DOMINATING SETS
AND DOMINATION POLYNOMIALS
OF CERTAIN GRAPHS, II

Abstract. The domination polynomial of a graph $G$ of order $n$ is the polynomial $D(G, x) = \sum_{i=\gamma(G)} d(G, i) x^i$, where $d(G, i)$ is the number of dominating sets of $G$ of size $i$, and $\gamma(G)$ is the domination number of $G$. In this paper, we obtain some properties of the coefficients of $D(G, x)$. Also, by study of the dominating sets and the domination polynomials of specific graphs denoted by $G'(m)$, we obtain a relationship between the domination polynomial of graphs containing an induced path of length at least three, and the domination polynomial of related graphs obtained by replacing the path by shorter path. As examples of graphs $G'(m)$, we study the dominating sets and domination polynomials of cycles and generalized theta graphs. Finally, we show that, if $n \equiv 0, 2(\text{mod} 3)$ and $D(G, x) = D(C_n, x)$, then $G = C_n$.

Keywords: domination polynomial, dominating set, cycle, theta graph.

Mathematics Subject Classification: Primary 05C69; Secondary 11B83.

1. INTRODUCTION

Let $G = (V, E)$ be a graph of order $|V| = n$. For any vertex $v \in V$, the open neighborhood of $v$ is the set $N(v) = \{u \in V | uv \in E\}$ and the closed neighborhood of $v$ is the set $N[v] = N(v) \cup \{v\}$. For a set $S \subseteq V$, the open neighborhood of $S$ is $N(S) = \bigcup_{v \in S} N(v)$ and the closed neighborhood of $S$ is $N[S] = N(S) \cup S$. A set $S \subseteq V$ is a dominating set if $N[S] = V$, or equivalently, every vertex in $V - S$ is adjacent to at least one vertex in $S$. The domination number $\gamma(G)$ is the minimum cardinality of a dominating set in $G$. A dominating set with cardinality $\gamma(G)$ is called a $\gamma$-set, and the family of $\gamma$-sets are denoted by $\Gamma(G)$. For a detailed treatment of this parameter, the reader is referred to [9]. Let $D(G, i)$ be the family of dominating sets of a graph $G$ with cardinality $i$ and let $d(G, i) = |D(G, i)|$. The domination polynomial $D(G, x)$ of $G$ is defined as $D(G, x) = \sum_{i=\gamma(G)} d(G, i) x^i$, where $\gamma(G)$ is the domination number of $G$ ([4]).
Let \( P_{m+1} \) be a path with vertices labeled by \( y_1, y_2, \ldots, y_{m+1} \), for \( m \geq 1 \) and let \( v_0 \) be a specific vertex of a graph \( G \). Denote by \( G_{v_0}(m) \) (or simply \( G(m) \)) a graph obtained from \( G \) by identifying the vertex \( v_0 \) of \( G \) with an end vertex \( y_1 \) of \( P_{m+1} \) ([3] or [6]). For graphs \( G(m) \) we proved the following theorem:

**Theorem 1.1** ([3, Theorem 3.2.10]). For every \( m \geq 3 \),

\[
D(G(m), x) = x \left[ D(G(m - 1), x) + D(G(m - 2), x) + D(G(m - 3), x) \right].
\]

A graph \( G \) is called \( P_4 \)-free, if \( G \) does not contain an induced subgraph \( P_4 \). (For details of \( P_4 \)-free graphs, see [10]).

In the next section we obtain some results of the coefficients of the domination polynomial of a graph \( G \). We study the dominating sets of graphs with a specific construction denoted by \( G'(m) \), to obtain a relationship between \( D(G'(m), x) \) and \( D(G'(m - 1), x) \), \( D(G'(m - 2), x) \) and \( D(G'(m - 3), x) \) in Section 3. Using recursive formula for \( D(G'(m), x) \) and Theorem 1.1, we give a recursive formula for the domination polynomial of non \( P_4 \)-free graphs. As examples of \( G'(m) \) we study the dominating sets and the domination polynomial of a cycle \( C_n \) and generalized theta graphs in Section 4. In the last section, we show that, if \( n \equiv 0, 2 \pmod{3} \) and \( D(G, x) = D(C_n, x) \), then \( G = C_n \).

As usual we use \([x], \lfloor x \rfloor\) for the smallest integer greater than or equal to \( x \) and the largest integer less than or equal to \( x \), respectively. In this article we denote the set \( \{1, 2, \ldots, n\} \) simply by \([n]\).

### 2. SOME PROPERTIES OF COEFFICIENTS OF DOMINATION POLYNOMIALS

In this section, we obtain some properties of the coefficients of the domination polynomial of a graph \( G \).

We recall that a subset \( M \) of \( E(G) \) is called a matching in \( G \) if its elements are not loops and no two of them are adjacent in \( G \); the two ends of an edge in \( M \) are said to be matched under \( M \). A matching \( M \) saturates a vertex \( v \), and \( v \) is said to be \( M \)-saturated if some edges of \( M \) are incident with \( v \); otherwise \( v \) is \( M \)-unsaturated.

We need the following result to prove Theorem 2.2:

**Theorem 2.1** (Hall [7, p. 72]). Let \( G \) be a bipartite graph with bipartition \((X, Y)\). Then \( G \) contains a matching that saturates every vertex in \( X \) if and only if for all \( S \subseteq X \), \(|N(S)| \geq |S|\).

**Theorem 2.2.** Let \( G \) be a graph of order \( n \). Then for every \( 0 \leq i < \frac{n}{2} \), we have \( d(G, i) \leq d(G, i + 1) \).

**Proof.** Consider a bipartite graph with two partite sets \( X \) and \( Y \). The vertices of \( X \) are dominating sets of \( G \) of cardinality \( i \), and the vertices of \( Y \) are all \((i + 1)\)-subsets of \( V(G) \). Join a vertex \( A \) of \( X \) to a vertex \( B \) of \( Y \), if \( A \subseteq B \). Clearly, the degree of each vertex in \( X \) is \( n - i \). Also for any \( B \in Y \), the degree of \( B \) is at most \( i + 1 \).
We claim that for any $S \subseteq X$, $|N(S)| \geq |S|$ and so by Theorem 2.1, the bipartite graph has a matching which saturates all vertices of $X$. By contradiction suppose that there exists $S \subseteq X$ such that $|N(S)| < |S|$. The number of edges incident with $S$ is $|S||n - i|$. Thus by a pigeon hole principle, there exists a vertex $B \in Y$ with degree more than $n - i$. This implies that $i + 1 \geq n - i + 1$. Hence $i \geq \frac{n}{2}$, a contradiction. Thus for every $S \subseteq X$, $|N(S)| \geq |S|$ and the claim is proved. Since for every $A \in X$, and every $v \in V(G) \setminus A$, $A \cup \{v\}$ is a dominating set of cardinality $i + 1$, we conclude that $d(G, i + 1) \geq d(G, i)$ and the proof is complete.

Here, we recall the relationship between the domination polynomial of a graph $G$ and the minimum degree of $G$. Also, we recall a result which gives a relationship between the domination polynomial of a graph and its regularity.

**Theorem 2.3** ([1]). Let $G$ be a graph of order $n$ with domination polynomial $D(G, x) = \sum_{i=1}^{n} d(G, i)x^i$. If $d(G, j) = \binom{n}{j}$ for some $j$, then $\delta(G) \geq n - j$. More precisely, $\delta(G) = n - l$, where $l = \min\{j : d(G, j) = \binom{n}{j}\}$, and there are at least $\binom{n}{n-\delta(G)-1} - d(G, n-\delta(G)-1)$ vertices of degree $\delta(G)$ in $G$. Furthermore, if for every two vertices of degree $\delta(G)$, say $u$ and $v$ we have $N[u] \neq N[v]$, then there are exactly $\binom{n}{n-\delta(G)-1} - d(G, n-\delta(G)-1)$ vertices of degree $\delta(G)$.

By Theorem 2.3, we have the following theorem which gives the relationship between the domination polynomial of a graph $G$ and the regularity of $G$.

**Theorem 2.4.** Let $H$ be a $k$-regular graph with $N[u] \neq N[v]$, for $u, v \in V(H)$. If $D(G, x) = D(H, x)$, then $G$ is a $k$-regular graph.

3. DOMINATING SETS AND DOMINATION POLYNOMIALS OF GRAPHS $G'(m)$

Let $P_m$ be a path with vertices labeled $y_1, \ldots, y_m$ and let $a, b$ be two specific vertices of a graph $G$ (note that may be $a = b$). Denote by $G_{a,b}'(m)$ (or simply $G'(m)$), if there is no likelihood of confusion) a graph obtained from $G$ by identifying the vertices $a$ and $b$ of $G$ with end vertices $y_1$ and $y_m$ of $P_m$, respectively. See Figure 1. Throughout our discussion these two vertices $a$ and $b$ are fixed.

We need some lemmas to obtain main results in this section. The following lemma follows from our observation.

**Lemma 3.1.** If a graph $G$ contains a simple path of length $3k - 1$, then every dominating set of $G$ must contain at least $k$ vertices of the path.

**Lemma 3.2.** (i) $D(G'(m), i) = 0$ if and only if $i > |V(G'(m))|$ or $i < \gamma(G'(m))$.

(ii) For any $m \geq 2$, $\gamma(G'(m)) - 1 \leq \gamma(G'(m-1)) \leq \gamma(G'(m)).$

**Proof.** (i) It follows from the definition of a dominating set of a graph.

(ii) Suppose that $e \in \{y_1y_2, \ldots, y_{m-1}y_m\}$, so $G'(m) * e = G'(m-1)$, where $G * e$ is the graph obtained from $G$ by contracting the edge $e$. Since for every $e \in \{y_1y_2, \ldots, y_{m-1}y_m\}$, $\gamma(G'(m)) - 1 \leq \gamma(G'(m) * e) \leq \gamma(G'(m))$, then we have the result.
Since $G$ means, by Lemma 3.1, we only need to consider each case, $Y$

Let $\text{Proof.}$ for some $x$

If $\text{Lemma 3.4.}$ 

The dominating sets of $G$ consider this in Theorem 3.6.

For every $\text{Lemma 3.3.}$

and hence, $G$ is empty or otherwise. Thus, we have eight combinations of whether these three families are empty or not. Two of these combinations are not possible (see Lemma 3.3 (i) and (ii)). Also, the combination $D(G'(m - 1), i - 1) = D(G'(m - 2), i - 1) = D(G'(m - 3), i - 1) = \emptyset$; need not to be considered because it implies $D(G'(m), i) = \emptyset$; (see Lemma 3.3 (iii)). Thus, we only need to consider five combinations or cases. We consider this in Theorem 3.6.

We denote the $D(G'(m), i)$ simply by $G'_{m,i}$.

Lemma 3.3. For every $m \geq 4$:

(i) If $G'_{m-1,i-1} = G'_{m-3,i-1} = \emptyset$, then $G'_{m-2,i-1} = \emptyset$.

(ii) If $G'_{m-1,i-1} \neq \emptyset, G'_{m-3,i-1} \neq \emptyset$, then $G'_{m-2,i-1} \neq \emptyset$.

(iii) If $G'_{m-1,i-1} = G'_{m-2,i-1} = G'_{m-3,i-1} = \emptyset$, then $G'_{m,i} = \emptyset$.

$\text{Proof.}$ (i) Since $G'_{m-1,i-1} = G'_{m-3,i-1} = \emptyset$, by Lemma 3.2, $i - 1 < |V(G'(m - 1))|$ or $i - 1 < \gamma(G'(m - 3))$. In either cases we have $G'_{m-2,i-1} = \emptyset$.

(ii) Suppose that $G'_{m-2,i-1} = \emptyset$, so by Lemma 3.2, we have $i - 1 > |V(G'(m - 2))|$ or $i - 1 < \gamma(G'(m - 2))$. If $i - 1 > |V(G'(m - 2))|$, then $i - 1 > |V(G'(m - 3))|$, and hence, $G'_{m-3,i-1} = \emptyset$, a contradiction. So we have $i - 1 < \gamma(G'(m - 2))$, and hence, $G'_{m-1,i-1} = \emptyset$, also a contradiction.

(iii) Since $G'_{m-1,i-1} = G'_{m-2,i-1} = G'_{m-3,i-1} = \emptyset$, by Lemma 3.2, $i - 1 > |V(G'(m))| - 1$ or $i - 1 < \gamma(G'(m - 3))$. In either case, we have $G'_{m,i} = \emptyset$.

Lemma 3.4. If $Y$ is in $G'_{m-4,i-1}$ or $G'_{m-5,i-1}$ such that $Y \cup \{x\} \in G'_{m,i}$ for some $x \in \{y_1, \ldots, y_m\}$, then $Y \in G'_{m-3,i-1}$.

$\text{Proof.}$ Let $Y \in G'_{m-4,i-1}$ and $Y \cup \{x\} \in G'_{m,i}$ for some $x \in \{y_1, \ldots, y_m\}$. This means, by Lemma 3.1, we only need to consider $y_{m-4}$ or $y_{m-5}$ as elements of $Y$. In each case, $Y \in G'_{m-3,i-1}$. Now suppose that $Y \in G'_{m-5,i-1}$ and $Y \cup \{x\} \in G'_{m,i}$ for some $x \in \{y_1, \ldots, y_m\}$. This means, by Lemma 3.1, $y_{m-5}$ must be in $Y$. So $Y \in G'_{m-3,i-1}$. \qed
Now we state when five cases for the families \(G'_{m-1,i-1}, G'_{m-2,i-1}\) and \(G'_{m-3,i-1}\) can occur.

**Lemma 3.5.** Suppose that \(G'_{m,i} \neq \emptyset\), then:

(i) \(G'_{m-1,i-1} = G'_{m-2,i-1} = \emptyset\) and \(G'_{m-3,i-1} \neq \emptyset\) if and only if \(\gamma(G'(m-3)) + 1 \leq i < \gamma(G'(m-2)) + 1\).

(ii) \(G'_{m-2,i-1} = G'_{m-3,i-1} = \emptyset\) and \(G'_{m-1,i-1} \neq \emptyset\) if and only if \(i = |V(G'(m))|\).

(iii) \(G'_{m-1,i-1} = \emptyset, G'_{m-2,i-1} \neq \emptyset\) and \(G'_{m-3,i-1} \neq \emptyset\) if and only if \(\gamma(G'(m-2)) + 1 \leq i < \gamma(G'(m-1)) + 1\).

(iv) \(G'_{m-1,i-1} \neq \emptyset, G'_{m-2,i-1} \neq \emptyset\) and \(G'_{m-3,i-1} = \emptyset\) if and only if \(i = |V(G'(m))| - 1\).

(v) \(G'_{m-1,i-1} \neq \emptyset, G'_{m-2,i-1} \neq \emptyset\) and \(G'_{m-3,i-1} = \emptyset\) if and only if \(\gamma(G'(m-1)) + 1 \leq i \leq |V(G'(m))| - 2\).

**Proof.** (i) \((\Rightarrow)\) Since \(G'_{m-1,i-1} = G'_{m-2,i-1} = \emptyset\), by Lemma 3.2, we have \(i-1 > |V(G'(m))| - 1\) or \(i-1 < \gamma(G'(m-3))\). If \(i-1 > |V(G'(m))| - 1\), then \(i > |V(G'(m))|\), and by Lemma 3.2, \(G'_{m,i} = \emptyset\), a contradiction. So we have \(i-1 < \gamma(G'(m-2))\), and since \(G'_{m-3,i-1} \neq \emptyset\), together we have \(\gamma(G'(m-3)) \leq i-1 < \gamma(G'(m-2))\). So \(\gamma(G'(m-3)) + 1 \leq i < \gamma(G'(m-2)) + 1\).

(\(\Leftarrow\)) If \(\gamma(G'(m-3)) + 1 \leq i < \gamma(G'(m-2)) + 1\), then by Lemma 3.2 (i), we have \(G'_{m-1,i-1} = G'_{m-2,i-1} = \emptyset\) and \(G'_{m-3,i-1} \neq \emptyset\).

(ii) \((\Rightarrow)\) Since \(G'_{m-2,i-1} = G'_{m-3,i-1} = \emptyset\), by Lemma 3.2, \(i-1 > |V(G'(m))| = 2\) or \(i-1 < \gamma(G'(m-3))\). If \(i-1 < \gamma(G'(m-3))\), then \(i-1 < \gamma(G'(m-1))\), and hence \(G'_{m-1,i-1} = \emptyset\), a contradiction. So we must have \(i-1 > |V(G'(m))| - 2\).

Also since \(G'_{m-1,i-1} \neq \emptyset\), we have \(i-1 \leq |V(G'(m))| - 1\). Therefore we have \(i = |V(G'(m))|\).

(\(\Leftarrow\)) If \(i = |V(G'(m))|\), then by Lemma 3.2 (i), we have \(G'_{m-2,i-1} = G'_{m-3,i-1} = \emptyset\) and \(G'_{m-1,i-1} \neq \emptyset\).

(iii) \((\Rightarrow)\) Since \(G'_{m-1,i-1} = \emptyset\), by Lemma 3.2, \(i-1 > |V(G'(m))| - 1\) and \(i-1 < \gamma(G'(m-1))\). If \(i-1 > |V(G'(m))| - 1\), then \(i-1 = \gamma(G'(m-3))\).\(\Leftarrow\) If and \(\gamma(G'(m-2)) + 1 \leq i < \gamma(G'(m-1)) + 1\), then by Lemma 3.2 (i), \(G'_{m-1,i-1} = \emptyset, G'_{m-2,i-1} \neq \emptyset\) and \(G'_{m-3,i-1} \neq \emptyset\).

(iv) \((\Rightarrow)\) Since \(G'_{m-3,i-1} = \emptyset\), by Lemma 3.2, we have \(i-1 > |V(G'(m))| - 3\) or \(i-1 < \gamma(G'(m-3))\). Since \(G'_{m-2,i-1} \neq \emptyset\), by Lemma 3.2, we have \(\gamma(G'(m-2)) \leq i-1 \leq |V(G'(m))| - 2\). Therefore \(i-1 < \gamma(G'(m-3))\) is not possible. Hence we must have \(i-1 > |V(G'(m))| - 3\). Thus \(i = |V(G'(m))| - 1\) or \(|V(G'(m))|\).

But \(i \neq |V(G'(m))|\) because \(G'_{m-3,i-1} = \emptyset\). So we have \(i = |V(G'(m))| - 1\).

(\(\Leftarrow\)) If \(i = |V(G'(m))| - 1\), then by Lemma 3.2 (i), \(G'_{m-1,i-1} \neq \emptyset, G'_{m-2,i-1} \neq \emptyset\) and \(G'_{m-3,i-1} = \emptyset\).

(v) \((\Rightarrow)\) Since \(G'_{m-1,i-1} \neq \emptyset, G'_{m-2,i-1} \neq \emptyset\) and \(G'_{m-3,i-1} \neq \emptyset\), then by applying Lemma 3.2, we have \(\gamma(G'(m-1)) \leq i-1 \leq |V(G'(m))| - 1, \gamma(G'(m-2)) \leq \gamma(G'(m-3)) \leq i-1 \leq |V(G'(m))| - 2\).
Theorem 3.6. For every \( i \geq \gamma(G'(m)) \):

(i) If \( G'_{m-i,1} = G'_{m-2,i-1} = \emptyset \) and \( G'_{m-3,i-1} \neq \emptyset \), then
\[
G'_{m,i} = \begin{cases} \{y_m-2\} \cup X_1, \{y_m-1\} \cup X_2, \{y_m\} \cup X_3 & |y_m-5| \in X_1, y_m-4 \in X_2, y_m-3 \in X_3, \\
X_1, X_2, X_3 \in G'_{m-3,i-1} \end{cases}.
\]

(ii) If \( G'_{m-2,i} = G'_{m-3,i} = \emptyset \) and \( G'_{m-1,i} \neq \emptyset \), then
\[
G'_{m,i} = G'_{m,|V(G'(m))|} = \{\{y_m\} \cup X | X \in G'_{m-1,i-1} \}.
\]

(iii) If \( G'_{m-1,i} = \emptyset, G'_{m-2,i} \neq \emptyset \) and \( G'_{m-3,i} \neq \emptyset \), then
\[
G'_{m,i} = \begin{cases} \{y_m\} \cup X_1, \{y_m-1\} \cup X_2, X_1 \in G'_{m-2,i-1}, y_m-4 \in X_2, y_m-4 \notin X_1 \end{cases} \cup \\
\cup \{X \cup \begin{cases} \{y_m-2\}, & \text{if } y_m-5 \text{ or } y_m-4 \in X \\
\{y_m-1\}, & \text{if } y_m-3 \in X \end{cases} | X \in G'_{m-3,i-1} \}.
\]

(iv) If \( G'_{m-1,i} \neq \emptyset, G'_{m-2,i} \neq \emptyset \) and \( G'_{m-3,i} = \emptyset \), then
\[
G'_{m,i} = \begin{cases} \{y_m\} \cup X | X \in G'_{m-1,i-1} \} \cup \\
\cup \{y_m, \text{if } y_m-2 \text{ for } y_m-3 \in X_1, \text{ for } X_1 \in G'_{m-2,i-1} \} \cup \\
\cup \{y_{m-1}, \text{if } y_m-2 \notin X_1, y_m-3 \notin X_1 \text{ or } X_1 \in G'_{m-1,i-1} \cap G'_{m-2,i-1} \} \cup \\
\cup \{y_{m-2}, \text{if } y_m-5 \in X_2 \in G'_{m-3,i-1} \text{ for } X_2 \in G'_{m-3,i-1} \cap G'_{m-2,i-1} \} \cup \\
\cup \{y_{m-1}, \text{if } y_m-3 \text{ or } y_m-4 \in X_2, \text{ for } X_2 \in G'_{m-3,i-1} \cap G'_{m-2,i-1} \}.
\]

Prove (i) \( G'_{m-1,i-1} = G'_{m-2,i-1} = \emptyset \) and \( G'_{m-3,i-1} \neq \emptyset \). Suppose that \( X \in G'_{m-3,i-1} \). By Lemma 3.1, \( X \) contains at least one of vertices labeled \( y_m-3, y_m-4 \) or \( y_m-5 \). It’s obvious that
\[
\{y_m-2\} \cup X_1, \{y_m-1\} \cup X_2, \{y_m\} \cup X_3 | y_m-5 \in X_1, y_m-4 \in X_2, y_m-3 \in X_3, \\
X_1, X_2, X_3 \in G'_{m-3,i-1} \} \subseteq G'_{m,i}.
\]

Now, let \( Y \in G'_{m,i} \), then at least one of the vertices labeled \( y_m, y_m-1 \) or \( y_m-2 \) are in \( Y \). Suppose that \( y_m \in Y \). By Lemma 3.1 at least one of the vertices
$y_{m-1}, y_{m-2}$ or $y_{m-3}$ are in $Y$. If $y_{m-1} \in Y$, then $Y - \{y_m\} \in G'_{m-1,i-1}$, a contradiction. If $y_{m-2} \in Y$ and $y_{m-1} \notin Y$, then $Y - \{y_m\} \in G'_{m-2,i-1}$, a contradiction. If $y_{m-3} \in Y, y_{m-2} \notin Y$ and $y_{m-1} \notin Y$, then $Y - \{y_m\} \in G'_{m-3,i-1}$. So $Y = X \cup \{y_m\}$ where $X \in G'_{m-3,i-1}$ and $y_{m-3} \in X$. If $y_{m-1}$ or $y_{m-2}$ is in $Y$, we also have the result by a similar argument to that above. Hence in this case

$$\{X_1 \cup \{y_m\}, X_2 \cup \{y_m\}, X_3 \cup \{y_m\} \mid y_{m-5} \in X_1, y_{m-4} \in X_2, y_{m-3} \in X_3, X_1, X_2, X_3 \in G'_{m-3,i-1} \} = G'_{m,i}.$$ 

(ii) $G'_{m-2,i-1} = G'_{m-3,i-1} = \emptyset$ and $G'_{m-1,i-1} \neq \emptyset$. By Lemma 3.5 (ii), $i = |V(G'(m))|$. Suppose that $G'(m)$ is labeled with numbers in $[|V(G'(m))|]$, then

$$G'_{m,i} = G'_{|V(G')|, |V(G')|} = \left\{ |V(G')| \right\} = \left\{ \{y_m\} \cup X \mid X \in G'_{m-1,i-1} \right\}.$$ 

(iii) $G'_{m-1,i-1} = \emptyset$, $G'_{m-2,i-1} \neq \emptyset$, and $G'_{m-3,i-1} \neq \emptyset$. We denote the families

$$\left\{ \{y_m\} \cup X_1, \{y_m\} \cup X_2 \mid X_1, X_2 \in G'_{m-2,i-1}, y_{m-4} \in X_2, y_{m-3} \in X_1 \right\},$$

and

$$X \cup \left\{ \{y_m\}, \{y_{m-2}\}, \{y_{m-4}\} \mid y_{m-5} \in X \right\} \text{ if } y_{m-3} \in X$$

by $Y_1$ and $Y_2$, respectively.

We shall prove that $G'_{m,i} = Y_1 \cup Y_2$. Obviously $Y_1 \subseteq G'_{m,i}$. Let $X \in G'_{m-3,i-1}$, if $y_{m-4}$ or $y_{m-5}$ are in $X$, then $X \cup \{y_m\} \in G'_{m,i}$, if $y_{m-3} \in X$, then $X \cup \{y_m\} \in G'_{m,i}$, and hence $Y_1 \cup Y_2 \subseteq G'_{m,i}$.

Now let $Y \in G'_{m,i}$, then by Lemma 3.1, at least one of the vertices labeled $y_{m-1}, y_{m-2}$ or $y_{m-3}$ is in $Y$. Suppose that $y_m \in Y$, then by Lemma 3.1, at least one of the vertices labeled $y_{m-1}, y_{m-2}$ are in $Y$. If $y_{m-1} \in Y$, $y_{m-2}$ are in $Y$, then $Y - \{y_m\} \in G'_{m-1,i-1}$, a contradiction. If $y_{m-3} \in Y$, then $y_{m-4} \in Y$, then $Y - \{y_m\} \in G'_{m-2,i-1}$, that is $Y \subseteq Y_1 \cup Y_2$.

Now suppose that $y_{m-1} \in Y$. By Lemma 3.1, at least one of the vertices labeled $y_{m-2}, y_{m-3}$ or $y_{m-4}$ are in $Y$. If $y_{m-2} \in Y$, then $Y - \{y_m\} \in G'_{m-2,i-1}$, that is $Y \subseteq Y_1$. If $y_{m-3} \in Y$, then $Y - \{y_m\} \in G'_{m-2,i-1} \cap G'_{m-3,i-1}$, that is $Y \subseteq Y_1 \cup Y_2$. If $y_{m-4} \in Y$, then $Y - \{y_m\} \in G'_{m-2,i-1}$, that is $Y \subseteq Y_2$.

Finally suppose that $y_{m-2} \in Y$. By Lemma 3.1, at least one of the vertices labeled $y_{m-3}, y_{m-4}$ or $y_{m-5}$ are in $Y$. In each case $Y - \{y_m\} \in G'_{m-3,i-1}$, that is $Y \subseteq Y_1 \cup Y_2$.

(iv) $G'_{m-3,i-1} = \emptyset$. $G'_{m-2,i-1} \neq \emptyset$, $G'_{m-1,i-1} \neq \emptyset$. By Lemma 3.5 (iv), $i = |V(G'(m))| - 1$. Suppose that $G'(m)$ is labeled with numbers in $[|V(G'(m))|]$, then

$$G'_{m,i} = G'_{|V(G'(m))|, |V(G'(m))| - 1} = \left\{ |V(G'(m))| - \{x\} \mid x \in |V(G'(m))| \right\} = \left\{ \{y_m\} \cup X_1, \{y_m\} \cup X_2 \mid X_1, X_2 \in G'_{m-1,i-1}, X_2 \in G'_{m-2,i-1} \right\}.$$
In this case $G'_{m-1,i-1} \neq \emptyset$, $G'_{m-2,i-1} \neq \emptyset$ and $G'_{m-3,i-1} \neq \emptyset$. First, suppose that $X \in G'_{m-1,i-1}$, then $X \cup \{y_m\} \in G'_{m,i}$. So $Y_1 = \{ \{y_m\} \cup X \mid X \in G'_{m-1,i-1} \} \subseteq G'_{m,i}$. Now suppose that $G'_{m-2,i-1} \neq \emptyset$. Let $X \in G'_{m-2,i-1}$.

We denote

$$X \cup \begin{cases} \{y_m\}, & \text{if } y_{m-2} \text{ or } y_{m-3} \in X, \text{ for } X \in G'_{m-2,i-1} \setminus G'_{m-1,i-1} \\ \{y_{m-1}\}, & \text{if } y_{m-2} \not\in X, y_{m-3} \not\in X \text{ or } X \in G'_{m-2,i-1} \cap G'_{m-1,i-1} \end{cases}$$

simply by $Y_2$. By Lemma 3.1, at least one of the vertices labeled $y_{m-2}, y_{m-3}$ or $y_{m-4}$ is in $X$. If $y_{m-2}$ or $y_{m-3}$ is in $X$, then $X \cup \{y_m\} \in G'_{m,i}$, otherwise $X \cup \{y_{m-1}\} \in G'_{m,i}$. Hence $Y_2 \subseteq G'_{m,i}$. Here we shall consider $G'_{m-3,i-1} \neq \emptyset$. Let $X \in G'_{m-3,i-1}$. We denote

$$X \cup \begin{cases} \{y_{m-2}\}, & \text{if } y_{m-5} \in X \text{ for } X \in G'_{m-3,i-1} \text{ or } X \in G'_{m-3,i-1} \cap G'_{m-2,i-1} \\ \{y_{m-1}\}, & \text{if } y_{m-3} \text{ or } y_{m-4} \in X \text{ for } X \in G'_{m-3,i-1} \setminus G'_{m-2,i-1} \end{cases}$$

simply by $Y_3$. If $y_{m-3}$ or $y_{m-4}$ is in $X$, then $X \cup \{y_{m-1}\} \in G'_{m,i}$, otherwise $X \cup \{y_{m-2}\} \in G'_{m,i}$. Hence $Y_3 \subseteq Y$. Therefore we have proved that $Y_1 \cup Y_2 \cup Y_3 \subseteq G'_{m,i}$.

Now suppose that $Y \in G'_{m,i}$, so by Lemma 3.1, $Y$ contains at least one of the vertices labeled $y_{m-1}, y_{m-2}$ or $y_{m-3}$. If $y_{m} \in Y$, so again by Lemma 3.1 at least one of the vertices labeled $y_{m-1}, y_{m-2}$ or $y_{m-3}$ are in $Y$. In all cases $Y = \{y_m\} \in G'_{m-1,i-1}$, so $Y \subseteq Y_1$.

If $y_{m-1} \in Y$ and $y_m \not\in Y$, by Lemma 3.1 at least one of the vertices labeled $y_{m-2}, y_{m-3}$ or $y_{m-4}$ are in $Y$. If $y_{m-2} \in Y$, then $Y - \{y_{m-1}\} \in G'_{m-1,i-1} \cap G'_{m-2,i-1}$, that is $Y \subseteq Y_2$. If $y_{m-3} \in Y$ or $y_{m-4} \in Y$, then $Y = X \cup \{y_{m-1}\}$ for $X \in G'_{m-3,i-1} \setminus G'_{m-2,i-1}$, that is $Y \subseteq Y_3$.

If $y_{m-2} \in Y, y_{m-1} \not\in Y$, and $y_m \not\in Y$. By Lemma 3.1 at least one of the vertices labeled $y_{m-3}, y_{m-4}$ or $y_{m-5}$ are in $Y$. In each case, $Y - \{y_{m-2}\} \in G'_{m-3,i-1}$, that is $Y \subseteq Y_3$. So we’ve proved that $G'_{m,i} \subseteq Y_1 \cup Y_2 \cup Y_3$.

**Theorem 3.7.** If $G'_{m,i}$ is the family of dominating sets of $G'(m)$ with cardinality $i$, then for every $m \geq 5$,

$$|G'_{m,i}| = |G'_{m-1,i-1}| + |G'_{m-2,i-1}| + |G'_{m-3,i-1}|.$$

**Proof.** We consider five cases in Theorem 3.6:

(i) In this case $|G'_{m,i}| = |G'_{m-3,i-1}|$. Since $|G'_{m-1,i-1}| = |G'_{m-2,i-1}| = 0$, we have the result.

(ii) In this case $|G'_{m,i}| = |G'_{m-1,i-1}|$. Since $|G'_{m-2,i-1}| = |G'_{m-3,i-1}| = 0$, we have the result.

(iii) In this case $G'_{m,i} = A_1 \cup A_2$, where $|A_1| = |G'_{m-2,i-1}|$ and $|A_2| = |G'_{m-3,i-1}|$.

Suppose that $A_1 \in A_1$ and $A_2 \in A_2$. If $y_{m-4} \in A_1$, then $y_{m-1} \in A_1$. On

Lemma 4.1 ([8, p.364]). \( \gamma(C_n) = \left\lceil \frac{4}{7} \right\rceil \).
Lemma 4.2. Suppose that $C_n^i \neq \emptyset$, then:

(i) $C_{n-1}^{i-1} = C_{n-2}^{i-1} = \emptyset$ and $C_{n-3}^{i-1} \neq \emptyset$, if and only if $n = 3k$, $i = k$ for some $k \in \mathbb{N}$.
(ii) $C_{n-1}^{i-1} = C_{n-3}^{i-1} = \emptyset$ and $C_{n-1}^{i-1} \neq \emptyset$, if and only if $i = n$.
(iii) $C_{n-1}^{i-1} = \emptyset, C_{n-2}^{i-1} \neq \emptyset$ and $C_{n-3}^{i-1} \neq \emptyset$, if and only if $n = 3k + 2$, $i = \lceil \frac{2k+2}{3} \rceil$ for some $k \in \mathbb{N}$.
(iv) $C_{n-1}^{i-1} \neq \emptyset, C_{n-2}^{i-1} \neq \emptyset$ and $C_{n-3}^{i-1} = \emptyset$, if and only if $i = n - 1$.
(v) $C_{n-1}^{i-1} \neq \emptyset, C_{n-2}^{i-1} \neq \emptyset$ and $C_{n-3}^{i-1} \neq \emptyset$, if and only if $\lceil \frac{n-1}{3} \rceil + 1 \leq i \leq n - 2$.

Proof. (i) $(\Rightarrow)$ By Lemmas 4.1 and 3.5 (i), we have $\lceil \frac{n}{3} \rceil \leq i < \lceil \frac{n-2}{3} \rceil + 1$, which gives us $n = 3k$ and $i = k$ for some $k \in \mathbb{N}$.

$(\Leftarrow)$ It follows from Lemmas 4.1 and 3.5 (i).

(ii) It follows from Lemma 3.5 (ii).

(iii) $(\Rightarrow)$ By Lemmas 4.1 and 3.5 (iii), we have $\lceil \frac{n-2}{3} \rceil + 1 \leq i < \lceil \frac{n-1}{3} \rceil + 1$, which gives us $n = 3k + 2$ and $i = k + 1 = \lceil \frac{2k+2}{3} \rceil$ for some $k \in \mathbb{N}$.

$(\Leftarrow)$ It follows from Lemmas 4.1 and 3.5 (iii).

(iv) It follows from Lemma 3.5 (iv).

(v) It follows from Lemmas 4.1 and 3.5 (v).

By Theorem 3.6 we can now construct $C_n^i$ from $C_{n-1}^{i-1}, C_{n-2}^{i-1}$ and $C_{n-3}^{i-1}$.

Theorem 4.3. (i) If $C_{n-1}^{i-1} = C_{n-2}^{i-1} = \emptyset$, and $C_{n-3}^{i-1} \neq \emptyset$, then

\[ C_n^i = C_n^\mathbb{N} = \left\{ \{1, 4, \ldots, n-2\}, \{2, 5, \ldots, n-1\}, \{3, 6, \ldots, n\} \right\}. \]

(ii) If $C_{n-1}^{i-1} = C_{n-3}^{i-1} = \emptyset$, and $C_{n-2}^{i-1} \neq \emptyset$, then $C_n^i = C_n^\mathbb{N} = \{[n]\}$.

(iii) If $C_{n-1}^{i-1} = \emptyset$, $C_{n-2}^{i-1} \neq \emptyset$, and $C_{n-3}^{i-1} \neq \emptyset$, then

\[ C_n^i = \left\{ \{1, 4, \ldots, n-4, n-1\}, \{2, 5, \ldots, n-3, n\}, \{3, 6, \ldots, n-2, n\} \right\} \cup \{n-2\}, \text{ if } 1 \in X \]

\[ \{n-1\}, \text{ if } 1 \not\in X, 2 \in X \}

\[ \{n\}, \text{ otherwise} \]

(iv) If $C_{n-3}^{i-1} = \emptyset$, $C_{n-2}^{i-1} \neq \emptyset$, and $C_{n-1}^{i-1} \neq \emptyset$, then $C_n^i = C_n^{\mathbb{N}^+} = \{[n] - \{x\} | x \in [n]\}$. 

Fig. 2. The cycle $C_n$ with vertices labeled $[n]$. 

---

Saeid Alikhani, Yee-hock Peng
(v) If $C_{n-1}^i \neq \emptyset, C_{n-2}^i \neq \emptyset$ and $C_{n-3}^i \neq \emptyset$, then $C_n^i = \left\{ n \right\} \cup X, X \in C_{n-1}^i \cup \{ n \}, n - 2 \text{ or } n - 3 \in X_1, X_1 \in C_{n-2}^i \setminus C_{n-1}^i \cup \{ n - 1 \}, n - 2 \notin X_1, n - 3 \notin X_1, X_1 \in C_{n-1}^i \cap C_{n-2}^i \cup \{ n - 2 \}, n - 5 \in X_2, X_2 \in C_{n-2}^i \cup \{ n - 1 \}, n - 3 \in X_2 \text{ or } n - 4 \in X_2, X_2 \in C_{n-2}^i \cap C_{n-3}^i \cup \{ n \} \right\} ∪ \{ \{ n \} \cup X_1, \{ n - 1 \} \cup X_2 | X_1 \in C_{n-2}^i, n - 4 \notin X_2, n - 4 \notin X_1 \} = \left\{ \{ 1, 4, \ldots, 3k - 2 \}, \{ 2, 5, \ldots, 3k - 1 \} \right\} = \left\{ \{ 1, 4, \ldots, 3k - 2, 3k + 1 \}, \{ 2, 5, \ldots, 3k - 1, 3k + 2 \} \right\}.

Since the condition $1 \in X$ implies $n - 4$ or $n - 5$ are in $X$, therefore we have the result by Theorem 3.6 (iii) (note that since for cycle $C_n$, vertices labeled 1 and $n$ are adjacent, so we may have $1 \notin X$ and $2 \notin X$, in this case $Y = X \cup \{ n \}$ for some $X \in C_{n-3}^i$).

(iv) $C_{n-3}^i = \emptyset, C_{n-1}^i \neq \emptyset, C_{n-2}^i \neq \emptyset$. By Lemma 4.2 (iv), $i = n - 1$. Therefore $C_n^i = C_{n-1}^i = \left\{ \{ n \} \setminus \{ x \} | x \in \{ n \} \right\}$.

(v) It follows from Theorem 3.6 (v).

\textbf{Theorem 4.4.} If $C_n^i$ is the family of the dominating set of $C_n$ with cardinality $i$, then $|C_n^i| = |C_{n-1}^i| + |C_{n-2}^i| + |C_{n-3}^i|$.

\textbf{Proof.} It follows from Theorem 4.3. \hfill \Box

By definition of the domination polynomial and Theorem 4.4, we have the following theorem.

\textbf{Theorem 4.5.} For every $n \geq 4$,

$$D(C_n, x) = x \left[ D(C_{n-1}, x) + D(C_{n-2}, x) + D(C_{n-3}, x) \right],$$

with the initial values $D(C_1, x) = x, D(C_2, x) = x^2 + 2x, D(C_3, x) = x^3 + 3x^2 + 3x$. 

\textbf{Proof.}
Remark 4.6. We have obtained Theorems 4.3, 4.4 and 4.5 in [5] with a different approach.

Using Theorem 4.4, we obtain the coefficients of \(D(C_n,x)\) for \(1 \leq n \leq 14\) in Table 1. There are interesting relationships between the numbers \(d(C_n,j)(\frac{3}{4} \leq j \leq n)\) in Table 1. In the following theorem, we state some properties of \(d(C_n,j)\).

**Theorem 4.7 (5).**

(i) \(d(C_{3n}, n) = 3\), for each \(n \in \mathbb{N}\). More precisely, if \(n \equiv 0 \pmod{3}\), then \(d(C_n, \frac{2n}{3}) = 3\).

(ii) \(d(C_n, j) = d(C_{n-1}, j-1) + d(C_{n-2}, j-1) + d(C_{n-3}, j-1)\), for each \(n \geq 4\), \(j \geq \lfloor \frac{n}{4} \rfloor \).

(iii) \(d(C_{3n+2}, n+1) = 3n + 2\), for each \(n \in \mathbb{N}\). More precisely, if \(n \equiv 2 \pmod{3}\), then \(d(C_n, \frac{2n+1}{3}) = n\).

(iv) \(d(C_{3n+1}, n+1) = \frac{n(3n+7)+2}{2}\), for each \(n \in \mathbb{N}\). More precisely, if \(n \equiv 1 \pmod{3}\), then \(d(C_n, \frac{2n+2}{3}) = \frac{n^2+5n}{6}\).

(v) \(d(C_n, n) = 1\), for each \(n \geq 3\).

(vi) \(d(C_n, n-1) = n\), for each \(n \geq 3\).

(vii) \(d(C_n, n-2) = \frac{n(n-1)}{6}\), for each \(n \geq 3\).

(viii) \(d(C_n, n-3) = \frac{(n-4)(n)(n+1)}{6}\), for each \(n \geq 4\).

(ix) \(\sum_{i=j}^{n} d(C_i, j) = 3 \sum_{i=j-1}^{n-3} d(C_i, j-1)\), for every \(j \geq 4\).

(x) \(1 = d(C_n, n) < d(C_{n+1}, n) < d(C_{n+2}, n) < \ldots < d(C_{2n-1}, n) < d(C_{2n}, n) < d(C_{2n+1}, n) > \ldots > d(C_{3n-1}, n) > d(C_{3n}, n) = 3\), for each \(n \geq 3\).

(xi) If \(S_n = \sum_{j=1}^{\lfloor \frac{3n}{4} \rfloor} |C_n^j|\), then for every \(n \geq 4\), \(S_n = S_{n-1} + S_{n-2} + S_{n-3}\) with initial values \(S_1 = 1, S_2 = 3\) and \(S_3 = 7\).
As another example of graphs $G'(m)$, we consider graph $C_n'(m)$, as shown in Figure 3 (here we suppose that $a \neq b$). The following theorem states the recursive formula for the domination polynomial of $C_n'(m)$.

**Theorem 4.8.** For every $n \geq 3$ and $m \geq 5$,

$$D(C_n'(m), x) = x \left[D(C_n'(m-1), x) + D(C_n'(m-2), x) + D(C_n'(m-3), x)\right].$$

**Proof.** It follows from Theorem 3.7.

The generalized theta graphs $\Theta_{s_1, \ldots, s_k}$, are formed by taking a pair of vertices $u, v$ (called the end vertices) and joining them by $k$ internally disjoint paths of lengths $s_1, \ldots, s_k \geq 1$. (A generalized theta graph with three paths is traditionally called a theta graph without adjectives).

Obviously, the graph $C_n'(m)$ is a generalized theta graph. Therefore we have the following theorem for the domination polynomial of generalized theta graphs:

**Theorem 4.9.** If there exist $1 \leq j \leq k$, such that $s_j \geq 3$, then

$$D(\Theta_{s_1, \ldots, s_j, \ldots, s_k}, x) = x \left[D(\Theta_{s_1, \ldots, s_j-1, \ldots, s_k}, x) + D(\Theta_{s_1, \ldots, s_j-2, \ldots, s_k}, x) + D(\Theta_{s_1, \ldots, s_j-3, \ldots, s_k}, x)\right].$$

5. **ON THE GRAPHS $G$ WITH $D(G, x) = D(C_n, x)$**

We begin this section with the following theorem, which follows from the definitions of isomorphic graphs and the domination polynomial.

**Theorem 5.1.** Let $G$ and $H$ be isomorphic. Then $D(G, x) = D(H, x)$.

Here we want to characterize graphs $G$ with $D(G, x) = D(C_n, x)$.

**Theorem 5.2.** Let $n$ be a natural number, and $n \equiv 0, 2 \pmod{3}$. If $D(G, x) = D(C_n, x)$, then $G = C_n$. 
Proof. Assume that \( G \) is a graph such that \( D(G, x) = D(C_n, x) \). By Theorem 2.4, \( G \) is a 2-regular graph. Hence \( G \) is a union of finitely many disjoint cycles. Let \( G \) be the disjoint union of cycles \( C_{m_1}, \ldots, C_{m_r} \). First suppose that \( n \equiv 0 (\text{mod} \ 3) \). Since \( D(G, x) = \prod_{i=1}^{r} D(C_{m_i}, x) = D(C_n, x) \) and \( d(C_n, \left\lceil \frac{n}{3} \right\rceil) = 3 \), by Theorem 4.7, we conclude that \( r = 1 \) and \( G = C_n \).

Now, suppose that \( n \equiv 2 (\text{mod} \ 3) \). If there exists some \( j \), such that \( m_j \equiv 0 (\text{mod} \ 3) \), noting that \( d(C_n, \left\lceil \frac{n}{3} \right\rceil) = n \) and \( d(C_{m_j}, \frac{m_j}{3}) = 3 \), we have \( n \equiv 0 (\text{mod} \ 3) \), a contradiction. Thus for each \( i, 1 \leq i \leq k \), \( m_i \equiv 1 \) or \( 2 (\text{mod} \ 3) \). Clearly, for every natural number \( n, n \leq \frac{n^2 + 5n}{6} \). This implies that the coefficient of \( x^{\left\lceil \frac{n}{3} \right\rceil} \) in the polynomial \( D(G, x) = \prod_{i=1}^{r} D(m_i, x) \) is at least \( \prod_{i=1}^{r} m_i \). By induction on \( r \) it is not hard to see that, if \( r \geq 2 \) and \( m_1, \ldots, m_r \) are natural numbers more than 2, then \( \prod_{i=1}^{r} m_i > \sum_{i=1}^{r} m_i = n = d(G, \left\lceil \frac{n}{3} \right\rceil) \), a contradiction. Therefore \( r = 1 \) and \( G = C_n \). The proof is complete.

Remark 5.3. Recently S. Akbari and M. R. Oboudi proved that the above theorem is also true for \( n \equiv 1 (\text{mod} \ 3) \) ([2]).

Acknowledgments
The authors would like to thank Professor Saeed Akbari for valuable discussions and the referee for his valuable comments.
