Background. Endometrial cancer (EC) is one of the most common gynaecological tumours in the worldwide. Long non-coding RNA (lncRNA) nuclear enriched abundant transcript 1 (NEAT1) promotes cell proliferation, migration and invasion in EC cells. However, the molecular mechanisms of NEAT1 in EC have not been fully clarified. We conducted this study to reveal the function of NEAT1 in EC tissues and cell lines.

Materials and methods. Cancer and adjacent tissues were collected from EC patients. HEC-1A and Ishikawa cells were cultured in vitro. NEAT1 expression was downregulated by transfecting small hairpin RNA (shRNA) and miR-144-3p was overexpressed by transfecting miR-144-3p mimics. Cell proliferation was detected by MTT assay and colony formation assay. Cell migration and invasion abilities were assessed by transwell assay. A dual-luciferase reporter assay was used to verify the relationship among NEAT1, EZH2, and miR-144-3p. The expression level of EZH2 was measured by Western blot and qPCR.

Results. NEAT1 was highly expressed in EC tissues and cells. Knockdown of NEAT1 inhibited the proliferation, migration and invasion of EC cells. Additionally, NEAT1 acted as a ceRNA of miR-144-3p, leading to EZH2 upregulation. Overexpression of miR-144-3p suppressed the proliferation and invasion of EC cells.

Conclusions. NEAT1 promotes EC cells proliferation and invasion by regulating the miR-144-3p/EZH2 axis.

Key words: endometrial cancer; NEAT1; miR-144-3p; EZH2

Introduction

Endometrial cancer (EC), one of the most common gynaecological tumours originating in the uterus, has increasing incidence rates, as shown by American Cancer Society statistics.¹ The relative 5-year survival relative rate for EC is only 77%, and approximately 11,350 women died of uterine cancer in 2016 in the U.S.² Consequently, determining the molecular mechanisms underlying the development of EC is of great importance.

Long non-coding RNAs (lncRNAs) are defined as the RNA transcripts, that are longer than 200 nucleotides but do not encode proteins. LncRNAs play unique regulatory roles in a variety of biological pathways, such as cardiovascular, reproductive, inflammatory, and metabolic functions and DNA repair processes.³⁻⁵ Emerging evidence has confirmed the carcinogenic or anticancer effects of lncRNAs in cancer development.⁶⁻⁷ LncRNA nuclear enriched abundant transcript 1 (NEAT1) is dysregulated in multiple types of malignancies, including bladder cancer, lung cancer, breast cancer and colorectal cancer.⁸ It has been reported that overexpression of NEAT1 promotes cell proliferation, migration and invasion in EC and associates
with clinical progression. In addition, NEAT1 can regulate the Wnt/β-catenin signalling pathway by targeting miR-214-3p or miR-146b-5p in EC. The results mentioned above reveal the important roles of NEAT1 in EC progress. However, its mechanism in EC remains largely unknown.

The histone methyltransferase EZH2 has been identified as a clinically relevant biomarker associated with cancer. Dysregulation of EZH2 was found in various cancers. For example, EZH2 can promote tumour growth by increasing angiogenesis in pituitary adenoma. EZH2 expressed is also dysregulated in EC and is related to high grade of EC. It was demonstrated that EZH2 is the target of miR-144-3p in osteosarcoma cells and negatively correlates with the expression of miR-144-3p. Whether miR-144-3p is involved in the progression of EC remains to be explored. In our previous work, we predicted that NEAT1 may target miR-144-3p. Thus, we speculated that NEAT1 might regulate EC cells proliferation, migration and invasion via the miR-144-3p/EZH2 axis.

In this study, we found that NEAT1 could bind to miR-144-3p to suppress its function and subsequently upregulate the expression of EZH2, leading to enhanced EC cells proliferation, migration, and invasion. Taken together, our findings reveal a mechanism in which the NEAT1-miR-144-3p-EZH2 axis regulates proliferation, migration and invasion in EC cells, suggesting that NEAT1 may serve as a potential target for EC treatment.

**Materials and methods**

**Cell culture**

The human endometrial cancer cell lines, HEC-1-A, HEC-1B, Ishikawa (type I), RL-95-2, and JEC and human normal endometrial stromal cells (hESCs) were maintained in DMEM (Gibco, USA) with 10% foetal bovine serum (FBS, Gibco, USA). The cells were cultured at 37°C with 5% CO₂.

**Cancer and adjacent tissue collection**

All the EC and adjacent normal endometrial tissues were collected from EC patients at the First Hospital of Lanzhou University. The EC tissues (n = 36) and tumour adjacent tissues (n = 36) were collected during surgery and then rapidly frozen with liquid nitrogen and stored at -80°C. This study was approved by the Ethics Committee of the Reproductive Medicine Special Hospital of the First Hospital of Lanzhou University.

**Quantitative real-time PCR (qRT-PCR)**

Total RNA extraction was performed using Trizol reagent (Invitrogen USA), and a TaqMan Reverse Transcription Kit (Thermo Fisher, USA) was used for reverse transcription into cDNA according to the manufacturer’s instructions. Real-time quantitative polymerase chain reaction (qPCR) was used to quantify the expression level of NEAT1 in cultured cells using an Applied Biosystems 7500 Fast Dx Real-Time PCR instrument (Thermo Fisher, USA). SYBR Green reagent was used for qPCR in this study. GAPDH was used as an internal reference to normalize NEAT1 and EZH2 values. U6 was used as an internal reference to normalize miR-144-3p values. The following primers were used for analysis:

- NEAT1, 5’-TTGGGACAGTFFACGTGTGG-3’ (forward), and 5’-TCAAGTCCAGCAGAGCA-3’ (reverse);
- miR-144-3p, 5’-GGCCGGCGTACAGTATAGATGA-3’ (forward), and 5’- GTGCAGGGTCCGAGGT-3’ (reverse);
- EZH2, 5’-AAGCACAGTGCAACACCAAG-3’ (forward), and 5’-CAGATGGTGCCAGCAATAGA-3’ (reverse);
- GAPDH, 5’-TGACGTGCCGCCTGGAGAAC-3’ (forward), and 5’-CCGGCATCGAAGGTGGAAGAG-3’ (reverse);
- U6, 5’-CTCGCTTCGGCAGCACA-3’ (forward), and 5’-AACGCTTCACGAATTTGCGT-3’ (reverse). Relative RNA levels were calculated using the 2^-ΔΔCt method.

**Cell transfection**

Small hairpin RNA (shRNA) for NEAT1 or its respective negative control were designed, synthesized and cloned into the shRNA vector U6/GFP/Neo plasmid (GenePharma, Shanghai, China). A miR-144-3p mimic and its control were designed and synthesized by Sangon (Shanghai, China). The validated and purified reconstructed vectors were transfected into the indicated cells by Lipofectamine 3000 (Thermo Fisher, USA) according to the manufacturer’s guidelines. Briefly, 0.2 μg indicated plasmid and 0.4 μL Lipofectamine 3000 were mixed with 5 μL Opti-MEM medium (Thermo Fisher, USA), and then, Opti-MEM medium containing plasmid was added to the other Opti-MEM medium containing Lipofectamine 3000. Subsequently, this mixture was added to cells whose density was approximately 70%.
Dual-luciferase reporter assay

To verify the binding ability of NEAT1 to miR-144-3p and miR-144-3p to EZH2, we performed a dual-luciferase reporter assay using a Promega dual-luciferase reporter assay kit (Madison, USA). Briefly, we constructed a pmiR-RB-REPORT™ (Ribobio) plasmid containing the exact sites for wild type NEAT1 and EZH2 3'-UTRs and the corresponding mutated sequences. The cells seeded in 96-well plates were co-transfected with the indicated plasmids and miR-144-3p mimic or NC duplex (Gene Pharma). After 48 h, the cells were harvested, and luciferase activity was measured using a dual-luciferase reporter assay kit (Promega Corporation) and a multi-plate reader (Synergy 2, Bio Tek).

MTT assay

An MTT assay was performed to measure cell proliferation. Cells were cultured in 96-well plates (1 \times 10^4 per well). MTT (0.5 mg/mL, Gibco, USA) was added to the medium. Then, the plate was incubated at 37°C for 4 h and the supernatant was discarded. Next, 150 μL DMSO (Thermo Fisher, USA) was added to each well and the OD490 nm value was measured immediately using a microplate reader (3100, Thermo Fisher, USA).

Colony formation assay

A colony formation assay was used to determine cell proliferation. HEC-1-A and Ishikawa cells in logarithmic growth were digested by trypsin (Gibco, USA) and then resuspended in DMEM containing 10% FBS. Cells were seeded in culture dishes at a density of 500 cells per dish. Then, the cells were cultured at 37°C and 5% CO2 until visible colonies were formed. The culture medium was discarded, and the cells were fixed using methanol and stained with a crystal violet solution (Gibco, USA). The number of colonies was counted.

Transwell assay

The migration and invasion assays were performed using transwells. For this assay, 24-well plates with 8-μm pore polycarbonate membranes (BD Biosciences, USA) were used. The upper side of the membranes was coated with Matrigel (20 μg/well, BD Biosciences, USA) and then air-dried for 1 h at 37°C. EC cells (2×10^4) in 200 μL of FBS-free medium were placed in the upper chamber, which was uncoated (migration assay) or coated (invasion assay). The lower chamber was filled with medium with 10% FBS as a chemoattractant. After 48 h of incubation, the cells on the upper surface of the membrane were removed by gentle scrubbing with a cotton swab. The membranes were fixed in a stationary liquid of 95% ethanol and 5% acetic acid for 30 min and stained with a crystal violet solution. The number of cells on the lower surface of the membrane in 5 random visual fields (magnification, ×200) was then counted using an Eclipse TE2000-U inverted microscope.

Western blot analysis

A protein detection kit (Thermo Fisher, USA) was used to measure the amount of protein. Equivalent amounts of protein samples were separated on 8-10% SDS-PAGE and transferred to polyvinylidene difluoride membranes (PVDF, Thermo Fisher, USA). After blocking with 0.1% Tween 20 and 5% skimmed milk, the protein-containing PVDF membranes were incubated for 12 h in solutions containing primary antibodies obtained from Abcam (anti-EZH2, ab186006; anti-GAPDH, ab9485) at 4°C. Then, secondary antibodies were incubated for 2 h. A western blotting kit (Thermo Fisher Scientific, USA) was used to detect the signals.

Statistical analysis

Statistical analysis was performed using GraphPad Prism. The continuous variables are shown as the mean ± SD.
Results

NEAT1 is highly expressed in EC tissues and cells

We first evaluated the expression of NEAT1 in cancer tissues and adjacent tissues derived from EC tissues and cells. To quantify the expression of NEAT1, we used qRT-PCR and Western blot analysis. The expression of NEAT1 was significantly higher in cancer tissues compared to adjacent tissues. This finding suggests that NEAT1 plays a crucial role in the development and progression of endometrial cancer.

We also investigated the effects of NEAT1 knockdown on cell proliferation, migration, and invasion. Our results showed that silencing NEAT1 significantly inhibited cell proliferation, migration, and invasion in HEC-1A and Ishikawa cells. These findings further support the role of NEAT1 in the pathogenesis of endometrial cancer.

Overall, our study provides valuable insights into the role of NEAT1 in endometrial cancer, which could potentially lead to the development of novel therapeutic strategies.

mean ± standard deviation (SD), and their differences were analysed by Student’s t test or ANOVA. P values less than 0.05 predicted the statistical significance of the results. Each assay was performed in triplicate.
Wei W et al. / LncRNA NEAT1 in endometrial cancer

By qRT-PCR. As shown in Figure 1A, we found that the expression of NEAT1 was prominently higher in EC tissues than in adjacent tissues (P<0.05, indicated a significant difference). To determine whether NEAT1 is highly expressed in various EC-related cell lines, we performed qRT-PCR to detect its expression in hESCs and endometrial cancer cell lines. Interestingly, we found that the transcription levels of NEAT1 were significantly higher in EC cell lines, including HEC-1A, HEC-1B, Ishikawa, RL-95-2, and JEC, than in hESCs (Figure 1B). Among these cell lines, HEC-1A and Ishikawa cells had the highest and lowest expression of NEAT1, respectively, and they were selected for the following experiments.

NEAT1 promotes EC cell proliferation, migration, and invasion

To investigate whether endogenous NEAT1 plays a role in EC, we constructed a NEAT1-shRNA plasmid that efficiently downregulated NEAT1 expression after transfection into HEC-1A and Ishikawa cells (Figure 2A). MTT and colony formation assays were performed to measure the EC cell proliferation ability. According to the MTT assay, knockdown of NEAT1 significantly inhibited cell growth compared with the NC and control conditions in HEC-1A (Figure 2B) and Ishikawa cells (Figure 2C). Furthermore, colony formation assays indicated that the suppression of NEAT1 reduced colony formation in HEC-1A and Ishikawa cells (Figure 2D, E). Taken together, the MTT assay and colony formation assays results indicated that knockdown of NEAT1 inhibited EC cell proliferation.

To determine whether endogenous NEAT1 affects EC cell migration and invasion, we performed a transwell assay to detect cell migration and invasion abilities. We found that knockdown of NEAT1 attenuated the migration of HEC-1A and Ishikawa cells (Figure 2F, G). Consistently, we also found that knockdown of NEAT1 inhibited the invasion of HEC-1A and Ishikawa cells (Figure 2H, I). Taken together, these data suggest that NEAT1 promotes EC cell proliferation, migration, and invasion.

NEAT1 is a molecular sponge of miR-144-3p

LncRNAs may act as sponges for direct binding to miRNA. In our previous work, we predicted that NEAT1 may target miR-144-3p using Starbase (http://starbase.sysu.edu.cn/) for bioinformatics prediction (Figure 3A). The miR-144-3p level was much lower in EC tissues than in adjacent tissues according to qRT-PCR. MiR-144-3p was also ex-
FIGURE 4. miR-144-3p inhibited EC cell proliferation, migration, and invasion. (A) Effects of the miR-144-3p mimic on miR-144-3p expression. The transcription of miR-144-3p was measured by qRT-PCR after miR-144-3p mimics or mimic NC transfection into HEC-1A and Ishikawa cells for 24 h. (B, C) Effects of the miR-144-3p mimic on the proliferation of EC cells. MIT assay results showed effects on cell growth as measured by cell vitality on three consecutive days. (D, E) Effects of the miR-144-3p mimic on the proliferation of EC cells. A colony formation assay was used to detect cell proliferation. Figure 4D is a representative result from the colony formation assay and Figure 4E shows one quantitative result repeated at least three times. (F, G) Effects of the miR-144-3p mimic on the migration of EC cells. A transwell assay was used to measure the cell migration ability. Figure 4F is a representative result from the transwell assays and Figure 4G shows one quantitative result with at least three replicates. (H, I) Effects of the miR-144-3p mimic on the invasion of EC cells. A transwell assay was used to measure the cell invasion ability. Figure 4H is a representative result from the transwell assays, and Figure 4I shows one quantitative result with at least three replicates.

** indicates P < 0.01. The data are presented as the mean ± SD.
pressed at lower level in EC cells than in hESCs (Figure 3 B, C). Next, we performed qRT-PCR to detect whether NEAT1 targets miR-144-3p to promote EC progression. As shown in Figure 3D, we found that knockdown of NEAT1 increased the level of miR-144-3p. To determine whether NEAT1 binds directly to miR-144-3p, we performed a dual luciferase activity assay to evaluate the binding ability by designing wild-type NEAT1 (WT-NEAT1) and a mutant (MUT-NEAT1). The luciferase signal will decrease when the lncRNA binds to its target miRNA. We found that the luciferase activity was decreased in the WT-NEAT1 and miR-144-3p mimic co-transfected group, whereas miR-144-3p cannot bind to EZH2 3'-UTR MUT. A dual luciferase activity assay was used to evaluate the binding ability of miR-144-3p to EZH2 3'-UTR WT and EZH2 3'-UTR MUT. * indicates P < 0.05, ** indicates P < 0.01. The data are presented as the mean ± SD.
miR-144-3p inhibits EC cell proliferation, migration, and invasion

We designed experiments to reveal the function of miR-144-3p in EC cells. First, miR-144-3p was overexpressed in EC cell lines by miR-144-3p mimic transfection (Figure 4 A). Next, EC cell proliferation was examined via MTT and colony formation methods. In HEC-1A and Ishikawa cells, the MTT assay showed that cell proliferation was significantly inhibited in the miR-144-3p mimic group compared with that in the control and NC groups (Figure 4 B, C). Furthermore, colony formation assays showed that the miR-144-3p mimic markedly attenuated the cell proliferation of HEC-1A and Ishikawa cells compared with the control and NC groups (Figure 4 D, E). Finally, to determine whether miR-144-3p affects EC cell invasion and migration, we performed transwell assays to measure the migration and invasion abilities of EC cells. We found that the miR-144-3p mimic inhibited the migration of HEC-1A and Ishikawa cells (Figure 4 F, G). Consistently, we also found that the miR-144-3p mimic attenuated invasion of HEC-1A and Ishikawa cells (Figure 4 H, I). Taken together, these data indicated that miR-144-3p inhibited EC cell proliferation, migration, and invasion.

NEAT1 promotes the expression of EZH2 via miR-144-3p

We found that knockdown of NEAT1 suppressed the transcription of the EZH2 gene in HEC-1A and Ishikawa cells (Figure 5 A). Consistently, Western blot analysis showed that knockdown of NEAT1 decreased the expression of EZH2 in HEC-1A and Ishikawa cells (Figure 5 B, C). However, whether miR-144-3p regulates EZH2 in EC cells was unknown. To verify the relationship between miR-144-3p and EZH2 in EC cells, we overexpressed miR-144-3p in HEC-1A and Ishikawa cells by miR-144-3p mimic transfection and evaluated the expression of EZH2 by qRT-PCR and Western blotting. The qRT-PCR results showed that the transcription of the EZH2 gene was significantly lower in the miR-144-3p mimic group than in the control and NC groups in HEC-1A and Ishikawa cells (Figure 5 D). Consistently, Western blot analysis showed that the miR-144-3p mimic decreased the expression of EZH2 in HEC-1A and Ishikawa cells (Figure 5 E). To verify whether miR-144-3p decreases EZH2 expression by binding to its 3'-UTR site, we performed a dual luciferase activity assay to evaluate the binding ability and designed wild-type EZH2 (WT-EZH2) and its mutant (MUT-EZH2) sequences (Figure 5 F). The dual-luciferase activity assay results showed that the luciferase activity was lower in the miR-144-3p mimic group than in the NC WT-EZH2 group, while there was no difference in the MUT-EZH2 groups (Figure 5 G). Taken together, these data suggested that miR-144-3p could directly target the 3'-UTR region of EZH2. These data suggested that NEAT1 may act as a ceRNA of miR-144-3p, leading to increased the expression of EZH2 which is a target gene of miR-144-3p.

Discussion

It is well known that IncRNAs play critical roles in various biological functions and disease processes. In cancer, IncRNAs could regulate gene expression and mediate cell signalling pathways such as p53, NF-κB, PI3K/AKT and Notch signalling.15 NEAT1 is a novel lncRNA that is localized in nuclear paraspeckles. The gene that transcribes NEAT1 is located on the familial tumour syndrome multiple endocrine neoplasia type 1 locus.16 In recent studies, high expression of NEAT1 has been found in various types of cancers, and it has been shown to serve as an oncogene. For examples, Chakravarty et al. found that NEAT1 is the most markedly overexpressed lncRNA in prostate cancer and that its expression is related to prostate cancer progression.17 Dong et al. reported that the expression levels of NEAT1 are significantly increased in early-stage EC tissue samples, and high expression levels of NEAT1 predict a poor prognosis.18 In this study, we found that NEAT1 was highly expressed in EC tissues and cell lines and that downregulation of NEAT1 in EC cells inhibited cancer cell proliferation, migration and invasion, which are consistent with of the results of Dong et al. These results suggested that NEAT1 may play carcinogenic roles in the progression of EC. Acting as a competitive endogenous RNAs, IncRNAs regulate protein expression by binding to miRNAs. For example, NEAT1 inhibits glioma cell migration and invasion via modulating SOX2 by targeting miR-132.19 In acute lymphoblastic leukaemia, NEAT1 can regulate miR-335-3p expression, and the dysregulation of miR-335-3p is associated with poor prognosis.20 In colorectal cancer, NEAT1 could promote the tumorigenesis by sponging miR-193a-3p.21 NEAT1 regulates the Wnt/β-catenin signalling pathway via the miR-214-3p-HMGA1 axis, leading to the promotion of cell growth, mi-
In this study, we first confirmed that NEAT1 directly targets miR-144-3p and that knockdown of NEAT1 promotes the expression of miR-144-3p. However, the function of miR-144-3p is still unknown. Through functional experiments, we found that overexpression of miR-144-3p can inhibit EC cell proliferation, migration and invasion. These results suggest that NEAT1 may act as an oncogene by targeting miR-144-3p in EC cells.

EZH2 participates in histone methylation, which regulates transcriptional repression. Emerging evidence has shown that EZH2 is associated with EC cell proliferation. Eskander et al. found that inhibition of EZH2 expression in EC cells significantly attenuates cell proliferation, migration, and invasion by increasing the expression of the Wnt pathway inhibitors sFRP1 and DKK3. Wang et al. reported that knockdown of EZH2 inhibits the proliferation of EC cells in vitro and induces apoptosis in EC cells via upregulating the expression of caspase-3/9 and downregulating the expression of Bel-2. Ihira et al. reported that knockdown of EZH2 suppresses EC progression via the miR-361/Twist axis. In this study, we first confirmed that NEAT1 could upregulate the expression of EZH2 and promote the proliferation, migration and invasion of EC cells by targeting miR-144-3p, which further confirmed the function of EZH2 in the progression of EC.

In conclusion, we demonstrated that NEAT1, as an oncogene, regulates miR-144-3p-EZH2 axis, which promotes the proliferation, migration and invasion of EC cells, providing a promising therapeutic target for EC.
