ON RANKS AND CRANKS OF PARTITIONS MODULO 4 AND 8

ERIC T. MORTENSON

Abstract. Denote by $p(n)$ the number of partitions of $n$ and by $N(a, M; n)$ the number of partitions of $n$ with rank congruent to $a$ modulo $M$. By considering the deviation

$$D(a, M) := \sum_{n=0}^{\infty} \left( N(a, M; n) - \frac{p(n)}{M} \right) q^n,$$

we give new proofs of recent results of Andrews, Berndt, Chan, Kim and Malik on mock theta functions and ranks of partitions. By considering deviations of cranks, we give new proofs of Lewis and Santa-Gadea’s rank-crank identities. We revisit ranks and cranks modulus $M = 5$ and 7, with our results on cranks appearing to be new. We also demonstrate how considering deviations of ranks and cranks gives first proofs of Lewis’s conjectured identities and inequalities for rank-crank differences of modulus $M = 8$.

0. Notation

Let $q$ be a complex number with $0 < |q| < 1$ and define $C^* := \mathbb{C} - \{0\}$. We recall:

$$(x)_n = (x; q)_n := \prod_{i=0}^{n-1} (1 - q^i x), \quad (x)_\infty = (x; q)_\infty := \prod_{i \geq 0} (1 - q^i x),$$

and

$$j(x; q) := (x)_\infty (q/x)_\infty (q)_\infty = \sum_n (-1)^n q^{\binom{n}{2}} x^n,$$

where in the last line the equivalence of product and sum follows from Jacobi’s triple product identity. Let $a$ and $m$ be integers with $m$ positive. Define

$$J_{a,m} := j(q^a; q^m), \quad \overline{J}_{a,m} := j(-q^a; q^m), \quad \text{and} \quad J_m := J_{m,3m} = \prod_{i \geq 1} (1 - q^{mi}).$$

1. Introduction

We recall a universal mock theta function

$$g(x; q) := x^{-1} \left( 1 + \sum_{n=0}^{\infty} \frac{q^{n^2}}{(x)_{n+1} (q/x)_n} \right).$$

Date: 31 July 2017.

Key words and phrases. partitions, rank, crank, mock theta functions.
One of the earliest celebrated results in the history of mock theta functions was Hickerson’s proof of the mock theta conjectures, that express fifth order mock theta functions $f_0(q)$ and $f_1(q)$ in terms of the universal mock theta function $g(x; q)$:

**Theorem 1.1.** [7] The following identities are true:

\[
f_0(q) := \sum_{n=0}^{\infty} \frac{q^{n^2}}{(-q; q)_n} = -2q^2 g(q^2; q^{10}) + \frac{J_{5,10} J_{2,5}}{J_1},
\]

\[
f_1(q) := \sum_{n=0}^{\infty} \frac{q^{n^2+n}}{(-q; q)_n} = -2q^3 g(q^4; q^{10}) + \frac{J_{5,10} J_{1,5}}{J_1}.
\]

Mock theta functions and the study of partitions are inextricably linked. A partition of a positive integer $n$ is a weakly-decreasing sequence of positive integers whose sum is $n$. For example the partitions of the number 4 are (4), (3, 1), (2, 2), (2, 1, 1), (1, 1, 1, 1). We denote the number of partitions of $n$ by $p(n)$. Among the most famous results in the theory of partitions are Ramanujan’s congruences:

\[
p(5n + 4) \equiv 0 \pmod{5},
\]

\[
p(7n + 5) \equiv 0 \pmod{7},
\]

\[
p(11n + 6) \equiv 0 \pmod{11}.
\]

To study Ramanujan’s partition congruences, Dyson constructed a function which assigns an integer value to a partition. Dyson defined the **rank of a partition** to be the largest part minus the number of parts. As an example, the ranks of the five partitions of 4 are 3, 1, 0, −1, −3, respectively, giving an equinumerous distribution of the partitions of 4 into the five residue classes mod 5. We further define

\[
N(a, M; n) := \text{number of partitions of } n \text{ with rank } \equiv a \pmod{M},
\]

which has the symmetric property $N(a, M; n) = N(M-a, M; n)$. To explain Ramanujan’s first two congruences, Dyson conjectured and Atkin and Swinnerton-Dyer proved [4, 5]

\[
N(a, 5; 5n + 4) = p(5n + 4)/5, \text{ for } 0 \leq a \leq 4,
\]

\[
N(a, 7; 7n + 5) = p(7n + 5)/7, \text{ for } 0 \leq a \leq 6.
\]

For more identities on ranks modulo $M = 5$ or 7 see [5], [11 (2.2)–(2.11)]. For analogous results for other low moduli $M$, see [10, 14].

Although the rank does not explain Ramanujan’s third congruence, Dyson conjectured another function, which he called the **crank**, that would divide the partitions of $11n+6$ into eleven equal classes. Andrews and Garvan later discovered the crank [11]. For a partition $\pi$, let $\lambda(\pi)$ denote the largest part, $\nu(\pi)$ the number of ones, and $\mu(\pi)$ the number of parts larger than $\nu(\pi)$. The crank of $\pi$, denoted $c(\pi)$, is defined as follows

\[
c(\pi) := \begin{cases} 
\lambda(\pi), & \text{when } \nu(\pi) = 0, \\
\mu(\pi) - \nu(\pi), & \text{otherwise}.
\end{cases}
\]
The cranks of the five partitions of 4 are 4, 0, 2, −2, −4, respectively, giving an equinumerous distribution of the partitions of 4 into the five residue classes mod 5. Defining

\[ C(a, M; n) := \text{number of partitions of } n \text{ with crank } \equiv a \pmod{M}, \]

Andrews and Garvan showed

\[
\begin{align*}
C(a; 5; 5n + 4) &= p(5n + 4)/5, \text{ for } 0 \leq a \leq 4, \\
C(a; 7; 7n + 5) &= p(7n + 5)/7, \text{ for } 0 \leq a \leq 6, \\
C(a; 11; 11n + 6) &= p(11n + 6)/11, \text{ for } 0 \leq a \leq 10.
\end{align*}
\]

Ranks and cranks are related. We point out that we do not consider ranks or cranks of the partition of zero. Lewis and Santa-Gadea proved identities such as [10, (8)–(17)]:

\[
\sum_{n=0}^{\infty} (N(0; 4; 2n) - N(0; 4; 2n)) q^n = 2 - 2q^2 q(-q^2; q^4) + 2q^5 q(-q^6; q^8) - \frac{J_{2,4} J_{6,16}}{J_4} + \frac{J_{2,4} J_{7,16}}{J_4}.
\]
Theorem 1.3. [3, Theorem 1.7] We have
\[
\sum_{n=0}^{\infty} \left( N(0, 8; n) - N(4, 8; n) \right) q^n = 2 + 2q^2g(q^2; q^{16}) - \frac{J_{2,4}J_{6,16}}{J_4} + q \frac{J_{2,4}J_{2,16}}{J_4},
\] (1.7)
\[
\sum_{n=0}^{\infty} \left( N(1, 8; n) - N(3, 8; n) \right) q^n = -1 - q^2g(q^2; q^{16}) + q^5g(q^6; q^{16}) + \frac{J_{2,4}J_{6,16}}{J_4}.
\] (1.8)

In this note we will demonstrate how methods and results from our work on mock theta functions and Dyson’s ranks [9, 12] can be used to prove results on ranks and cranks of partitions such as those found in [3, 10, 11]. We define the deviation of the ranks from the expected value as
\[
D(a, M) = D(a, M; q) := \sum_{n=0}^{\infty} \left( N(a, M; n) - \frac{p(n)}{M} \right) q^n,
\] (1.9)
and the deviation of the cranks from the expected value as
\[
D_C(a, M) = D_C(a, M; q) := \sum_{n=0}^{\infty} \left( C(a, M; n) - \frac{p(n)}{M} \right) q^n.
\] (1.10)

By determining the dissections of the relevant deviations it becomes straightforward to prove identities such as (1.6)–(1.8) and (1.3a)–(1.3f). For a preview, using notation
\[
\vartheta_4(a_0, a_1, a_2, a_3) := \frac{1}{4J_4} \left[ a_0 \cdot J_{4,8}J_{6,16} + a_1 \cdot q^2J_{0,8}J_{14,16} + a_2 \cdot qJ_{4,8}J_{14,16} + a_3 \cdot q^3J_{0,8}J_{6,16} \right],
\] (1.11)
and
\[
G_4(b_0, b_1) := b_0 \cdot (-1 + q^2g(-q^2; q^{16})) + b_1 \cdot q^5g(-q^6; q^{16}),
\] (1.12)
we will show the following two theorems which will prove (1.6), (1.3a), and (1.3f).

Theorem 1.4. We have the following 2-dissections:
\[
D(0, 4) = \vartheta_4(-5, 3, 1, 1) + 2 \cdot G_4(-1, 0),
\] (1.13)
\[
D(1, 4) = D(3, 4) = \vartheta_4(-3, -1, -3, 1) + G_4(1, 1),
\] (1.14)
\[
D(2, 4) = \vartheta_4(-1, -1, 5, -3) + 2 \cdot G_4(0, -1).
\] (1.15)

Theorem 1.5. We have the following 2-dissections:
\[
D_C(0, 4) = \vartheta_4(3, -1, 1, -3),
\] (1.16)
\[
D_C(1, 4) = D_C(3, 4) = \vartheta_4(-1, -1, 1, 1),
\] (1.17)
\[
D_C(2, 4) = \vartheta_4(-1, 3, -3, 1).
\] (1.18)

Identity (1.6) follows from evaluating the difference $D(0, 4) - D(2, 4)$. Given (1.1), we see that the Fourier expansions of $g(-q^2; q^{16})$ and $g(-q^6; q^{16})$ are supported on even powers of $q$. Hence $b_0, a_0, a_1$ are coefficients of even $q$-powers and $b_1, a_2, a_3$ are coefficients...
of odd $q$-powers. Comparing even powers of $q$ in (1.17) and (1.15) gives the first rank-crank relation (1.3a). Relation (1.3b) follows from comparing odd powers of $q$ in (1.17) and (1.13). In each theorem, the deviations sum to zero.

In Section 2, we cover preliminaries. In Section 3, we prove Theorem 1.1. In Sections 4 and 5, we use our methods to prove identities (1.3c)–(1.3f). In Section 6, we prove Theorem 1.2. In Section 7, we obtain corresponding dissections for cranks, which appear to be new. In the final section, we demonstrate how our results prove Lewis’s conjectured identities and inequalities for rank-crank differences of modulus 8 [11].

2. Preliminaries

For later use, we list useful product rearrangements:

\[ J_{0,1} = 2J_{1,4}, \quad J_{1,2} = \frac{2J_2^2}{J_1^2}, \quad J_{1,3} = \frac{J_2^2}{J_1^2}, \quad J_{1,4} = \frac{J_1 J_4}{J_2}, \quad J_{1,6} = \frac{J_1 J_2^2}{J_3}, \quad J_{1,6} = \frac{J_2 J_3 J_4}{J_1 J_4 J_6}. \]

We recall more theta function identities, here $\zeta_n$ is a primitive $n$-root of unity:

\[ j(q^x; q^3) + x j(q^2x^3; q^3) = J_j(x^2; q)/j(x; q), \] (2.1a)

\[ j(qx; q) = -x^{-1} j(x; q), \] (2.1b)

\[ j(x; q) = J_1 j(x; q^2) j(qx; q^2)/J_2^2, \] (2.1d)

\[ j(x; -q) = j(x; q^2) j(-qx; q^2)/J_{1,4}, \] (2.1e)

\[ j(z; q) = \sum_{k=0}^{m-1} (-1)^k q^{k^2} z^k j((-1)^{m+1} q^{(m^2)/2} + mk z^m, q^{m^2}), \] (2.1f)

\[ j(x^n; q^n) = J_n j(x, \zeta_n x, \ldots, \zeta_n^{n-1} x, q^n)/J_n^n \] if $n \geq 1$. (2.1g)

Identity (2.1a) is the quintuple product identity. A frequently used form of (2.1f) reads

\[ j(z; q) = j(qz^2; q^4) - z j(qz^3; q^4), \] (2.2a)

Proposition 2.1. [7] Theorems 1.1-1.2] For generic $x, y \in \mathbb{C}^*$

\[ j(x; q) j(y; q) = j(-xy; q^2) j(q^{-1}x; q^2) - x j(-qxy; q^2) j(-x^{-1} y; q^2), \] (2.3a)

\[ j(-x; q) j(y; q) + j(x; q) j(-y; q) = 2 j(xy; q^2) j(qx^{-1} y; q^2). \] (2.3b)

We recall the three-term Weierstrass relation for theta functions [15] (1.):

Proposition 2.2. For generic $a, b, c, d \in \mathbb{C}^*$

\[ j(ac, a/c, bd, b/d; q) = j(ad, a/d, bc, b/c; q) + b/c \cdot j(ab, a/b, cd, c/d; q). \] (2.4)

We recall a fact which follows from [4] Lemma 2] and is also [7 Theorem 1.7].
Proposition 2.3. Let $C$ be a nonzero complex number, and let $n$ be a nonnegative integer. Suppose that $F(z)$ is analytic for $z \neq 0$ and satisfies $F(qz) = Cz^{-n}F(z)$. Then either $F(z)$ has exactly $n$ zeros in the annulus $|q| < |z| \leq 1$ or $F(z) = 0$ for all $z$.

Proposition 2.4. \cite{12} Proposition 3.4] Let $x \neq 0$. Then

$$j(q^2 x; q^4)j(q^5 x; q^8) + \frac{q}{x} \cdot j(x; q^4)j(qx; q^8) - \frac{J_1}{J_4} \cdot j(-q^3 x; q^4)j(q^3 x; q^8) = 0.$$ \hfill (2.5)

Using Proposition 2.3 we can prove a result similar to (2.5).

Proposition 2.5. Let $x \neq 0$. Then

$$j(-x; q^4)j(-q^5 x; q^8) - j(-q^2 x; q^4)j(-q^3 x; q^8) - x \frac{J_1}{J_4} \cdot j(q^3 x; q^4)j(-q^7 x; q^8) = 0.$$ \hfill (2.6)

Proof of Proposition 2.5. Let $f(x)$ be the left-hand side of (2.6). We have $f(q^8 x) = q^{-9}x^{-3}f(x)$. By Proposition 2.3 if $f$ has more than three zeros in $|q^8| < |x| \leq 1$, then $f(x) = 0$ for all $x \neq 0$. But it is easy to check that $f(x) = 0$ for $x = -1, -q, -q^2, -q^3$. \hfill □

The following identity will be our workhorse and can be found in the lost notebook:

Proposition 2.6. \cite{13} p. 32], \cite{2} (12.5.3)] For generic $x \in \mathbb{C}$

$$g(x; q) = -x^{-1} + qx^{-3}g(-qx^{-2}; q^4) - qg(-qx^2; q^4) + \frac{J_2 J_{2,4}^2}{xj(x; q)j(-qx^2; q^2)}.$$ \hfill (2.7)

Proposition 2.6 has a useful and easily shown corollary:

Corollary 2.7. \cite{13} p. 39], \cite{2} (12.4.4)] For generic $x \in \mathbb{C}$

$$g(x; q) + g(-x; q) = -2qg(-qx^2; q^4) + \frac{2 J_2 J_{1,4}^2}{j(-qx^2; q^4)j(x^2; q^2)},$$ \hfill (2.8a)

$$g(x; q) - g(-x; q) = -2x^{-1} + 2qx^{-3}g(-qx^{-2}; q^4) + \frac{2 J_2 J_{1,4}^2}{xj(-q^3 x^2; q^4)j(x^2; q^2)}.$$ \hfill (2.8b)

Let us denote by $N(m, n)$ the number of partitions of $n$ with rank equal to $m$. The generating function for $N(m, n)$ is given by

$$\sum_{n=0}^{\infty} \sum_{m=-\infty}^{\infty} N(m, n) x^m q^n = \sum_{n=0}^{\infty} \frac{q^n}{(zq)_n(z^{-1}q)_n}.$$ \hfill (2.9)

Rank deviations \cite{1.9} can be computed using (2.9) and (1.1):

$$D(a, M) = \frac{1}{M} \sum_{j=0}^{M-1} \zeta_M^{-aj} \left(1 - \zeta_M^j\right) \left(1 + \zeta_M^j g(\zeta_M^j; q)\right),$$ \hfill (2.10)

where $\zeta_M$ is a primitive $M$-th root of unity. In general, one expresses $g(x; q)$ in terms of Appell–Lerch functions and then sums them over roots of unity using \cite{8} Theorem 3.9, see \cite{9}. In our setting the modulus $M$ is a power of two, so we use instead Corollary 2.7.
Let us denote by $C(m, n)$ the number of partitions of $n$ with crank equal to $m$. The generating function for $C(m, n)$ is given by

$$
\sum_{n=0}^{\infty} \sum_{m=-\infty}^{\infty} C(m, n)z^m q^n = \prod_{n=1}^{\infty} \frac{(1 - q^n)}{(1 - zq^n)(1 - z^{-1}q^n)}, \tag{2.11}
$$

and the analogous deviation from the expected value is

$$
D_C(a, M) = \frac{1}{M} \sum_{j=1}^{M-1} \frac{\zeta_M^{-aj}}{(\zeta_M q)_{\infty}(\zeta_M^{-1} q)_{\infty}}, \tag{2.12}
$$

where $\zeta_M$ is a primitive $M$-th root of unity.

3. Proof of Theorem 1.4

Theorem 1.4 is a straightforward consequence of the following proposition:

**Proposition 3.1.** We have the following 2-dissections:

$$
D(0, 4) = 2 - 2q^2 g(-q^2; q^{16}) - 2 \cdot \frac{J_{4, 8}J_{6, 16}}{J_4} + \frac{1}{2} \cdot \frac{J_{1, 2}J_{1, 4}}{J_4} + \frac{1}{4} \cdot \frac{J_{1, 2}J_{1, 4}}{J_4}, \tag{3.1}
$$

$$
D(1, 4) = D(3, 4) = -1 + q^2 g(-q^2; q^{16}) + q^5 g(-q^6; q^{16}) + \frac{J_{4, 8}J_{1, 4}}{J_4} - \frac{1}{4} \cdot \frac{J_{1, 2}J_{1, 4}}{J_4}, \tag{3.2}
$$

$$
D(2, 4) = -2q^5 g(-q^6; q^{16}) + 2 \cdot q \cdot \frac{J_{4, 8}J_{2, 16}}{J_4} - \frac{1}{2} \cdot \frac{J_{1, 2}J_{1, 4}}{J_4} + \frac{1}{4} \cdot \frac{J_{1, 2}J_{1, 4}}{J_4}. \tag{3.3}
$$

**Proof of Theorem 1.4.** Using identity (2.2a) and collecting terms gives

$$
\frac{J_{1, 2}J_{1, 4}}{J_4} = \frac{1}{J_4} \cdot \left[ J_{4, 8} - qJ_{0, 8} \right] \cdot \left[ J_{6, 16} - qJ_{14, 16} \right] = \frac{1}{J_4} \cdot \left[ J_{4, 8}J_{6, 16} + q^2J_{0, 8}J_{14, 16} \right] - \frac{q}{J_4} \cdot \left[ J_{4, 8}J_{14, 16} + J_{0, 8}J_{6, 16} \right], \tag{3.4}
$$

as well as

$$
\frac{J_{4, 8}J_{1, 4}}{J_4} = \frac{1}{J_4} \cdot \left[ J_{4, 8}J_{6, 16} + q^2J_{0, 8}J_{14, 16} \right] + \frac{q}{J_4} \cdot \left[ J_{4, 8}J_{14, 16} + J_{0, 8}J_{6, 16} \right], \tag{3.5}
$$

and

$$
\frac{J_{4, 8}J_{1, 4}}{J_4} = \frac{1}{J_4} \cdot \left[ J_{4, 8}J_{6, 16} - q \cdot J_{4, 8}J_{14, 16} \right]. \tag{3.6}
$$

Rewrite identities (3.1)–(3.3) using (3.4)–(3.6) and collect terms. \hfill \square

**Proof of Proposition 3.1.** Using (2.10), we have

$$
D(0, 4) = \frac{1}{4} \sum_{j=0}^{3} \left[ (1 - i^j)(1 + i^j g(i^j; q)) \right]
$$
Using Corollary 2.7, we obtain

\[
\sum_{j=0}^{3} \left[ 1 - i^j + i^j g(i^j; q) - i^{2j} g(i^j; q) \right]
\]

\[
= 1 + \frac{1}{4} \left[ [g(1; q) - g(-1; q)] - [g(1; q) + g(-1; q)] \right.
\]

\[
+ \left. i [g(i; q) - g(-i; q)] + [g(i; q) + g(-i; q)] \right]
\]

(3.7)

Corollary 2.7 gives

\[
D(0, 4) = 1 + \frac{1}{4} \left[ -4 + 4qg(-q; q^4) - 4qg(q; q^4) \right.
\]

\[
+ \lim_{x \to 1} 2J_2J_{1,4}^2 \cdot \left( \frac{1}{xj(-q^3x^2; q^4)} j(x^2; q^2) - \frac{1}{j(-qx^2; q^4)} j(x^2; q^2) \right)
\]

\[
+ \frac{1}{2} \cdot \frac{j(-qx^2; q^4)}{J_2 J_4} \cdot \frac{J_2}{J_1} \cdot \frac{1}{J_1}
\]

\[
= qg(-q; q^4) - qg(q; q^4) + \frac{J_2 J_{1,4}^2}{J_1 J_{0,2}}
\]

(3.8)

where we have used (2.2a) and (2.1g). Employing Corollary 2.7 again, we obtain

\[
D(0, 4) = 2 - 2q^2 g(-q^2; q^16) - 2 \cdot \frac{J_4 J_{4,8} J_{6,16}}{J_4} + \frac{1}{2} \cdot \frac{J_{1,2} J_{1,4}}{J_4} + \frac{1}{4} \cdot \frac{J_{1,2} J_{1,4}}{J_4}.
\]

(3.9)

Using (2.10), we have

\[
D(1, 4) = -1 + \frac{1}{4} \left[ [g(1; q) + g(-1; q)] - [g(1; q) - g(-1; q)] \right.
\]

\[
+ \left. [g(i; q) + g(-i; q)] - i [g(i; q) - g(-i; q)] \right]
\]

(3.10)

Using Corollary 2.7, we obtain

\[
D(1, 4) = -1 + \frac{1}{4} \left[ 4 - 4qg(-q; q^4) \right.
\]

\[
+ \lim_{x \to 1} 2J_2J_{1,4}^2 \cdot \left( \frac{1}{j(-qx^2; q^4)} j(x^2; q^2) - \frac{1}{xj(-q^3x^2; q^4)} j(x^2; q^2) \right)
\]
Using Corollary 2.7, we obtain
\[\frac{1}{j(q; q^4)}j(-1, q^2) - \frac{i}{ij(q^3; q^4)j(-1; q^2)}\]
where we have used (2.2a) and (2.1g). Employing Corollary 2.7 again yields
\[\frac{1}{2} \cdot \frac{xj(-q^3 x^2; q^4) - j(-q^2 x^2; q^4)}{xj(-q^2 x^2; q^4)j(-q^3 x^2; q^4)j(x^2; q^2)}\]
where we have again used (2.2a) and (2.1g). Proposition 2.6 then yields
\[D(1, 4) = -1 + q^2 g(-q^2; q^16) + q^5 g(-q^6; q^16) + \frac{J_{1, 4} J_{1, 4}}{J_4} = \frac{1}{4} \cdot \frac{J_{1, 2} J_{1, 4}}{J_4}.\] (3.11)

Using (2.10) gives
\[D(2, 4) = \frac{1}{4} \left[ [g(1; q) - g(-1; q)] - [g(1; q) + g(-1; q)] - i [g(i; q) - g(-i; q)] - [g(i; q) + g(-i; q)] \right].\] (3.13)

Using Corollary 2.7, we obtain
\[D(2, 4) = \frac{1}{4} \left[ 4qg(-q; q^4) + 4qg(q; q^4) - \frac{J_{1, 4} J_{1, 4}}{J_4} \right.\]
\[\left. + \lim_{x \to 1} 2J_{1, 4} J_{1, 4} \cdot \left( \frac{1}{j(-q^3 x^2; q^4)j(x^2; q^2)} - \frac{1}{j(-q^2 x^2; q^4)j(x^2; q^2)} \right) \right] \]
\[= qg(-q; q^4) + qg(q; q^4)\]
\[- \frac{1}{2} \cdot \frac{J_{1, 2} J_{1, 4}}{J_4} + \lim_{x \to 1} \frac{J_{1, 4} J_{1, 4}}{2} \cdot \frac{j(x; q)}{xj(-q^2 x^2; q^4)j(-q^3 x^2; q^4)j(x^2; q^2)} \]
\[= qg(-q; q^4) + qg(q; q^4) - \frac{1}{2} \cdot \frac{J_{1, 2} J_{1, 4}}{J_4} + \frac{1}{4} \cdot \frac{J_{1, 2} J_{1, 4}}{J_4}.\] (3.14)

where we have used (2.2a) and (2.1g). Employing Corollary 2.7 again yields
\[D(2, 4) = -2q^5 g(-q^6; q^{16}) + 2q \cdot \frac{J_{1, 4} J_{2, 16}}{J_4} - \frac{1}{2} \cdot \frac{J_{1, 2} J_{2, 4}}{J_4} + \frac{1}{4} \cdot \frac{J_{1, 2} J_{1, 4}}{J_4}.\] (3.15)

which completes the proof. \(\square\)

4. Proof of Theorem 1.2

Recalling (1.13) and (1.15) and regrouping terms, we have
\[D(0, 4) - D(2, 4)\]
We have the following
\[ \text{Theorem 5.1 is an immediate consequence of the following proposition:} \]
\[
D(0, 8) = 2 - 2q^2 g(q^2; q^{16}) + 2q^6 g(-q^2; q^{16}) - \frac{J_{4, 8} J_{6, 16}}{J_4} + \frac{q^2 J_{6, 16}}{J_4} - q \cdot \frac{J_{4, 8} J_{14, 16}}{J_4} + q \cdot \frac{J_{6, 16}}{J_4} \]
\[ = 2 - 2q^2 g(q^2; q^{16}) + 2q^5 g(-q^2; q^{16}) - \frac{1}{J_4} \left( \frac{J_{4, 8} - q J_{6, 16}}{J_4} \right) \left[ J_{6, 16} + q J_{14, 16} \right] \]
\[ = 2 - 2q^2 g(q^2; q^{16}) + 2q^5 g(-q^2; q^{16}) - \frac{J_{1, 2} J_{1, 4}}{J_4}, \quad (4.1) \]
where we have used (2.2a). Elementary product rearrangements give
\[
\frac{J_{1, 4} J_{1, 2}}{J_4} = \frac{J_{2, 4}}{J_4} \cdot J_{1, 4} = \frac{J_{2, 4}}{J_4} \cdot \left[ J_{6, 16} - q J_{14, 16} \right], \quad (4.2) \]
where we have again used (2.2a). Rewriting (4.1) with (4.2) gives Theorem 1.2

5. On rank deviations modulo 8

\[ \text{Theorem 5.1. We have the following 2-dissections:} \]
\[ D(0, 8) = \vartheta_8(-9, 7, -3, 5, -1, -1, 5, -3) + G_8(1, -1, 0, 0), \quad (5.1) \]
\[ D(1, 8) = D(7, 8) = \vartheta_8(7, -5, -3, 1, 3, -1, -3, 1) + \frac{1}{2} \cdot G_8(-1, 1, 1, 1), \quad (5.2) \]
\[ D(2, 8) = D(6, 8) = \vartheta_8(-1, -1, 5, -3, -1, -1, 5, -3) + G_8(0, 0, 0, -1), \quad (5.3) \]
\[ D(3, 8) = D(5, 8) = \vartheta_8(-1, 3, -3, 1, -5, 7, -3, 1) + \frac{1}{2} \cdot G_8(1, 1, -1, 1), \quad (5.4) \]
\[ D(4, 8) = \vartheta_8(-1, -1, 5, -3, 7, -9, -3, 5) + G_8(-1, -1, 0, 0), \quad (5.5) \]

where
\[
\vartheta_8(a_0, a_1, a_2, a_3, a_4, a_5, a_6, a_7) := \frac{1}{8 J_4} \left[ a_0 \cdot J_{4, 8} J_{28, 64} + a_1 \cdot q^2 J_{0, 8} J_{52, 64} + a_2 \cdot q J_{4, 8} J_{20, 64} + a_3 \cdot q J_{0, 8} J_{28, 64} + a_4 \cdot q^2 J_{0, 8} J_{20, 64} + a_5 \cdot q^6 J_{4, 8} J_{60, 64} + a_6 \cdot q J_{4, 8} J_{52, 64} + a_7 \cdot q^7 J_{0, 8} J_{60, 64} \right], \quad (5.6) \]

and
\[
G_8(b_0, b_1, b_2, b_3) := b_0 \cdot (1 + q^2 g(q^2; q^{16})) + b_1 \cdot (-1 + q^2 g(-q^2; q^{16})) + b_2 \cdot q^5 g(q^6; q^{16}) + b_3 \cdot q^5 g(-q^6; q^{16}). \quad (5.7) \]

Theorem 5.1 is an immediate consequence of the following proposition:

\[ \text{Proposition 5.2. We have the following 2-dissections:} \]
\[ D(0, 8) = 2 + q^2 g(q^2; q^{16}) - q^2 g(-q^2; q^{16}) \]
\[ - \frac{J_{4, 8} J_{6, 16}}{J_4} - \frac{J_{1, 4} J_{1, 2}}{J_4} + \frac{1}{8} \frac{J_{1, 2} J_{1, 4}}{J_4} + \frac{1}{2} \frac{J_8 J_{1, 2}}{J_4} \cdot J_{1, 8} J_{3, 8}, \quad (5.8) \]
\[
D(1, 8) = -1 - \frac{1}{2} q^2 g(q^2; q^{16}) + \frac{1}{2} q^2 g(-q^2; q^{16}) + \frac{1}{2} q^5 g(q^6; q^{16}) + \frac{1}{2} q^5 g(-q^6; q^{16}) \\
+ \frac{1}{2} \frac{J_{4,8} J_{1,4}}{J_4} - \frac{1}{2} q \frac{J_{4,8} J_{2,16}}{J_4} + \frac{1}{2} \frac{J_{4,8} J_{6,16}}{J_4} - \frac{1}{8} J_{1,2} J_{1,4} + \frac{1}{2} \frac{J_{1,2} J_{14,16}}{J_4},
\]

\[
D(2, 8) = -q^5 g(-q^6; q^{16}) + q \frac{J_{4,8} J_{14,16}}{J_4} - \frac{1}{8} J_{1,2} J_{1,4} + \frac{1}{2} \frac{J_{1,2} J_{2,16}}{J_4},
\]

\[
D(3, 8) = \frac{1}{2} q^2 g(q^2; q^{16}) + \frac{1}{2} q^2 g(-q^2; q^{16}) - \frac{1}{2} q^5 g(q^6; q^{16}) + \frac{1}{2} q^5 g(-q^6; q^{16}) \\
+ \frac{1}{2} \frac{J_{4,8} J_{1,4}}{J_4} + \frac{1}{2} \frac{J_{4,8} J_{2,16}}{J_4} - \frac{1}{2} \frac{J_{4,8} J_{6,16}}{J_4} - \frac{1}{8} J_{1,2} J_{1,4} - \frac{1}{2} \frac{J_{1,2} J_{2,16}}{J_4},
\]

\[
D(4, 8) = -q^2 g(q^2; q^{16}) - q^2 g(-q^2; q^{16}) \\
- \frac{J_{4,8} J_{6,16}}{J_4} + \frac{J_{4,8} J_{6,16}}{J_4} + \frac{1}{4} \frac{J_{1,2} J_{1,4}}{J_4} + \frac{1}{8} J_{1,2} J_{1,4} - \frac{1}{2} \frac{J_{6,16}}{J_4} J_{1,8} J_{3,8},
\]

**Proof of Theorem 5.7** Using (2.2a) and (2.3a) gives
\[
\frac{J_8}{J_4^2 J_{16}} \cdot J_{1,2} \cdot J_{1,8} J_{3,8} = \frac{J_8}{J_4^2 J_{16}} \cdot \left[ J_{4,8} + q J_{0,8} \right] \cdot \left[ J_{6,16} J_{12,16} - q J_{14,16} J_{14,16} \right] \\
= \frac{1}{J_4} \cdot \left[ J_{4,8} J_{6,16} - q^2 J_{0,8} J_{14,16} \right] + q \cdot \frac{1}{J_4} \cdot \left[ J_{0,8} J_{6,16} - J_{4,8} J_{14,16} \right].
\]

Four more consequences of (2.2a) read
\[
J_{6,16} = J_{28,64} + q^5 J_{60,64}, \quad J_{2,16} = J_{20,64} + q^5 J_{52,64},
\]
\[
J_{6,16} = J_{28,64} - q^5 J_{60,64}, \quad J_{2,16} = J_{20,64} - q^5 J_{52,64}.
\]

Rewrite Proposition 5.2 using (2.2a) with (3.3)–(3.6), (5.13), (5.14) and collect terms. □

**Proof of Proposition 5.2** The proofs for the five identities are all similar, so we will only do the first two. Using (2.10), we have
\[
D(0, 8) = 1 + \frac{1}{8} \left[ - [g(1; q) + g(-1; q)] + [g(1; q) - g(-1; q)] \right. \\
\left. + [g(i; q) + g(-i; q)] + i[g(i; q) - g(-i; q)] \right. \\
- i[g(\zeta_8; q) + g(-\zeta_8; q)] + \zeta_8 [g(\zeta_8; q) - g(-\zeta_8; q)] \\
\left. + i[g(\zeta_8^{-1}; q) + g(-\zeta_8^{-1}; q)] + \zeta_8^{-1} [g(\zeta_8^{-1}; q) - g(-\zeta_8^{-1}; q)] \right].
\]

Similarly, we have
\[
D(1, 8) = -1 + \frac{1}{8} \left[ [g(1; q) + g(-1; q)] - [g(1; q) - g(-1; q)] \right. \\
\left. + [g(i; q) + g(-i; q)] - i[g(i; q) - g(-i; q)] \right. \\
\left. + [g(\zeta_8; q) + g(-\zeta_8; q)] - \zeta_8 [g(\zeta_8; q) - g(-\zeta_8; q)] \right. \\
\left. + i[g(\zeta_8^{-1}; q) + g(-\zeta_8^{-1}; q)] + \zeta_8^{-1} [g(\zeta_8^{-1}; q) - g(-\zeta_8^{-1}; q)] \right].
\]
Applying Corollary 2.7 to (3.13) and combining terms produces

\[ D(0, 8) = 1 + \frac{1}{8} \left[ -2 + 4qg(-q; q^4) \right. \]

\[ + \lim_{x \to 1} 2J_2 J_{1,4}^2 \left[ \frac{1}{xj(-q^3x^2; q^4)j(x^2; q^2)} - \frac{1}{j(-qx^2; q^4)j(x^2; q^2)} \right] \]

\[ + \left[ -2qg(q; q^4) + \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(i; q^2)} \right] i \left[ 2 + 2iqg(q; q^4) + \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(i; q^2)} \right] \]

\[ - i \left[ -2qg(-iq; q^4) + \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(-i; q^2)} \right] \]

\[ + \zeta_8 \left[ -2\zeta_8^{-1} - 2\zeta_8 qg(iq; q^4) + \zeta_8^{-1} \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(i; q^2)} \right] \]

\[ + \zeta_8^{-1} \left[ -2\zeta_8 - 2\zeta_8^{-1} qg(-iq; q^4) + \zeta_8 \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(-i; q^2)} \right] \]

\[ = 1 + \frac{1}{8} \left[ -8 - 4qg(q; q^4) + 4qg(-q; q^4) \right. \]

\[ + \frac{4J_2 J_{1,4}^2}{j(-iq; q^4)j(i; q^2)} + \lim_{x \to 1} 2J_2 J_{1,4}^2 \left[ \frac{j(-qx^2; q^4) - xj(-q^3x^2; q^4)}{xj(-q^3x^2; q^4)j(-qx^2; q^4)j(x^2; q^2)} \right] \]

\[ - 4iqg(iq; q^4) + 4iqg(-iq; q^4) - i \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(i; q^2)} + \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(-i; q^2)} \]

\[ + \frac{2J_2 J_{1,4}^2}{j(-iq; q^4)j(i; q^2)} \]

We rewrite the first quotient and use (2.2a) and (2.1g) to evaluate the expression inside the limit. We combine pairwise the last four quotients using (2.1b) and (2.1c). This gives

\[ D(0, 8) = \frac{1}{8} \left[ -4qg(q; q^4) + 4qg(-q; q^4) + \frac{2J_{1,2} J_{1,4}}{J_4} \right. \]

\[ - 4iqg(iq; q^4) + 4iqg(-iq; q^4) + \frac{4J_2 J_{1,4}^2}{j(-iq; q^4)j(-i; q^2)} + \frac{4J_2 J_{1,4}^2}{j(iq; q^4)j(i; q^2)} \]

Regrouping terms and combining the last two quotients gives

\[ D(0, 8) = \frac{1}{8} \left[ -4q \left[ g(q; q^4) - g(-q; q^4) \right] - 4iq \left[ g(iq; q^4) - g(-iq; q^4) \right] + \frac{2J_{1,2} J_{1,4}}{J_4} \right. \]
Using Corollary 2.7, rewriting the new theta quotients and collecting terms, we have

$$+rac{J_{1,2}J_{1,4}}{J_4} + \frac{4J_3J_{2,14}}{J_{2,8}J_{0,4}} \cdot \frac{J_8J_4}{J_{16}^4J_2} \cdot [j(-iq; q^4)j(-i; q^2) + j(iq; q^4)j(i; q^2)].$$

Using (2.1d) and noting that $j(iq^2; q^4) = j(-iq^2; q^4) = J_2^3/J_16$, we have

$$D(0, 8) = \frac{1}{8} \left[ -4q[g(q; q^4) - g(-q; q^4)] - 4iq[g(iq; q^4) - g(-iq; q^4)]
+ \frac{2\Tilde{J}_{1,2}J_{1,4}}{J_4} + \frac{J_{1,2}J_{1,4}}{J_4}
+ \frac{4J_3J_{2,14}}{J_{2,8}J_{0,4}} \cdot \frac{J_8J_4}{J_{16}^4J_2} \cdot \frac{J_2}{J_4} \cdot \frac{J_8^2}{J_{16}} \cdot 2J_{1,8}\Tilde{J}_{3,8},\right]$$

where we have used (2.3b). Rewriting the last term we have

$$D(0, 8) = \frac{1}{8} \left[ -4q[g(q; q^4) - g(-q; q^4)] - 4iq[g(iq; q^4) - g(-iq; q^4)]
+ \frac{2\Tilde{J}_{1,2}J_{1,4}}{J_4} + \frac{J_{1,2}J_{1,4}}{J_4}
+ \frac{4J_3J_{2,14}}{J_{2,8}J_{0,4}} \cdot \frac{J_8J_4}{J_{16}^4J_2} \cdot \frac{J_2}{J_4} \cdot \frac{J_8^2}{J_{16}} \cdot J_{1,8}\Tilde{J}_{3,8}.\right]$$

Using Corollary 2.7 rewriting the new theta quotients and collecting terms, we have

$$D(0, 8) = \frac{1}{8} \left[ -4q[ -2q^{-1} + 2qg(-q^2; q^{16}) + \frac{2J_8\Tilde{J}_{14,16}}{q\Tilde{J}_{14,16}J_{2,8}}]
- 4iq[2iq^{-1} + 2iqg(q^2; q^{16}) + \frac{2J_8\Tilde{J}_{4,16}}{iq\Tilde{J}_{4,16}J_{2,8}}]
+ \frac{2\Tilde{J}_{1,2}J_{1,4}}{J_4} + \frac{J_{1,2}J_{1,4}}{J_4}
+ \frac{4J_3J_{2,14}}{J_{2,8}J_{0,4}} \cdot \frac{J_8J_4}{J_{16}^4J_2} \cdot J_{1,8}\Tilde{J}_{3,8}\right]$$

$$= 2 + q^2g(q^2; q^{16}) - q^2g(-q^2; q^{16})
- \frac{\Tilde{J}_{4,8}\Tilde{J}_{6,16}}{J_4} - \frac{\Tilde{J}_{4,8}\Tilde{J}_{6,16}}{J_4}
+ \frac{\Tilde{J}_{4,8}\Tilde{J}_{6,16}}{4} \cdot \frac{J_{1,2}J_{1,4}}{J_4}
+ \frac{1}{8} \cdot \frac{J_{1,2}J_{1,4}}{J_4}
+ \frac{1}{2} \frac{J_8\Tilde{J}_{1,2}}{J_{16}} \cdot \frac{J_{1,8}\Tilde{J}_{3,8}}{J_4},$$

where we have rewritten products and combined terms.

Applying Corollary 2.7 to (5.16) and combining terms produces

$$D(1, 8) = -1 + \frac{1}{8} \left[ 2 - 4qg(-q; q^4)
- \lim_{x \to 1} 2J_2J_{1,4}^2 \left[ \frac{1}{xj(-q^3x^2; q^4)j(x^2; q^2)} - \frac{1}{j(-qx^2; q^4)j(x^2; q^2)} \right]\right]$$
\[ + \left[ -2qg(q; q^4) + \frac{2J_2 J_{1,4}^2}{J_{1,4} J_{0,2}} \right] - i \left[ 2i + 2iqg(q; q^4) + \frac{2J_2 J_{1,4}^2}{i J_{3,4} J_{0,2}} \right] \]
\[ + \left[ -2qg(-iq; q^4) + \frac{2J_2 J_{1,4}^2}{j(-iq; q^4) j(i; q^2)} \right] \]
\[ - \zeta_8 \left[ -2\zeta_8^{-1} - 2\zeta_8 qg(iq; q^4) + \zeta_8^{-1} \frac{2J_2 J_{1,4}^2}{j(-iq^3; q^4) j(i; q^2)} \right] \]
\[ + \left[ -2qg(iq; q^4) + \frac{2J_2 J_{1,4}^2}{j(iq; q^4) j(-i; q^2)} \right] \]
\[ - \zeta_8^{-1} \left[ -2\zeta_8 - 2\zeta_8^{-1} qg(-iq; q^4) + \zeta_8 \frac{2J_2 J_{1,4}^2}{j(iq^3; q^4) j(-i; q^2)} \right] \]
\[ = -1 + \frac{1}{8} \left[ 8 - 4qg(-q; q^4) \right. \]
\[ - 2q \left[ g(iq; q^4) + g(-iq; q^4) \right] + 2iq \left[ g(iq; q^4) - g(-iq; q^4) \right] \]
\[ - \frac{J_{1,2} J_{1,4}}{J_{1,4}} + \frac{2J_2 J_{1,4}^2}{j(-iq; q^4) j(i; q^2)} - \frac{2J_2 J_{1,4}^2}{j(iq; q^4) j(i; q^2)} \]
\[ + \frac{2J_2 J_{1,4}^2}{j(iq^3; q^4) j(-i; q^2)} - \frac{2J_2 J_{1,4}^2}{j(iq^3; q^4) j(-i; q^2)} \],

where we have used (2.2a) and (2.1g) to evaluate the limit. Next we have

\[ D(1, 8) = \frac{1}{8} \left[ -4qg(-q; q^4) - 2q \left[ g(iq; q^4) + g(-iq; q^4) \right] + 2iq \left[ g(iq; q^4) - g(-iq; q^4) \right] \right. \]
\[ - \frac{J_{1,2} J_{1,4}}{J_{1,4}} + (1 + i) \frac{2J_2 J_{1,4}^2}{j(-iq; q^4) j(i; q^2)} - (1 + i) \frac{2J_2 J_{1,4}^2}{j(iq; q^4) j(i; q^2)} \],

where we have combined theta quotients using (2.1b) and (2.1c). Combining fractions and using (2.2a) gives

\[ D(1, 8) = - \frac{1}{8} \left[ -4qg(-q; q^4) - 2q \left[ g(iq; q^4) + g(-iq; q^4) \right] + 2iq \left[ g(iq; q^4) - g(-iq; q^4) \right] \right. \]
\[ - \frac{J_{1,2} J_{1,4}}{J_{1,4}} + (1 + i) \frac{2J_2 J_{1,4}^2}{j(-iq; q^4) j(i; q^2)} \left[ j(iq; q^4) - j(-iq; q^4) \right] \]
\[ = \frac{1}{8} \left[ -4qg(-q; q^4) - 2q \left[ g(iq; q^4) + g(-iq; q^4) \right] - \frac{J_{1,2} J_{1,4}}{J_{1,4}} \right. \]
\[ + 2iq \left[ g(iq; q^4) - g(-iq; q^4) \right] + \frac{1 + i}{1 - i} \frac{2J_2 J_{1,4}^2 J_8}{J_{2,8} J_{4}^2 J_2 J_8} \left[ -2iq J_{1,4,16} \right] \]
\[
= \frac{1}{8} \left[ -4qg(-q; q^4) - 2q \left( g(iq; q^4) + g(-iq; q^4) \right) \right. \\
+ 2iq \left[ g(iq; q^4) - g(-iq; q^4) \right] - \frac{J_{1.2}J_{1.4}}{J_4} + 4q \frac{J_{1.2}J_{14.16}}{J_4},
\]
where we have simplified the last quotient. Proposition 2.6 and Corollary 2.7 yield
\[
D(1, 8) = \frac{1}{8} \left[ -4q^{-1} - qg(-q^2; q^{16}) - q^4g(-q^6; q^{16}) - \frac{J_{8}J_{8.16}^2}{qJ_{1.4}J_{6.8}} \right]
- 2q \left[ -2q^4g(q^6; q^{16}) + \frac{2J_{8}J_{4.16}^2}{J_{6.16}J_{2.8}} \right]
+ 2iq \left[ 2iq^{-1} + 2iqg(q^2; q^{16}) + \frac{2J_{8}J_{4.16}^2}{iqJ_{14.16}J_{2.8}} \right] - \frac{J_{1.2}J_{1.4}}{J_4} + 4q \frac{J_{1.2}J_{14.16}}{J_4}
\]
\[
= -1 - \frac{1}{2} q^2g(q^2; q^{16}) + \frac{1}{2} q^4g(-q^2; q^{16}) + \frac{1}{2} q^5g(q^6; q^{16}) + \frac{1}{2} q^5g(-q^6; q^{16})
+ \frac{1}{2} \frac{J_{4.8}J_{1.4}}{J_4} - \frac{1}{2} q \frac{J_{4.8}J_{2.16}}{J_4} + \frac{1}{2} q \frac{J_{4.8}J_{6.16}}{J_4} - \frac{1}{8} J_{1.2}J_{1.4} + \frac{1}{2} q \frac{J_{1.2}J_{14.16}}{J_4},
\]
where we have rewritten products and collected terms.

6. Proof of Theorem 1.3

Recalling (5.1) and (5.5), we have
\[
D(0, 8) - D(4, 8)
= 2 + 2q^2g(q^2; q^{16}) - \frac{J_{4.8}J_{28.64}}{J_4} + q^4 \frac{J_{0.8}J_{52.64}}{J_4} - q^6 \frac{J_{0.8}J_{20.64}}{J_4} + q \frac{J_{0.8}J_{28.64}}{J_4}
- q^2 \frac{J_{0.8}J_{20.64}}{J_4} + q^6 \frac{J_{4.8}J_{60.64}}{J_4} + q^3 \frac{J_{4.8}J_{52.64}}{J_4} - q^7 \frac{J_{0.8}J_{60.64}}{J_4}
= 2 + 2q^2g(q^2; q^{16}) - \frac{J_{4.8}(J_{28.64} - q^6J_{60.64})}{J_4} - q^2 \frac{J_{0.8}(J_{20.64} - q^2J_{52.64})}{J_4}
- q \frac{J_{4.8}(J_{20.64} - q^2J_{52.64})}{J_4} + q^6 \frac{J_{0.8}(J_{28.64} - q^6J_{60.64})}{J_4}
= 2 + 2q^2g(q^2; q^{16}) - \frac{J_{4.8}J_{6.16}}{J_4} - q^2 \frac{J_{0.8}J_{14.16}}{J_4} - \frac{J_{4.8}J_{14.16}}{J_4} + \frac{J_{0.8}J_{6.16}}{J_4}
= 2 + 2q^2g(q^2; q^{16}) - \frac{1}{J_4} \left[ J_{4.8}J_{6.16} + q^2J_{0.8}J_{14.16} \right] + \frac{1}{J_4} \left[ J_{0.8}J_{6.16} - J_{4.8}J_{14.16} \right],
\]
where we have regrouped terms, used (2.22), and regrouped terms again. Using (2.5) with \(x \mapsto -1, q \mapsto -q^2\) and (2.4) with \(x \mapsto 1, q \mapsto -q^2\) yields
\[
D(0, 8) - D(4, 8)
\]
\[ = 2 + 2q^2g(q^2; q^{16}) - \frac{1}{J_4} j(-q^2; -q^6) \frac{J_{6,8} J_{14,16}}{J_8} + q \cdot \frac{1}{J_4} j(-q^2; -q^6) J_{6,8} J_{14,16} \]
\[ = 2 + 2q^2g(q^2; q^{16}) - \frac{1}{J_4} j(-q^2; q^{12}) j(q^6; q^{12}) \frac{J_{6,16}^2}{J_2} [J_{6,16} - qJ_{14,16}] \]
\[ = 2 + 2q^2g(q^2; q^{16}) - \frac{J_{2,4} J_{14,16}}{J_4} + q \frac{J_{2,4} J_{14,16}}{J_4}, \]

where we have regrouped terms, used (2.1e) and then simplified the product.

Recalling (5.2) and (5.4), we have

\[ D(1, 8) - D(3, 8) = -1 - q^2g(q^2; q^{16}) + q^5g(q^6; q^{16}) \]
\[ + \frac{J_{4,8} J_{28,64}}{J_4} - q^4 J_{0,8} J_{52,64} \]
\[ = -1 - q^2g(q^2; q^{16}) + q^5g(q^6; q^{16}) \]
\[ + \frac{J_{4,8} J_{28,64}}{J_4} - q^2 J_{0,8} J_{52,64} \]
\[ = -1 - q^2g(q^2; q^{16}) + q^5g(q^6; q^{16}) + \frac{J_{4,8} J_{14,16}}{J_4} + \frac{J_{4,8} J_{14,16}}{J_4} \]
\[ = -1 - q^2g(q^2; q^{16}) + q^5g(q^6; q^{16}) + \frac{J_{4,8} J_{14,16}}{J_4} + \frac{J_{4,8} J_{14,16}}{J_4}, \]

where we have regrouped terms, used (2.2a), and regrouped terms again. Using (2.5) with
\[ x \mapsto -1, \ q \mapsto -q^2 \] and simplifying with (2.1c) gives
\[ D(1, 8) - D(3, 8) = -1 + q^5g(q^6; q^{16}) - q^2g(q^2; q^{16}) + \frac{1}{J_4} j(-q^2; -q^6) J_{6,8} J_{14,16} \]
\[ = -1 + q^5g(q^6; q^{16}) - q^2g(q^2; q^{16}) + \frac{J_{2,4} J_{14,16}}{J_4}. \]

7. Proof of Theorem 1.5

The three identities have similar proofs, so we only do the first. Using (2.12), we have

\[ D_C(0, 4) = \frac{1}{4} \sum_{j=1}^{3} i^{-0-j} \frac{(q)_\infty}{(i^j q)_{\infty}(i^{-j} q)_{\infty}} = \frac{1}{4} \left[ \frac{(q)_{\infty}}{(-q^2; q^2)_{\infty}} + \frac{(q)_{\infty}}{(-q^2; q^2)_{\infty}} + \frac{(q)_{\infty}}{(-q^2; q^2)_{\infty}} \right] \]
\[ = \frac{1}{4} \left[ \frac{2}{J_4} J_{1,4} + \frac{J_3}{J_2} \right] = \frac{1}{2} \frac{J_{1,2} J_{1,4}}{J_4} + \frac{1}{4} \frac{J_{1,2} J_{1,4}}{J_4}. \] (7.1)

Using (2.2a) on both theta functions in the numerator and expanding gives
\[ \frac{J_{1,2} J_{1,4}}{J_4} = \frac{1}{J_4} \cdot J_{4,8} J_{6,16} - q^2 J_{0,8} J_{14,16} \]
\[ + q \cdot \frac{J_{4,8} J_{14,16} - J_{0,8} J_{6,16}}{J_4}. \] (7.2)

Rewriting (7.1) with (7.2) and (3.4) and collecting terms produces (1.16).
8. On crank deviations modulo 8

We have analogous dissections for crank deviations modulo 8.

**Theorem 8.1.** We have the following 4-dissections:

\[
D_C(0, 8) = \vartheta_8(3, -1, 1, -3, -1, 3, 1, -3) + \vartheta'_8(1, -1, -1, 1), \tag{8.1}
\]

\[
D_C(1, 8) = D_C(7, 8) = \vartheta_8(-1, -1, 1, -1, -1, 1, -1, 1) + \vartheta'_8(0, 1, 0, -1), \tag{8.2}
\]

\[
D_C(2, 8) = D_C(6, 8) = \vartheta_8(-1, 3, -3, 1, 3, -3, 1, -3), \tag{8.3}
\]

\[
D_C(3, 8) = D_C(5, 8) = \vartheta_8(-1, -1, 1, -1, -1, 1, -1, 1) + \vartheta'_8(0, -1, 0, 1), \tag{8.4}
\]

\[
D_C(4, 8) = \vartheta_8(3, -1, 1, -3, -1, 3, 1, -3) + \vartheta'_8(-1, 1, 1, -1), \tag{8.5}
\]

where

\[
\vartheta_8(a_0, a_1, a_2, a_3, a_4, a_5, a_6, a_7) := \frac{1}{8J_4} \left[ a_0 \cdot J_{4,8} J_{28,64} + a_1 \cdot q^4 J_{0,8} J_{52,64} + a_2 \cdot q^{14} J_{0,8} J_{20,64} + a_3 \cdot q J_{0,8} J_{28,64} + a_4 \cdot q^2 J_{0,8} J_{20,64} + a_5 \cdot q^6 J_{4,8} J_{60,64} + a_6 \cdot q^4 J_{4,8} J_{52,64} + a_7 \cdot q^8 J_{0,8} J_{60,64} \right], \tag{8.6}
\]

and

\[
\vartheta'_8(c_0, c_1, c_2, c_3) := \frac{1}{2J_4} \left[ c_0 \cdot J_{4,8} J_{28,64} + c_1 \cdot q J_{4,8} J_{20,64} + c_2 \cdot q^2 J_{4,8} J_{60,64} + c_3 \cdot q^3 J_{4,8} J_{52,64} \right]. \tag{8.7}
\]

**Proof of Theorem 8.1.** The proofs for each of the five identities are all similar, so we prove only the first and third identities. Using (2.12) and collecting like terms, we have

\[
D_C(0, 8) = \frac{1}{8} \left[ 2 \frac{(q)_\infty}{(\zeta_8 q; q)_\infty (\zeta_8 q; q)_\infty} + 2 \frac{(q)_\infty}{(-\zeta_8 q; q)_\infty (-\zeta_8 q; q)_\infty} \right] + 2 \frac{(q)_\infty}{(iq q; q)_\infty (iq q; q)_\infty} + 2 \frac{(q)_\infty}{(q_q; q)_\infty (q_q; q)_\infty}
\]

\[
= \frac{1}{8} \left[ \frac{(1 - \zeta_8) J_4^2}{j(\zeta_8; q)} + 2 \frac{(1 + \zeta_8) J_4^2}{j(-\zeta_8; q)} + 2 \frac{J_{1,2} J_{1,4}}{J_4} + \frac{J_{1,2} J_{1,4}}{J_4} \right],
\]

where we have rewritten the four terms using our theta function notation.

\[
D_C(0, 8) = \frac{1}{8} \left[ 2 \frac{J_4^2}{j(\zeta_8; q) j(-\zeta_8; q)} \left( (1 - \zeta_8) j(-\zeta_8; q) + (1 + \zeta_8) j(\zeta_8; q) \right) \right.
\]

\[
+ 2 \frac{J_{1,2} J_{1,4}}{J_4} + \frac{J_{1,2} J_{1,4}}{J_4} \left. \right]
\]

\[
= \frac{1}{8} \left[ \frac{2 J_4^2}{j(iq; q^4) J_1^2} \left( 1 - \zeta_8 \right) \left( j(-q i; q^4) + \zeta_8 j(qi; q^4) \right) \right.
\]

\[
+ (1 + \zeta_8) \left( j(-q i; q^4) - \zeta_8 j(qi; q^4) \right) \right] + 2 \frac{J_{1,2} J_{1,4}}{J_4} + \frac{J_{1,2} J_{1,4}}{J_4} \]
\[
\frac{1}{8} \left[ 4 \frac{J_1^2 J_4 J_2}{1 - i J_2 J_8 J_1^2} \left( j(-qi; q^4) - ij(qi; q^4) \right) + 2 \frac{J_{1,2} J_{1,4}}{J_4} + \frac{J_{1,2} J_{1,4}}{J_4} \right],
\]

where we have used identities \((2.1g)\) and \((2.2a)\), distributed the products, and used the fact that \(j(i; q^2) = (1 - i)J_2 J_8/J_4\). Using \((2.2a)\) again

\[
D_C(0, 8) = \frac{1}{8} \left[ 4 \frac{J_1^2 J_4 J_2}{1 - i J_2 J_8 J_1^2} \left( J_{6,16} + qiJ_{14,16} - i \left( J_{6,16} - qiJ_{14,16} \right) \right) + 2 \frac{J_{1,2} J_{1,4}}{J_4} + \frac{J_{1,2} J_{1,4}}{J_4} \right]
\]

\[
= \frac{1}{8} \left[ 4 \frac{J_1^2 J_4 J_2}{1 - i J_2 J_8 J_1^2} \left( (1 - i)J_{6,16} - (1 - i)qJ_{14,16} \right) + 2 \frac{J_{1,2} J_{1,4}}{J_4} + \frac{J_{1,2} J_{1,4}}{J_4} \right]
\]

\[
= \frac{1}{2} \frac{J_{1,8} J_{6,16}}{J_4} - \frac{q}{2} \frac{J_{1,2} J_{1,4}}{J_4} + \frac{1}{4} \frac{J_{1,2} J_{1,4}}{J_4} + \frac{1}{8} \frac{J_{1,2} J_{1,4}}{J_4}.
\]

Rewriting \((8.8)\) with \((7.2)\) and \((3.4)\) and collecting terms produces \((1.16)\) yields

\[
D_C(0, 8) = \frac{3}{8} \frac{J_{1,8} J_{6,16}}{J_4} - \frac{1}{8} q \frac{J_{0,8} J_{14,16}}{J_4} + \frac{1}{8} \frac{J_{1,8} J_{14,16}}{J_4} - \frac{3}{8} q \frac{J_{0,8} J_{6,16}}{J_4}
\]

\[
+ \frac{1}{2} \frac{J_{1,8} J_{6,16}}{J_4} - \frac{q}{2} \frac{J_{1,8} J_{2,16}}{J_4}.
\]

Rewriting \((8.9)\) using \((5.14)\) and collecting terms finally results in our 4-dissection \((8.1)\).

Using \((2.12)\) and noting pairwise cancellation,

\[
D_C(2, 8) = -\frac{1}{4} \frac{(q)_\infty}{(iq; q)_\infty} \frac{(-iq; q)_\infty}{q} + \frac{1}{8} \frac{(q)_\infty}{(-q^2; q^2)_\infty} + \frac{1}{8} \frac{(q)_\infty}{(-q; q^2)_\infty}
\]

\[
= -\frac{1}{4} \frac{J_1 J_2}{J_4} + \frac{1}{8} \frac{J_1^2}{J_4} = -\frac{1}{4} \frac{J_1 J_2}{J_4} + \frac{1}{8} \frac{J_{1,2} J_{1,4}}{J_4}.
\]

Rewriting \((8.10)\) with theta-dissections \((7.2)\) and \((3.4)\) and collecting terms produces

\[
D_C(2, 8) = -\frac{1}{8} \frac{J_{1,8} J_{6,16}}{J_4} + \frac{3}{8} q^2 \frac{J_{0,8} J_{14,16}}{J_4} - \frac{3}{8} \frac{J_{1,8} J_{14,16}}{J_4} + \frac{1}{8} \frac{J_{0,8} J_{6,16}}{J_4}.
\]

Rewriting \((8.11)\) with \((5.14)\), we arrive our 4-dissection \((8.3)\).

9. On Rank-Crank Identities of Lewis and Santa-Gadea

Theorems \((5.1)\) and \((8.1)\) prove the relations \((1.3a) - (1.3j)\). We give some examples.

### 9.1. Identities \((1.3g) - (1.3j)\)

To prove \((1.3g)\) and \((1.3h)\), we do not need to compute the entire 4-dissection for \(D(3, 8)\). We only need to determine which terms contribute to \(q\)-powers \(q^n\) where \(n \equiv 0, 1 \pmod{4}\). We see that the first line of \((5.4)\) does not contribute. Using Corollary \((2.7)\) we note that the two expressions

\[
q^2 g(q^2; q^{16}) + q^2 g(-q^2; q^{16}) = -2q^{18} g(-q^{20}; q^{64}) + 2q^2 \frac{J_{32} J_{16,64}^2}{J_{20,64} J_{4,32}},
\]

(9.1)
\[ q^5 g(q^6; q^{16}) - q^5 g(-q^6; q^{16}) = -2q^{-1} + 2q^3 g(-q^4; q^{64}) + 2q^{-1} \frac{J_{32} J_{16,64}^2}{J_{60,64} J_{12,32}} \]  

(9.2)

are supported on \( q \)-powers \( q^n \) where \( n \equiv 2, 3 \mod 4 \) respectively. Hence contributions can only come from the last two lines in (5.4). Comparing \( q \)-powers \( q^n \) where \( n \equiv 0 \mod 4 \) in (8.3) and (5.4) proves (1.3g). Similarly, comparing \( q \)-powers \( q^n \) where \( n \equiv 1 \mod 4 \) in (8.3) and (5.4) proves (1.3h).

For (1.3d) and (1.3f), we proceed analogously. We first note that the top line of \( D(1, 8) \) in (5.2) does not contribute. Using Corollary 2.7, we see that

\[ q^2 g(q^2; q^{16}) - q^2 g(-q^2; q^{16}) = -2 + 2q^{12} g(-q^{12}; q^{64}) + 2 \frac{J_{32} J_{16,64}^2}{J_{52,64} J_{14,32}}. \]  

(9.3)

\[ q^5 g(q^6; q^{16}) + q^5 g(-q^6; q^{16}) = -2q^{21} g(-q^{28}; q^{64}) + 2q^5 \frac{J_{32} J_{16,64}^2}{J_{28,64} J_{12,32}} \]  

(9.4)

are supported on \( q \)-powers \( q^n \) where \( n \equiv 0, 1 \mod 4 \) respectively. Any potential contribution can only come from the last two lines in (5.2). Comparing \( q \)-powers \( q^n \) where \( n \equiv 2 \mod 4 \) in (8.3) and (5.2) proves (1.3d). Likewise, comparing \( q \)-powers \( q^n \) where \( n \equiv 3 \mod 4 \) in (8.3) and (5.2) proves (1.3f).

### 9.2. Identity 1.3d

Recalling (8.1), (8.2), (8.4) and (8.5), we have

\[ D_C(0, 8) + D_C(1, 8) \]

\[ = \frac{1}{4} \cdot \frac{T_{4,8} T_{28,64}}{J_4} - \frac{1}{4} \cdot q^4 \frac{T_{0,8} T_{52,64}}{J_4} + \frac{1}{4} \cdot q \frac{T_{4,8} T_{20,64}}{J_4} - \frac{1}{4} \cdot q^3 \frac{T_{0,8} T_{28,64}}{J_4} \]

\[ - \frac{1}{4} \cdot q^2 \frac{T_{0,8} T_{20,64}}{J_4} + \frac{1}{4} \cdot q^6 \frac{T_{4,8} T_{60,64}}{J_4} + \frac{1}{4} \cdot q^3 \frac{T_{4,8} T_{52,64}}{J_4} - \frac{1}{4} \cdot q^7 \frac{T_{0,8} T_{60,64}}{J_4} \]

\[ + \frac{1}{2} \cdot \frac{J_{4,8} T_{28,64}}{J_4} - \frac{1}{2} \cdot q^6 \frac{J_{4,8} T_{60,64}}{J_4}. \]  

(9.5)

\[ D_C(3, 8) + D_C(4, 8) \]

\[ = \frac{1}{4} \cdot \frac{T_{4,8} T_{28,64}}{J_4} - \frac{1}{4} \cdot q^4 \frac{T_{0,8} T_{52,64}}{J_4} + \frac{1}{4} \cdot q \frac{T_{4,8} T_{20,64}}{J_4} - \frac{1}{4} \cdot q^3 \frac{T_{0,8} T_{28,64}}{J_4} \]

\[ - \frac{1}{4} \cdot q^2 \frac{T_{0,8} T_{20,64}}{J_4} + \frac{1}{4} \cdot q^6 \frac{T_{4,8} T_{60,64}}{J_4} + \frac{1}{4} \cdot q^3 \frac{T_{4,8} T_{52,64}}{J_4} - \frac{1}{4} \cdot q^7 \frac{T_{0,8} T_{60,64}}{J_4} \]

\[ - \frac{1}{2} \cdot \frac{J_{4,8} T_{28,64}}{J_4} + \frac{1}{2} \cdot q^6 \frac{J_{4,8} T_{60,64}}{J_4}. \]  

(9.6)

Comparing \( q \)-powers \( q^n \) where \( n \equiv 1 \mod 4 \) in (9.5) and (9.6) proves the first equality in (1.3d).

Noting (5.2) and (5.3), we have

\[ D(1, 8) + D(2, 8) \]
and (34)–(37) respectively, where we used $M = 5$ and $7$. The first half of each theorem is just a rewritten (9, (12)–(14)) and (9, (9.1) and (9.2)). Comparing $q$-powers $q^n$ where $n \equiv 1 \pmod{4}$ in (9.6) and (9.7) proves the second equality in (1.3d). Noting (5.4) and (5.5), we have

$$D(3, 8) + D(4, 8)$$

$$= -1 - \frac{1}{2} q^2 g(q^2; q^{16}) + \frac{1}{2} q^2 g(-q^2; q^{16}) + \frac{1}{2} q^5 g(q^6; q^{16}) - \frac{1}{2} q^5 g(-q^6; q^{16})$$

$$+ \frac{3}{4} \cdot \frac{J_{4,8} J_{2,64}}{J_4} - \frac{3}{4} q^4 \frac{J_{0,8} J_{52,64}}{J_4} + \frac{1}{4} q \frac{J_{4,8} J_{20,64}}{J_4} - \frac{1}{4} q \frac{J_{0,8} J_{28,64}}{J_4}$$

$$+ \frac{1}{4} q^2 \frac{J_{0,8} J_{20,64}}{J_4} - \frac{1}{4} q^6 \frac{J_{4,8} J_{60,64}}{J_4} + \frac{1}{4} q^3 \frac{J_{4,8} J_{52,64}}{J_4} - \frac{1}{4} q^7 \frac{J_{0,8} J_{60,64}}{J_4}.$$
Theorem 10.2. We have the following 7-dissections:

\[
D(0, 7) = 2 \cdot \vartheta_7(-4, 3, -1, 2, 1, -2) + 2 \cdot G_7(1, 0, 0),
\]

(10.10)

\[
D(1, 7) = D(6, 7) = \vartheta_7(6, -1, 5, -3, 2, 3) + G_7(-1, 1, 0),
\]

(10.11)

\[
D(2, 7) = D(5, 7) = \vartheta_7(-1, -1, -2, 4, -5, 3) + G_7(0, -1, 1),
\]

(10.12)

\[
D(3, 7) = D(4, 7) = \vartheta_7(-1, -1, -2, -3, 2, -4) + G_7(0, 0, -1),
\]

(10.13)

and

\[
D_C(0, 7) = 2 \cdot \vartheta_7(3, -4, -1, 2, 1, -2),
\]

(10.14)

\[
D_C(1, 7) = D_C(6, 7) = \vartheta_7(-1, 6, -2, -3, -5, 3),
\]

(10.15)

\[
D_C(2, 7) = D_C(5, 7) = \vartheta_7(-1, -1, 5, -3, 2, -4),
\]

(10.16)

\[
D_C(3, 7) = D_C(4, 7) = \vartheta_7(-1, -1, -2, 4, 2, 3),
\]

(10.17)

where

\[
\vartheta_7(a_0, a_1, a_2, a_3, a_4, a_5) := \frac{1}{7J_5} \left[ a_0 \cdot J_{10,25}^3 + a_1 \cdot qJ_{5,25} J_{10,25}^2 + a_2 \cdot q^2 J_{5,25}^2 J_{10,25} + a_3 \cdot q^3 J_{5,25}^3 \right],
\]

(10.18)

and

\[
G_7(b_0, b_2, b_6) := b_0 \cdot (1 + q^{7}g(q^7; q^{49})) + b_2 \cdot q^{16}g(q^{21}; q^{49}) + b_6 \cdot q^{13}g(q^{14}; q^{49}).
\]

(10.19)

Proof of Theorem 10.1. The proofs of identities (10.5)–(10.7) are all similar, so we do only (10.6) as an example. The \( m = 5 \) specialization of (2.1f) with (2.16) and (2.17) gives

\[
j(\zeta_5; q) = J_{10,25} - \zeta_5 J_{15,25} + q\zeta_5^2 J_{20,25} + q^6\zeta_5^4 J_{30,25} = (1 - \zeta_5)J_{10,25} + q\zeta_5^2(1 - \zeta_5^2)J_{5,25}.
\]

(10.20)

Specializing the quintuple product identity (2.1d) with \( q \mapsto q^{25} \) yields

\[
j(q^{25}x^3; q^{75}) + xj(q^{50}x^3; q^{75}) = \frac{J_{25}j(x^2; q^{25})}{j(x; q^{25})}.
\]

(10.21)

Using (2.1d) and writing the common denominator, we have

\[
D_C(1, 5) = \frac{1}{5} \left[ \frac{(\zeta_5^{-1} + \zeta_5^{-4})(q)_{\infty}}{(\zeta_5 q)_{\infty}(\zeta_5^{-1} q)_{\infty}} + \frac{(\zeta_5^{-2} + \zeta_5^{-3})(q)_{\infty}}{(\zeta_5 q)_{\infty}(\zeta_5^{-2} q)_{\infty}} \right]
\]

\[
= \frac{J_5^2}{5} \left[ \frac{(1 - \zeta_5)(\zeta_5 + \zeta_5^4)}{j(\zeta_5; q)} + \frac{(1 - \zeta_5^2)(\zeta_5^2 + \zeta_5^3)}{j(\zeta_5^2; q)} \right]
\]
where we have used product rearrangements to rewrite the denominator:
\[ j(\zeta; q)j(\zeta^2; q) = (1 - \zeta)(1 - \zeta^2)J_1J_5. \] (10.22)

Using (10.20) and simplifying gives
\[
D_C(1, 5) = \frac{1}{5} \frac{J_1}{J_5} \left[ (1 - \zeta)(\zeta + \zeta^4)(1 - \zeta^2) \right] \left[ (1 - \zeta)(\zeta + \zeta^4)(1 - \zeta^2) \right] \left[ (1 - \zeta)(1 - \zeta^2) \right] \left[ (1 - \zeta)(1 - \zeta^2) \right]
\]
\[ + (1 - \zeta^2)(\zeta + \zeta^4)(1 - \zeta^2) \left[ (1 - \zeta)(1 - \zeta^2) \right] \left[ (1 - \zeta)(1 - \zeta^2) \right] \left[ (1 - \zeta)(1 - \zeta^2) \right] \left[ (1 - \zeta)(1 - \zeta^2) \right]. \] (10.23)

The \( m = 5 \) specialization of (2.1f) followed by (2.1b), (2.14) and (10.21) yields
\[
j(q, q^3) = J_{35.75} - qJ_{50.25} + q^5J_{65.75} - q^{12}J_{80.75} + q^{22}J_{95.75}
\]
\[ = J_{35.75} + q^5J_{65.75} - q^2(J_{20.75} + q^{10}J_{80.75}) - qJ_{25}
\]
\[ = J_{25}J_{10.25} - q^2J_{25}J_{20.25} - qJ_{25}. \] (10.24)

Note that \( J_1 = j(q; q^3) \) and substitute (10.24) into (10.23):
\[
D_C(1, 5) = \frac{1}{5} \frac{J_25}{J_5} \left[ J_{10.25} - q^2J_{25}J_{20.25} - q \right] \left[ J_{10.25} + 3qJ_{25} \right]
\]
\[ = \frac{1}{5} \frac{J_25}{J_5} \left[ J_{10.25} - q^2J_{25}J_{20.25} - q \right] \left[ J_{10.25} + 3qJ_{25} \right]. \] (10.25)

The result then follows from the product rearrangement \( J_{25}J_{10.25} = J_5J_{25}. \)

**Proof of Theorem 10.2** The proof is much the same as the previous one, so we provide only an outline. Using (2.12) and writing the summands over a common denominator
\[
D_C(a, 7) = \frac{1}{7} \frac{1}{J_7} \left[ (1 - \zeta_7)(1 - \zeta_7^2)(1 - \zeta_7^3) \right] \left[ (1 - \zeta_7)(\zeta_7^6 + \zeta_7^a)j(\zeta_7^2; q)j(\zeta_7^3; q) \right]
\]
\[ + (1 - \zeta_7^2)(\zeta_7^{2a} + \zeta_7^{-2a})j(\zeta_7; q)j(\zeta_7^3; q) + (1 - \zeta_7^3)(\zeta_7^{3a} + \zeta_7^{-3a})j(\zeta_7; q)j(\zeta_7^2; q), \] (10.26)

where we have used product rearrangements to rewrite the denominator:
\[ j(\zeta; q)j(\zeta^2; q)j(\zeta^3; q) = (1 - \zeta)(1 - \zeta^2)(1 - \zeta^3)J_7J_7. \] (10.27)

The \( m = 7 \) specialization of (2.1f) with (2.1b) and (2.1c) gives
\[ j(\zeta; q) = (1 - \zeta_7)J_{21.49} - q\zeta_7^{-1}(1 - \zeta_7^3)J_{14.49} - q^3\zeta_7^3(1 - \zeta_7^2)J_{7.49}. \] (10.28)
Inserting \((10.28)\) along with analogs corresponding to \(\zeta_7 \rightarrow \zeta_7^2\) and \(\zeta_7 \rightarrow \zeta_7^3\) into \((10.26)\) and collecting coefficients of the theta products of \((10.18)\) gives the desired results. \(\square\)

11. On Conjectures of Richard Lewis

Lewis [11] Conjecture 1] conjectured 4-dissections for the one hundred combinations of
\[
\sum_{n=0}^{\infty} \left( N(i, 8; 4n + k) - C(j, 8; 4n + k) \right) q^n, \text{ where } 0 \leq i, j \leq 4, \ 0 \leq k \leq 3. \tag{11.1}
\]
Frank Garvan has pointed out that Proposition 2.6 strengthens Theorem 5.1 to a 4-dissection. Using the new version of Theorem 5.1, Theorem 8.1, and his thetaids package, he verified all one hundred conjectures [6]. The truth of the one-hundred identities of [11, Conjecture 1] implies the veracity of the thirty-seven conjectured rank-crank inequalities [11, Conjecture 2] and the four evenness conjectures [11, Conjecture 3].

We give an example to demonstrate how Theorems 5.1 and 8.1 resolve Lewis’s conjectures. Identities (0)-(3) of [11, Conjecture 2] are equivalent to the following:

**Proposition 11.1.** We have the following 4-dissection:
\[
D(0, 8) - D_C(0, 8) = 2q^{12} g(-q^{12}; q^{64}) - 2q^8 \frac{T_{2, 64}^2 T_{20, 64}^2 T_{28, 64}^2 T_{32, 64}^2}{J_{8, 64}^2 J_{16, 64}^2 J_{24, 64}^2 J_{32, 64}^2} + 2q \cdot \frac{T_{12, 64}^2 T_{20, 64}^2 T_{28, 64}^2 T_{32, 64}^2}{J_{8, 64}^2 J_{16, 64}^2 J_{24, 64}^2 J_{32, 64}^2} - 2q^2 \cdot q^3 \frac{T_{2, 64}^2 T_{12, 64}^2 T_{20, 64}^2 T_{28, 64}^2 T_{32, 64}^2}{J_{8, 64}^2 J_{16, 64}^2 J_{24, 64}^2 J_{32, 64}^2} + 2q^3 \cdot q^4 \frac{T_{4, 64}^2 T_{12, 64}^2 T_{20, 64}^2 T_{28, 64}^2 T_{32, 64}^2}{J_{8, 64}^2 J_{16, 64}^2 J_{24, 64}^2 J_{32, 64}^2}.
\tag{11.2}
\]

The truth of \((11.2)\) implies three rank-crank inequalities (1)-(3) of [11, Conjecture 2]:

**Proposition 11.2.** We have the following inequalities
\[
N(0, 8; 4n + 1) \geq 2 C(0, 8; 4n + 1), \tag{11.3}
\]
\[
N(0, 8; 4n + 2) \leq 2 C(0, 8; 4n + 2), \tag{11.4}
\]
\[
N(0, 8; 4n + 3) \geq 1 C(0, 8; 4n + 3), \tag{11.5}
\]
where \(A_n > B_n\) means \(A_n \geq B_n\) for all \(n \in \mathbb{N}\) and \(A_n > m B_n\) means \(A_n \geq B_n\) for all \(n \geq m\).

**Proof of Proposition 11.1.** We recall Theorems 5.1 and 8.1 and identity (9.3). Expanding \(T_{4, 8}, T_{0, 8}, \text{ and } T_{4, 8}\) with (2.2a) gives
\[
D(0, 8) - D_C(0, 8) = 2q^{12} g(-q^{12}; q^{64}) + 2q^{12} T_{32, 64}^2 T_{20, 64}^2 T_{16, 64}^2 T_{32, 64}^2 - 2q^{16} T_{16, 64}^2 T_{28, 64}^2 T_{28, 64}^2 T_{32, 64}^2 - q^4 T_{0, 32}^2 T_{28, 64}^2 T_{28, 64}^2 \tag{11.6}
\]
Proving Proposition [11.1] is then reduced to proving the four identities:

\[
2 \frac{J_{32} J_{16,64}}{J_{52,64} J_{4,32}} - 2 \frac{J_{16,32} J_{28,64}}{J_4} - q^4 \frac{J_{0,32} J_{28,64}}{J_4} + 2q^4 \frac{J_{8,32} J_{52,64}}{J_4} = -2q^8 \frac{J^2_{8,64} J^2_{20,64} J_{28,64} J^2_{4,32}}{J_{8,64} J_{16,64} J^2_{24,64} J_{32,64}},
\]  
(11.7a)

\[
2 \frac{J_{8,32} J_{28,64}}{J_4} - q^4 \frac{J_{0,32} J_{20,64}}{J_4} = 2 \frac{J^2_{12,64} J_{20,64} J^2_{28,64} J^2_{4,32}}{J^2_{8,64} J_{16,64} J^2_{24,64} J^2_{32,64}},
\]  
(11.7b)

\[
q^8 \frac{J_{0,32} J_{60,64}}{J_4} = 2q^8 \frac{J^2_{4,64} J_{12,64} J_{20,64} J^2_{28,64} J^2_{4,32}}{J^2_{8,64} J_{16,64} J^2_{24,64} J^2_{32,64}},
\]  
(11.7c)

\[
q^4 \frac{J_{0,32} J_{52,64}}{J_4} = 2q^4 \frac{J^2_{4,64} J^2_{12,64} J_{20,64} J^2_{28,64} J^2_{4,32}}{J^2_{8,64} J_{16,64} J^2_{24,64} J^2_{32,64}}.
\]  
(11.7d)

We proceed in the order of difficulty. Identities (11.7c) and (11.7d) are the easiest and are just elementary product rearrangements.

We prove identity (11.7d). Straightforward product rearrangements yield

\[
J_4 = J_{4,12} = \frac{J_{8,64} J_{16,64} J^2_{24,64} J_{32,64}}{J^2_{4,64} J_{12,64} J_{20,64} J_{28,64} J_{64}}.
\]  
(11.8)

Using (11.8) and simplifying, Identity (11.7b) is then seen to be equivalent to

\[
2 \frac{J_{8,32} J_{28,64}}{J_4} - q^4 \frac{J_{0,32} J_{20,64}}{J_4} = 2 \frac{J_{12,64} J_{28,64} J_{32,128}}{J^2_{4,64}},
\]  
(11.9)

which is equivalent to

\[
J_{4,64} J_{8,32} J_{28,64} - q^4 J_{4,64} J_{20,64} J_{32,128} = J_{12,64} J_{28,64} J_{32,128}.
\]  
(11.10)

Identity (11.10) is easily verified with (2.3a) and product rearrangements:

\[
J_{4,64} J_{8,32} J_{28,64} = J_{12,64} J_{28,64} J_{32,128} + q^4 J_{4,64} J_{20,64} J_{32,128}
\]  
(11.11)

\[
= J_{32,128} (J_{12,64} J_{28,64} + q^4 J_{4,64} J_{20,64}) = J_{32,128} J_{4,12} J_{8,32}.
\]

We prove identity (11.7b). Using (11.8) and simplifying, (11.7b) is then equivalent to

\[
\frac{J_{16,32} J_{4,16} J_{8,32} J_{32,128}}{J_{4,32} J_{12,64}} - J_{16,32} J_{28,64} - q^4 J_{32,128} J_{28,64} + q^4 J_{8,32} J_{52,64}
\]  
(11.12)

\[
= -q^8 \frac{J^2_{4,64} J_{20,64} J_{32,128}}{J_{12,64}},
\]
which is equivalent to

\[
J_{16,32} J_{4,16} J_{8,32} J_{32,128} - J_{16,32} J_{28,64} J_{4,32} J_{12,64} - q^4 J_{32,128} J_{28,64} J_{4,32} J_{12,64}
\]  
(11.13)

\[
+ q^4 J_{8,32} J_{52,64} J_{4,32} J_{12,64} = -q^8 \frac{J_{4,64} J_{20,64} J_{32,128}}{J_{4,32}}.
\]
Let us consider the pieces of \((11.13)\). Using \((2.3a)\) and product rearrangements, we have
\[
q^4 J_{32,128} J_{28,64} J_{4,32} J_{12,64} - q^8 J_{4,64} J_{20,64} J_{32,128} J_{4,32}
= q^4 J_{32,128} J_{4,32} (J_{12,64} J_{28,64} - q^4 J_{4,64} J_{20,64}) = q^4 J_{32,128} J_{4,32} J_{4,32} J_{8,32}.
\]
(11.14)

Using product rearrangements, \((2.1e)\), and \((2.2a)\), we obtain
\[
J_{16,32} J_{4,16} J_{8,32} J_{32,128} - q^4 J_{32,128} J_{4,32} J_{4,32} J_{8,32}
= J_{32,128} J_{8,32} (J_{16,32} J_{4,16} - q^4 J_{4,32})
= J_{8,64} J_{4,64} (J_{16,32} J_{4,16} - q^4 J_{4,32})
= J_{8,64} J_{4,64} (J_{4,32} J_{8,64} (J_{32,128} J_{8,32}) - q^4 J_{4,32})
= J_{8,64} J_{4,64} (J_{4,32} J_{8,64} (J_{32,128} J_{8,32} - q^4 J_{4,32}) - q^4 J_{4,32}) = J_{4,32}^2 J_{24,64}.
\]
(11.15)

Using \((11.14)\), \((11.15)\), and factoring out a \(J_{4,32}\), identity \((11.13)\) is then equivalent to
\[
J_{4,32} J_{24,64}^2 = J_{16,32} J_{28,64} J_{12,64} + q^4 J_{8,32} J_{52,64} J_{12,64} = 0.
\]
(11.16)

which is equivalent to
\[
J_{24,64}^2 J_{4,64} J_{36,64} + q^4 J_{12,64} J_{8,64} J_{4,64} = J_{12,64} J_{28,64} J_{16,64} J_{48,64},
\]
(11.17)

where we have used \((2.1d)\) and factored out common terms. Identity \((11.17)\) follows from \((2.3)\) with \(q \mapsto q^4\), \(a \mapsto -q^{32}\), \(b \mapsto q^{20}\), \(c \mapsto q^{16}\), \(d \mapsto -q^8\).

**Proof of Proposition 11.3** The proofs for the three inequalities are the same, so we will only do the third one. Instead of using Proposition 11.1, we use the equivalent form identity \((11.6)\), which gives
\[
\sum_{n=0}^{\infty} \left(N(0, 8; 4n + 3) - C(0, 8; 4n + 3)\right) q^n = q \cdot \frac{J_{0,8} J_{13,16}}{J_{1}} = \sum_{k=1}^{\infty} c(n) q^n.
\]
(11.18)

In sum form, the two theta functions in the numerator can be written
\[
J_{a,m} := J(-q^a; q^m) = \sum_{n=-\infty}^{\infty} (-1)^n q^{m(n)} (-q^a)^n = \sum_{k=-\infty}^{\infty} q^{m(n)} q^{ak},
\]
(11.19)

which has only positive Fourier coefficients. In product form, the denominator reads
\[
J_1 = J_{1,3} = \prod_{n=1}^{\infty} (1 - q^n).
\]
(11.20)

By the geometric series \((1 - q^n)^{-1} = \sum_{k=0}^{\infty} q^{nk}\), the denominator contributes only positive Fourier coefficients. Given the lead factor \((1 - q)^{-1}\), we know that every Fourier coefficient \(c(n), n \geq 1\), of \((11.18)\) will be strictly positive.
