A SURVEY OF CARDINALITY BOUNDS ON
HOMOGENEOUS TOPOLOGICAL SPACES

NATHAN CARLSON

ABSTRACT. In this survey we catalogue the many results of the past several decades concerning bounds on the cardinality of a topological space with homogeneous or homogeneous-like properties. These results include van Douwen’s Theorem, which states $|X| \leq 2^{\pi w(X)}$ if $X$ is a power homogeneous Hausdorff space [26], and its improvements $|X| \leq d(X)^{\pi \chi(X)}$ [44] and $|X| \leq 2^{c(X)^{\pi \chi(X)}}$ [19] for spaces $X$ with the same properties. We also discuss de la Vega’s Theorem, which states that $|X| \leq 2^{t(X)}$ if $X$ is a homogeneous compactum [25], as well as its recent improvements and generalizations to other settings. This reference document also includes a table of strongest known cardinality bounds on spaces with homogeneous-like properties. The author has chosen to give some proofs if they exhibit typical or fundamental proof techniques. Finally, a few new results are given, notably (1) $|X| \leq d(X)^{\pi \chi(X)^{\pi \chi(X)}}$ if $X$ is homogeneous and Hausdorff, and (2) $|X| \leq \pi \chi(X)^{\psi(X)}$ if $X$ is a regular homogeneous space. The invariant $\pi \chi(X)$, defined in this paper, has the property $\pi \chi(X) \leq \pi \chi(X)$ and thus (1) improves the bound $d(X)^{\pi \chi(X)}$ for homogeneous Hausdorff spaces. The invariant $q(X)$, defined in [33], has the properties $q(X) \leq \pi \chi(X)$ and $q(X) \leq \psi(X)$ if $X$ is Hausdorff, thus (2) improves the bound $2^{c(X)^{\pi \chi(X)}}$ in the regular, homogeneous setting.

1. INTRODUCTION

A topological space $X$ is homogeneous if for every $x, y \in X$ there exists a homeomorphism $h : X \to X$ such that $h(x) = y$. Roughly, $X$ is homogeneous if the topology at every point is “identical” to that of every other point. $X$ is power homogeneous if there exists a cardinal $\kappa$ such that $X^\kappa$ is homogeneous. Many commonly studied spaces are homogeneous (for example, $\mathbb{R}^2$, the unit circle, all connected manifolds in general, and topological groups) and as such are ubiquitous across fields of mathematics. In particular, those homogeneous
