Citation: Lackner T, Hlaváč P (2012) Description of a new species of Sternocoelis from Morocco with proposal of the Sternocoelis marseulii species group (Coleoptera, Histeridae). ZooKeys 181: 11–21. doi: 10.3897/zookeys.181.2953

Abstract

The Sternocoelis marseulii species group is proposed based on antennal and prosternal characters. Five species are included in the group: S. marseulii (Brisout de Barneville, 1866) (Spain), S. viaticus Lewis, 1892 (Algeria), S. vaucheri Lewis, 1896 (Morocco), S. berberus Lackner & Yélamos, 2001 (Morocco) and S. yelamosi sp. n. (Morocco). The external morphology of Sternocoelis yelamosi sp. n. is described and illustrated, the illustrations of genitalia of all species of the group (except for S. vaucheri) are provided and a key to the species of the group is given.

Keywords

Coleoptera, Histeridae, Haeteriinae, Sternocoelis, new species, Morocco, Spain, Algeria

Introduction

The genus Sternocoelis Lewis, 1888 is a small genus of myrmecophilous histerids with 27 described species distributed in the Mediterranean area with most species described from Morocco and Algeria (Yélamos 1995, Mazur 1997). The genus has been recently revised by Yélamos (1995). Since then only one further species has been described,
from the Moroccan High Atlas (Lackner and Yélamos 2001). Recently, mainly Slovak and Czech coleopterists have carried out numerous expeditions with focus on the myrmecophilous beetles of Morocco. The newly described species from the Moroccan Middle Atlas results from one such expedition and shows that our knowledge of the Moroccan fauna of *Sternocoelis* is still incomplete.

**Material and methods**

Beetles, after being removed from original cards, were side-mounted on triangular points and examined under Nikon 102 binocular microscope with diffuse light. Male genitalia were first macerated in 10% KOH solution for about 15 minutes, cleared in 80% alcohol and macerated in lactic acid with fuchsine heated up to 60°C for another two hours. After that, they were treated with aceto-salycilate heated up to 60°C for 15 minutes and cleared in xylene. They were subsequently examined in α-terpineol in a small dish. Digital photographs were taken by a Nikon 4500 Coolpix camera and edited in Adobe Photoshop CS3. Based on the photographs, observing the actual genitalia, pencil art was drawn; pen art followed, re-tracing the pencil art and making minor corrections. SEM photographs were taken by Hitachi S-2250N camera.

The following acronyms of museums and private collections are used throughout the text:

- **BMNH** The Natural History Museum, London, United Kingdom (R. Booth);
- **CTLA** Tomáš Lackner collection, Leiden, The Netherlands;
- **CTYB** Tomás Yélamos collection, Barcelona, Spain;
- **MNHN** Muséum National d’Histoire Naturelle, Paris, France (A. Taghavian).

**Abbreviations**

Abbreviations of morphological measurements follow Óhara (1994) and are used throughout the text as follows:

- **APW** width between anterior angles of pronotum
- **EL** length of elytron along elytral suture
- **EW** maximum width between outer margins of elytra
- **PEL** length between anterior angles of pronotum and apices of elytra
- **PPW** width between posterior angles of pronotum.

Separate lines of the same label are marked by slash (/); separate labels are marked by double slash (//). Morphological conventions and terminology and methods of illustration preparation follow Lackner (2010).
Taxonomy

*Sternocoelis marseulii* species group

All members of the group can easily be distinguished from all other *Sternocoelis* by the combination of the following character states:

1. prosternal lobe at the same level or slightly below the level of prosternal keel;
2. prosternal lobe not divided medially and without deep emargination;
3. prosternal keel with carinal prosternal striae distinct and (almost) joined anteriorly;
4. elytra with first dorsal elytral stria complete;
5. antennal scape with a ‘hook’ (except for *S. viaticus*).

Yélamos (1995), in his revision of the genus placed species *S. marseulii* (Brisout de Barneville, 1866), *S. vaucheri* Lewis, 1896 and *S. viaticus* Lewis, 1892 in a small clade closest to the out-group (*Haeterius ferrugineus* (Olivier, 1789)). *Sternocoelis berberus* Lackner & Yélamos, 2001 and *S. yelamosi* (described here) share with the three afore-mentioned species identical character states, so we believe that these two species also belong in this plesiotypic clade, which we define as ‘*Sternocoelis marseulii* species group’. Although the monophyly of this group is highly likely, it requires testing by a phylogenetic analysis in the future. A phylogenetic analysis of *Sternocoelis* would be, however, outside of the scope of this paper. We are aware of the fact that proposing new taxonomic structure without a real phylogenetic analysis to support it should not be a standard measure. In the present work we therefore designate this species-group mostly on pragmatic grounds as an informal taxonomic unit that should serve as a pointer for the future studies of this difficult genus. We believe that male terminalia should be examined in all extant species with the special focus on the male terminalia and spiculum gastrale in particular (see Discussion). All five species included in the group are externally rather similar and, for secure identification, the examination of the male terminalia, especially spiculum gastrale, is necessary.

Key to the species of the *S. marseulii* group:

1 (8) Antennal scape with a ‘hook’ (Fig. 20)
2 (3) Prosternum, especially apically, weakly punctate (Fig. 4) .........................
............... .............................................. *S. yelamosi* sp. n. (Morocco: Jebel Tazzeka)
3 (2) Prosternum apically very coarsely and densely punctate, rugose (Fig. 17)
4 (5) Pronotal sides strongly explanate (see Lackner and Yélamos 2001: fig. 1), well-separated from disc, body size 1.40–1.60 mm .................................
............... ...................*S. berberus* Lackner & Yélamos, 2001 (Morocco: High Atlas)
5 (4) Pronotal sides weakly explanate, not well separated from the disc (Fig. 30), body size 1.30–1.40 mm.
6 (7) Anterior pronotal angles strongly produced, elytra along widest point rather narrow, ratio width: length 1.14 (Fig. 18), meso-metaventral excavation deep (Fig. 19) .................... S. marseulii (Brisout de Barneville, 1866) (Spain)

7 (6) Anterior pronotal angles weakly produced, elytra along widest point rather broad, ratio width : length 1.20 (Fig. 30), meso-metaventral excavation shallow (Fig. 31)..................... S. vaucheri Lewis, 1896 (Morocco: Tangier)

8 (1) Antennal scape without a ‘hook’ ............. S. viaticus Lewis, 1892 (Algeria)

Figs 1–16

**Type locality.** Morocco, Jebel Tazzeka.

**Type material examined.** Holotype, ♂: MOROCCO: Moyen Atlas / Taza: Jebel Tazzeka / N34°12.226’, W04°03.908’ / 11.V.2009 / Hlaváč lgt., under stone with ants, 1360 m (printed); // HOST ANT: Aphaenogaster mauritanicus Emery / H. Cagniant, det. 2009 (printed); // HOLOTYPE Sternocoelis yelamosi Lackner & Hlaváč, det. 2010 (red label, printed); CTLA. **Note.** One specimen of minor worker ant is pinned together with the holotype.

**Description.** PEL:1.425; APW:0.625; PPW:1.075; EL:0.875; EW:1.20. Body (Fig. 1) colour reddish-brown, shiny, weakly convex, oval, dorsal surface with sparse setation, ventral surface lacking setae.

Frons wide, almost rugulose-lacunose, coarsely punctate, punctures with sparse setae; eyes well-visible from above; frontal stria carinate, prolonged onto clypeus; antennal scape thickened, apically with a ‘hook’, antennal club cylindrical, truncate at apex.

Pronotum with dense fine punctulation anteriorly and evanescent punctulation laterally and basally, with sparse setae (many setae probably worn off); pronotal sides weakly separated from disc by shallow marginal depression; marginal pronotal stria present on basal three-quarters; anterior pronotal angles produced, truncate; posterior angles of pronotum acute, not produced.

Elytra weakly convex, with long but sparse setae; disc densely punctate, punctures separated by several times their diameter; marginal elytral stria complete, carinate, briefly continued as apical elytral stria; first dorsal elytral stria complete, second dorsal elytral stria reaching approximately two-thirds of elytral length apically, third elytral stria the shortest, fine, reaching approximately mid elytral length apically, other elytral striae absent.

Propygidium about 2.5 times as long as pygidium, both with sparse punctuation and sparse long setae.

Prosternal process (Fig. 4) at slightly higher level than prosternal lobe; carinal prosternal striae bisinuate, joined anteriorly, interspace between them rugose; prosternal lobe roughly punctulate.
Mesoventrite smooth, shiny, asetose; meso-metaventral depression shallow; mesoventral foveae incipient (Fig. 5); three lateral mesoventral striae present; inner one middle of mesoventrite posteriorly. Metaventrite with sparse and fine punctuation present mainly in anterior part, shiny.
All visible abdominal sternites smooth, asetose, second visible abdominal sternite medially about twice as long as sternite I and III.

Legs (Figs 2–3, 6–7) relatively short, with sparse but strong setae, all tibiae expanded from base to apex, with strong setae, mainly on outer margins.

Male genitalia. Eighth sternite (Figs 8–9) longitudinally divided medially, apically without velae, each half of divided eighth sternite apically with round sclerotized ‘ring’; eighth tergite much larger than sternite, longitudinally almost divided medially, its halves widely separated; eighth sternite and tergite completely separated laterally (Fig. 10). Ninth tergite (Figs 11–12) widely separated by tooth-shaped tenth tergite. Spiculum gastrale (Figs 13–14) dilated on both ends, apical end dilated, with medio-apical notch. Aedeagus (Figs 15–16) typical for the genus (see Yélamos 1995: 147, Figs 69–83 for comparison), truncated apically; apical third with pseudopores, laterally barely curved; ratio of basal piece of aedeagus to the parameres approximately 1:2.

**Differential diagnosis.** *S. yelamosi* sp. n. closely resembles other species included in the *S. marseulii* species group, but it can be differentiated from all of them as follows: from *S. viaticus* by presence of ‘hook’ on antennal scape [lacking only in *S. viaticus*]; from *S. marseulii* by weaker punctuation of the prosternum and coarser punctuation.
Description of a new species of Sternocoelis from Morocco...

of dorsum [prosternum of S. marseulii is rugose and densely punctate; dorsum with weaker punctation]; from S. vaucheri by weaker punctation of the prosternum and coarser punctation of elytra [prosternum of S. vaucheri is rugose, coarsely punctate and elytra are almost impunctate]: from S. berberus by smaller body size [1.425 vs. 1.60 mm in S. berberus] as well as by weakly explanate pronotal sides [pronotal disc of S. berberus is clearly separated from strongly explanate pronotal sides].

**Etymology.** Patronymic, named after and dedicated to our friend Tomás Yélamos (Barcelona, Spain), who revised the genus Sternocoelis and confirmed this to be a new species.

**Distribution.** So far known only from the type locality, Jebel Tazzeka in Middle Atlas, northeast Morocco.

**Host ant.** Aphaenogaster mauritanicus Dalla Torre, 1893.

**Other material studied.** Sternocoelis berberus Lackner & Yélamos, 2001: 26 exs (sex undetermined): Morocco, Oïkameden, 2646m - 2656m (N31°11.605’, W07°51.172’ – N31°11.609’, W07°51.168’), 20.V. 2009, P. Koniar & M. Švarc lgt., under rocks on open slope.

*Sternocoelis viaticus* Lewis, 1892: Paralectotype, ♂, side-mounted on a triangular point with dismembered genitalia glued to the same triangular point as specimen, with another mounting card bearing an ant, with written label: „Meskoutin / G. Lewis

*Sternocoelis marseulii* (Brisout de Barneville, 1866): 2 ♀♀ & 2 ♂♂ Spain, Escorial (MNHN).

*Sternocoelis vaucheri* Lewis, 1896: Paralectotype, ♂, side-mounted on a triangular point with dismembered genitalia glued to the same triangular point as specimen (spiculum gastrale missing), with another mounting card bearing an ant, with written label: „Tanger / 1896 / Vaucher“, followed by another written label: „Much more / convex than / Marseulii Bris.“, followed by printed label: „G. Lewis Coll. / B.M. 1926-369“, followed by another printed label: „Sternocoelis / vaucheri / Lewis, 1896 / T. Yélamos Det.“, followed by another red label, printed „Paralectotypus / T. Yélamos / Des. 1993“ (BHMN).

Discussion

*S. yelamosi* shares numerous character states with another four species (*S. vaucheri, S. berberus, S. viaticus* and *S. marseulii*) that are found in Morocco, Algeria and Spain, respectively. Most of these character states, according to the phylogenetic analysis performed by Yélamos (1995), are presumed to be symplesiomorphies (Yélamos 1995:168). Yélamos (1995) determined polarities of character states using the Palaeartic genus *Haeterius* Dejean, 1833 for the out-group. Yélamos (1995) did not study male terminalia in detail; he only mentioned that “...male genitalia are very constant, with an almost imperceptible intraspecific variability” (Yélamos 1995: 168). According to our study of the male terminalia of members of the ’*Sternocoelis marseulii* species group’ the most reliable character for distinguishing species of this group is the shape of spiculum gastrale, especially its apical and basal ends (compare Figs 13, 26, 37 and 45). *S. marseulii* is the only species of *S. marseulii* species group that already had its spiculum gastrale illustrated (Yélamos 1995: 147, Fig. 84). However, our study of the male terminalia of *S. marseulii* indicates that the spiculum gastrale of this species (Fig. 26) is rather different from that illustrated by Yélamos (1995). The rest of the male terminalia (Figs 8–12, 14–16; 21–25, 27–29; 32–36, 38–39; 40–44, 46–48) show more uniformity and are less valuable tools for the intra-specific recognition. The spiculum gastrale of *S. vaucheri* could not have been examined; therefore the validity of this taxon remains dubious. *S. vaucheri* is known only from two males and two specimens of unidentified sex, all collected more than hundred years ago in Tangier (northern Morocco). Two males of this species belonging to the type series housed in BMNH have been examined, unfortunately their male terminalia (except for the aedeagus already drawn by Yélamos 1995) are damaged and unsuitable for drawing. According to Yélamos (1995), there should be another two specimens of unidentified sex housed in MNHN; these two specimens, however, have not been found in the col-
Figures 32–39. *Sternocoelis berberus* Lackner & Yélamos, 2001, male terminalia. 32 Eighth sternite and tergite, ventral view 33 ditto, dorsal view 34 ditto, lateral view 35 ninth and tenth tergites, ventral view 36 ditto, lateral view 37 spiculum gastrale, ventral view 38 aedeagus, dorsal view 39 ditto, lateral view.

Figures 40–48. *Sternocoelis viaticus* Lewis, 1892, male terminalia. 40 Eighth sternite and tergite, ventral view 41 ditto, dorsal view 42 ditto, lateral view 43 ninth and tenth tergites, ventral view 44 ditto, lateral view 45 spiculum gastrale, ventral view 46 ditto, lateral view 47 aedeagus, dorsal view 48 ditto, lateral view.
lections (Taghavian pers. comm., 2011). A lot of effort was devoted to find this rare species in the surroundings of Tangier, Morocco, but without success. According to Yélamos (pers. comm. 2011), S. vaucheri might be a junior synonymy of S. marseulii. S. marseulii occurs predominantly in the mountains of central and eastern Spain, with few findings also in southern Spain (Yélamos 1995). One locality, Sierra de Córdoba is approximately 300 km from the type locality of S. vaucheri (Tangier, Morocco). However, without the examination of the male terminalia of S. vaucheri it would be premature to synonymize the two species and therefore both species are kept in their current taxonomic status. We believe that a newly performed phylogenetic analysis including the male terminalia, with desired molecular characters would help to elucidate the relationships among the Sternocoelis species.

Acknowledgements

We are grateful to our colleague and friend Tomás Yélamos (Barcelona, Spain) for his time to verify the identity of this new species as well as for his help with the myrmecophilous histerids of Morocco in general. Thanks are due to the curators of the above-mentioned institutions for their help with the specimens as well as to J. Cooter (Oxford, UK) for the grammatical revision of the manuscript.

Open access to this paper was supported by the Encyclopedia of Life (EOL) Open Access Support Project (EOASP).
