Abstract

*Sylvilagus andinus* (Thomas, 1897) is a highland lagomorph from the Ecuadorean Paramos. Its distribution was tentatively believed to extend to northwestern Peru on the basis of ecological niche modeling and the inclusion of the Peruvian *S. capsalis* Thomas, 1913 as a synonym. Here, we confirm the occurrence of *S. andinus* in Peru by a morphological examination of seven new records from northwestern Peru and one new record from Ancash department in central Peru.

Keywords

Ancash, Andes, Cajamarca, *Sylvilagus capsalis*, mammals, Paramos

Introduction

Cottontail rabbits of the genus *Sylvilagus* Gray, 1867 are highly speciose, with about 30 valid species (Ruedas et al. 2017, 2019). *Sylvilagus* is endemic to the Americas and is widely distributed from southeastern Canada to northern Argentina (Chapman and Ceballos 1990; Silva et al. 2019), occupying temperate, tropical, and subtropical habitats (Schai-Braun and Hackländer 2016).

*Sylvilagus andinus* (Thomas, 1897), commonly known as the Andean Cottontail, occurs in highlands in Venezuela, Ecuador, and Peru (Ruedas et al. 2017, 2019), but currently its presence in Peru is based only on the type specimen of *S. capsalis* Thomas, 1913, which has been considered a synonym of *S. andinus*, and on ecological niche modelling (Ruedas et al. 2017). To improve the resolution of this model and confirm the occurrence of the species in Peru, Ruedas et al. (2017) recommended examining additional specimens from the country and tentatively treated *S. capsalis* (type locality “San Pablo, Cajamarca [Peru]”), as well as other highland taxa from Ecuador and Venezuela (*S. meridensis* Thomas, 1904; *S. andinus chimbanus* Thomas, 1913; *S. a. canarius* Thomas, 1913; *S. a. carchensis* Hershkovitz, 1938; *S. a. chotanus* Hershkovitz, 1938; *S. nivicola* Cabrera, 1913; *S. kelloggi* Anthony, 1923; and *S. chillae* Anthony, 1923) as junior synonyms of *S. andinus* based on their elevation and habitat.

Thus, previous records of the Andean cottontails from Peru published as *S. brasiensis* and other associated...
names are now allocated to *S. andinus*. These Peruvian records of *S. andinus* include the one reported from Cutervo, Cajamarca (Thomas 1882, as *Lepus brasiliensis*), from San Pablo, Cajamarca (Thomas 1913, as *S. capsalis*), and from La Libertad and Cajamarca (Osgood 1914, as *S. capsalis*). Grimwood (1969) reported this species at 1500–3000 m from Piura, Cajamarca, and La Libertad as *S. brasiliensis*. No additional records of northern Peruvian populations of *Sylvilagus* were published until Jiménez et al. (2010) recorded *S. brasiliensis* from Pagaibamba Protected Forest, Cajamarca department, based on indirect records (Table 1). More recently, Pacheco et al. (2020) tentatively recognized the Grimwood’s (1969) historical records from northwestern Peru as *S. andinus* (sensu Ruedas et al. 2017).

*Sylvilagus andinus* has an important ecological role as a pervasive herbivore, consuming a wide variety of plant species (Garcia et al. 2016). The species is also an important food source for several predators such as the Andean Fox *Lycalopex* (*Pseudalopex*) *culpeaus* (Molina, 1782) (Trujillo and Trujillo 2007; Cadena-Ortiz et al. 2020), Long-tailed Weasel *Neogale frenata* (Lichtenstein, 1831) (Garcia et al. 2016), Mountain Lion *Puma concolor* (Linnaeus, 1771) (Hernandez-Guzman et al. 2011), and Black-chested Buzzard Eagle *Geranoaetus melanoleucus* (Vielliot, 1819) (Jimenez and Jaksic 1989). Despite this, *S. andinus* is still a poorly known rabbit and is currently classified as Data Deficient by the International Union for Conservation of Nature because distribution data are scarce compared to other cottontail species (Ruedas and Smith 2019).

Here, based on a direct examination of eight new specimens from eight localities, we confirm by our own morphological examination the presence of *S. andinus* in northwestern and central Peru.

**Methods**

We examined eight specimens housed in the mammal collection of the Museo de Historia Natural de la Universidad Nacional Mayor de San Marcos (MUSM), Lima, Peru. We took external measurements from specimen tags. We also estimated the head and body length (HBL) by subtracting the tail length (TailL) from the total length (TotalL). External measurements are reported to the nearest millimeter (mm). We took the cranial and mandibular measurements to the nearest 0.1 mm using dial calipers mainly following Ruedas et al. (2017): greatest length of skull (GLS), basilar length (BL), greatest rostrocaudal length of nasal bone (NL), greatest width across left and right nasal bones (NW), zygomatic breadth measured at zygomatic spine (BZS), zygomatic breadth (ZB), zygomatic length (ZL), dorsoventral depth of zygomatic arch (DZ), breadth of braincase (BB), width of cranium at exoccipital bones (WX), length of auditory bulla (LB), width of auditory bulla (WB), interorbital breadth (IOB), height of rostrum (HR), width of rostrum (WR), rostrocaudal length of incisive foramina (LIF), width of incisive foramina (WIF), palate length from henselion (HPL), rostrocaudal length of palatal bridge (PBL), width of choana at first upper molar (WCH), breadth of alisphenoid constriction (BAC), alveolar length of maxillary toothrow (ATL), alveolar length of upper diastema I2–PM2 (DL), dantary toothrow length (DTL). We followed the age classification of Hoffmeister and Zimmerman (1967), and the taxonomic identification followed Thomas (1897), Hershkovitz (1938, 1950), and Ruedas et al. (2017, 2019).

Our samples also included one photograph and two sighting records with accurate coordinates housed in a separate database (MUSM2). Finally, we present a map (Fig. 1) based on vouchers and indirect records for *Sylvilagus andinus* from Peru and Ecuador (Table 1).

**Results**

After a morphological revision of *Sylvilagus* specimens housed in the MUSM, which were previously identified as *S. brasiliensis* following Hershkovitz (1950) and Hoffmann and Smith (2005), we confirm the presence of *S. andinus* in seven different localities in northwestern Peru and one record from central Peru (Table 1; Fig. 1).

_collected during the rainy season._

**Identification.** *Sylvilagus andinus* is a medium-sized species (HBL 326–353 mm) with a small tail (6–7% of HBL) and long hindfeet (64–81 mm) (Table 2), characterized by the following combination of external and craniodental characters: pelage long, soft, dusky in appearance; forehead suffused with brownish; small nostril patches white; ears rather short, gray basally; cheeks and sides of neck ashy gray; back awns hairs long, colored warm buff to clay color irregularly streaked with black presenting a saturated general appearance; rump with a reddish suffusion which passes down on the legs to the heels; chin and belly whitish; underhairs woolly gray; upper surface of fore and hind feet pale, with more white than ochraceous; soles of feet thickly furred, brown; tail a mere stump colored like the rump (concurring with Thomas 1897 and Ruedas et al. 2017). Crown enamel pattern of third lower premolar (p3) with multiple, deep anteroflexid invaginations into rostral aspect of anterior lobe; rostral aspect of p3 hypoflexid heavily crenellated from anteroconid to paraflexid; deep, crenellated paraflexus, with generally conspicuous hypoflexus in second upper premolar (P2) (concurring with Ruedas et al. 2017).

As mentioned by Hershkovitz (1950), *S. brasiliensis* s.l. (lowland Peruvian population) can be differentiated from *S. andinus* by the following external characters: *S. brasiliensis* has ochraceous-buff back, ochraceus-tawny rump, and warm buff cheeks, while *S. andinus* has warm buff back and rump and ashy gray cheeks. No other revision has included the Peruvian lowland population of *Sylvilagus*. Ruedas et al. (2017) identified the following craniodental features that distinguish *S. brasiliensis* s.s. (Brazilian population) from *S. andinus* (Ecuadorean population): *S. brasiliensis* s.s. has longer postorbital
Table 2. External and skull measurements (in mm) of the holotype of *Sylvilagus andinus* (Thomas 1897; Ruedas et al. 2017) and collected specimens from Cañaris, Lambayeque (MUSM 55249), Monteseco, Cajamarca (MUSM 55796), and Sanagorán, La Libertad (MUSM 46735).

Figure 2. New records of the Andean cottontail *Sylvilagus andinus* from Peru. A. Dorsal view of skin specimens from Cutervo (left, juvenile MUSM 2071) and Monteseco (right, adult MUSM 55796) both in Cajamarca. B. Second left upper premolar (left) and third right lower premolar (right) of one specimen from Cañaris, Lambayeque (MUSM 55249) showing diagnostic characteristics: h, presence of hypoflexus; p, crenellated paraflexus; a, multiple anteroflexids; y, crenellated hypoflexid. C. Lateral view of fluid specimen from Conchucos, Ancash (MUSM 23254). D. Individual from Pariamarca Alto, Piura in its natural habitat (MUSM 23). Scale bars = 50 mm.
processes ending broadly rounded and fused to the frontal; U-shaped frontonasal suture; single simple shallow anteroflexid, paraflexid and protoflexid; smooth hypoflexid; absence of hypoflexus; and simple deep paraflexus; in contrast, *S. andinus* (Ecuadorean population) has shorter, V-shaped postorbital processes not coalescing with the frontal; V-shaped frontonasal suture; multiple invaginations in the anteroflexid, paraflexid and protoflexid; crenellated hypoflexid; presence of hypoflexus; and crenellated paraflexus. Following Ruedas et al. (2017), our specimens correspond to *S. andinus* because of the aforementioned characteristics for the species (Fig. 2).

**Discussion**

Our study confirms the presence of *Sylvilagus andinus* in Peru based on the direct examination of eight specimens, two sightings, and one photograph, from eight localities, which range in elevation from 1085 m (MUSM 34654) to 3905 m (MUSM 23173). Our specimens exhibit the characteristics that differentiate *S. andinus* from *S. brasiliensis* (Figs. 2, 3), following Ruedas et al. (2017, 2019), but we are aware that some authors are still lumping *andinus* and other Andean forms under *S. brasiliensis* (Diersing and Wilson 2017) without additional arguments.

We also extend the current distribution range of the species by about 169 km southeast from San Pablo, Cajamarca department (type locality of *S. capsalis*; Fig. 1) to Ancash department in central Peru (MUSM 23254). Records of this species are rare because it seems to avoid commonly used traps; nonetheless, the records presented here show that it is more widely distributed than previously thought. Little is known regarding the natural history this species, but it is known that lowland tropical forest cottontails have been trapped in Tomahawk traps set in native gardens and baited with yuca (Voss and Emmons 1996). Two specimens, which were determined as juveniles based on general size and cranial features, were trapped using Victor® mouse traps with standard bait (Pacheco et al. 2007), probably because of their inexperience.

Although the phenotype of our specimens matches the diagnostic characters of *S. andinus*, we observed morphological variability in three adult specimens: the premolar foramen and the antorbital process of the interorbital region were present only in MUSM 55249 (Fig. 3). Also, a smooth braincase was seen only in MUSM 46735 and MUSM 55796. These characters were indicated as diagnostic for *S. andinus*, but our observations suggest they could be individual or geographic variation. Documented morphological data for this species are scarce (Thomas 1897, 1913; Ruedas et al. 2017, 2019; Diersing and Wilson 2017), which limits our understanding of age, sex, and population variability. Therefore, pending a thorough revision of the Andean forms, we tentatively follow the latest revision of the genus (Ruedas et al. 2017, 2019).

Although our study improves the current distribution of *S. andinus*, we acknowledge that a larger set of samples is needed to properly assess intraspecific variability. While this contribution considerably extends the southern range of the species and provides important natural history information, we recommend that additional studies be undertaken to fully assess the taxonomic, distribution, and conservation status of *S. andinus*.

**Acknowledgements**

We want to thank the collectors of the specimens of *Sylvilagus* in the MUSM, including Lynn Marina Villalobos, Richard Cadenillas, Lucia Luna, Liz Huamani, and Alfonso Miranda. We also thank Sandra Velazco and Alicia Rodriguez for field support, and Andddson Solis for sharing with us his sighting records. We especially thank José Serrano-Villavicencio, Catherine Sahley, and Klaus Cervantes, as well as the editors Guilherme Garbino and Robert Forsyth, the reviewer Sergio Solari, and two anonymous reviewers, for providing valuable...
comments on the manuscript and improving the English. The non-profit organization Idea Wild donated equipment necessary for this work.
