Abstract

*Hemibrycon sanjuanensis*, new species, is described from the upper San Juan River drainage, Pacific versant, Colombia. It is distinguished from *H. boquiae*, *H. brevispini*, *H. cairoense*, *H. colombianus*, *H. mikrostiktos*, *H. metae*, *H. palomae*, *H. rafaelense* and *H. tridens* by the presence of a circular or oblong humeral spot that is located two scales posterior to the opercle (vs. 3–4 scales in *H. palomae*, *H. rafaelense*, *H. brevispini* and *H. cairoense*, and 0–1 scales, in *H. metae* and *H. boquiae*). It further differs from *H. colombianus* in having a round or oblong humeral spot (vs. rectangular). It differs from *H. beni*, *H. dariensis*, *H. divisoresis*, *H. belleri*, *H. huamboncus*, *H. inambari*, *H. jabonero*, *H. jelskii*, *H. mikrostiktos*, *H. polyodon*, *H. quindos*, *H. raqueliae*, *H. santamartae*, *H. surinamensis*, *H. taeniurus*, *H. tridens*, and *H. yacopiae* in having melanophores on the posterior margins of the scales along the sides of body (vs. lacking melanophores on margins of scales along entire length of the sides of body). The new species differs from all congeners mentioned above in having, among other features, six teeth in the outer premaxillary row arranged in a straight line (vs. five or fewer teeth not arranged in straight line except *H. cairoense* with two to six teeth in the outer premaxillary row).
Resumen
Hemibrycon sanjuanensis, nueva especie, se describe de la cuenca alta del Río San Juan, vertiente Pacífico, Colombia. Este se distingue de H. boquiae, H. brevispini, H. cairoense, H. colombianus, H. mikrostiktos, H. metae, H. palomae, H. rafaelense y H. tridens por la presencia de una mancha humeral circular u ovalada que se localiza a dos escamas posterior al borde del opérculo (vs. 3–4 escamas en H. palomae, H. rafaelense, H. brevispini y H. cairoense, y cero o una escama desde el opérculo en H. metae y H. boquiae). Esta se distingue de H. colombianus en poseer una mancha humeral rojiza u ovalada (vs. rectangular). Esta se diferencia de H. beni, H. dariensis, H. divisorenisis, H. helleri, H. huambionicus, H. inambari, H. jabonero, H. jelskii, H. mikrostiktos, H. polyodon, H. quindos, H. raqueliae, H. santamartae, H. surinamensis, H. taeniurus, H. tridens, y H. yacopiae en presentar melanóforos sobre el borde posterior de las escamas a lo largo de los lados del cuerpo (vs. ausencia de melanóforos sobre el borde posterior de las escamas de los lados del cuerpo). La nueva especie se distingue de todos los congéneres, citados arriba, por presentar seis dientes en la fila externa del premaxilar ordenados en línea recta (vs. cinco o menos no ordenados en línea recta, excepto H. cairoense con dos a seis dientes en la fila externa del premaxilar).

Introduction
Today there are 36 species reported in the genus Hemibrycon (Eschmeyer and Fricke 2013). Of these, 21 species are distributed in Colombian watersheds, but only one species, H. dariensis, has been reported from the San Juan drainage on the Pacific coast. The present day distribution of Hemibrycon in Colombia suggests that this genus has its greatest diversity in Andean streams and high mountain habitats. But there are exceptions such as H. dariensis, which occurs in Pacific drainages, H. santamartae and Hemibrycon sp. n. found in northern Colombia, and H. metae from the upper Meta River drainage in the Orinoco River Basin (Bertaco and Malabarba 2010; Román-Valencia and Ruiz-C 2007; Román-Valencia et al. 2009a; Román-Valencia et al. 2013). The discovery of a new species of Hemibrycon from the upper San Juan River Basin, Pacific versant in Colombia, is a result of the authors’ ongoing revision of Hemibrycon (Román-Valencia et al. 2010; 2013) and is further proof of undocumented biodiversity in the genus.

Material and methods
Fishes were captured using seines and were preserved in the field with 10% formalin and later stored in 70% ethanol. Measurements and counts follow Armbruster (2012) and Román-Valencia et al. (2010). Measurements were made with digital calipers to 0.01 mm precision and are expressed as percentages of standard length (SL) and head
A new species of Hemibrycon (Characiformes, Characidae)...

length (HL). In reporting counts, values for the holotype are indicated with an asterisk (*). In the list of paratypes, the number of individuals is given immediately after the catalog number, which is followed by the range of SL in mm for that lot. Counts and measurements were taken on the left side of specimens when possible. A multivariate analysis was performed on the morphometric data with the PAST program, version 1.81 for Windows (Hammer et al. 2008), and a variable canonical analysis (CVA) was undertaken assuming allometric growth. All measurements were log transformed, correcting for size using Burnaby methods (Burnaby 1966) in the software PAST to adjust for or eliminate the influence of size and compensate for the allometric growth. In the CVA we included data for *H. dariensis* (n=71), which is allopatric with the new species in the San Juan River drainage and *H. cairoense* (n=46), which occurs in nearby watersheds. Morphological analysis based on bivariate or multivariate testing seeks to establish parameters (= morphological characters) for discriminating the closest species to the new taxon from other species present in the area of geographic distribution.

Osteological observations were made on cleared and stained specimens (C and S) prepared according to Taylor and Van Dyke (1985) and Song and Parenti (1995). Bone nomenclature follows Weitzman (1962), Vari (1995), and Ruiz-C and Román-Valencia (2006). Specimens are deposited in the Ichthyology Laboratory at the Universidad del Quindío, Armenia, Colombia (IUQ). Institutional acronyms for comparative material follow Sabaj-Pérez (2010). All collections were made in Colombia.

**Taxonomy**

*Hemibrycon sanjuanensis* sp. n.

**Holotype.** IUQ 3693, 53.5 mm SL, Colombia, Risaralda, Pueblo Rico, El Recreo, upper San Juan River, Aguas Claras River, Tatamá River tributary on Apia-Pueblo Rico road, 5°13'04.9"N, 76°01'50.1"W; 1519 m.a.s.l. (meters above sea level); **Paratypes:** IUQ 3039, 8, 47.0-58.4 mm SL, collected with holotype; IUQ 3040, 8, 39.3-81.2 mm SL, Risaralda, Pueblo Rico, La Selva, upper San Juan River Basin, La Selva Creek, tributary of Taiba River, 5°14’29.1”N, 76°04’42.1”W; 1359 m.a.s.l; IUQ 3041, 2, 70.6–84.9 mm SL, Risaralda, Pueblo Rico, upper San Juan River Basin, creek 1 km from Pueblo Rico on road to Santa Cecilia, 5°14’06.1”N , 76°02’20.1”W; 1357 m.a.s.l; IUQ 3042, 17, 21.3–70.9 mm SL, Risaralda, Pueblo Rico, upper San Juan River Basin, Agua Bonita Creek tributary of Tatamá River on road from Pueblo Rico to Santa Cecilia, 5°13’46”N ,76°02’05.1”W; 1530 m.a.s.l.; IUQ 3694, 2 C and S, 66.0–69.3 mm SL, Risaralda, Pueblo Rico, La Selva, upper San Juan River Basin, La Selva Creek, tributary of Rio Taiba, 5°14’29.1”N, 76°04’42.1”W; 1359 m.a.s.l; IUQ 3695, 2 C and S, 55.0–66.7 mm SL, Risaralda, Pueblo Rico, upper San Juan River Basin, Agua Bonita Creek, tributary of Tatamá River on Pueblo Rico- Santa Cecilia road,
Diagnosis. *Hemibrycon sanjuanensis* sp. n. differs from *H. boquiae*, *H. brevispini*, *H. cairoense*, *H. colombianus*, *H. mikrostiktos*, *H. metae*, *H. palomae*, *H. rafaelense* and *H. tridens* by the presence of a circular or oblong humeral spot located two scales posterior to the opercle (vs. 3–4 scales in *H. palomae*, *H. rafaelense*, *H. brevispini* and *H. cairoense*), and 0–1 scales in *H. metae* and *H. boquiae*). It further differs from *H. colombianus* in having a round or oblong humeral spot (vs. rectangular). It differs from *H. beni*, *H. dariensis*, *H. divisorensis*, *H. helleri*, *H. huambonicus*, *H. inambari*, *H. jabonero*, *H. jelskii*, *H. mikrostiktos*, *H. polyodon*, *H. quindos*, *H. raqueliae*, *H. santamartae*, *H. surinamensis*, *H. taeniurus*, *H. tridens* and *H. yacopiae* in having melanophores present on the posterior margins of the scales all along the sides of body (vs. melanophores absent from margins of scales along entire length of sides of body). The new species further differs from all the species mentioned above in having a wide, concave pelvic bone (vs. narrow and straight); the middle part of the dorsal margin of the orbitosphenoid bone flattened and not in contact with frontal (vs. dorsal margin straight and in contact with frontal); ventral tip of supracleithrum bifurcate (vs. not bifurcate); six teeth in the outer premaxillary row arranged in a straight line (vs. five or fewer teeth in outer premaxillary row and not arranged in straight line, except *H. cairoense* with two to six teeth in the outer premaxillary row).

Description. Body slender and elongate (mean maximum body depth about 26.1% SL). Area above orbits flat between anterior margin of orbits and supraoccipital spine. Dorsal profile of head and body oblique from supraoccipital to dorsal-fin origin and from last dorsal-fin ray to base of caudal fin. Ventral profile of body convex from snout to base of pelvic fin; straight from pelvic-fin origin to anal fin. Caudal peduncle laterally compressed. Head and snout short (21.2% SL and 25.0% HL respectively), jaws...
equal, mouth terminal, lips soft and flexible, and outer row of premaxillary teeth; ventral border of upper jaw flat; posterior edge of maxilla reaching anterior edge of orbit. Premaxilla with two rows of teeth (Fig. 4). Six teeth of outer row tricuspid with central cusp largest, teeth arranged in straight line. Inner premaxillary row with four pentacuspid teeth that diminish gradually in size. Maxilla long, posterior margin straight, with 5–11 uni- or tricuspid teeth, central cusp slightly longer than outer cusps in tricuspid teeth (Fig. 4). Dentary with three or four large tricuspid teeth with central cusp largest, followed by two to four smaller, uni- to tricuspid teeth (Fig. 4). Six infraorbitals present, the first thin and narrow, extending between the dorsal edge of maxilla and lateral ethmoid, with sensorial canal. Second infraorbital short and wide, not covering dorsal part of angulo-articular. Anterior part of second infraorbital overlaying anterior part of first infraorbital; its posterior margin extending below third infraorbital. Third infraorbital widest and longest, its ventral border in contact with sensorial canal of preopercle. Fourth, fifth and sixth infraorbitals short and wide, covering posterior margin of hyomandibular. Supraorbital absent. Eight to nine supraneurals present between head and anterior part of dorsal fin, without cartilage on upper and lower edges, and with medial sensorial canal. Scales cycloid, moderately large. Lateral line complete with 40–47 pored scales (44*, mean=42.5, n=40). Scale rows between dorsal-fin origin and lateral line 5–6 (5*, mean=5.9); scale rows between lateral line and pelvic-fin origin 4–6 (5*, mean=5, n=40); scale rows between lateral line and anal-fin origin 4–6 (5*, mean=4.8, n=40); predorsal scales 11–14, arranged in regular series 11–14 (12*, mean=12.4, n=40). Dorsal-fin rays iii, 7–8 (iii, 7*, n=40); first unbranched ray approximately one-half length of second ray, its tip not reaching first bifurcation of first branched ray. Anal-fin rays iii-iv, 24–30 (iii, 27*, n=40). Anal-fin origin posterior to vertical through base of last dorsal-fin ray. Pectoral-fin rays ii, 9–12 (11*, n=40). Pelvic-fin rays ii, 6 (6*, n=40). Pelvic-fin origin anterior to vertical through dorsal-fin origin. Caudal fin not covered with scales except at its base, forked with short pointed lobes. Total number of vertebra 39–41.

Secondary sexual dimorphism. Males have between 3–11 very short hooks present on all branched pelvic-fin rays, located on both branches of rays, but predominantly on internal and lateral branches; hooks present on one simple pelvic-fin ray. Males have row of very short hooks on first seven to fifteen branched anal-fin rays, each ray has from 3–5 hooks, which extend along the extreme distal branch of rays; no hooks on simple anal-fin rays.

Live colors. Dorsum of body and head silvery green; sides and ventrum silvery white from opercle to caudal peduncle. Caudal peduncle with dark midlateral stripe that extends on to middle caudal-fin rays and has a reddish spot on the ventral portion of the caudal- fin base. Humeral spot dark and rounded or oblong with some dispersed melanophores extending dorsally and ventrally. Pectoral and pelvic fins hyaline, but dorsal, anal and caudal fins with hues of reddish yellow and with dispersed melanophores on interradial membranes.

Pigmentation in alcohol. Body dark brownish-yellow, melanophores more densely concentrated on dorsum and upper sides than on ventrum, most intense on head; with melanophores present on the posterior margins of the scales all along the
sides of body. Trunk with dark, midlateral stripe from posterior margin of humeral spot to caudal peduncle, extending on to caudal fin. Humeral spot circular or oblong, located two scales posterior to the opercle, not reaching the first series of scales below the lateral-line canal. Ventral part of body light yellow. Dorsal fin with melanophores concentrated mostly on interradial membranes and rays. Adipose fin hyaline. Dark melanophores present on middle caudal-fin rays, near caudal-fin base. Pectoral and pelvic fins hyaline; anal and caudal-fin lobes dusky and with melanophores concentrated on interradial membranes to form band.

| Maxillary teeth        | 5        | 7–10    |

**Distribution and ecological notes.** This species is so far known only from the upper San Juan River Basin, Tatamá River drainage, Pacific versant, Colombia (Fig. 2). *Hemibrycon sanjuanensis* sp. n. was captured in streams characterized by relatively rapid water running over rocky and sandy substrates with high transparency. The pH was near neutral, dissolved oxygen values were high, and conductivity and total solids were low (Table 2), typical of oligotrophic environments.
The new species is syntopic with *Bryconamericus emperador*, *Astroblepus* sp., *Pimelodella* sp. and *Characidium* sp. The analysis of stomach contents of four specimens revealed the presence of adults and larvae of two different species of Coleoptera: *Hydrophilidae*, *Promoresia* sp. and *Elmid* sp., *Diptera: Simulidae* and *Sarcophagidae*, adult of *Odonata* *Zygoptera*, *Dytiscidae*, *Trichoptera*, *Nematoda*, *Isopoda* and fragments of unidentified arthropods. The presence of autochthonous and some allochthonous items suggest that this species is insectivorous with considerable plasticity in its diet.

**Etymology.** *Hemibrycon sanjuanensis* is named for the San Juan River Basin, where the type series was collected (Fig. 2).

**Remarks.** Canonical Variables Analysis (CVA) of *H. sanjuanensis* and species found in the San Juan and nearby rivers (including *H. dariensis* and *H. cairoense*), revealed significant differences among them, based on several characters, the most important of which are the length of the pelvic fin (variable M) and upper jaw length (related to variable W) (Fig. 3); the first canonical variable explained 84.3% of total variation, the second explained 15.6%. Linear regression analysis of the upper jaw length showed positive increment of these variables in *H. sanjuanensis* (vs. negative increment in the other species studied) and so separated it from the other species included in the analysis (r=-0.15, P=0.02).

Moreover, this new species is distinguished from *H. cairoense* (Román-Valencia and Arcila-Mesa 2009) by the number of unbranched dorsal-fin rays (iii vs. ii), by the number of scales rows between the dorsal-fin origin and the lateral line (5–6 vs. 6–7), between the anal-fin origin and the lateral line (5–6 vs. 6–7), and between the pelvic-fin insertion and the lateral line (4–6 vs. 6–7), by the presence of hooks on the males (only on the pelvic fin rays vs. on the anal, pelvic, pectoral and posterior portions of dorsal fin ray).

**Table 2.** Physicochemical variables in habitat of *Hemibrycon sanjuanensis* sp. n. San Juan River Basin, Colombia. Localities: 1. Aguas Claras River 2. La Selva Creek, 3. Agua bonita Creek 4. Discussion. *Hemibrycon sanjuanensis* has all of the synapomorphies observed in other *Hemibrycon* (Arcila-Mesa 2008, Mirande 2010). Although species of *Hemibrycon* have a similar color pattern throughout their geographic distribution, subtle differences in the concentration and distribution of black pigment in the humeral and caudal regions have been used to diagnose new species (Bertaco and Malabarba 2010; Román-Valencia et al. 2009a, b, c, 2013; Román-Valencia and Arcila-Mesa 2010).

*Hemibrycon sanjuanensis* has a reddish spot on the ventral portion of the caudal-fin base in life. This characteristic has also been observed in several other species of *Hemibrycon* (Bertaco et al. 2007; Román-Valencia et al. 2010) and has been suggested as a synapomorphy for the genus by Arcila-Mesa (2008) and Román-Valencia et al. (2013). Two species, *H. dariensis* and *H. microformaa*, have been reported previously from the San Juan, Atrato and Leon River drainages (Román-Valencia and Ruiz-C 2007; Román-Valencia and Arcila-M. 2008). The new species is similar and probably related phylogenetically to *H. dariensis* but is distinguished from it by the following: the presence of a dark lateral stripe that continues on to the middle caudal-fin rays (vs. wide lateral band extending only to bases of middle caudal-fin rays); pectoral fins not reaching pelvic-fin origins (vs. pectoral fins reaching pelvic-fin origins); 39–41 total vertebrae (vs. 37–38); mean length of pelvic fins 11.7% SL, (vs. 15.2%). From *H. microformaa* (Román-Valencia and Ruiz-C 2007), the new species differs in attaining a larger adult size (greater than 31 mm SL vs. SL < 31 mm); in not having flat dorsal margins of the orbits and ventral profile of the snout (vs. flat); terminal mouth with upper jaw not surpassing lower (vs. mouth subterminal); greater total number of vertebrae 39–41 (vs. 33–34); and a greater number of branched anal-fin rays 24–30 (vs. 14–16).

Comparative material examined. *Hemibrycon beni*: UMSS 09585, 18, Bolivia, Amazonas/Madera/Beni/Bopo, Pekheñkharma River Imanblaya, 3 Jan. 1990; UMSS 0890, 50, Bolivia, Amazonas/Beni/Madera/Kaka, tributary of Taipiplaya-Taipiplaya Rivers, 3 Oct. 2008. *Hemibrycon boquiae*: All from Colombia, Quindío state, Salento municipality, Upper Cauca River, Quindío River: IUQ 301a, 3, (C and S), Boquia Creek, 4°38’35”N, 75°75’11”W, 1819 m.a.s.l; IUQ 754,104, Boquia Creek (4°38’35”N, 75°75’11”W, 1819 m.a.s.l); IUQ 871, 15, Boquia Creek, 4°38’35”N, 75°75’11”W, 1819 m.a.s.l. *Hemibrycon brevispini* paratypes: IUQ 883,6, Colombia, Quindío state, Calarcá municipality, Upper Cauca River, Quindió River, Venada Creek, tributary of Santo Domingo River, Quebrada Negra road, 200 m along Quebrada Negra road after the bridge of the Santo Domingo River. *Hemibrycon cairoense* Paratypes: IUQ 537, 2 (C and S), Colombia, Risaralda state, El Cairo, Upper Cauca River, Los Ramirez Creek, tributary of La Italia Creek, road from Quinchia to El Cairo, 200 m beside the bridge; IUQ 537, 2 (C and S), Valle del Cauca state, El Cairo municipality, Upper Cauca River, Los Ramirez Creek, tributary of La Italia Creek, El Cairo, road from Quinchia to El Cairo, 200 m from bridge. *Hemibrycon colombianus*: IAvH 3130, 28, Colombia, Santander state, Magdalena River, Moniquira River, Suarez River, Sept 11
and 13, 1995; IAvH 2942, 6, Colombia, Boyacá state, Suarez River and El Cobre Creek; IAvH 3132, 24, Colombia, Boyacá state, Moniquira and Suarez Rivers, El Cobre Creek; ICNMNH 755, 7, Colombia, Santander state, Capitaneo and Nevado Rivers. *Hemibrycon coxeyi* ANSP 70155 (Holotype), Ecuador, Hacienda Las Mascotas, mouth of the Pastaza River, Marañón River drainage. *Hemibrycon dariensis*: USNM 260697, 1, Colombia, Choco state, Atrato River, Bernal Creek, tributary of Negua River, 17 Mar 1967; USNM 293218, 2, Panamá, of Kuna Yala, Madinga River between Pingandi River and Mandinga (Atlántico), 09°28’N, 70°06’W, 3 Mar 1985; USNM 293234, 1, Panamá, Darién, Pirre River about 1/2 km above El Real (Tuira River), Pacific, 19 Feb 1985; USNM 293245, 28, Panamá, Darién, Tuira River, Darién Province, Pucuro River about 3–4 km above the confluence of the Tuira River, Pacific, 17 Feb 1985; IUQ 523, 26, Colombia, Antioquia state, Uraba, Zungo River highway, León River system, 17 Dec 1990; IUQ 524, 2, Colombia, Antioquia, Uraba, Creek km 25 Mutatá-Chigorodo road, Dec 1990; IUQ 525, 26, Colombia, Antioquia, Uraba, Caribbean sea, León River drainage, Villarteaga River, Dec 1990. *Hemibrycon fasciatus* (paratypes): All from the state (Departamento) of Antioquia, middle Magdalena River Basin: IUQ 3065, 4; 32.4–71.5mm SL, Santa Gertrudis Creek, tributary of Nare River, Concepción municipality 6°19’21.0”N, 75°09’38.6”W, 1820 m.a.s.l., 31 Jan 2010; IUQ 3156, 1, 52.7mm SL, Santa Gertrudis Creek, tributary of Nare River, Concepción and Alejandría municipality, after the Peñol-Guatapé dam. *Hemibrycon guppyi*: BMNH 1906623, lectotype, 1. Hemi- 

brycon santamartae (Paratypes) all from Colombia in Cesar state, Rancheria River drainage: IUQ 924, 1, Atanquez municipality, Sierra Nevada de Santa Marta, Candela
A new species of Hemibrycon (Characiformes, Characidae)...

Acknowledgments

We are grateful for the support of the University of Quindío (UQ), Vicerrectoría of Investigations for grants 304, 357, 464 to C.R-V. and R.I.R-C. and Facultad de Ciencias Basicas and Tecnologías U.Q. for financial support for Research Project 594 and funding for a visiting researcher to IUQ (DCT) in June–July 2013 and 2014. Cristian Román-P (IUQ and UV) identified stomach contents and elaborated figure 2. We thank the editor of ZooKeys and one anonymous referee for their comments and corrections which helped to improve this paper.
