1. Cloning, expression and enzyme preparation

1.1. Cloning procedures

The cloning procedures of the genes encoding EcMAT (E. coli methionine adenosyltransferase), RnCOMT (Rattus norvegicus catechol-O methyltransferase), EcMTAN (E. coli methylothioadenosine/ S-adenosylhomocysteine nucleosidase), SafC from Myxococcus xanthus (MxSafC), EfTyrDC (Enterococcus faecalis DC32 decarboxylase), and CnTYR (Candidatus Nitrosopumilus salaria BD31 tyrosinase) have been described previously.[1–4]

Synthetic gene 6OMT_COPJA (NCBI accession number Q9LEL6) was provided by Eurofins Genomics in a plasmid vector pEX-K248, and sub-cloned in our in-house plasmid pET28a-SacB-SpiI (containing the C-terminal His6Tag). The plasmid construct was transformed into chemically competent E. coli NovaBlue and grown overnight in LB agar with kanamycin 50 μg mL\(^{-1}\) at 37 °C. A colony was picked and grown overnight in 10 mL of LB broth with kanamycin 50 μg mL\(^{-1}\) at 37 °C and 250 rpm, and the plasmid was extracted using QiAprep Spin Miniprep kit (Qiagen). The plasmid construct was then transformed into expression host E. coli BL21(DE3).

Synthetic gene CjCNMT (CNMTI - Coptis japonica, UniProt accession number Q948P7) was provided by BioCat GmbH (Germany) in a plasmid vector pET28a (containing the N-terminal His6Tag). The plasmid construct was transformed into electro competent E. coli BL21(DE3) and grown overnight in LB agar with kanamycin 30 µg mL\(^{-1}\) at 37 °C. A colony was picked and grown overnight in 50 mL of LB broth with kanamycin 30 μg mL\(^{-1}\) at 37 °C and 150 rpm.

1.2. Recombinant protein expression in E. coli BL21 (DE3)

**Cj6-OMT (Coptis japonica norcoclaurine 6-O-methyltransferase) expression:** Selected enzyme glycerol stocks (E. coli BL21 (DE3)) were plated out on agar plates supplemented with 50 μg/mL kanamycin. A single colony was then picked to inoculate into 10 mL of TB media supplemented with 50 μg/mL kanamycin and grown at 37 °C and 250 rpm overnight (16 h). 1 mL of the overnight cultures were inoculated into a 500 mL baffled shaking flask containing 100 mL TB media supplemented with 50 μg/mL kanamycin at 37 °C, 250 rpm until an OD\(_{600}\) of approximately 0.8. Enzyme expression was initiated by the addition of 0.4 mM IPTG (Sigma-Aldrich) to the culture. Cells were further cultivated at 16 °C, 200 rpm for 48 h. The cells were then harvested by centrifugation at 15 °C for 15 min. The cell pellets were stored at -20 °C.

**CjCNMT (Coptis japonica coclaurine N-methyltransferase) expression:** For gene expression in 2 L of LB broth with kanamycin 30 µg mL\(^{-1}\) at 37 °C and 150 rpm in baffled flasks induction was carried out by adding 0.2 mM IPTG (final concentration) at an OD\(_{600}\) of 0.5. Bacterial cultures were further incubated overnight at 20 °C and 150 rpm.

**EcMAT, EcMTAN, RnCOMT, and MxSafC expression:** Selected enzyme glycerol stocks (E. coli BL21 (DE3)) were plated out on agar plates supplemented with 50 μg/mL kanamycin. A single colony was then picked to inoculate into 10 mL of LB media supplemented with 50 μg/mL kanamycin and grown at 37 °C and 250 rpm overnight (16 h). 1 mL of the overnight cultures were inoculated into a 500 mL baffled shaking flask containing 100 mL LB media supplemented with 50 μg/mL kanamycin at 37 °C, 250 rpm until an OD\(_{600}\) of approximately 0.6. Enzyme expression was initiated by the addition of 0.25 mM IPTG (Sigma-Aldrich) to the culture. Cells were further cultivated at 20 °C, 200 rpm for 16-24 h. The cells were then harvested by centrifugation at 10000 rpm for 15 min. The cell pellets were stored at -20 °C.

**TfNCS, Cv-TAm, decarboxylase, and tyrosinase expression** have been described previously.[4]
SUPPORTING INFORMATION

1.3. Cell lysate preparation

Cells pellets were resuspended in 50 mM HEPES buffer (pH 7.5) at a 1:25 volume ratio (1 mL of the resuspension buffer per 25 mL of cell suspension) and disrupted by 10 cycles of sonication on ice (10 s on plus 10 s off, 12 Watts output) equipped with a Process Timer. In the case of Cv-TAm the lysis buffer was supplemented with 1 mM PLP. Lysed cells were centrifuged at 4 °C, 10000 rpm for 15 min. The supernatant protein concentration was measured following the standard Bradford procedure. The samples were duplicated and the average OD<sub>595</sub> were used for cell lysate concentration calculations. To check the protein expression, the supernatant was examined using an SDS gel (Figure S1).

1.4. Enzyme purification

**RnCOMT, MxSafC, and EcMTAN purification:** Cell pellets were lysed as described above. The supernatant was collected by centrifugation at 4 °C, 10000 rpm for 15 min, then filtered through a 0.2 µm cellulose acetate springe filter. Enzymes were purified via Ni-NTA affinity chromatography. After stepwise washing with 2 mL fractions of purification buffer containing 0, 10, 20, 50, 100 and 150 mM imidazole, enzymes were eluted from the column using fractions of 2 mL purification buffer containing 200, 250, and 2 x 500 mM imidazol. Finally, proteins were desalted on PD-10 columns according to the protocol of the manufacturer (GE Healthcare, UK). The success of the purification was controlled via SDS PAGE analysis (Figure S2).

**EcMAT and TfNCS (Δ29TfNCS) purification:** Cell pellets were lysed as described above. The supernatant was collected by centrifugation at 4 °C, 10000 rpm for 15 min, then filtered through a 0.2 µm cellulose acetate springe filter. An empty cartridge charged with Ni-NTA (8 mL) was washed with 40 mL of MilliQ water, followed by 40 mL of binding buffer (50 mM HEPES, 20 mM imidazole (Sigma-Aldrich), 100 mM NaCl, pH 7.5). The filtered supernatant was then passed through the Ni-NTA column, and the column was washed with wash buffer (40 mL, 50 mM HEPES, 40 mM imidazole, pH 7.5) to remove some background protein. The bound protein was then eluted with elution buffer (50 mM HEPES, 500 mM imidazole, 100 mM NaCl, pH 7.5) until all the protein was collected. The eluent containing pure enzyme was concentrated using a vivaspH (10000 MW) at 4 °C, 8000 rpm for 5 min until 2.5 mL eluent remained. Then the concentrated eluent was desalted into 3.5 mL of 50 mM HEPES (pH 7.5), using a SephadexTM G-25 in PD-10 column (GE Healthcare lifesciences). The concentration of the pure protein was measured by OD<sub>280</sub> using a Nanodrop. The protein was aliquoted and stored at -20 °C in 10% glycerol. To check the protein purity, the expression supernatant, and pure protein were examined using an SDS gel (Figure S3).
**CjCNMT purification:** The purification of CjCNMT was carried out via an Äkta Purifier (GE Healthcare) according to the following protocol. Lysis buffer (40 mM Tris HCl, 100 mM NaCl, 20 mM imidazole, pH 8.0), elution buffer (40 mM Tris HCl, 100 mM NaCl, 500 mM imidazole; pH 8.0) and desalting buffer (100 mM potassium phosphate, pH 7.5) were used. The cell pellet was stored at -20 °C. For lysis it was thawed and resuspended in lysis buffer using 2-5 mL per gram of wet weight. Then lysozyme and DNaseI (each 0.1 mg/mL) were added and incubated on ice for 30 min. Cell disruption was achieved by using a French Press (1.81 kbar at 5 °C). The lysate was cleared by centrifugation at 10,000 x g for 30 min at 4°C and subsequently filtered through a 0.2 µm filter membrane. For purification through IMAC a Ni-NTA column was equilibrated with lysis buffer. Then the cleared sample was loaded onto the column with a volumetric flow rate of 2.0 mL/min. The unbound or unspecific bound protein was washed away with lysis buffer until the absorption at 280 nm reached the baseline. Further, the His6-tagged protein was eluted using a step gradient of lysis buffer and elution buffer (first step: 5% (v/v) elution buffer, second step: 60% (v/v) elution buffer, third step: 100% elution buffer). The target enzyme was found in the fraction using 60% elution buffer. A sample of each fraction was collected and monitored via SDS-PAGE analysis. The fraction containing the enriched protein were desalted using PD10 columns. Freeze-drying was carried out and the protein was stored and -20 °C.

**Figure S3.** SDS-PAGE analysis of purified protein (1 - crude extract, elution steps with buffer containing: 2 - 40 mM imidazole, 3 - 500 mM imidazole). A – EcMAT (44 kDa), B – TINCS (25 kDa), the calculated molecular weight inside the parentheses always includes the His6-tag.

**Figure S4.** SDS-PAGE analysis of purified protein; 1- CjCNMT (41 kDa) sample after desalting, the calculated molecular weight inside the parentheses always includes the His6-tag.
2. General experimental and analytic methods

2.1. Chemicals, NMR spectroscopy and mass spectrometry

The solvents and chemicals were purchased from Sigma-Aldrich (Saint Louis, MO, USA) or Alfa Aesar (Thermo Fisher Scientific Inc., MA, USA). All chemicals were purchased in the highest purity available and were used as supplied. Adenosine 5′-triphosphate (ATP) was purchased as a disodium salt hydrate Grade II, ≥98.5% (HPLC), crystalline, from Sigma-Aldrich. S-5′-Adenosyl)-L-methionine (SAM) was purchased as the p-toluenesulphonate from Sigma-Aldrich. ¹H and ¹³C NMR spectra were recorded respectively at 600 MHz and 150 MHz on a Bruker Avance 600 spectrometer or at 700 MHz and 170 MHz on a Bruker Avance 700 spectrometer in the stated solvent. Chemical shifts (in ppm) are quoted relative to tetramethylsilane and referenced to residual proton and carbon signals for the deuterated solvents.

Mass spectra were obtained using either a VG70-S or MAT 900XP spectrometer at the Department of Chemistry, University College London. All optical rotations were measured on a Bellingham and Stanlay ADP 430 polarimeter with a path length of 0.5 cm.

2.2. Analytical and preparative HPLC

**Achiral analytical HPLC** methods were performed with a HPLC system Agilent 1260 Infinity II system equipped with a DAD detector.

Method A1: Analytical reverse-phase (RP) HPLC was conducted with a ACE 5-C18 300 column (4 μm, 4.6 mm × 150 mm) at 30 °C [5% B for 2 min, gradient of 5% to 70% B up to 10 min, 70% B to 100% B over 0.1 min, 100% B for 1.9 min, 100% B to 5% B over 0.1 min, 5% B for 2.4 min (A = H₂O with 0.1% TFA; B = acetonitrile) flow rate = 1 mL/min; A₂₈₀ if not otherwise specified].

Method A2: Analytical reverse-phase (RP) HPLC was conducted with a ACE 5-C18 300 column (4 μm, 4.6 mm × 150 mm) at 30 °C [10% B for 1 min, gradient of 10% to 70% B up to 5 min, 70% B to 100% B over 0.1 min, 100% B for 0.4 min, 100% B to 10% B over 0.1 min, 5% B for 3.4 min (A = H₂O with 0.1% TFA; B = acetonitrile) flow rate = 1 mL/min; A₂₈₀ if not otherwise specified].

**Preparative HPLC** methods were developed with an Agilent 1260 InfinityTM HPLC System, with a 1260 InfinityTM Preparative Pump, a 1260 InfinityTM Preparative-scale Fraction Collector, a 1260 InfinityTM Multiple Wavelength Detector and a 1260 InfinityTM Preparative Autosampler.

Method B: The separation of compounds (S)-6-OMe-1, (S)-2-NMe-6-OMe-1, (S)-6-OMe-2, (S)-6,7-(OMe)→2, (S)-6,3'-(OMe)→3, (S)-6,4'-(OMe)→3, (S)-2-NMe-6,3'-(OMe)→3, (S)-6-OMe-5, (S)-6-OMe-6, 6-OMe-9, 7-OMe-9, 6-OMe-10, 7-OMe-10, and (S)-6-OMe-11 was achieved with a SupelcoTM Discovery BIO wide pore (C18, 10 μm, 2.12 cm × 25 cm) preparative column at 25 °C [5% B for 3 min, gradient of 5% to 70% B up to 20 min, 70% B to 100% B over 0.1 min, 100% B for 1.9 min, 100% B to 5% B over 1 min, 5% B for 5 min (A = H₂O with 0.1% TFA; B = acetonitrile with 0.1% TFA) flow rate = 8 mL/min; products were identified via UV absorbances at 214 nm and 280 nm]. The injection volume was 500-900 μL.

**Chiral analytical HPLC** methods were performed with an Agilent 1260 Infinity II system equipped with a DAD detector.

Method C1: The chiral separation of compound (rac)-1 and (S)-1, (S)-6-OMe-1, (rac)-2 and (S)-2, (S)-6-OMe-2, (rac)-5 and (S)-5, (S)-6-OMe-5, (S)-6-OMe-6, (S)-6-OMe-11 were achieved with an Supelco Astec Chirobiotic T column (25 cm × 4.6 mm) and a flow speed of 1 mL/min at 30 °C. The injection volume was 10 μL. Products were measured via UV absorbance at 230 nm. Methanol (0.2% AcOH, 0.1% TEA) was used as a mobile phase over 40 min.

Method C2: The chiral separation of compound (rac)-3 and (S)-3 were achieved with a Supelco Astec Chirobiotic T column (25 cm × 4.6 mm) and a flow speed of 0.2 mL/min at 30 °C. The injection volumes were 5 μL. Compounds were detected by UV absorbance at 230 nm. An isocratic mobile phase 20 mM HEPES pH 4.0 MeOH (70:30) was used over 120 min.

Method C3: The chiral separation of compound (rac)-11 and (S)-11 were achieved with an Supelco Astec Chirobiotic T2 column (25 cm × 4.6 mm) and a flow speed of 1 mL/min at 30 °C. The injection volume was 5 μL. Products were detected via UV absorbance at 230 nm. Methanol (0.2% AcOH, 0.1% TEA) was used as a mobile phase over 40 min.

Method C4: The chiral separation of compound (rac)-6 and (S)-6 were achieved with a Diacel Chiralpak AD-H column (25 cm × 4.6 mm, 5 μm) with an isocratic n-hexane:ethanol:diethylamine (80:20:0.01) mobile phase at 1 mL min⁻¹. Products were detected via UV absorbance at 280 nm. The column temperature used was 30 °C.

3. Biocatalytic reactions

3.1. Single step methylation reactions for preliminary screening

The assay was conducted in a 96-well plate. Each well contained the reaction mixture consisting of 50 mM HEPES pH 7.5, 20 mM MgCl₂, 0.5 mM substrate (1-14), 3 mM SAM, and the specific methyltrasferases RnCOMT, MxSatC or Cj-6-OMT as clarified lysate (10% v/v) in a total volume of 100 μL. The assay was performed at 37 °C, 750 rpm for 90 min unless otherwise specified. After this time, the reaction was quenched with 100 μL of MeOH. All the experiments were performed in duplicate and the reaction mixture was prepared freshly for each experiment. The conversion yields reported refer to depletion of starting material and are calculated using calibration curves for each substrate. When no starting material was left at the end of the reaction a quantitative conversion was reported.

3.2. Comparison between pure enzymes and clarified lysates for RnCOMT and MxSafC

The assay was conducted in Eppendorf vials. Each vial contained the reaction mixture consisting of 50 mM HEPES pH 7.5, 20 mM MgCl₂, 2.5 mM substrate 1-3, 2.5 mM SAM, and the specific methyltransferase RnCOMT, MxSafC as clarified lysate (10% v/v) or pure enzyme (0.4 mg/mL) in a total volume of 100 μL. The assay was performed at 37 °C, 450 rpm for 4 h. After this time, the reaction was quenched with 100 μL of MeOH and clarified by centrifugation (Figure S4).

![Graph showing the comparison between pure enzymes and clarified lysates for RnCOMT and MxSafC](image)

Figure S5. Comparison between pure enzymes and clarified lysates for RnCOMT and MxSafC for (a) substrate (S)-1, (b) substrate (S)-2, and (c) substrate (S)-3. Regioselectivity for pure enzyme and clarified lysate can also be compared as peak areas of the two different regioisomers are reported.
3.3. Multi-enzyme methylation reactions with the SAM supply system (scale-up optimization)

Small scale assays were carried out in order to find the optimal conditions for the scale-up reactions. Optimised conditions are reported. The reaction mixture consisted of 50 mM HEPES pH 7.5, 20 mM MgCl₂, 200 mM KCl, 5 mM substrate (1-14), ATP (1-4 equiv), L-methionine (1-4 equiv), in a total volume of 200 μL. The methylation step was started by adding 10% v/v RnCOMT lysate together with EcMAT (0.4 mg/mL) and EcMTAN (0.025 mg/mL). Finally, the pure EcMAT and EcMTAN were replaced by the clarified lysate and 10% v/v EcMAT lysate and 2.5% v/v EcMTAN lysate were added.

The assay was performed at 37 °C, 450 rpm in eppendorf vials for 19 h unless otherwise specified. After this time, the reaction was quenched with 100 μL of MeOH.

3.4. Preparative scale multi-enzyme cascade reactions with the SAM supply system and product characterisation

Four-enzymes cascade to (S)-1-benzyl-6-methoxy-1,2,3,4-tetrahydroisoquinolin-7-ol (S)-6-OMe-1

Dopamine hydrochloride (9.45 mg, 0.05 mmol), phenylacetaldehyde (8.4 μL in 0.5 mL of CH₃CN, 0.075 mmol), sodium ascorbate (9.9 mg, 0.05 mmol), and 10% v/v of TNCS clarified lysate desalted into 50 mM HEPES (pH 7.5), were combined with HEPES (50 mM pH 7.5) to a total volume of 5 mL. The reaction was stirred at 37 °C for 16 h. Once the reaction had completed, the yellow suspension was centrifuged, and the supernatant used for the next step.

ATP (55 mg, 0.10 mmol) and L-methionine (15 mg, 0.10 mmol) were combined in HEPES buffer (50 mM) and the pH was adjusted to 7.5. The ATP/L-methionine mixture was added to the supernatant. The methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of RnCOMT lysate in a total volume of 10 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the standard product (see calibration curve below). The reaction was centrifuged, the supernatant was basified with NaHCO₃ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give (S)-1a as white powder (TFA salt, 10 mg, 55% yield, 96% yield by HPLC). Trace impurities (5%) were also identified by NMR spectroscopy corresponding to the regioisomeric product methylated at O-7. ¹H NMR (700 MHz, MeOD) δ 7.40 (t, J = 7.6 Hz, 2H, Ar-H), 7.36 – 7.30 (m, 3H, Ar-H), 6.79 (s, 1H, 5-H), 6.63 (s, 1H, 8-H), 4.70 (dd, J = 8.8, 5.7 Hz, 1H, 1-H), 3.86 (s, 3H, OMe), 3.53 – 3.45 (m, 2H, NHCH₂), 3.30 – 3.26 (m, 1H, 3-HH), 3.08 (m, 2H, NHCH₂ and 4-HH), 3.03 – 1.96 (dt, J = 17.1, 6.3 Hz, 1H, 4-HH); ¹³C NMR (176 MHz, MeOD) δ 149.4, 146.9, 136.6, 130.6, 130.3, 128.6, 124.9, 123.6, 114.2, 112.6, 57.7, 56.4, 41.2, 40.9, 25.9; HRMS (ES+) found [M+H]+ 270.1488; C₁₁H₁₂NO₂ requires 270.1489; [α]D₂⁵ -5.8 (c 0.24, MeOH).

HPLC Method A1 (achiral)
Calibration curve

\[ y = 1644.7x \]
\[ R^2 = 0.9985 \]

HPLC method C1 (chiral) (S)-1 (>97% e.e.)

HPLC method C1 (chiral), rac-1
HPLC method C1 (chiral) (S)-6-OMe-1
Dopamine hydrochloride (9.45 mg, 0.05 mmol), phenylacetaldehyde (8.4 μL in 0.5 mL of CH₃CN, 0.075 mmol), sodium ascorbate (9.9 mg, 0.05 mmol), and purified TNCS (2.5 mg) were combined with HEPES (50 mM pH 7.5) containing 20 mM MgCl₂ and 100 mM NaCl. The methylation step was initiated in the same pot and all the components were added to have a final concentration of 15 mM ATP (82.5 mg, 0.15 mmol), phenylacetaldehyde (8.4 mg, 0.05 mmol), L-methionine (0.15 mmol, 22.4 mg), 0.4 mg/mL of EcMAT, 0.1 mg/mL of EcMTAN, 0.6 mg/mL of CjNMT, and 10% v/v of RnCOMT lysate in a total volume of 10 mL. The reaction was started upon enzymes addition and incubated overnight at 37 °C at 180 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the standard product (see the calibration curve below). The reaction was quenched with 1 M HCl (1 mL) and the product was purified using preparative HPLC (method B, retention time: 16.0 min). Fractions containing the desired product were freeze-dried to give (S)-2-NMe-6-OMe-1 as a powder (TFA salt, 8.7 mg, 46% yield, 66% yield by HPLC). Trace impurities (< 5%) were also identified by NMR corresponding to the regioisomeric methylated at 3-OH. HRMS (ES+) found [M+H]+ 284.1647; C₁₇H₂₀N₂O₂ requires 284.1651.

The product was characterized as a free base and only signals for the major regioisomer are given:

1H NMR (500 MHz, MeOD) δ 7.28 – 7.21 (m, 2H, Ar-H), 7.18 (d, J = 7.3 Hz, 1H, Ar-H), 7.13 – 7.06 (m, 2H, Ar-H), 6.64 (s, 1H, 5-H), 6.09 (s, 1H, 8-H), 3.80 (s, 3H, -OMe), 3.78 (dd, J = 7.5, 5.2 Hz, 1H, 1-H), 3.26 – 3.13 (m, 2H, 3-H and NHCHCH₃), 2.91 – 2.82 (m, 2H, NHCHCH₃ and 4-H), 2.76 (ddd, J = 12.1, 6.0, 3.7 Hz, 1H, 3-H), 2.71 – 2.60 (m, 1H, 4-H), 2.49 (s, 3H, -NMe); 13C NMR (126 MHz, MeOD) δ 173.0, 147.9, 145.2, 140.8, 2 x 130.7, 2 x 129.3, 127.2, 125.3, 115.6, 112.6, 65.9, 56.3, 47.5, 42.5, 41.5, 25.9.

Another N-methylation reaction was also carried out on (S)-6-OMe-1 using EcMAT and EcMTAN as clarified lysate giving the same product (S)-2-NMe-6-OMe-1 and the experimental details are reported below.

Compound (S)-1 (TFA salt, 8.0 mg, 0.02 mmol), ATP (16.5 mg, 0.03 mmol), and L-methionine (5.0 mg, 0.03 mmol) were combined in HEPES buffer (50 mM pH 7.5). The methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 1 mg/mL of pure CjNMT in a total volume of 5 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time the reaction was centrifuged, the supernatant was basified with NaHCO₃ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give (S)-2-NMe-6-OMe-1 as a powder (TFA salt, 3.5 mg, 49% yield, 59% yield by HPLC). The characterization data agreed with that above.

R² = 0.9906

AU 280 nm

concentration (mM)
Seven enzymes cascade to (S)-1-(4-hydroxybenzyl)-6-methoxy-1,2,3,4-tetrahydroisoquinolin-7-ol (S)-6-OMe-2

The reaction mixture (50 mL, pH 5.5) consisted of 50 mM HEPES, 20 mM L-tyrosine hydrochloride salt, 50 mM sodium ascorbate, 100 μM CuSO$_4$·5H$_2$O, 5 mM PLP and 10 mM sodium pyruvate. To initiate the decarboxylation step, 10% v/v of EfTyrDC lysate was added to the reaction mixture which was incubated at 25 °C, 250 rpm for 8 h. Then, the reaction mixture was adjusted to pH 7.5 with 2.5 M NaOH, and the next steps performed with 5% v/v of CvTyr lysate, 10% v/v of CvTAm lysate and 50 μg/mL of TnNCS at 37 °C, 250 rpm for 8 h. The reaction mixture was then centrifuged, and 40 mM MgCl$_2$, 200 mM KCl, 5 mM ATP and 5 mM L-methionine were added to the supernatant. To initiate the methylation step, 10% (v/v) of RnCOMT cell lysate, 10% (v/v) of EcMAT cell lysate and 2.5% v/v of EcMTAN lysate were added and the reaction mixture was incubated at 37 °C, 250 rpm for another 12 h. After this time the reaction was centrifuged, and the supernatant was extracted with EtOAc (3 x 20 mL). The organic fractions were collected, evaporated under vacuum, and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give (S)-6-OMe-2 as an off-white powder (TFA salt, 26.2 mg, 55%, 92% yield by HPLC). Trace impurities (5%) were also identified by NMR corresponding to the regioisomeric product methylated at O-7.

$^1$H NMR (700 MHz; MeOD) δ = 7.12 (d, J = 8.4 Hz, 2H, 2'-H and 6'-H), 6.80 (d, J = 8.4 Hz, 2H, 3'-H and 5'-H), 6.76 (s, 1H, 5-H), 6.63 (s, 1H, 8-H), 4.59 (dd, J = 8.4, 6.0 Hz, 1H, 1-H), 3.84 (s, 3H, OMe), 3.47 (dt, J = 12.5, 6.0 Hz, 1H, 3-HH), 3.36-3.32 (m, 1H, NHCHCHH), 3.26 (ddd, J = 12.5, 7.3, 6.0, 1H, 3-HH), 3.05 (dt, J = 16.9, 6.0, 1H, 4-HH), 3.00-2.95 (m, 2H, 4-HH and NHCHCHH), 13C (176 MHz; MeOD) δ = 158.2, 149.2, 146.7, 131.7, 127.0, 125.0, 123.7, 117.0, 114.2, 112.1, 57.8, 56.4, 40.8, 40.4, 25.9; HRMS (ES+) found [M+H]$^+$ 286.1443; C$_{17}$H$_{20}$NO$_3$ requires 286.1365; [α]$^D$$_{2}$= -13.3 (c 0.14, MeOH).

HPLC method C1 (chiral) (S)-6-OMe-2
Seven enzymes cascade to (S)-1-(4-hydroxybenzyl)-6-methoxy-1,2,3,4-tetrahydroisoquinolin-7-ol (S)-6-OMe-2, (S)-1-(4-hydroxybenzyl)-7-methoxy-1,2,3,4-tetrahydroisoquinolin-6-ol (S)-7-OMe-2 and ((S)-4-(6,7-dimethoxy-1,2,3,4-tetrahydroisoquinolin-1-yl)methyl)phenol (S)-6,7-(OMe)-2.

The reaction mixture (100 mL, pH 5.5) consisted of 50 mM HEPES, 2.5 mM L-tyrosine hydrochloride salt, 10 mM sodium ascorbate, 40 μM CuSO₄·5H₂O, 1.25 mM PLP and 1.25 mM sodium pyruvate. To initiate the decarboxylation step, 10% v/v of EfTyrDC cell lysate was added to the reaction mixture which was incubated at 25 °C, 250 rpm for 8 h. Then, the reaction mixture was adjusted to pH 7.5 with 2.5 M NaOH, and the next steps performed with 5% v/v of CnTyr lysate, 10% v/v of CvTam lysate and 50 μg/mL of 7TNCs at 37 °C, 250 rpm for 8 h. The reaction mixture was then centrifuged, and 40 mM MgCl₂, 200 mM KCl, 5 mM ATP and 5 mM L-methionine were added to the supernatant. To initiate the methylation step, 10% v/v of RnCOMT lysate, 10% v/v of EcMTAN lysate and 2.5% v/v of EfTyrDC cell lysate was added and the reaction mixture, which was incubated at 37 °C, 250 rpm for another 12 h. The reaction was centrifuged, and the supernatant was extracted with EtOAc (3 x 20 mL). The organic fractions were collected, evaporated under vacuum, and the residue purified using preparative HPLC (method B). Fractions containing the desired products were freeze-dried to give (S)-6-OMe-2 and (S)-7-OMe-2 as mixture (a powder) (TFA salt, 20.5 mg, 43%, 89% yield by HPLC). Fractions containing the desired product were freeze-dried to give (S)-6,7-(OMe)-2 (off-white powder) (TFA salt, 2.9 mg, 6% yield by HPLC).

Compound (S)-7-OMe-2: ¹H NMR (700 MHz; CD₃OD) δ = 7.10 (app. dt, J = 7.0, 2.8 Hz, 2'H, 3'-H and 6'-H), 6.81-6.79 (m, 2'H, 3'-H and 5'-H), 6.64 (s, 1'H, 5'-H), 6.44 (s, 1'H, 8-H), 4.59 (app. dd, J = 9.1, 5.6 Hz, 1'H, 1-H), 3.66 (s, 3'H, 7-OMe), 3.50 (app. ddd, J =12.6, 7.7, 5.6 Hz, 1'H, 3'-H), 3.32-3.31 (m, 1'H, NHCHCH₂), 3.30-3.29 (m, 1'H, 3'-H), 3.06-3.02 (m, 1'H, 4'-H), 3.00-2.92 (m, 2'H, NHCHHH and 4'-H); ¹³C (176 MHz; MeOD) δ = 158.1, 147.9, 147.7, 131.8, 127.2, 124.8, 123.3, 113.8, 116.0, 111.1, 57.7, 56.2, 56.0, 40.4, 40.1, 25.5; HRMS (ES+) found [M+H]⁺ 286.1437; C₁₇H₂₅NO₃ requires 286.1437.

Compound (S)-6,7-(OMe)-2: ¹H NMR (700 MHz; CD₃OD) δ = 7.10 (app. dt, J = 8.4, 2.8 Hz, 2'H, 2'-H and 6'-H), 6.80 (app. dt, J = 9.1, 2.8 Hz, 2'H, 3'-H and 5'-H), 6.79 (s, 1'H, 8-H), 6.47 (s, 1'H, 5'-H), 4.64 (t, J = 7.7 Hz, 1'H, 1-H), 3.81 (s, 3'H, 6-OMe), 3.64 (s, 3'H, 7-OMe), 3.53 (app. ddd, J =12.6, 7.7, 5.6 Hz, 1'H, 3'-H), 3.35-3.32 (m, 2'H, NHCHCHH and 3'-H), 3.07-3.00 (m, 3'H, NHCHHH, 4'-HH and 4'-H); ¹³C (176 MHz; MeOD) δ = 158.2, 150.4, 149.1, 132.4, 131.8, 127.0, 124.7, 116.8, 112.7, 111.3, 57.6, 56.5, 56.2, 40.3, 40.0, 25.7; HRMS (ES+) found [M+H]⁺ 300.1594; C₁₈H₂₆NO₃ requires 300.1594; [α]D²⁵ = -21.5 (c 0.2, MeOH).

HPLC method C1 (chiral) rac-6,7-(OMe)2-2 (rac-2 prepared following the literature\textsuperscript{[6]} which was methylated as described above)
Dopamine hydrochloride (19 mg, 0.1 mmol), sodium ascorbate (20 mg, 0.1 mmol), sodium pyruvate (5.5 mg, 0.05 mmol), CvTAm 10% v/v lysate, and 10% v/v of TNCS lysate desalted into 50 mM HEPES (pH 7.5), using a Sephadex™ G-25 in PD-10 column (GE Healthcare lifesciences), were combined with HEPES (50 mM pH 7.5) containing PLP 0.5 mM to a total volume of 5 mL. The reaction was stirred at 37 °C until completion. Once the reaction had completed, the yellow suspension was centrifuged, and the supernatant used for the next step. ATP (110 mg, 0.20 mmol) and L-methionine (30 mg, 0.20 mmol) were combined in HEPES buffer 50 mM and the pH was adjusted to 7.5. The ATP/L-methionine mixture was added to the supernatant and the methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of RnCOMT lysate in a total volume of 10 mL containing 20 mM MgCl$_2$ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the standard product (see the calibration curve below). The reaction was centrifuged, the supernatant was basified with NaHCO$_3$ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give nororientaline (S)-6,3'-((OMe)$_2$)-3 as white powder (TFA salt, 7 mg, 34% yield, 64% yield by HPLC). Trace impurities (< 5%) were also identified by NMR corresponding to the regioisomeric product methylated at O-7. $^1$H NMR (700 MHz; CD$_3$OD) $\delta$ = 6.84 (d, $J$ = 2.1 Hz, 1H, 2'-H), 6.81 (d, $J$ = 8.0 Hz, 1H, 5'-H), 6.78 (s, 1H, 8-H), 6.75 (dd, $J$ = 8.0, 2.1 Hz, 1H, 6'-H), 6.68 (s, 1-H, 5-H), 4.64 (dd, $J$ = 8.8, 5.6 Hz, 1H, 1-H), 3.85 (s, 3H, 6-OMe), 3.83 (s, 3H, 3'-OMe), 3.49-3.43 (m, 1H, NHCH$_2$CH$_2$H), 3.39 (dd, $J$ = 14.6, 5.5 Hz, 1H, NHCH$_2$H), 3.30-3.24 (m, 1H, 3'-H), 3.07-3.01 (m, 1H, 4'-H), 2.95-2.02 (m, 2H, 3'-HH and 4'-HH); $^{13}$C NMR (151 MHz; CD$_3$OD) $\delta$ = 149.5, 149.3, 147.4, 146.9, 127.5, 125.0, 123.6, 123.2, 116.8, 114.2, 113.9, 112.6, 57.7, 56.4, 40.8, 25.9; HRMS (ES+) found [M +H]$^+$ 316.1544; C$_{18}$H$_{22}$NO$_4$ requires 316.1543; $[\alpha]_D^{25}$ + 2.0 (c 0.1, MeOH).

SUPPORTING INFORMATION

Five-Enzymes Cascade to (S)-1-(4-hydroxy-3-methoxybenzyl)-6-methoxy-1,2,3,4-tetrahydroisoquinolin-7-ol (S)-6,4'(OMe)₂-3

Dopamine hydrochloride (19 mg, 0.1 mmol), sodium ascorbate (20 mg, 0.1 mmol), sodium pyruvate (5.5 mg, 0.05 mmol), CvTAm 10% v/v lysate, and 10% v/v of TNCS lysate desalted into 50 mM HEPES (pH 7.5) using a Sephadex™ G-25 in PD-10 column (GE Healthcare lifesciences), were combined with HEPES (50 mM pH 7.5) containing PLP 0.5 mM to a total volume of 5 mL. The reaction was stirred at 37 °C until completion. Once the reaction had completed, the yellow suspension was centrifuged, and the supernatant used for the next step.

ATP (55 mg, 0.10 mmol) and L-methionine (15 mg, 0.10 mmol) were combined in HEPES buffer 50 mM and the pH was adjusted to 7.5. The ATP/L-methionine mixture was added to the supernatant and the methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of Cj6-OMT lysate in a total volume of 10 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the product standard (see calibration curve below). The reaction was centrifuged and the supernatant used for the next step. A solution of ATP and L-methionine (0.75 mL, 100 mM in HEPES buffer 50 mM with the pH adjusted to 7.5) was added to the supernatant and the methylation step was initiated upon addition of EcMAT lysate (1 mL), EcMTAN lysate (0.2 mL), and MxSafC lysate (1 mL). The reaction was incubated overnight at 37 °C and 180 rpm. After this time the mixture was centrifuged and the supernatant was basified with NaHCO₃ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give norreticuline (S)-6,4'-(OMe)₂-3 as white powder (TFA salt, 5.6 mg, 27% yield, 70% yield by HPLC).

1H NMR (700 MHz; CD₃OD)  δ = 6.93 (d, J = 8.2 Hz, 1H, 5'-H), 6.80 (d, J = 2.2 Hz, 1H, 2'-H), 6.78 (s, 1H, 5-H), 6.75 (dd, J = 8.2, 2.2 Hz, 1H, 6'-H), 6.68 (s, 1H, 8-H), 4.61 (dd, J = 9.1, 5.5 Hz, 1H, 1-H), 3.86 (s, 3H, 6-OMe), 3.83 (s, 3H, 4'-OMe), 3.48 (dd, J = 12.5, 6.8, 5.6 Hz, 1H, 3-HH), 3.37 (dd, J = 14.6, 5.5 Hz, 1H, 4-HH), 3.27 (dd, J = 12.8, 7.6, 5.7 Hz, 3-HH), 3.10-3.03 (m, 1H, NHCH₂HH), 2.98 (dt, J = 17.1, 6.2 Hz, 1H, NHCH₂HH), 2.94 (dd, J = 14.6, 9.2 Hz, 1H, 4-HH); 13C NMR (151 MHz; CD₃OD) δ = 149.2, 148.7, 148.2, 146.8, 128.9, 124.9, 123.4, 121.6, 117.1, 113.9, 113.1, 112.5, 57.7, 56.3 x 2, 40.8, 40.5, 25.8; HRMS (ES+) found [M+H]+ 316.1542; C₁₈H₂₂NO₄ requires 316.1543.

Six-Enzymes Cascade to (S)-1-benzyl-8-fluoro-6-methoxy-1,2,3,4-THIQ-7-ol (S)-6-OMe-5

The reaction mixture (20 mL, pH 5.5) consisted of 50 mM HEPES, 10 mM 3-F-L-tyrosine, 40 mM sodium ascorbate, 100 μM CuSO₄·5H₂O and 5 mM PLP. To initiate the hydroxylase and decarboxylation step, 10% v/v of CnTYR and EfTyrDC lysate were added to the reaction mixture which was incubated at 25 °C, 250 rpm for 16 h. After this time, the pH was adjusted to 7.5 with 2.5 M NaOH, and 15 mM phenylacetaldehyde were added. The Pictet-Spengler reaction was initiated by adding 50 μg/mL of pure TfNCS and the reaction was incubated at 37 °C, 250 rpm for 8 h. The reaction mixture was then centrifuged, and 40 mM MgCl₂, 200 mM KCl, 20 mM ATP and 20 mM L-methionine were added to the supernatant. To initiate the methylation step, 10% v/v of RnCOMT lysate, 10% v/v of EcMAT lysate, and 2.5% v/v of EcMTAN lysate were added to the reaction mixture which was incubated at 37 °C, 250 rpm for another 8 h. After this time the reaction was centrifuged, and the supernatant was extracted with EtOAc (3 x 20 mL). The organic fractions were collected, evaporated under vacuum, and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give (S)-6-OMe-5 as an off-white powder (TFA salt, 14.6 mg, 19%, 27% yield by HPLC). Trace impurities (5%) were also identified by NMR corresponding to the regioisomeric product methylated at O-7.

1H NMR (700 MHz; CD₃OD) δ = 7.39 (t, J = 7.4 Hz, 2H, 3'-H and 5'-H), 7.34-7.31 (m, 3H, 2'-H, 4'-H, and 6'-H), 6.69 (s, 1H, 5-H), 4.94 (dd, J = 9.5, 4.5 Hz, 1H, 1'-H), 3.88 (s, 3H, OMe), 3.53 (dt, J = 13.0, 7.5 Hz, 1H, 3'-H), 3.43 (dd, J = 15.0, 4.5 Hz, 1H, NHCH₂CH₂), 3.35-3.32 (m, 1H, 2'-H), 3.18 (dd, J = 9.5 Hz, 1H, 1H, NHCH₂CH₂), 3.04 (dd, J = 7.5, 5.1 Hz, 2H, 4-H); 13C NMR (151 MHz; CD₃OD) δ = 151.1, 151.0, 150.3, 148.8, 136.4, 135.0, 130.5, 130.3, 128.9, 108.2, 56.8, 53.3, 39.9, 38.8, 25.4; HRMS (ES+) found [M+H⁺] 288.1394; C₁₇H₁₉FNO₂ requires 288.1394; [α]D²⁶ + 2.0 (c 0.2, MeOH).

Compound (S)-6-OMe-5 was also obtained as an off-white powder (TFA salt, 15.3 mg, 20%, 31% yield by HPLC) using MxSafC instead of RnCOMT and following the above procedure.

Four-Enzymes Cascade to \((S)-6\text{-methoxy-1-pentyl-1,2,3,4-tetrahydroisoquinolin-7-ol}\) \((S)-6\text{-OMe-6}\)

Dopamine hydrochloride (19 mg, 0.1 mmol), hexanal (49.2 μl, 0.4 mmol) dissolved in 1 mL of acetonitrile, sodium ascorbate (19.8 mg, 0.025 mmol), and 7NCS (5 mg) were combined with HEPES (50 mM pH 7.5) mM to a total volume of 10 mL. The reaction was incubated at 37 °C with 200 rpm shaking until completion (3 h). Once the reaction had completed, the suspension was centrifuged, and the supernatant used for the next step. The methylation step was initiated in the same pot and all the components were added to have a final concentration of 5 mM ATP (110.2 mg, 0.2 mmol), 5 mM of L-methionine (30 mg, 0.2 mmol), 10 % v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of RnCOMT lysate in a total volume of 20 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was started upon enzymes addition and incubated overnight at 37 °C at 200 rpm. After this time an aliquot was taken to calculate the HPLC yield against the product standard (see calibration curve below). The reaction was quenched with 1 M HCl (2 ml) and the product was purified using preparative HPLC (method B). Fractions containing the desired product were concentrated under vacuum and redissolved in 0.1 M aqueous HCl, before lyophilisation to give \((S)-6\text{-OMe-6}\) as a white powder (HCl salt, 12.6 mg, 44 % yield, 90% yield by HPLC).

\(^1\)H NMR (700 MHz; D₂O) δ = 6.84 (s, 1H, 5-H), 6.75 (s, 1H, 8-H), 4.45 (dd, J = 8.3, 4.8 Hz, 1H, 1-H), 3.86 (s, 1H, -OMe), 3.57 (dt, J = 12.4, 6.0 Hz, 1H, 3-H), 3.40-3.35 (m, 1H, 3-H); 3.06 (dt, J = 17.2, 6.2 Hz, 1H, 4-H), 3.00 (dt, J = 17.2, 6.2 Hz, 1H, 4-H), 2.09-2.02 (m, 1H, 1-H), 1.92-1.81 (m, 1H, 1-H), 1.49-1.33 (m, 2H, 3'-HH), 1.39-1.30 (m, 4H, 4'-HH and 2'-HH), 0.87 (t, J = 7.6 Hz, 3H, -Me); \(^{13}\)C NMR (176 MHz; D₂O - MeOH standard) δ = 147.7, 144.3, 125.3, 124.3, 113.6, 112.9, 56.8, 55.5, 39.9, 33.7, 31.3, 24.8, 24.7, 22.2, 13.7; HRMS (ES+) found [M+H]⁺ 250.1802; \(C_{15}H_{24}NO_2\) requires 250.1802; \([\alpha]_D^{25} +13.2 \text{ (c 0.07, H}_2\text{O)}\).

HPLC method C1 (chiral) (S)-6-OMe-6
Dopamine hydrochloride (9.5 mg, 0.05 mmol), cyclohexanone (7.5 µL, 0.075 mmol), and 50% v/v of TnCS clarified lysate were combined with HEPES (50 mM pH 7.5) to a total volume of 2.5 mL. The reaction was stirred at 37 °C until completion (16 h). Once the reaction had completed, the suspension was centrifuged and the supernatant used for the next step. ATP (27 mg, 0.05 mmol) and L-methionine (7.5 mg, 0.05 mmol) were combined in HEPES buffer 50 mM and the pH was adjusted to 7.5. The ATP/L-methionine mixture was added to the supernatant and the methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of RnCOMT lysate in a total volume of 5 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time the reaction was centrifuged, the supernatant was basified with NaHCO₃ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give 7'-OMe-9 as white powder (TFA salt, 9.6 mg, 40%). An impurity (10%) was also identified by NMR corresponding to the regiosomeric product methylated at O-7. 1H NMR (700 MHz; CD₃OD) δ = 6.89 (s, 1H, 8'-H), 6.63 (s, 1H, 5'-H), 3.87 (s, 3H, OMe), 3.43 (t, J = 6.4 Hz, 2H, 4'-H), 2.99 (t, J = 6.4 Hz, 2H, 4'-H), 2.15 (td ap, J = 14.1, 13.6, 4.3 Hz, 2H, 2x 1-HH), 2.10-2.05 (m, 2H, 2 x 1-HH), 1.90-1.79 (m, 3H, 2 x 2HH+3HH), 1.66 (m, 2H, 2 x 2HH) – 1.53 (1H, m, 3HH); 13C NMR (151 MHz; CD₃OD) δ = 148.7, 147.6, 129.8, 124.6, 116.1, 110.1, 61.3, 56.7, 38.5, 36.8, 36.6, 26.3, 25.1, 21.6; HRMS (ES+) found [M+H]+ 248.1645; C₁₅H₂₁NO₂ requires 248.1645.[10]
Four-Enzymes Cascade to 6'-methoxy-3',4'-dihydro-2'H-spiro[cyclohexane-1,1'-isoquinolin]-7'-ol 6-OMe-9

Compound 9 (TFA salt, 33 mg, 0.1 mmol), ATP (66 mg, 0.12 mmol), and L-methionine (18 mg, 0.12 mmol) were combined in HEPES buffer (50 mM pH 7.5). The methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of MxSaFC lysate in a total volume of 10 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the product standard (see calibration curve below). The reaction was centrifuged, the supernatant was basified with NaHCO₃ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give 6-OMe-9 as white powder (TFA salt, 13.8 mg, 56% yield, 94% yield by HPLC).

An impurity (10%) was also identified by NMR corresponding to the regioisomeric product methylated at O-7. ¹H NMR (700 MHz; CD₃OD) δ = 6.81 (s, 1H, 8-H), 6.73 (s, 1H, 5-H), 3.84 (s, 3H, OMe), 3.44 (t, J = 6.4 Hz, 2H, 3'-H), 3.04 (t, J = 6.4 Hz, 2H, 4'-H), 2.08-2.02 (m, 4H, 2'-HH and 6'-HH), 1.89 – 1.79 (m, 3H), 1.65-1.55 (m, 2H), 1.51 (tt, J = 12.7, 3.7 Hz, 1H, 4-HH); ¹³C NMR (151 MHz; CD₃OD) δ = 148.9, 147.1, 131.1, 122.9, 113.2, 61.1, 56.4, 38.6, 36.6, 26.4, 25.2, 21.6; HRMS (ES+) found [M+H]+ 248.1645; C₁₅H₂₂NO₂ requires 248.1645.

HPLC Method A1
Synthesis of 7'-methoxy-3',4'-dihydro-2'H-spirocyclopentane-1,1'-isoquinolin]-6'-ol 7-OMe-10

Compound 10 (TFA salt, 16 mg, 0.05 mmol), ATP (55 mg, 0.1 mmol), and L-methionine (15 mg, 0.1 mmol) were combined in HEPES buffer 50 mM pH 7.5. The methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of MxSafC lysate in a total volume of 10 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the product standard (see calibration curve below). The reaction was centrifuged, the supernatant was basified with NaHCO₃ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give 7-OMe-10 as white powder (TFA salt, 7.4 mg, 45% yield, 90% yield by HPLC). An impurity (10%) were also identified by NMR corresponding to the regioisomeric product methylated at O-6. Only signal for the major isomer are shown. ¹H NMR (700 MHz, MeOD) δ 6.74 (s, 1H, 8'-H), 6.60 (s, 1H, 5'-H), 3.84 (s, 3H, OMe), 3.43 (t, J = 6.4 Hz, 2H, 3'-H), 2.97 (t, J = 6.4 Hz, 2H, 4'-H), 2.26 (m, 2H), 2.23 – 2.16 (m, 2H), 2.06 (m, 2H), 1.96 (m, 2H); ¹³C NMR (176 MHz, MeOD) δ 148.8, 147.4, 129.1, 124.7, 115.8, 109.4, 68.9, 56.5, 41.8 x 2, 39.9, 25.7 x 3; HRMS (ES+) found [M+H]⁺ 234.1486; C₁₄H₂₀NO₂ requires 234.1489.

HPLC Method A1
Synthesis of 6'-methoxy-3',4'-dihydro-2'H-spiro[cyclopentane-1,1'-isoquinolin]-7'-ol 6-OMe-10

Compound 10 (TFA salt, 16 mg, 0.05 mmol), ATP (55 mg, 0.1 mmol), and L-methionine (15 mg, 0.1 mmol) were combined in HEPES buffer 50 mM pH 7.5. The methylation step was initiated upon addition of 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of MxSafC lysate in a total volume of 10 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was incubated overnight at 37 °C and 180 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the product standard (see calibration curve below). The reaction was centrifuged, the supernatant was basified with NaHCO₃ and extracted with EtOAc (3 x 10 mL). The organic fractions were collected, evaporated under vacuum and the residue purified using preparative HPLC (method B). Fractions containing the desired product were freeze-dried to give 6'-OMe-10 as white powder (TFA salt, 4.9 mg, 30% yield, 89% yield by HPLC). An impurity (10%) was also identified by NMR corresponding to the regioisomeric product methylated at O-7. Only signals for the major isomer are shown. 1H NMR (700 MHz, MeOD) δ 6.71 (s, 1H, 8'-H), 6.70 (s, 1H, 5'-H), 3.84 (s, 3H, OMe), 3.45 (t, J = 6.4 Hz, 2H, 3'-H), 3.02 (t, J = 6.4 Hz, 2H, 4'-H), 2.20-2.17 (m, 4H), 2.03-2.01 (m, 2H), 1.96-1.93 (m, 2H); 13C NMR (176 MHz, MeOD) δ 148.9, 147.4, 130.8, 123.0, 112.7, 112.1, 68.7, 56.3, 42.0 x 2, 40.3, 26.2 x 3; HRMS (ES+) found [M+H]⁺ 234.1485; C₁₄H₂₀NO₂ requires 234.1489.

HPLC Method A1 (achiral)
Four-Enzymes Cascade to (S)-6-methoxy-1-phenethyl-1,2,3,4-tetrahydroisoquinolin-7-ol (S)-6-OMe-11

Dopamine hydrochloride (19 mg, 0.1 mmol), 3-phenylpropanal (53.1 μL, 0.4 mmol) dissolved in 1 mL of acetonitrile, sodium ascorbate (29.7 mg, 0.15 mmol), and 7NCS (5 mg) were combined with HEPES (50 mM pH 7.5) mM to a total volume of 10 mL. The reaction was stirred at 37 °C with 200 rpm shaking until completion (3 h). After completion, the methylation step was initiated in the same pot and all the components were added to have a final concentration of 10 mM ATP (110 mg, 0.2 mmol), 10 mM of L-methionine (7.5 mg, 0.05 mmol), 10% v/v of EcMAT lysate, 2% v/v of EcMTAN lysate, and 10% v/v of RnCOMT lysate in a total volume of 20 mL containing 20 mM MgCl₂ and 200 mM KCl. The reaction was started upon enzymes addition and incubated overnight at 37 °C at 200 rpm. After this time an aliquot was taken to calculate the yield by HPLC against the product standard (see calibration curve below). The reaction was quenched with 0.5 M HCl (2 ml), centrifuged and the supernatant was purified using preparative HPLC (method B). Fractions containing the product were concentrated under vacuum and re-dissolved in 0.1 M aqueous HCl, before lyophilisation to give the HCl salt of (S)-6-OMe-11 as a white powder (8.2 mg, 33%, 40% yield by HPLC). Impurities (15%) were also identified by NMR corresponding to the regioisomeric product methylated at O-7. ¹H NMR (700 MHz; D₂O with MeOH standard) δ = 7.37 (t, J = 7.6 Hz, 2H, m-Ph), 7.31-7.26 (m, 3H, o-Ph + p-Ph), 6.88 (s, 1H, 8-H), 6.74 (s, 1H, 5-H), 4.50 (dd, J = 7.8, 4.9 Hz, 1H, 1-H), 3.84 (s, 3H, OMe), 3.60 (dt, J = 13.0, 6.0 Hz, 1H, 4-H), 3.39 (ddd, J = 13.0, 7.5, 6.0 Hz, 1H, 3-H), 3.07 (dt, J = 17.0, 6.0 Hz, 1H, 4-H), 3.00 (dt, J = 17.0, 6.0 Hz, 1H, 4-H), 2.84 - 2.74 (m, 2H, 2'-H), 2.38 - 2.30 (m, 1H, 1'-H), 2.28 - 2.19 (m, 1H, 1'-H); ¹³C NMR (151 MHz; D₂O with MeOH standard) δ = 148.3, 144.8, 141.6, 129.8, 129.4, 127.5, 125.0, 124.8, 114.0, 113.3, 56.8, 55.5, 40.3, 36.0, 31.7, 25.2; m/z HRMS (ESI+) found [M+H]⁺ 284.1644; C₁₈H₂₂NO₂ requires 284.1645. [α]D²⁴ = +6.4 (c 0.10, H₂O).

HPLC Method C1 (chiral) (S)-6-OMe-11
4. Analytical HPLC chromatograms

(a) 
(b) 
(c) 
(d)
**Figure S5.** Representative HPLC chromatograms from the single step methylation reaction (preliminary screening) using SAM. For each methyltransferase: yellow dots correspond to starting material, full dots correspond to 6-OMe product, light dots correspond to 7-OMe products, purple dots correspond respectively to the dimethoxy products.
5. **Docking**

Docking was performed with Chimera UCSF using the AutoDock Vina plugin,[11,12] (docking box parameters and settings: energy-range (kcal/mol) 3, exhaustiveness 8, number of modes 5). Binding modes relevant to the explanation of enzyme reactivity were selected. Images generated using Chimera,[12] RnCOMT (PDB ID: 1VID) and MxSaC (PDB ID: 5LOG).

**Docking analysis of derivative (S)-6-OMe-3 for the second methylation with RnCOMT or MxSaC**

This showed that the aromatic side chain can occupy the active site, with the catechol moiety coordinated with the magnesium ion (Figure S6). RnCOMT exhibited high regioselectivity for the second methylation at 3'-OH which is located towards the cofactor and in proximity to the catalytic lysine (Figure S6a). The THIQ heterocyclic ring interacts with W143 (π-π stacking) on the hydrophobic wall, directing the methylation to the 3'-OH. For MxSaC (Figure S6b) the interactions of the THIQ moiety with the outer region of the active site, is consistent with the favoured methylation at 4'-OH which is kept towards the catalytic lysine, K145 and near the cofactor.

**Figure S6.** Computational docking of (S)-6-OMe-3 (blue) into the active site (a) RnCOMT (PDB ID: 1VID) containing SAM (orange) and (b) MxSaC (PDB ID: 5LOG) containing SAH (orange). The magnesium ion is represented in green.
