) is given by Yamaguchi [7], but unfortunately, it has some typos. So here, our computation is based on Ravenel’s.

Let \( \beta_{p/p} \) be the generator of the \( E_2 \)-term \( E_2^{2,p^2,q}(S) \) of the Adams-Novikov spectral sequence converging to the homotopy groups \( \pi_*(S) \) of the sphere spectrum \( S \). Hereafter, \( q = 2p - 2 \) as usual. A relation given by Toda implies that \( \beta_{p/p} \) dies in the Adams-Novikov spectral sequence at a prime \( p > 2 \). At the prime two, \( \beta_{2/2}^2 = 0 \) by [2, Prop. 8.22], while at the prime numbers three and five, Ravenel showed that \( \beta_{p/p}^p \) survives to a homotopy element of \( \pi_*(S) \) and \( \alpha_1 \beta_{p/p}^p = 0 \) for the generator \( \alpha_1 \) of \( \pi_{q-1}(S) \). Here, we show the following

**Theorem 1.1** At a prime \( p > 3 \), \( \beta_{p/p}^p \) survives to \( \pi_{(p^3-1)q-2}(S) \) and \( \alpha_1 \beta_{p/p}^p = 0 \).

**Corollary 1.2** At a prime \( p > 3 \), the Toda bracket \( \langle \alpha_1, \alpha_1, \beta_{p/p}^p \rangle \) \( = \alpha_1 \beta_{p^2/p^2} \) is defined.
Remark 1.3 It is already known that $\alpha_1 \beta_{p^2/p^2}$ survives in the Adams-Novikov spectral sequence by the work of R. Cohen [1]. Corollary 1.2 states that the Cohen’s element is a Toda bracket $\langle \alpha_1, \alpha_1, \beta_{p/p} \rangle$.

We notice that at the prime 3, Ravenel showed these in [4].

Let $\beta_1$, $\beta_2$ and $\gamma_t$ ($t > 0$) be the generators of Coker $J$ of dimensions $pq - 2$, $(2p + 1)q - 2$ and $(tp^2 + (t - 1)p + t - 2)q - 3$, respectively.

Theorem 1.4 Let $p > 5$, and $t$ be a positive integer with $p \nmid t(t^2 - 1)$. Then, the elements $\alpha_1 \gamma_t$, $\beta_2 \gamma_t$, $\langle \alpha_1, \alpha_1, \beta_{p/p} \rangle \beta_1 \gamma_t$ and $\langle \beta_1, p, \gamma_t \rangle$ generate subgroups of the stable homotopy groups of spheres isomorphic to $\mathbb{Z}/p$. Besides, even in the case $p|t(1 + 1)$, $\beta_1 \gamma_t$ and $\langle \beta_1, p, \gamma_t \rangle$ are generators of order $p$.

Note that $\langle \beta_1, p, \gamma_t \rangle = \langle \gamma_t, p, \beta_1 \rangle$. We also notice that if $t = 1$, then $\langle \gamma_t, p, \beta_1 \rangle = 0$, while $\beta_2 \gamma_t$ is non-trivial (see section five).

From here on, we assume that the prime number $p$ is greater than three.

2 $H^* S(3)$ revisited

We begin with recalling some notation from Ravenel’s green book [4]. Let $BP$ denote the Brown-Peterson spectrum. Then, the pair $$(BP_*, BP_*(BP)) = (\mathbb{Z}[v_1, v_2, \ldots], BP_*(t_1, t_2, \ldots))$$

is a Hopf algebroid. Here, the degrees of $v_i$ and $t_i$ are $2p^i - 2$. The structure maps act as follows:

\[
\begin{align*}
\eta_R(v_1) &= v_1 + pt_1 \\
\eta_R(v_2) &\equiv v_2 + v_1 t_1^p + pt_2 \mod (p^2, v_1) \\
\eta_R(v_3) &\equiv v_3 + v_2 t_1^p + v_1 t_2^p + pt_3 \\
&\quad -p v_1 t_2^{p-1} (t_2 + t_1^{p+1}) \mod (p^2, v_1, v_2^2) \\
\Delta(t_1) &= t_1 \otimes 1 + 1 \otimes t_1 \\
\Delta(t_2) &\equiv t_2 \otimes 1 + t_1 \otimes t_1^p + 1 \otimes t_2 - v_1 b_{10} \\
\Delta(t_3) &\equiv t_3 \otimes 1 + t_2 \otimes t_1^p + t_1 \otimes t_3^p + 1 \otimes t_3 \mod (v_1, v_2) \\
\Delta(t_4) &\equiv t_4 \otimes 1 + t_3 \otimes t_1^p + t_2 \otimes t_2^p + t_1 \otimes t_3^p + 1 \otimes t_4 \\
&\quad -v_3 b_{12} \mod (v_1, v_2) \\
\Delta(t_5) &\equiv t_5 \otimes 1 + t_4 \otimes t_1^p + t_3 \otimes t_3^p + t_2 \otimes t_3^p + t_1 \otimes t_4^p + 1 \otimes t_5 \\
&\quad -v_3 b_{22} - v_4 b_{13} \mod (p, v_1, v_2) \\
\end{align*}
\]
Now we abbreviate Ext

Theorem 2.3

for

\( b_{1k} = \frac{1}{p} \left( \Delta(t_1)^{p^{k+1}} - t_1^{p^{k+1}} \otimes 1 - 1 \otimes t_1^{p^{k+1}} \right) = \frac{1}{p} \sum_{i=1}^{p^{k+1}-1} \left( \delta_{i+1} \right) t_1^i \otimes t_1^{p^{k+1}-i} \) and

\( b_{2k} = \frac{1}{p} \left( \Delta(t_2)^{p^{k+1}} - t_2^{p^{k+1}} \otimes 1 - 1 \otimes t_2^{p^{k+1}} - 1 \otimes t_2^{p^{k+1}} - v_1^{p^{k+1}} b_{1k+1} \right) \).

Let \( K(3) = F_p[v_3, v_3^{-1}] \) have the \( BP_\ast \)-module structure given by \( v_3 v_3^i = v_3^i \) if \( i = 3 \), and \( = 0 \) otherwise, and

\[ \Sigma(3) = K(3) \otimes_{BP_\ast} BP_\ast(BP) \otimes_{BP_\ast} K(3) \]

\[ = K(3)[t_1, t_2, \ldots] / (v_3 t_3^i - v_3^i t_i : i > 0) \] (by \([4, 6.1.16])

is the Hopf algebra with structure inherited from \( BP_\ast(BP) \). Define the Hopf algebra \( S(3) \) by \( S(3) = \Sigma(3) \otimes_{K(3)} F_p \), where \( K(3) \) acts on \( F_p \) by \( v_3 \cdot 1 = 1 \). Then,

\[ S(3) = F_p[t_1, t_2, \ldots] / (t_3^i - t_i : i > 0) \).

Now we abbreviate Ext\(S(3))(F_p, F_p)\) to \(H^*S(3)\).

Consider integers \( d_i (= d_{3,i} \text{ in } [4, 6.3.1])\)

\[ d_i = \begin{cases} 
0 & i \leq 0, \\
\max(i, pd_{i-3}) & i > 0.
\end{cases} \]

Then, there is a unique increasing filtration of the Hopf algebroid \( S(3) \) with deg \( t_i^{d_i} = d_i \) for \( 0 \leq j < 3 \).

Theorem 2.3 (Ravenel\([4, 6.3.2]\)) The associated Hopf algebra \( E^0S(3) \) is isomorphic to the truncated polynomial algebra of height \( p \) on the elements \( t_i^{d_i} \) for \( i > 0 \) and \( j \in \mathbb{Z}/3 \), with coproduct defined by

\[ \Delta(t_i^{d_i}) = \begin{cases} 
\sum_{k=0}^i \delta_{i-k} t_k^{d_i} \otimes t_{i-k}^{d_i} & i \leq 3, \\
t_i^{d_i} \otimes 1 + 1 \otimes t_i^{d_i} + b_{3-i,j} & i > 3.
\end{cases} \]

Let \( L(3) \) be the Lie algebra without restriction with basis \( x_{i,j} \) for \( i > 0 \) and \( j \in \mathbb{Z}/3 \) and bracket given by

\[ [x_{i,j}, x_{k,l}] = \begin{cases} 
\delta_{i+k,j} x_{i+k,j} - \delta_{k+i,j} x_{i+k,j} & \text{for } i + k \leq 3, \\
0 & \text{otherwise},
\end{cases} \]

where \( \delta_{i}^j = 1 \) if \( i \equiv j \mod 3 \) and \( 0 \) otherwise, and \( L(3, k) \) the quotient of \( L(3) \) obtained by setting \( x_{i,j} = 0 \) for \( i > k \). Then, Ravenel noticed in \([4, 6.3.8]\):
**Theorem 2.4** $H^*(L(3,k))$ for $k \leq 3$ is the cohomology of the exterior complex $E(h_{i,j})$ on one-dimensional generators $h_{i,j}$ with $i \leq k$ and $j \in \mathbb{Z}/3$, with coboundary

$$d(h_{i,j}) = \sum_{s=1}^{i-1} h_s h_{i-s,s+j}.$$  

From now on, we abbreviate $h_{i,j}$ to $h_{ij}$, and $h_{1j}$ to $h_j$.

Under the above filtration, Ravenel constructed the May spectral sequences

**Theorem 2.5** (Ravenel [4, 6.3.4, 6.3.5]) There are spectral sequences

\begin{enumerate}[(a)]
  \item $E_2 = H^*(L(3,3)) \Rightarrow H^*(E_0 S(3))$ and
  \item $E_2 = H^*(E_0 S(3)) \Rightarrow H^*(S(3)).$
\end{enumerate}

Since these spectral sequences collapse, $H^* S(3)$ is additively isomorphic to $H^* L(3,3)$. Therefore, we have a projection

\begin{equation}
\pi: H^* S(3) \rightarrow E^0 H^* S(3) = H^*(E_0 S(3)) = H^* L(3,3).
\end{equation}

Note that the Massey product $\langle h_i, h_{i+1}, h_{i+2}, h_i \rangle$ is homologous to $v_3^{(2-pp')} b_{i+2}$ represented by $v_3^{(2-pp')} b_{1,i+2}$ of (2.2), and $\pi$ assigns the Massey product to $b_{i+2} \in H^* L(3,3)$. Ravenel determined in [4, 6.3.34] the additive structure of $H^* L(3,3)$. In particular, we have the following:

**Theorem 2.7** $H^* L(3,3)$ contains submodules generated by the linear independent elements:

$$h_1 k_1 \zeta_3, \ b_0 k_1 \zeta_3, \ h_0 l, \ k_0 l, \ h_0 b_0 b_2 l \text{ and } h_1 l.$$  

Here, $l = h_2 h_{21} h_{30}, \ k_i = h_2 h_{i+1}$ ($i = 0, 1), \ b_0 = h_1 h_{32} + h_{21} h_{20} + h_{31} h_1, \ b_2 = h_{30} h_{31} + h_{20} h_{22} + h_{30} h_{0}$ and $\zeta_3 = h_{30} + h_{31} + h_{32}.$

**Proof** In the table of the proof of [4, 6.3.34], we find the elements

$$h_0, \ h_1, \ k_0, \ b_0, \ b_2, \ l, \ l' = h_0 h_{22} h_{31}, \text{ and } \zeta_3,$$

as well as the first element $h_1 k_1 \zeta_3$ of the theorem. We also have the element $-h_1 k_1 h_{30} = h_1 h_2 h_{21} h_{30}$ in the table, which is the last element $h_1 l$ of the theorem. Besides $h_1 k_1 h_{31}$ and $h_1 k_1 h_{32}$ are in the table too. We see that $b_0 k_1 = -h_1 k_1 h_{31} + h_1 k_1 h_{32}$ and so the second element is given by $b_0 k_1 \zeta_3 = -h_1 k_1 h_{31} \zeta_3 + h_1 k_1 h_{32} \zeta_3.$

The element $h_0 b_0 b_2 l \zeta_3$ is computed as

$$h_0 h_2 h_{21} h_{30} (h_1 h_{32} + h_{21} h_{20} + h_{31} h_1)(h_0 h_{31} + h_{20} h_{22} + h_{30} h_0)(h_{30} + h_{31} + h_{32}) = -2 h_0 h_1 h_{20} h_{21} h_{22} h_{30} h_{31} h_{32}.$$
Therefore, $h_0b_0b_2l$ is the dual of the generator $-\frac{1}{2}\zeta_3$, and the elements $h_0b_0b_2l$ and $h_0l$ are generators. Similarly, a computation
\[
k_{0}l'\zeta_3 = h_20h_1h_2h_31h_0h_22h_31(h_30 + h_31 + h_32) = h_0h_1h_2h_2h_31h_32h_31h_32
\]
shows that $k_{0}l'$ is the dual of the generator $l'\zeta_3$.

\section{Greek letter elements}

Let $E_r^s(X)$ denote the $E_r$-term of the Adams-Novikov spectral sequence converging to the homotopy group $\pi_{r-s}(X)$ of a spectrum $X$. Then the $E_2$-term is $\text{Ext}_{BP_*}(BP_*)(BP_*, BP_*(X))$. We here consider the Ext-group $\text{Ext}_{BP_*}(BP_*)$ for a $BP_*$-comodule $M$ as the cohomology of the cobar complex $\Omega_{BP_*}(BP_* M)$ (cf. [2]). Consider a sequence $A = (a_0, a_1, \ldots, a_n)$ of non-negative integers so that the sequence $p^{a_0}, v_1^{a_1}, \ldots, v_n^{a_n}$ is invariant and regular. For such a sequence $A$, Miller, Ravenel and Wilson introduced in [2] $n$-th Greek letter elements $\eta_{(A)}(n)$ in the Adams-Novikov $E_2$-term $E_2^{a_0, a_1}(S)$ by

\begin{equation}
\eta_{(A)}(n) = \delta_{A,1} \cdots \delta_{A,n}(\eta_{n}^{a_0}) \in E_2^{a_0, a_1}(S)
\end{equation}

for $\eta_n^{a_0} \in \text{Ext}_{BP_*}^{0, 2a_0(p^n - 1)}(BP_*, BP_*/I(A, n))$. Here, $s(A) = a_n/a_{n-1}, a_{n-2}, \ldots, a_0$ and $t(A) = 2a_n(p^n - 1) - 2 \sum_{i=0}^{n-1} a_i(p^i - 1)$, $I(A, k)$ denotes the ideal of $BP_*$ generated by $p^{a_0}, v_1^{a_1}, \ldots, v_{k-1}^{a_{k-1}}$, and $\delta_{A,k+1}$ is the connecting homomorphism associated to the short exact sequence

\[0 \to BP_*/I(A, k) \xrightarrow{\nu_k^{a_0}} BP_*/I(A, k) \to BP_*/I(A, k+1) \to 0.\]

In particular, we write $\alpha = \eta^{(1)}$, $\beta = \eta^{(2)}$ and $\gamma = \eta^{(3)}$. So far, only when $n \leq 3$, many conditions for that Greek letter elements survives to homotopy elements are known. We abbreviate $\eta_{(A)}(n)$ to $\eta_{(A)}(n)$ if $A = (1, \ldots, 1, a_n)$ as usual. For example, we consider $\beta$-elements defined by

\begin{equation}
\beta_k = \delta_{(1,1),1}(\beta_k) \in E_2^{2, n(1,1,s)}(S)
\end{equation}

for $\beta_k = \delta_{(1,1),2}(\nu_2^{a_0}) \in E_2^{1, n(1,1,s)}(V(0))$, and $\beta_{p'/p'} = \beta_{p'/p',1} = \delta_{(1,p'),1} \eta_{(1,p'),2}(\nu_2^{a_0}) \in E_2^{2, n(1,p',p')}$. 

\section{Lemma 2.8}

In $H^*(L(3,3), h_0k_1 = 0$ and $k_0k_1 = 0$.

\textbf{Proof} From the proof of [4, 6.3.34], we read off the relations $h_0k_1 = e_{30}h_2$ and $k_0k_1 = e_{30}g_1$ in $H^*(L(3,3), 2)$. Since $e_{30}t$ bounds $h_0l$ in $H^*(L(3,3), 1)$, the lemma follows.
Hereafter we assume that the prime $p$ is greater than three. We have the Smith-Toda spectrum $V(k)$ for $k = 0, 1, 2$ defined by the cofiber sequences

$$
S \xrightarrow{p} S \xrightarrow{i} V(0) \xrightarrow{j} \Sigma S,
$$

(3.3) $\Sigma^p V(0) \xrightarrow{\alpha} V(0) \xrightarrow{i} V(1) \xrightarrow{j} \Sigma^1 V(0)$ and $\Sigma^{p+1} V(0) \xrightarrow{\beta} V(1) \xrightarrow{i} V(2) \xrightarrow{j} \Sigma^{p+1} V(1)$.

Here, $\alpha \in [V(0), V(0)]_q$ is the Adams map and $\beta \in [V(1), V(1)]_{(p+1)q}$ is the $v_2$-periodic element due to L. Smith. Note that the $BP_*$-homology of these spectra are $BP_*(V(k)) = BP_*/I_{k+1}$ for the ideal $I_k$ of $BP_*$ generated by $v_i$ for $0 \leq i < k$ with $v_0 = p$. We consider the Bousfield-Ravenel localization functor $L_3$ with respect to $v_3^{-1}BP$. The $E_2$-term $E_2^j(L_3 V(2))$ is isomorphic to $K_3 \otimes H^* S(3)$, whose structure is given in [4] (see also [7]), and we consider the composite

$$
r: E_2^j(S) \xrightarrow{i} E_2^j(V(2)) \xrightarrow{j} E_2^j(L_3 V(2)) \xrightarrow{p} H^* (S(3)) \xrightarrow{r} H^* L(3, 3).
$$

Here the first map is induced from the inclusion $V(S) \rightarrow V(2)$ to the bottom cell, the second is from the localization map, the third is obtained by setting $v_3 = 1$ and the last is the projection (2.6).

Lemma 3.4 The map $r$ assigns the Greek letter elements as follows:

$$
r(\alpha_1) = h_0, \quad r(\beta_1) = -b_0, \quad r(\beta_2) = 2k_0, \quad r(\gamma_i) = -t(t^2 - 1)i - t(t - 1)k_1 \zeta_3 \quad \text{and} \quad r(\beta_{p/p}) = -b_1.
$$

We also have $\beta'_i = h_1 - v_i^{p-1} h_0 \in E_2^{1, p} V(0))$ for the generators $h_i$ of $E_2^{1, p} V(0))$ represented by $r_i^{p}$.\[\]

Proof First we consider the images of the Greek letter elements under the map $\iota_*: E_2^j(S) \rightarrow E_2^j(V(2))$. In the coalgebra complex $\Omega_{BP_*(BP)} BP_*$, by (2.1), $d(v_1^j) = pt_1$, $d(v_1^i) = v_1^{j+1} - v_1^{p+1} t_1^i \mod (p)$ for $i \geq 0$, $d(v_2^j) = 2v_1^i v_1^{p} + v_1^{2p} \mod (p, v_1^p)$, and $d(v_2^i) = tv_2 v_2^{p-1} t_1^i + \left(\frac{i}{2}\right) v_2^3 v_3^{p-3} t_1^i \mod (p, v_1, v_2)$, which imply

$$
\delta_{(1,1), 2}(v_1) = \left[ t_1, \quad \delta_{(1,1), 2}(v_2) = \left[ t_1 - v_1^{p-1} t_1 \right],
$$

$$
\delta_{(1,1), 2}(v_2) = \left[ 2v_1 v_2^p + v_1^{2p} + v_1^{p-1} x \right], \quad \delta_{(1, p), 2}(v_1) = \left[ t_1^p - v_1^{2p} t_1^p \right] \quad \text{and} \quad \delta_{(1,1), 3}(v_2) = \left[ tv_2 v_2^{p-2} t_1^i + \left(\frac{i}{2}\right) v_2^3 v_3^{p-3} t_1^i \right].
$$

for cochains $y \in \Omega_{BP_*(BP)} BP_*/(p)$ and $z \in \Omega_{BP_*(BP)} BP_*/(p, v_1)$. Here, $[x]$ denotes a cohomology class represented by a cocycle $x$. The first one shows $\alpha_1 = h_0$, and the second gives the last statement of the lemma. We further see that $d(r_i^p) = -pb_{1k-1}$
for \( k \geq 1 \) and \( d(v_k) \equiv pt_k \mod I((2, 1, 1), k) \) for \( k = 2, 3 \) by (2.1) in \( \Omega^1_{BP_c(BP)BP} \). Moreover, \([b_{1k}]\)’s are assigned to \( b_k \) in \( H^4L(3, 3) \) under the projection \( \pi \), and we obtain

\[
\begin{align*}
&\frac{1}{2} \delta_{(1,k^2)}(h_k - v_1^{p^k} h_{k-1}) = -b_{k-1} \quad \text{for } k = 1, 2, \\
&\frac{1}{2} \delta_{(1,1),1}((2v_2 t_1^2 + v_1 t_2^2)) = 2k_0, \\
&\delta_{(1,1),2}\left( (t - 1)v_2^{t_2} + \frac{1}{2}v_3^{t_3} + \gamma_1' \right) = \gamma_1' \quad \text{and} \\
&\frac{1}{2} \delta_{(1,1),1}(\gamma_1') = t(t - 1)(t - 2) h_3 k_1 + t(t - 1) r_3(1,1,1) (\{t_2^2 \otimes t_1^2 + 2t_1^2 \otimes t_1^2\}). 
\end{align*}
\]

Here, \( w \) is a linear combination of terms in the ideal \((v_1, v_2)^2\). Thus the relations other than \( r(\gamma_1) \) follows.

We note that \( b_{20} \) in (2.2) corresponds to \( h_{21}h_{30} + h_{31}h_{21} \) by \( \Delta(t_3) \) in (2.1). Since \( d(t_3^2) = - t_1^2 \otimes t_1^2 + v_1 b_{11} - pb_{20} \) by (2.1), we obtain \( r(\delta_{(1,1),1}((t_2^2 \otimes t_1^2 + 2t_1^2 \otimes t_1^2))) = -(h_{21}h_{30} + h_{31}h_{21}) h_2 + h_{21} b_1 = - 3 l - k_1 c_3, \) which shows the relation on \( r(\gamma_1) \).

Recall the cofiber sequences (3.3) and the \( v_3 \)-periodic element \( \gamma \in [V(2), V(2)]_{q_3} \) \((q_3 = (p^2 + p + 1)q)\) due to H. Toda. Then, the Greek letter elements in homotopy are defined by

\[
(3.5) \quad \alpha_t = j_0^t i, \quad \beta_t = j_1^t \beta_1 \quad \text{for } \beta_1 = j_1 \beta_1 i_i \quad \text{and} \quad \gamma_t = j_1 j_2^t \gamma_1 i_2 i_i
\]

for \( t > 0 \), and the Greek elements in the \( E_2 \)-term survives to the same named one in homotopy by the Geometric Boundary Theorem (cf. [4]).

**Proof of Theorem 1.4** We begin with noticing that the element \( b_i \) in \( H^4L(3, 3) \) is the image of the Massey product \( \langle h_i, h_{i+1}, h_{i+2}, h_i \rangle \) under \( \pi \), which is homologous to \( b_i \) represented by \( b_i \) in (2.2). We further note that the Toda brackets \( \langle \alpha_1, \alpha_1, \beta_1 p/p \rangle \) and \( \langle \beta_1, p, \gamma_1 \rangle \) are detected by \( \alpha_1 b_2 \) and \( h_1 \gamma_1 \) of \( E_2^2(S) \), respectively. Indeed, in the first bracket, \( d_{2p-1}(b_2) = \alpha_1 \beta_1 p/p \) by Corollary 4.4 below, and in the second bracket, \( \langle \beta_1, p, \gamma_1 \rangle = j \langle \beta_1', p, \gamma_1 \rangle \). Under the condition on \( t \), Lemmas 3.4, 2.7 and 2.8 imply that each element of \( \alpha_1 \gamma_1', \beta_2 \gamma_1', \alpha_1 b_2 \gamma_1 \beta_1 \) and \( h_1 \gamma_1 \), as well as \( \beta_1 \gamma_1 \), generates a submodule isomorphic to \( \mathbb{Z}/p \) of the \( E_2 \)-term \( E_2^2(S) \). These are, of course, permanent cycles, and nothing kills them in the Adams-Novikov spectral sequence since each element has a filtration degree less than \( 2p - 1 \).
4 $\beta^p_{p/p}$ in the homotopy of spheres

Let $X$ and $\overline{X}$ be the $(p - 1)q$- and $(p - 2)q$-skeletons of the Brown-Peterson spectrum $BP$. Then, we have the cofiber sequences

$$S \xrightarrow{j} X \xrightarrow{\kappa} \Sigma^p \overline{X} \xrightarrow{\lambda} S^1$$

and

$$\overline{X} \xrightarrow{j'} X \xrightarrow{\kappa'} \Sigma \overline{X}.$$

Then,

$$BP_* (X) = BP_* [x]/(p^q)$$

and

$$BP_* (\overline{X}) = BP_* [x]/(p^{q - 1})$$

as subcomodules of $BP_* (BP)$, where $x$ corresponds to $t_1$. From [4, Chap.7], we read off the following:

$$b^p_0 = 0 \in E^2_{2p,q} (X), \text{ which implies } E^2_{2s,e,q} (X) = 0 \text{ if } s \geq p \text{ and } t < (s - 1)p^2 + (s + 1 + e)p.$$

**Lemma 4.3** $b_0 : E^2_{2s+e,q} (S) \to E^2_{2s+2+e,(t+p)q} (S)$ is monomorphic if $s \geq p$ and $t \leq (s - 1)p^2 + (s + e)p$.

**Proof** Note that $b_0 = \lambda \lambda'$, and the lemma follows from (4.2) and the exact sequences

$$E^2_{2s+e,(t+p-1)q} (X) \xrightarrow{\kappa'} E^2_{2s+e,q} (S) \xrightarrow{\lambda'} E^2_{2s+1+e,(t+p-1)q} (\overline{X})$$

$$E^2_{2s+e+1,(t+p)q} (X) \xrightarrow{\lambda} E^2_{2s+2+e,(t+p)q} (\overline{X}) \xrightarrow{\lambda} E^2_{2s+2+e,(t+p)q} (S)$$

induced from the cofiber sequences in (4.1). $\square$

Ravenel showed that $d_{2p-1} (\beta^p_{p/p}) \equiv \alpha_1 \beta^p_{p/p} \mod Ker \beta^p_1$ in the Adams-Novikov spectral sequence for $\pi_* (S)$ (cf. [4, 6.4.1]). Here, the mapping $\beta^p_1$ on $E^2_{2p+1,(p^3+1)q} (S)$ is a monomorphism by Lemma 4.3:

**Corollary 4.4** In the Adams-Novikov spectral sequence for $\pi_* (S)$, $d_{2p-1} (\beta^p_{p/p}) = \alpha_1 \beta^p_{p/p} \in E^2_{2p+1,(p^3+1)q} (S) = E^2_{2p+1,(p^3+1)q} (S)$.

**Proof of Theorem 1.1** Consider the first cofiber sequence in (4.1). Since the Adams-Novikov $E_2$-term $E^2_{2s+3,(p^3+1)q} (X)$ vanishes for $s > 0$ by (4.2), the element $t_* (\beta^p_{p/p}) \in E^2_{2,p^3,q} (X)$ survives to a homotopy element $x^* \beta^p_{p/p} \in \pi_* (X)$. In general, we see that
(4.5) Let $T: S \to \overline{X}$ denote the inclusion to the bottom cell. Then, $\lambda_1 \overline{x} = \alpha_1 x$ for $x \in \E_2^2(S)$.

Put $\overline{\beta}_{p/p} = \tau_*(\beta_{p/p}) \in \E_2^{2p^2q}(\overline{X})$, and we see that $\lambda_*(\overline{\beta}_{p/p}) = \alpha_1 \beta_{p/p}$, and so we see that $\overline{\beta}_{p/p}$ detects an essential homotopy element $\kappa_*(\overline{X}) \in \pi_* \overline{X})$ by Corollary 4.4 and [5], which we also denote by $\overline{\beta}_{p/p}$.

Now turn to the second cofiber sequence in (4.1). The relation $b_1^p = 0$ of (4.2) yields a cochain $y = \sum_{i=0}^{p-1} x^i y_i \in \Omega^{2p-1} \BP_*(X)$ such that $d(y) = b_1^p$, where $y_i \in \Omega^{2p-1} \BP_*$. It follows that $d(y) = b_1^p - d(x^{p-1})y_{p-1} \in \Omega^{2p} \BP_*(\overline{X})$ for $y = \sum_{i=0}^{p-2} x^i y_i \in \Omega^{2p-1} \BP_*(\overline{X})$. In particular $d(y_{p-1}) = 0 \in \Omega^{2p-1} \BP_*$ and $d(y_{p-2}) = (1-p)y_t \otimes y_{p-1}$. By definition, these imply $\lambda_*(y_{p-1}) = b_1^p$. Consider the exact sequence obtained by applying the homotopy groups to the second cofiber sequence. Then, $\ell_*(\overline{\beta}_{p/p}) = 0$ by (4.2), and so $\overline{\beta}_{p/p}$ must be pulled back to an element $\xi \in \pi_* (S)$ detected by $y_{p-1}$. Since $b_0 = \lambda \lambda^* \lambda^{*} = b_0 \otimes y_{p-1} = h_0 b_1^p$, and $\langle h_0, \ldots, h_0 \rangle y_{p-1} = h_0 \langle h_0, \ldots, h_0, y_{p-1} \rangle$, we see that

$$b_1^p \equiv \langle h_0, \ldots, h_0, y_{p-1} \rangle \neq 0 \in \E_2^{2p^2q}(S) \mod h_0.$$ 

Put $b_1^p = \langle h_0, \ldots, h_0, y_{p-1} \rangle + c$ for $c \in \ker h_0 \subset \E_2^{2p^2q}(S)$. Then, $b_1^p - c$ survives to $\beta_{p/p} \in \pi_* (S)$.

The element $\alpha_1 \beta_{p/p}$ is detected by $h_0 (b_1^p - c) = h_0 b_1^p$ in the Adams-Novikov $E_2$-term, which is killed by $b_2$ by Corollary 4.4.

\[\square\]

5 Remarks

5.1 A relation on Toda bracket

The relation $\langle \beta_s, p, \gamma_t \rangle = \langle \gamma_t, p, \beta_s \rangle$ follows immediately from results of Toda: By definition, $\langle \beta_s, p, \gamma_t \rangle = j j b_s - y_t i$ and $\langle \gamma_t, p, \beta_s \rangle = j y_t - y_t i$ for $y_t(j) = j_1 i_2 i_1$ and $y_t(j) = j_1 j_2 i_1$. Since $V(2)$ and $V(3)$ are $V(0)$-module spectra, $\theta(\beta) = 0$ and $\theta(\gamma) = 0$ by [6, Lemma 2.3]. Similarly, $\theta(j_1 i) = 0$ and $\theta(j_2 i) = 0$ for $k = 1, 2$. Therefore, [6, Lemma 2.2] implies $\theta(\beta_s) = 0$ and $\theta(\gamma_s) = 0$. Therefore, $\beta_s \gamma_t = \gamma_t \beta_s$ by [6, Cor. 2.7] as desired.
5.2 On the action of $\gamma_1$

Note that $\gamma_1 = \alpha_1 \beta_{p-1}$. Then, $\alpha_1 \gamma_1 = \alpha_1^2 \beta_{p-1} = 0$, $\langle \alpha_1, \alpha_1, \beta_{p/p}^0 \rangle \beta_1 \gamma_1 = -\alpha_1 \langle \alpha_1, \alpha_1, \beta_{p/p}^0 \rangle \beta_1 \beta_{p-1} = -\langle \alpha_1, \alpha_1, \alpha_1 \rangle \beta_{p/p}^0 \beta_1 \beta_{p-1} = 0$ since $\langle \alpha_1, \alpha_1, \alpha_1 \rangle = 0$, and $\langle \gamma_1, p, \beta_1 \rangle = \beta_{p-1} \langle \alpha_1, p, \beta_1 \rangle = \beta_{p-1} j \alpha j \beta j i = 0$.

For $t \geq 2$,
\[
\beta_t = \delta_{1,1,1} \delta_{1,1,2}(v_2^t) = \delta_{1,1,1}((b_1^2 v_2^{t-1} - \frac{1}{2} v_2 v_1^{t-2} b_0 + v_1^t) \mod (p, v_1))
\]
\[
\equiv (i(t - 1)v_2^{t-2} b_0 - \frac{1}{2} v_2 v_1^{t-2} b_0) \mod (p, v_1)
\]
and $\alpha_1 \beta_2 \beta_{p-1} \in E_2^3(S^0)$ is projected to $h_0(2k_0 - 2v_2 b_0)(2v_2^{p-3} k_0 + v_2 b_0) = -2v_2^{p-2} h_0 k_0 b_0 - 2h_0 v_2^{p-2} b_0^2$ in $E_2^3(V(2))$ under the induced map $i_*$ from the inclusion $i: S^0 \to V(2)$ to the bottom cell. Here, $k_0 = [t_2 \otimes t_1 + \frac{1}{2} t_1 \otimes t_1^p]$. Then, this element is detected by $-2v_2^{p-2} k_0 \in E_1^3 = E_2^2(\nu^{2p+1} q)(X \wedge V(2))$ in the small descent spectral sequence. The killer of this element, if any, stays in the $E_1$-terms $E_1^2 = E_2^2(\nu^{2p+1} q)(X \wedge V(2))$, $E_1^1 = E_2^3(\nu^{2p+1} q)(X \wedge V(2))$ and $E_1^0 = E_2^4(\nu^{2p+1} q)(X \wedge V(2))$. These are zero, and we see that the product is not zero.
