Estimation of pollen lipid content

The EMSC and baseline corrected spectra were used for the estimation of relative lipid content in pollen belonging to *Pinus*, *Quercus* and *Iris* genera. The analyses were based on the three vibrational bands: lipid band at ~1740 cm\(^{-1}\), amide II band at ~1545 cm\(^{-1}\), and sporopollinen band at 833 cm\(^{-1}\). The average transmission spectra (based on three measurements per species) were scaled to amide II band (with sporopollinen band serving as a double-check for scaling), followed by spectral deconvolution (multipeak fitting of Gaussian and Lorentzian curves), and application of Beer–Lambert law, i.e. the linear correlation of absorbance (area under the curve with the lipid band as a centre) and quantity (Fig. S1). The obtained relative lipids content for the three genera are presented in Table 2.

The estimation of relative content of pollen lipids is based on the following approximations: 1) all congenital species have pollen grains with identical morphology, 2) sporopollenin and protein content in pollen for all congenital species is quantitatively invariant, 3) lipids content of pollen can be estimated by applying Beer–Lambert law on transmission spectra of the KBr sample pellets. Although the third approximation is quite far off due to diffuse reflection and saturated absorption, similar pollen morphology of congenital species will result in comparable deviations from Beer–Lambert law. The maximal values (Table 2) are probably underestimated regarding that saturated absorption is higher for samples with elevated lipids content. Different fitting parameters were assessed and the results typically varied approximately 10 % from the values reported in the Table 2.

Parameters used for spectral deconvolution:
For *Pinus* species: spectral range: 1900-1496 cm\(^{-1}\); No. of curves: 6; Fitting constrains (function, FWHM, approx. position of peak value): Lorentzian (20, 1515 cm\(^{-1}\)), Lorentzian (50, 1545 cm\(^{-1}\)), Lorentzian (20, 1600 cm\(^{-1}\)), Gaussian (110, 1635 cm\(^{-1}\)), Gaussian (130, 1660 cm\(^{-1}\)), Lorentzian (25, 1745 cm\(^{-1}\)).
For *Quercus* species: spectral range: 1900-1481 cm\(^{-1}\); No. of curves: 5; Fitting constrains (function, FWHM, approx. position of peak value): Lorentzian (50, 1510 cm\(^{-1}\)), Lorentzian (50, 1545 cm\(^{-1}\)), Gaussian (150, 1620 cm\(^{-1}\)), Gaussian (100, 1660 cm\(^{-1}\)), Lorentzian (25, 1745 cm\(^{-1}\)).
For *Iris* species: spectral range: 1900-1481 cm\(^{-1}\); No. of curves: 5; Fitting constrains (function, FWHM, approx. position of peak value): Lorentzian (50, 1510 cm\(^{-1}\)), Lorentzian (50, 1545 cm\(^{-1}\)), Gaussian (100, 1635 cm\(^{-1}\)), Gaussian (150, 1660 cm\(^{-1}\)), Lorentzian (25, 1745 cm\(^{-1}\)).

**Fig. S1.** Estimation of pollen lipid content for *Iris pallida* depicting bands for the normalization of transmission spectra (amide II band at 1547 cm\(^{-1}\), and sporopollinen band at 833 cm\(^{-1}\) that was used as the secondary standard), spectral deconvolution (multipeak fitting of three Lorentzian and two Gaussian curves), and application of Beer–Lambert law, i.e. the linear correlation of absorbance (blue area under the curve with the peak center at ~1745 cm\(^{-1}\)) and lipid quantity.
Carbohydrate-to-protein ratio in pollen

Pollen grain wall composition

Pollen grain has double-layered outer wall made of the cellulose-rich intine layer, and the highly resistant exine composed predominantly of a complex biopolymer sporopollenin. As a result of thick cellulose intine wall pollen grains of Cupressaceae family have unique and outlying spectral features (Fig. S3A). While Cupressaceae pollen grains have thick intine and thus increased relative amount of cellulose, pollens of Pinaceae family have a large hollow projection (saccus) from the central body of pollen grain composed only by the exine, resulting with increased relative amount of sporopollenin in the grains. For that reason the vibrational bands associated with the sporopollenin dominate to a larger extent in Pinaceae reflectance spectra than is the case with Cupressaceae spectra (Fig. S3D).

Fig. S3. (A) PCA plot of transmission IR spectral data set (300 species, three spectra per species; second derivative and EMSC corrected spectra) with depiction of plant families: Pinaceae (light blue), Cupressaceae (dark blue), Poaceae (light green), Cyperaceae (dark green), Betulaceae (red), and Juglandaceae (orange). The percent variances for the first five PCs are 23.83, 16.13, 11.30, 6.11, and 5.24. (B) reflectance IR spectra of cellulose. EMSC corrected transmission (C) and reflectance (D) IR spectra of Cupressus sempervirens (Mediterranean cypress, Pinales order, Cupressaceae family) and Pinus sylvestris (Scots pine; Pinales order, Pinaceae family) pollen. For better viewing the spectra are offset; the vibrational bands associated with sporopollenin are denoted with asterisks.
Correlation between spectroscopic data and taxonomy

Fig. S4. (A) PCA plot of transmission IR spectral data set (300 species, three spectra per species; second derivative and EMSC corrected spectra) with depiction of plant families: Pinaceae (light blue), Cupressaceae (dark blue), Poaceae (light green), Cyperaceae (dark green), Betulaceae (red), and Juglandaceae (orange). The percent variances for the first five PCs are 23.83, 16.13, 11.30, 6.11, and 5.24. (B) Loadings plot on the first four principal component of the PCA.
Fagales order pollen samples

All pollen samples depicted in Fig. S5 were sampled in 2011 within the area of 100 m radius. The timeframe of the sampling was the following (expressed in weeks): *Corylus* (*W* denotes first week of March), *Alnus* (*W*), *Betula* (*W*+4), *Ostrya* (*W*+4), *Carpinus* (*W*+4), *Pterocarya* (*W*+4), *Juglans* (*W*+4 till *W*+6), *Quercus* (*W*+4 till *W*+7), *Fagus* (*W*+5) and *Carya* (*W*+10; i.e. third week of May).

Pollen samples depicted in Fig. S6 were sampled in 2010, in the first week of March. Five *Corylus avellana* samples (depicted in different shades of red) were collected from different individuals, all growing several meters apart on a same location.

**Fig. S5.** (A) PCA plot of transmission IR spectral data set containing pollen samples of *Fagales* order in the 2011 pollination season (33 species, three spectra per specie; first derivative and EMSC corrected spectra) with depiction of plant families: *Betulaceae* (red: *Corylus* (hazel), *Alnus* (alder), *Betula* (birch), *Carpinus* (hornbeam) and *Ostrya* (hop-hornbeam)), *Fagaceae* (green: *Fagus* (beech) and *Quercus* (oak)), and *Juglandaceae* (blue: *Juglans* (walnut), *Pterocarya* (wingnut) and *Carya* (hickory)). The percent variances for the first five PCs are 76.05, 11.85, 3.78, 2.75, and 1.24.

**Fig. S6.** Reflectance IR spectral data set containing pollen samples of *Betulacea* family in the 2010 pollination season (10 samples, three spectra per sample; first derivative and EMSC corrected spectra) with depiction of plant genera and species (two *Alnus* and four *Corylus* species). (A) PCA plot of spectral data; The percent variances for the first five PCs are 57.39, 16.19, 11.33, 6.06, and 1.93. (B) HCA dendrogram.
Triglycerides content of pollen

The spectral variability caused by the specific biochemicals can be extracted from the rest of the data (Fig. S7). That way, the influence of specific biochemical components on spectral variability, such as triglycerides, can be evaluated.

The data matrix containing complete set of transmission spectra was deflated by using either 1) the PC 1q vector (the first principal component obtained by PCA on quercus subset; i.e. set of transmission spectra obtained by measuring pollen samples of Quercus genus), or 2) reflectance spectra of tristearin (Fig. S7D). For the deflation the data matrix was centred while the vectors were normalized. The PC 1q vector accounts for the maximal spectral variance in congenital pollen samples of Quercus genus. Since both deflation procedures resulted with the similar reduced data sets, as seen by the PCA plots of this sets (Figs. S7B and C), it is clear that congenital differentiation of Quercus pollen, as well as Pinus and Iris pollen, can be based on the relative content of triglycerides. The impact of triglycerides on spectral variance can be more directly estimated from spectral differences of congenital pollen samples (Fig. S7E)
Fig. S7. PCA plots of transmission IR spectral data set (300 species, three spectra per specie; second derivative and EMSC corrected spectra) with depiction of plant genera: *Pinus* (blue), *Iris* (green) and *Quercus* (red). (A) Original data. The percent variances for the first five PCs are 23.83, 16.13, 11.30, 6.11, and 5.24. (B) Modelling spectral contribution of triglycerides, approximated by tristearin spectrum. The percent variances for the first five PCs are 24.87, 14.48, 9.40, 7.17, and 5.91. (C) Modelling spectral contribution of PC 1q obtained by PCA on quercus subset. The percent variances for the first five PCs are 23.19, 15.27, 7.43, 6.22, and 5.71. Note the similarity between figures B and C: It is clear that triglyceride content is responsible for the majority of congenital spectral variations. (D) reflectance IR spectra of tristearin (amorphous phase). (E) Transmission IR spectra of *Quercus cerris* (Turkey oak) and *Quercus robur* (pedunculate oak) pollen, and spectral differences of the two transmission spectra. For better viewing the spectra are offset.
**Table S1.** List of analyzed pollen taxa (part I): eudicots.

| ORDER    | FAMILY       | GENUS | SPECIES       | COMMON NAME               |

| ORDER    | FAMILY          | GENUS       | SPECIES     | COMMON NAME          |
|----------|-----------------|-------------|-------------|----------------------|
| Pinales  | Cupressaceae    | Platycladus | P. orientalis | Chinese Arborvitae  |
|          |                 | Thujopsis  | T. dolabrata | Thujopsis            |
|          |                 | Chamaecyparis | C. lawsoniana | Lawson's Cypress     |
|          |                 |            | C. obtusa | Hinoki Cypress       |
|          |                 |            | C. pisifera | Sawara Cypress       |
| Juniperus|                 | J. chinensis | Chinese Juniper |
|          |                 | J. virginiana | Eastern Juniper |
|          |                 | J. sabina | Savin Juniper |
|          |                 | J. phoenicea | Phoenicean Juniper |
|          |                 | J. communis | Common Juniper |
|          |                 | J. oxycedrus | Prickly Juniper |
|          |                 | J. excelsa | Greek Juniper |
|          |                 | Calocedrus  | C. decurrens | California Incense-cedar |
|          |                 | Cupressus   | C. x leylandii | Leyland Cypress     |
|          |                 |            | C. lusitanica | Mexican Cypress     |
|          |                 |            | C. sargentii | Sargent Cypress     |
|          |                 | Cunninghamia | C. lancelota | China Fir            |
|          |                 | Cryptomeria | C. japonica | Japanese Cedar      |
| Thuja    |                 | T. occidentalis | Eastern Arborvitae |
|          |                 | T. standishii | Japanese Thuja |
| Taxodium |                 | T. distichum | Bald Cypress  |
| Sequoia  |                 | S. sempervirens | Coast Redwood  |
| Metasequoia | M. glyptostroboi | Dawn Redwood |
| Taxaceae |                 | Taxus       | T. baccata | European Yew        |
|          |                 |              | T. cuspidata | Japanese Yew        |
| Cephalotaxaceae | Cephalotaxus | C. harringtonia | Japanese Plum Yew |
| Torreya  |                 | T. californica | California Torreya |
| Pinaceae |                 | Tsuga       | T. canadensis | Eastern Hemlock    |
| Cedrus   |                 | C. atlantica | Atlas Cedar |
|          |                 | C. deodara | Deodar Cedar |
| Abies    |                 | A. koreana | Korean Fir |
|          |                 | A. pinsapo | Spanish Fir |
|          |                 | A. alba | Silver Fir |
|          |                 | A. cephalonica | Greek Fir |
| Picea    |                 | P. abies | Norway Spruce |
|          |                 | P. asperata | Dragon Spruce |
|          |                 | P. omorika | Serbian Spruce |
|          |                 | P. chihuahuana | Chihuahua Spruce |
|          |                 | P. orientalis | Caucasian Spruce |
|          |                 | P. smithiana | Morinda Spruce |
|          |                 | P. pungens | Blue Spruce |
| Pinus    |                 | P. pinea | Stone Pine |
|          |                 | P. mugo | Mountain Pine |
|          |                 | P. sylvestris | Scots Pine |
|          |                 | P. tabuliformis | Chinese Red Pine |
|          |                 | P. banksiana | Jack Pine |
|          |                 | P. pinaster | Maritime Pine |
|          |                 | P. densiflora | Japanese Red Pine |
|          |                 | P. nigra | European Black Pine |
|          |                 | P. ponderosa | Ponderosa Pine |
|          |                 | P. resinosa | Red Pine |
|          |                 | P. wallichiana | Himalayan pine |
|          |                 | P. bungeana | Lacebark Pine |
|          |                 | P. peuce | Macedonian Pine |
|          |                 | P. strobus | Eastern White Pine |
|          |                 | P. heldreichii | Bosnian Pine |
| Podocarpaceae | Podocarpus | P. neriifolius | Brown Pine |
| Ginkgoales | Ginkgoaceae | Ginkgo | G. biloba | Ginkgo |

*Table S1. List of analyzed pollen taxa (part VI): conifers and ginkos.*
