(Dated: December 21, 2013)

Abstract

This paper reports the tenth-order QED contribution to the lepton $g-2$ from the gauge-invariant set, called Set III(c), which consists of 390 Feynman vertex diagrams containing an internal fourth-order light-by-light-scattering subdiagram. The mass-independent contribution of Set III(c) to the electron $g-2$ ($a_e$) is 4.9210 (103) in units of ($\alpha/\pi$)$^5$. The mass-dependent contributions to $a_e$ from diagrams containing a muon loop is 0.00370 (37) ($\alpha/\pi$)$^5$. The tau-lepton loop contribution is negligible at present. Altogether the contribution of Set III(c) to $a_e$ is 4.9247 (104) ($\alpha/\pi$)$^5$. We have also evaluated the contribution of the closed electron loop to the muon $g-2$ ($a_\mu$). The result is 7.435 (134) ($\alpha/\pi$)$^5$. The contribution of the tau-lepton loop to $a_\mu$ is 0.1999 (28) ($\alpha/\pi$)$^5$. The total contribution of various leptonic loops (electron, muon, and tau-lepton) of Set III(c) to $a_\mu$ is 12.556 (135) ($\alpha/\pi$)$^5$.

I. INTRODUCTION

The anomalous magnetic moment $a_e \equiv (g-2)/2$ of the electron has played the central role in testing the validity of quantum electrodynamics (QED) as well as the Standard Model. On the experimental side, the latest measurement of $a_e$ by the Harvard group has reached the precision of $0.24 \times 10^{-9}$ [1, 2]:

$$a_e(HV08) = 1\,159\,652\,180.73\,(0.28) \times 10^{-12} \quad [0.24 \text{ppb}]. \quad (1)$$

The theoretical prediction thus far consists of QED corrections of up to the eighth order [3–5], direct evaluation of hadronic corrections [6–12], and electroweak corrections scaled down from their contributions to the muon $g-2$ [13–15]. To compare the theory with the measurement (1), we also need the value of the fine structure constant $\alpha$ determined by a method independent of $g-2$. The best value of such an $\alpha$ available at present is one obtained from the measurement of $h/m_{\text{Rb}}$, the ratio of the Planck constant and the mass of Rb atom, combined with the very precisely known values of the Rydberg constant and $m_{\text{Rb}}/m_e$: [16]

$$\alpha^{-1}(\text{Rb10}) = 137.035\,999\,037\,(91) \quad [0.66 \text{ppb}]. \quad (2)$$

With this $\alpha$ the theoretical prediction of $a_e$ becomes

$$a_e(\text{theory}) = 1\,159\,652\,181.13\,(0.11)(0.37)(0.02)(0.77) \times 10^{-12}; \quad (3)$$

where the first, second, third, and fourth uncertainties come from the calculated eighth-order QED term [5], the crude tenth-order estimate [17], the hadronic and electroweak contributions, and the fine structure constant [2], respectively. The theory (3) is in good agreement with the experiment (1):

$$a_e(HV08) - a_e(\text{theory}) = -0.40\,(0.88) \times 10^{-12}, \quad (4)$$

proving that QED (Standard Model) is in good shape even at this very high precision.

Eq. (3) shows clearly that the largest source of uncertainty is the fine structure constant [2]. To put it differently, a non-QED $\alpha$, even the best one available at present, is too crude to test QED to the extent achieved by the theory and measurement of $a_e$. Thus it
makes more sense to test QED by an alternate approach, namely, obtain $\alpha$ from theory and measurement of $a_e$:

$$\alpha^{-1}(a_e08) = 137.035\,999\,085 \pm (12)(37)(2)(33) \pm 0.37\text{ppb}, \quad (5)$$

where the first, second, third, and fourth uncertainties come from the calculated eighth-order QED term, the crude tenth-order estimate, the hadronic and electroweak contributions, and the measurement of $a_e$(HV08), respectively.

Although the uncertainty of $\alpha^{-1}(a_e08)$ in (5) is a factor 2 smaller than $\alpha^{-1}(\text{Rb10})$, it is not a firm factor since it depends on the estimate of the tenth-order term, which is only a crude guess [17]. For a more stringent test of QED, it is obviously necessary to calculate the actual value of the tenth-order term. To meet this challenge we launched several years ago a systematic program to evaluate the complete tenth-order term [18–20].

The 10th-order QED contribution to the anomalous magnetic moment of an electron can be written as

$$a_e^{(10)} = \left(\frac{\alpha}{\pi}\right)^5 \left[A_1^{(10)} + A_2^{(10)}(m_e/m_\mu) + A_3^{(10)}(m_e/m_\mu, m_e/m_\tau)\right], \quad (6)$$

where $m_e/m_\mu = 4.836\,331\,66 (12) \times 10^{-3}$ and $m_e/m_\tau = 2.875\,64 (47) \times 10^{-4}$ [17]. In the rest of this article the factor $\left(\frac{\alpha}{\pi}\right)^5$ is suppressed for simplicity.

The diagrams contributing to the mass-independent term $A_1^{(10)}$ can be classified into six gauge-invariant sets, further divided into 32 gauge-invariant subsets depending on the nature of closed lepton loop subdiagrams. Thus far, numerical results of 30 gauge-invariant subsets, which consist of 5928 vertex diagrams, have been published [3, 21–27], or submitted for publication [28]. Five of these 30 subsets are also known analytically [29, 30]. They are in good agreement with our calculations.

In this paper we report the contribution to $A_1^{(10)}$ from the gauge-invariant subset called Set III(c), which consists of 390 vertex diagrams and is represented by 24 self-energy-like diagrams of Figure 1. A characteristic feature of these diagrams is that they have vertex and self-energy subdiagrams which contain a light-by-light ($l-l$) scattering subdiagram. They can be classified into three types:

1. Sixth-order vertex subdiagrams containing an $l-l$ loop externally as is shown in Figure 2. Here “external” means that one of the photons is external to the subdiagrams containing the $l-l$ loop.
FIG. 1: Tenth-order self-energy-like diagrams in which lepton lines propagate in the magnetic field. They represent 390 vertex diagrams of Set III(c). Assignment of Feynman parameters $z_1, z_2, \ldots, z_9$ to the lepton lines and $z_a, z_b, \ldots, z_e$ to the photon lines is indicated in the figure A1, B1, and C1.

2. Eighth-order vertex subdiagrams containing an $l$-$l$ loop externally as is shown in Figure 3. They are obtained by applying a virtual photon correction on the open fermion line of a sixth-order $l$-$l$ vertex subdiagram of Figure 2.

3. Eighth-order vertex and self-energy subdiagrams which contain an $l$-$l$ loop internally.
FIG. 2: Vertex diagrams of sixth order containing an $l$-$l$ subdiagram. The diagram $6LL(3)$ and $6LL(4)$ are identical with each other because of the time-reversal symmetry. There are six vertex diagrams of this type, taking into account of two directions in which the closed fermion loop can take.

This type appears for the first time in the tenth-order perturbation theory of QED. See Figure 4.

The vertex subdiagrams of type 1 and type 2 do not have their Ward-Takahashi-related self-energy subdiagrams which vanish identically due to Furry’s theorem. Thus, the gauge-invariant sums of the vertex renormalization constants of these external $l$-$l$ subdiagrams also vanish identically.

For vertex subdiagrams of type 3, the corresponding self-energy subdiagrams do exist which have an internal $l$-$l$ diagram. In this case both vertex subdiagram and self-energy subdiagram have UV divergence due to the sixth-order external $l$-$l$ vertex subdiagram.

Because of these specific features of an $l$-$l$ scattering diagram and vertex diagrams containing an external $l$-$l$ loop, we adopt for the Set III(c) an approach different from the one used for a diagram without an $l$-$l$ loop [19, 20]. Our formulation and treatment of UV divergences and IR divergences due to subdiagrams are described in Sec. II. Results of numerical evaluation will be presented in Sec. III. Sec. IV is devoted to the summary and discussion of this work. Renormalization of these diagrams is described in Appendix A.

II. FORMULATION

Instead of dealing with the 390 vertex diagrams of Set III(c) individually, we consider the sum $\Lambda''$ of a set of vertex diagrams that are obtained from a self-energy-like diagram
FIG. 3: Various diagrams of the eighth order needed for renormalization. $8LL\alpha$ ($\alpha = E, F, G, H, I$) is denoted as $LL\alpha$ in Ref. [31]. A vertex diagram $8LL\alpha(i)$ ($i = 5, 6, 7$) is obtained by inserting an external vertex into a fermion line $i$ of the diagram $8LL\alpha$. It is denoted as $LL\alpha(i)$ in Ref. [32].

FIG. 4: The eighth-order self-energy-like diagrams $8LLJ$, $8LLK$, and $8LLL$, containing a light-by-light scattering loop internally. Open lepton lines propagate in the weak magnetic field. They represent 18 vertex diagrams in total. The vertex diagram $8LLJ(1)$ is a part of the diagram $8LLJ$ in which the magnetic vertex is attached only to the fermion line 1 of the self-energy diagram $8LLJ$.

$\Sigma(p)$ of Figure [1] by inserting a magnetic vertex $\gamma^\nu$ in the lepton lines 1, 2, 3, 4, and 5. We rewrite this $\Lambda^\nu$ as

$$\Lambda^\nu(p, q) \simeq -q^\mu\left[\frac{\partial \Lambda_\mu(p, q)}{\partial q_\nu}\right]_{q=0} - \frac{\partial \Sigma(p)}{\partial p_\nu}. \quad (7)$$

with the help of the Ward-Takahashi identity, where $p-q/2$ and $p+q/2$ are the 4-momenta of incoming and outgoing lepton lines and $(p-q/2)^2 = (p+q/2)^2 = m^2$. Each sum corresponds to one of the 24 self-energy-like diagrams shown in Figure [1]. The $g-2$ term is projected out from the right-hand side of (7).

A. Construction of Unrenormalized Integrals

Each diagram $\mathcal{G}$ of Figure [1] can be expressed by a momentum integral applying the Feynman-Dyson rule. Introducing Feynman parameters $z_1, z_2, \ldots, z_9$ for the electron prop-
agators and \( z_a, z_b, \ldots, z_e \) for the photon propagators (see the figures \( A_1, B_1, \) and \( C_1 \) of Figure 1), we carry out the momentum integration analytically by means of a home-made program written in FORM \[33\]. This leads to an integral of the form

\[
M_G = -\left(\frac{-1}{4}\right)^5 4! \int (dz)_G \left[ \frac{1}{4} \left( \frac{E_0 + C_0}{U^2V^4} + \frac{E_1 + C_1}{U^3V^3} + \cdots \right) + \left( \frac{N_0 + Z_0}{U^2V^5} + \frac{N_1 + Z_1}{U^3V^4} + \cdots \right) \right],
\]

(8)

where \( E_n, C_n, N_n \) and \( Z_n \) are functions of Feynman parameters, and “symbolic” building blocks \( A_i, B_{ij}, C_{ij}, \) for \( i, j = 1, 2, \ldots, 9 \). \( n \) is the number of contractions (see \[34\] for definitions). \( U \) is the Jacobian of transformation from the momentum space variables to Feynman parameters. \( A_i \) is the scalar current defined by

\[
A_i = \eta_i - \frac{1}{U} \sum_{j=1}^{5} z_j B_{ij},
\]

and

\[
(dz)_G = \prod_{i \in G} dz_i (1 - \sum_{i \in \mathcal{G}} z_i).
\]

See, for example, Ref. \[19\] for definitions of \( B_{ij} \) and \( C_{ij} \). \( V \) is obtained by combining all denominators of propagators into one with the help of Feynman parameters. It has a form common to all diagrams of Figure 1

\[
V = \sum_{i=1}^{9} z_i (1 - A_i)m_i^2 + \sum_{k=a}^{e} z_k \lambda_k^2,
\]

(11)

where \( m_i \) and \( \lambda_k \) are the rest masses of lepton \( i \) and photon \( k \), respectively. Of course, \( m_i \) is independent of \( i \) and \( \lambda_k \) is 0 independent of \( k \). But it is useful to distinguish different lepton lines and photon lines in deriving Eq. (8). The form of \( A_i \) as a function of Feynman parameters depends on the structure of individual diagram \( G \) of Figure 1

B. Renormalization

The diagrams of Set III(c) as a whole form a (formal) gauge-invariant set. However, individual diagrams have UV divergences arising from the light-by-light-scattering (l-l) sub-diagram as well as vertex subdiagrams or self-energy subdiagrams. All these divergences must be regularized in advance. In order to maintain gauge invariance the l-l subdiagram may be regularized by the Pauli-Villars method or by the dimensional regularization. The
sixth-order vertex renormalization constant associated with the diagram containing an $l\ell$ subdiagram and the eighth-order vertex renormalization constant containing an $l\ell$ subdiagram are logarithmically divergent, but their sum over all diagrams vanishes due to Ward-Takahashi identity. Note that the self-energy diagrams associated with these vertex diagrams do not exist in QED because of the Furry’s theorem.

As is indicated in the figures $A_1$, $B_1$, $C_1$ of Figure 1, we denote open fermion lines as 1, 2, 3, 4, 5, fermion lines forming a closed loop as 6, 7, 8, 9, and photon lines as a, b, c, d, e. We will identify a subdiagram containing open lepton lines in terms of a subset of (1,2,3,4,5). For instance, the vertex subdiagram (1,2) of $A_1$ will be denoted by (1,2), and the vertex subdiagram \{(2,3,4,5; 6,7,8,9; b,c,d)\} of $A_1$ will be denoted by (2,3,4,5). An exception is the $l\ell$ subdiagram, which will be denoted as (6,7,8,9). Under this convention the diagram $A_1$ has five divergent subdiagrams (1,2), (4,5), (1,2,3,4), (2,3,4,5), and (6,7,8,9). The fifteen UV subtraction terms can be constructed from these subdiagrams following the Zimmermann’s forest formula [35].

Diagrammatically, the second-order vertex subdiagram appears not only in the forests including the subdiagram (1,2) but also in the forest (2,3,4,5)(4,5). In the latter, the reduced diagram (2,3) forms a second-order vertex diagram. We will treat renormalization of this implicit second-order vertex in a manner different from the explicit second-order vertex. A detailed account will be given in Appendix A.

The UV divergence arising from the explicit second-order vertex (1,2) of the diagram $A_1$ can be subtracted by an integral defined by the $K_{12}$-operation [34] applied on the integral $M_{A_1}$. The $K_{12}$-operation is defined in such a way that the result of the operation factorizes exactly as

$$K_{12}M_{A_1} = L_2^{(1,2)\text{UV}} M_{8LLJ}^{(3,4,5)},$$

where $L_2^{(1,2)\text{UV}}$ is the UV-divergent part of the second-order on-shell vertex renormalization constant $L_2^{(1,2)}$ and $M_{8LLJ}^{(3,4,5)}$ is the magnetic moment amplitude from the eighth-order self-energy-like diagram 8$LLJ$ of Figure 4.

UV divergences from the explicit second-order vertex subdiagram are also found in the diagrams $B_1$, $C_1$, $A_6$, $B_6$, and $C_6$. UV divergences due to the explicit second-order self-energy-like subdiagram come from the diagrams $A_5$, $B_5$, $C_5$, $A_8$, $B_8$, and $C_8$. The renormalization scheme in which only these second-order divergences appear are handled by the $K$-operation and is described in Appendix A.
All other subdiagrams contain an $l$-$l$ subdiagram, which we treat by the Pauli-Villars method or by the dimensional regularization. For instance, in the latter method, let $F_{\alpha i}(d)$ be one of such integrals defined in $d$ dimension, where $\alpha i$ takes values $\alpha = A, B, C$; $i = 1, 2, \ldots, 8$. Let $G_{\alpha i}(d)$ be $F_{\alpha i}(d)$ in which the $l$-$l$ subdiagram (of the form $\Pi_{\mu \nu \sigma \rho}(k_1, k_2, k_3, k_4)$) is replaced by the tensor with zero external momenta, namely, $\Pi_{\mu \nu \sigma \rho}(0, 0, 0, 0)$. Let us rewrite $F_{\alpha i}(d)$ symbolically as

$$ [F_{\alpha i}(d) - G_{\alpha i}(d)] + G_{\alpha i}(d), \quad (13) $$

where by “symbolically” we mean that subtraction is performed on the integrand before the integration is carried out. Now we can safely take the limit $d \to 4$ for the term $[F_{\alpha i}(d) - G_{\alpha i}(d)]$ since its integrand does not cause UV divergence. Of course, the second term $G_{\alpha i}(d)$ is singular for $d \to 4$. However, gauge invariance guarantees that the sum of $G_{\alpha i}(d)$ over all diagrams of Figure 1 vanishes for any value of dimension $d$:

$$ C \sum_{\alpha=A}^{8} \sum_{i=1}^{8} \eta_i G_{\alpha i}(d) = 0, \quad (14) $$

where $\eta_i = 2$ for $i = 4, 7, 8$, and $\eta_i = 4$ for $i = 1, 2, 3, 5, 6$. Thus, in the end, we have to compute only

$$ \lim_{d \to 4} [F_{\alpha i}(d) - G_{\alpha i}(d)]. \quad (15) $$

Of course the same result is obtained by the Pauli-Villars method. To avoid crowded notations let us use $F_{\alpha i}(4)$ instead of Eq. (15) in the following.

Each self-energy-like diagram of Figure 1 represents the sum of five vertex diagrams. Diagrams obtained by reversing the momentum flow within the $l$-$l$ loop are not shown but they give the same integrals as the original ones. Another factor 2 must be included for diagrams that are not symmetric under time-reversal. Thus, integrals for diagrams such as A1 actually represent $2 \times 2 \times 5$ vertex diagrams. The $g-2$ contribution from the sum of all diagrams of Set III(c), after the renormalization described in Appendix A is carried out, can thus be written as

$$ A_{1}^{(10)}[\text{Set III(c)}^{(l_1 l_2)}] = \sum_{\alpha=A}^{C} \sum_{i=1}^{8} \eta_i \Delta M_{\alpha i}^{(l_1 l_2)} - 3 \Delta LB_2 \Delta M_{8,JKL}^{(l_1 l_2)}, \quad (16) $$

where $l_1$ refers to the open lepton line and $l_2$ refers to the closed lepton line. $\eta_i = 2$ for $i = 4, 7, 8$, and $\eta_i = 4$ for $i = 1, 2, 3, 5, 6$. $\Delta LB_2$ and $\Delta M_{8,JKL}^{(l_1 l_2)}$ are defined in Appendix A.
III. NUMERICAL RESULTS

Evaluation of integral $\Delta M_{i_i}^{(l_1l_2)}$ is carried out by the adaptive-iterative Monte-Carlo integration routine VEGAS [36]. The results for the case $(l_1l_2) = (ee)$ are listed in Table II. From this table and Table III listing the residual renormalization terms we obtain

$$A_1^{(10)}[\text{Set III}(c)^(ee)] = 4.9210 \ (103). \quad (17)$$

The contribution of the muon loop to $a_e$ can be calculated from the data listed in Table III and Table II

$$A_2^{(10)}[\text{Set III}(c)^(em)] = 0.00370 \ (37). \quad (18)$$

The contribution of the tau-lepton loop to $a_e$ is within the uncertainty of (17). Thus the total QED contribution to $a_e^{(10)}$ is essentially the sum of (17) and (18):

$$a_e^{(10)}[\text{Set III}(c)] = 4.9247 \ (104) \left(\frac{\alpha}{\pi}\right)^5. \quad (19)$$

FORTRAN programs for $a_e$ can be readily adapted to the evaluation of $a_\mu$. The results of evaluation of the contribution of the electron loop to the muon $g-2$ are listed in Table IV. From this table and Table III we obtain

$$A_2^{(10)}[\text{Set III}(c)^(em)] = 7.435 \ (134). \quad (20)$$

The contribution of the tau-lepton loop to $a_\mu$ is calculated from the data listed in Table V and Table II:

$$A_2^{(10)}[\text{Set III}(c)^(mt)] = 0.1999 \ (28). \quad (21)$$

The total QED contribution to $a_\mu^{(10)}$ is the sum of (17), (20), and (21):

$$a_\mu^{(10)}[\text{Set III}(c)] = 12.556 \ (135) \left(\frac{\alpha}{\pi}\right)^5. \quad (22)$$

IV. DISCUSSION

All programs of diagrams of the Set III(c) were written in two independent ways, in order to detect possible programming error. No such error was found.

The value of $A_2^{(10)}[\text{Set III}(c)^(me)]$ given in (20) is not much larger than that of $A_1^{(10)}[\text{Set III}(c)^(ee)]$ given in (17). This is somewhat unexpected since, as is seen from Table
and closed fermion lines consist of fermions $l_e$, $l_{\mu}$, and $l_{\tau}$ for electron, muon, and tau-lepton, respectively. The letters $e$, $m$, and $t$ stand for electron, muon, and tau-lepton, respectively. The superscript $(ee)$ is suppressed for simplicity. The multiplicity $n_F$ is the number of vertex diagrams represented by the integral and is incorporated in the numerical value. All integrals are evaluated initially with $10^8$ sampling points per iteration, iterated 50 times, followed by $10^9$ points, iterated several times.

### TABLE II: Auxiliary integrals for Set III(c).

| Integral | $n_F$ | Value (Error) including $n_F$ | Sampling per iteration | No. of iterations |
|----------|-------|------------------------------|------------------------|-------------------|

| $\Delta M_{C3}$ | 20 | $-1.329 04 (260)$ | $1 \times 10^8, 1 \times 10^9$ | 50, 338 |
| $\Delta M_{C4}$ | 10 | $0.435 88 (131)$ | $1 \times 10^8, 1 \times 10^9$ | 50, 30 |
| $\Delta M_{C5}$ | 20 | $-3.729 22 (159)$ | $1 \times 10^8, 1 \times 10^9$ | 50, 60 |
| $\Delta M_{C6}$ | 20 | $4.273 41 (258)$ | $1 \times 10^8, 1 \times 10^9$ | 50, 300 |
| $\Delta M_{C7}$ | 10 | $-2.233 00 (159)$ | $1 \times 10^8, 1 \times 10^9$ | 50, 65 |
| $\Delta M_{C8}$ | 10 | $-1.514 28 (142)$ | $1 \times 10^8, 1 \times 10^9$ | 50, 20 |

Some integrals are known exactly. Other integrals are obtained by the integration routine VEGAS. The superscript $(l_1 l_2)$ indicates that the open and closed fermion lines consist of fermions $l_1$ and $l_2$, respectively.
TABLE III: Contributions of diagrams of Set III(c) to $a_e$ for $(l_1 l_2) = (em)$. The superscript $(em)$ is suppressed for simplicity. The multiplicity $n_F$ is the number of vertex diagrams represented by the integral and is incorporated in the numerical value. All integrals are evaluated with $10^7$ sampling points per iteration, iterated 50 times, and subsequently evaluated with $10^8$ sampling points per iteration, iterated 50 times.

individual integrals contributing to $A_2^{(10)}$[Set III(c)$^{(me)}$] are an order of magnitude larger than those given in Table I. Presumably, the modest value of (20) is a consequence of strong cancellation among contributing integrals.

Acknowledgments

We thank Mr. N. Watanabe for his contribution in the early stage of this work. This work is supported in part by the JSPS Grant-in-Aid for Scientific Research (C)19540322, (C)20540261, and (C)23540331. The part of material presented by T. K. is based on work
TABLE IV: Contributions of diagrams of Set III(c) to $a_\mu$ for $(l_1 l_2) = (me)$. The superscript $(me)$ is suppressed for simplicity. The multiplicity $n_F$ is the number of vertex diagrams represented by the integral and is incorporated in the numerical value. All integrals are evaluated initially with $10^8$ sampling points per iteration, iterated 50 times, followed by $10^9$ points, iterated several times.

Appendix A: Renormalization of diagrams of Set III(c)

Diagrams of Set III(c), shown in Figure II, contain an $l-l$ subdiagram internally. Thus we find it convenient to pursue a renormalization scheme somewhat different from all other Sets contributing to the tenth-order $g-2$. As is indicated by figures A1, B1, C1 of Figure II we denote open fermion lines as 1, 2, 3, 4, 5, closed fermion lines as 6, 7, 8, 9, and photon lines as a, b, c, d, e. We will identify a subdiagram containing open lepton lines in terms of their line numbers. For instance, the second-order vertex subdiagram \{1,2;e\} and sixth-order vertex subdiagram \{4,5;6,7,8,9;b,c,d\} of A1 will be denoted by the superscript (1,2) and
(4,5), respectively. An exception is the \( l-l \) subdiagram, which will be denoted as (6,7,8,9). Of course this is just for the sake of keeping track of where a particular subdiagram is located. The superscript will be removed when it is no longer needed.

1. \( A1, B1, C1 \)

Let us begin with the \( g-2 \) amplitude \( M_{A1} \). Noting that, out of 15 forests of the diagram \( A1 \) mentioned in Sec. II B, 8 are hidden in our convention leading to Eq. (15), the renormalized amplitude \( a_{A1} \) can be written as

\[
a_{A1} = M_{A1} - L_2^{(1,2)} M_{8LLJ}^{(3,4,5)} - L_{6LL(5)}^{(4,5)} M_{4a}^{(1,2,3)} - L_{8LLF(7)}^{(1,2,3,4)} M_2^{(5)} - L_{8LLJ(1)}^{(2,3,4,5)} M_2^{(1)} + L_2^{(1,2)} L_{6LL(5)}^{(4,5)} M_2^{(3)} + L_2^{(1,2)} L_{6LL(5)}^{(3,4)} M_2^{(5)} + L_2^{(2,3)} L_{6LL(5)}^{(4,5)} M_2^{(1)}. \tag{A1}
\]

As was discussed in Sec. II, all terms of (A1) containing an \( l-l \) subdiagram are to be understood as shorthands for the regularized quantity defined by Eq. (15). In other words, the UV divergence arising from the \( l-l \) subdiagram has been removed by the procedure described in Sec. II so that it can be treated as a UV-finite quantity. \( M_{8LLJ} \) is the proper magnetic moment amplitude of the eighth-order diagram \( 8LLJ \) of Figure 4. See [31, 32] for its precise definition. \( L_2 \) is the vertex renormalization constant of the second order. \( L_{6LL(5)} \) is the renormalization constant associated with the sixth-order vertex diagram \( 6LL(5) \) shown in Figure 2. \( L_{8LLF(7)} \) and \( L_{8LLJ(1)} \) are the eighth-order vertex renormalization constants associated with the self-energy-like diagrams \( 8LLF \) of Figure 3 and \( 8LLJ \) of Figure 4, respectively.

In the amplitude \( M_{A1} \), the \( K \)-operation is applied only on the explicit second-order vertex subdiagram (1,2). For other terms the full bodies of the vertex renormalization constants of the sixth- and eighth-orders are used and subtracted. These vertex renormalization constants are extracted from a vertex diagram \( \Gamma_\nu(p, q) \), where \((p - q/2)^2 = (p + q/2)^2 = m^2\), using the projection operator

\[
L = \frac{1}{4} \text{Tr}[(\not{p} + m)\not{p}'\Gamma_\nu]|_{q=0}. \tag{A2}
\]

The result is combined with the lower-order magnetic moment amplitude using, for instance, the factorization procedure described in Sec. III D of Ref. [19] backwards so that the combined formula is described by the same set of Feynman parameters as those of the unrenormalized magnetic moment \( M_{A1} \). Then the UV-finite quantity \( \Delta M_{A1} \) can be written
\[
\Delta M_{A1} = M_{A1} - L_2^{UV(1,2)} M_{LLJ}^{(3,4,5)} - L_{6LL(5)}^{(4,5)} M_{a}^{(1,2,3)} - L_{8LLF(7)}^{(1,2,3,4,5)} M_{2}^{(5)} - L_{8LLJ(1)}^{(2,3,4,5)} M_{2}^{(1)}
\]
\[
+ L_2^{UV(1,2)} L_{6LL(5)}^{(3,4)} M_{2}^{(5)} + L_2^{UV(1,2)} L_{6LL(5)}^{(4,5)} M_{2}^{(3)} + L_{2}^{(2,3)} L_{6LL(5)}^{(4,5)} M_{2}^{(1)}. \tag{A3}
\]

where \( L_2^{UV(1,2)} \) is the UV-divergent part of \( L_2^{(1,2)} \) defined by the \( K \)-operation. Note that \( L_{6LL(5)}^{(3,4)} \), \( L_{6LL(5)}^{(4,5)} \), \( L_{8LLF(7)}^{(1,2,3,4,5)} \), \( L_{8LLJ(1)}^{(2,3,4,5)} \), and \( L_{8LLJ(1)}^{(2,3)} \) are not decomposed into UV-divergent and UV-finite parts. Note, in particular, that \( L_{2}^{(2,3)} \) has an IR-divergent part besides a UV-divergent part. This is the reason why we normally avoid use of the whole \( L_2 \) as a subtraction term and use the \( L_2^{UV} \) defined by the \( K \)-operation instead. For the diagram \( A1 \), however, the IR divergences in \( L_{2}^{(2,3)} \) and \( L_{8LLJ(1)} \) cancel each other. Thus the UV-divergence-free amplitude \( \Delta M_{A1} \) is also IR-divergence-free. The numerical integration code for the Set III(c) is constructed taking this observation into account.

Substituting (A3) in (A1) we obtain
\[
a_{A1} = \Delta M_{A1} - L_2^{R} M_{8LLJ}^{(3,4,5)} + L_2^{R} L_{6LL(5)}^{(3,4)} M_{2} + L_2^{R} L_{6LL(5)}^{(4,5)} M_{2}
\]
\[
= \Delta M_{A1} - L_2^{R} \Delta M_{8LLJ}, \tag{A4}
\]

where \( L_2^{R} \equiv L_2 - L_2^{UV} \) is UV-finite but IR-divergent and \( \Delta M_{8LLJ} = M_{8LLJ} - 2 L_{6LL(5)} M_{2} \) is the finite \( g-2 \) contribution from the eighth-order diagram 8LLJ [31, 32].

Similar consideration for the diagrams \( B1 \) and \( C1 \) yields
\[
a_{B1} = \Delta M_{B1} - L_2^{R} M_{8LLL}^{(3,4,5)} + 2 L_2^{R} L_{6LL(3)} M_{2}
\]
\[
= \Delta M_{B1} - L_2^{R} \Delta M_{8LLL}, \tag{A5}
\]

and
\[
a_{C1} = \Delta M_{C1} - L_2^{R} M_{8LLK}^{(3,4,5)} + 2 L_2^{R} L_{6LL(3)} M_{2}
\]
\[
= \Delta M_{C1} - L_2^{R} \Delta M_{8LLK}. \tag{A6}
\]

From (A4), (A5), and (A6) we obtain
\[
\sum_{\alpha=A}^{C} a_{\alpha 1} = \sum_{\alpha=A}^{C} \Delta M_{\alpha 1} - L_2^{R} \Delta M_{8JKL}, \tag{A7}
\]

where \( \Delta M_{8JKL} \equiv \Delta M_{8LLJ} + \Delta M_{8LLK} + \Delta M_{8LLL} [31] \). Note that the sum \( L_{6LL} \equiv L_{6LL(3)} + L_{6LL(4)} + L_{6LL(5)} = 0 \) because of the gauge invariance.
2. **A2, B2, C2**

The diagram $A2$ has UV-divergent subdiagrams $(1, 2, 3, 4), (2, 3, 4, 5)$ besides the $l-l$ subdiagram $(6, 7, 8, 9)$. Thus the renormalized amplitude $a_{A2}$ can be written as

\[
a_{A2} = M_{A2} - M_2^{(1)} L_{8LLJ(2)}^{(2,3,4,5)} - L_{8LLJ(7)}^{(1,2,3,4)} M_2^{(5)}.
\]  

(A8)

Diagrams $8LLJ$ and $8LLG$ are shown in Figure 3. Since $A2$ has no UV divergence due to the second-order subdiagram, we define $\Delta M_{A2}$ by

\[
\Delta M_{A2} = M_{A2} - M_2^{(1)} L_{8LLJ(2)}^{(2,3,4,5)} - L_{8LLJ(7)}^{(1,2,3,4)} M_2^{(5)}.
\]  

(A9)

Substituting (A9) in (A8) we obtain

\[
a_{A2} = \Delta M_{A2}.
\]  

(A10)

Similar equations hold for $a_{B2}$ and $a_{C2}$. Thus we have

\[
\sum_{\alpha=A} C^{a_{\alpha}} = \sum_{\alpha=A} C^{\Delta M_{\alpha}}.
\]  

(A11)

3. **A3, B3, C3**

The diagram $A3$ has five forests after the $l-l$ subdiagrams are treated following the consideration of Sec. II B. Thus the renormalized amplitude $a_{A3}$ can be written as

\[
a_{A3} = M_{A3} - M_2^{(1)} L_{8LLJ(3)}^{(2,3,4,5)} - M_2^{(5)} L_{8LLJ(7)}^{(1,2,3,4)} - M_4^{(1,4,5)} L_{6LL(2)}^{(2,3)} + M_2^{(1)} L_{6LL(5)}^{(4,5)} L_{6LL(2)}^{(2,3)} + M_2^{(5)} L_{6LL(2)}^{(1,4)} L_{6LL(5)}^{(2,3)}.
\]  

(A12)

The second-order vertex renormalization constants $L_2^{(1,4,5)}$ and $L_2^{(4,5)}$ appear in (A12) as reduced diagrams, which we called *implicit*, and used the full renormalization constant $L_2$ for them. Thus we define the finite amplitude by

\[
\Delta M_{A3} = M_{A3} - M_2^{(1)} L_{8LLJ(3)}^{(2,3,4,5)} - M_2^{(5)} L_{8LLJ(7)}^{(1,2,3,4)} - M_4^{(1,4,5)} L_{6LL(5)}^{(2,3)} + M_2^{(1)} L_{6LL(5)}^{(4,5)} L_{6LL(2)}^{(2,3)} + M_2^{(5)} L_{6LL(2)}^{(1,4)} L_{6LL(5)}^{(2,3)}.
\]  

(A13)

In other words, we have

\[
a_{A3} = \Delta M_{A3}.
\]  

(A14)

Similar relation holds for $a_{B3}$ and $a_{C3}$. Thus we have

\[
\sum_{\alpha=A} C^{a_{\alpha}} = \sum_{\alpha=A} C^{\Delta M_{\alpha}}.
\]  

(A15)
4. \( A_4, B_4, C_4 \)

The diagram \( A_4 \) has one self-energy subdiagram \((2,3,4)\) and two vertex subdiagrams \((2,3)\) and \((3,4)\) as well as the \( l-l \) subdiagram \((6,7,8,9)\). Thus the renormalized amplitude \( a_{A4} \) is given by

\[
a_{A4} = M_{A4} - M_{4b}^{(1,2,5)} I_{6LL(5)}^{(3,4)} - M_{4b}^{(1,4,5)} I_{6LL(5)}^{(2,3)} - M_2^{(1,5)} B_{8LLJ}^{(2,3,4)} - M_2^{(1,5)} \delta m_{8LLJ}^{(2,3,4)}
\]

\[
+ M_2^{(1,5)} B_2^{(2)} I_{6LL(5)}^{(3,4)} + M_2^{(1,5)} \delta m_2^{(2)} L_{6LL(5)}^{(3,4)}
\]

\[
+ M_2^{(1,5)} B_2^{(4)} I_{6LL(5)}^{(2,3)} + M_2^{(1,5)} \delta m_2^{(4)} L_{6LL(5)}^{(2,3)}.
\]  

(A16)

We define the UV-finite amplitude \( \Delta' M_{A4} \) by

\[
\Delta' M_{A4} = M_{A4} - M_{4b}^{(1,2,5)} I_{6LL(5)}^{(3,4)} - M_{4b}^{(1,4,5)} I_{6LL(5)}^{(2,3)} - M_2^{(1,5)} B_{8LLJ}^{(2,3,4)} - M_2^{(1,5)} \delta m_{8LLJ}^{(2,3,4)}
\]

\[
+ M_2^{(1,5)} B_2^{(2)} I_{6LL(5)}^{(3,4)} + M_2^{(1,5)} \delta m_2^{(2)} L_{6LL(5)}^{(3,4)}
\]

\[
+ M_2^{(1,5)} B_2^{(4)} I_{6LL(5)}^{(2,3)} + M_2^{(1,5)} \delta m_2^{(4)} L_{6LL(5)}^{(2,3)}.
\]  

(A17)

where \( M_2^- \) is derived from \( M_2 \) by inserting a two-point vertex in the lepton line. Note that the renormalization constants \( B_2 \) and \( \delta m_2 \) arising from the self-energy subdiagrams \( \{2;a\} \) and \( \{4;d\} \) are subtracted as a whole without breaking them up into UV-divergent and UV-finite parts. This is consistent only if we use the full body of the renormalization constant \( B_{8LLJ} \). Otherwise, IR-singular part of \( B_{8LLJ} \) and two \( B_2 \)'s do not cancel out each other.

Substituting (A17) in (A16), we obtain

\[
a_{A4} = \Delta' M_{A4}.
\]  

(A18)

The resulting \( a_{A4} \) is UV-finite but IR-divergent. Separating the IR divergence of \( \Delta' M_{A4} \) from the subdiagram \( \{1,5;e\} \) by the \( I \)-operation, we can write

\[
a_{A4} = \Delta M_{A4} + L_2^R (M_{8LLJ}^{(2,3,4)} - 2L_{6LL(5)} M_2) = \Delta M_{A4} + L_2^R \Delta M_{8LLJ}^{(2,3,4)}.
\]  

(A19)

Similarly we have

\[
a_{B4} = \Delta M_{B4} + L_2^R (M_{8LLL}^{(2,3,4)} - 2L_{6LL(3)} M_2) = \Delta M_{B4} + L_2^R \Delta M_{8LLL}^{(2,3,4)},
\]  

(A20)

and

\[
a_{C4} = \Delta M_{B4} + L_2^R (M_{8LLK}^{(2,3,4)} - 2L_{6LL(3)} M_2) = \Delta M_{B4} + L_2^R \Delta M_{8LLK}^{(2,3,4)}.
\]  

(A21)
Adding up these three results we obtain
\[ \sum_{a=A}^{C} a_{a4} = \sum_{a=A}^{C} \Delta M_{a4} + L^R_2 \Delta M_{8JKL}, \quad (A22) \]
noting that gauge invariance guarantees the vanishing of the sum \( L_{6LL} \equiv L_{6LL(3)} + L_{6LL(4)} + L_{6LL(5)} = 0. \)

We also developed an alternative method for separating UV-divergence from \( M_{A4} \), in which a UV-finite amplitude is defined by
\[
\Delta'' M_{A4} = M_{A4} - M_{4b}^{(1,2,5)} L_{6LL(5)}^{(3,4)} - M_{4b}^{(1,4,5)} L_{6LL(5)}^{(2,3)} - M_{2}^{(1,5)} B_{8LLJ} (E) (2,3,4) - M_{2}^{(1,5)} \delta m_{8LLJ}^{(2,3,4)} \\
+ M_{2}^{(1,5)} B_{2}^{(2)} (E) L_{6LL(5)}^{(3,4)} + M_{2}^{(1,5)} \delta m_{2}^{(2)} L_{6LL(5)}^{(3,4)} \\
+ M_{2}^{(1,5)} B_{2}^{(4)} (E) L_{6LL(5)}^{(2,3)} + M_{2}^{(1,5)} \delta m_{2}^{(4)} L_{6LL(5)}^{(2,3)}, \quad (A23) \]
where
\[
B_{8LLJ} = B_{8LLJ} (E) + B_{8LLJ} (N), \\
B_{2} = B_{2} (E) + B_{2} (N). \quad (A24) \]
The \( B(E) \) term of the wave-function renormalization constant comes from the derivative of the numerator of the self-energy diagram \( \Sigma(p) \) with respect to the fermion momentum \( p \), while the \( B(N) \) term is the derivative of the denominator function \( V \) defined in (11). For the second-order case, we find \( B_{2} (E) = B_{2}^{UV} \) and \( B_{2} (N) = B_{2}^{R} \). The relationship to the fully subtracted \( \Delta' M_{A4} \) is thus clear and we find
\[
\Delta' M_{A4} = \Delta'' M_{A4} - M_{2}^{(1,5)} B_{8LLJ}^{(2,3,4)}, \\
\Delta B_{8LLJ} = B_{8LLJ} (N) - 2B_{2}^{R} L_{6LL(5)}. \quad (A25) \]
The IR subtraction term used for \( \Delta'' M_{A4} \) is the same one for \( \Delta' M_{A4} \). As a check we evaluated both integrals numerically. The results are in good agreement within the uncertainty of VEGAS integration.

5. \( A5, B5, C5 \)

The diagram \( A5 \) has a self-energy subdiagram (2) and two vertex subdiagrams (1,2,3,4) and (4,5) besides the \( l-l \) subdiagram (6,7,8,9). The subdiagram (2) is the second-order self-energy diagram which contributes to the renormalization constants \( B_{2} \) and \( \delta m_{2} \). Taking
this into account we can write the renormalized amplitude \( a_{A5} \) as

\[
a_{A5} = M_{A5} - L_{6LL(5)}^{(4,5)} M_{4b}^{(1,2,3)} - L_{8LL(7)}^{(1,2,3,4)} M_2^{(5)} - B_2^{(2)} M_{8LLJ}^{(1,3,4,5)} - \delta m_2^{(2)} M_{8LLJ}^{*},
\]

\[
+ B_2^{(2)} L_{6LL(5)}^{(1,3,4)} M_2^{(5)} + \delta m_2^{(2)} L_{6LL(5)}^{*(5)} M_2^{(5)}
\]

\[
+ B_2^{(2)} L_{6LL(5)}^{(4,5)} M_2^{(1,3)} + \delta m_2^{(2)} L_{6LL(5)}^{(4,5)} M_2^{(1,3)}.
\]

(A26)

Applying the \( K_2 \)-operation to the self-energy subdiagram (2), we obtain

\[
\Delta M_{A5} = M_{A5} - L_{6LL(5)}^{(4,5)} M_{4b}^{(1,2,3)} - L_{8LL(7)}^{(1,2,3,4)} M_2^{(5)} - B_2^{(2)UV} M_{8LLJ}^{(1,3,4,5)} - \delta m_2^{(2)} M_{8LLJ}^{*}
\]

\[
+ B_2^{(2)UV} L_{6LL(5)}^{(1,3,4)} M_2^{(5)} + \delta m_2^{(2)} L_{6LL(5)}^{*(5)} M_2^{(5)}
\]

\[
+ B_2^{(2)UV} L_{6LL(5)}^{(4,5)} M_2^{(1,3)} + \delta m_2^{(2)} L_{6LL(5)}^{(4,5)} M_2^{(1,3)}.
\]

(A27)

Note that the \( K_2 \)-operation yields the whole mass-renormalization constant \( \delta m_2 \). Substituting (A27) in (A26), we obtain

\[
a_{A5} = \Delta M_{A5} - B_2^{R} M_{8LLJ}^{(1,3,4,5)} + B_2^{R} L_{6LL(5)}^{(1,3,4)} M_2^{(5)} + B_2^{R} L_{6LL(5)}^{(4,5)} M_2^{(1,3)}
\]

\[
= \Delta M_{A5} - B_2^{R} \Delta M_{8LLJ}.
\]

(A28)

where \( B_2^{R} = B_2 - B_2^{UV} \). Similar consideration for the diagrams B5 and C5 yields

\[
a_{B5} = \Delta M_{B5} - B_2^{R} M_{8LLL}^{(1,3,4,5)} + B_2^{R} L_{6LL(3)}^{(1,3,4)} M_2^{(5)} + B_2^{R} L_{6LL(3)}^{(4,5)} M_2^{(1,3)}
\]

\[
= \Delta M_{B5} - B_2^{R} \Delta M_{8LLL}.
\]

(A29)

\[
a_{C5} = \Delta M_{C5} - B_2^{R} M_{8LLK}^{(1,3,4,5)} + B_2^{R} L_{6LL(3)}^{(1,3,4)} M_2^{(5)} + B_2^{R} L_{6LL(3)}^{(4,5)} M_2^{(1,3)}
\]

\[
= \Delta M_{C5} - B_2^{R} \Delta M_{8LLK}.
\]

(A30)

Adding up these results, we obtain

\[
\sum_{C} a_{\alpha} = \Delta M_{\alpha} - B_2^{R} \Delta M_{8JKL}.
\]

(A31)

6. A6, B6, C6

The diagram A6 has UV-divergent subdiagrams (2, 3), (1, 2, 3, 4), (2, 3, 4, 5), besides (6, 7, 8, 9), and the corresponding forest structure. Thus the renormalized amplitude \( a_{A6} \) can be written as

\[
a_{A6} = M_{A6} - L_{2}^{(2,3)} M_{8LLJ}^{(1,4,5)} - L_{8LL(7)}^{(1,2,3,4)} M_2^{(5)} - L_{8LLF(7)}^{(2,3,4,5)} M_2^{(1)}
\]

\[
+ L_{2}^{(2,3)} L_{6LL(5)}^{(4,5)} M_2^{(1)} + L_{2}^{(2,3)} L_{6LL(5)}^{(4,5)} M_2^{(5)}.
\]

(A32)
Applying the $K_{23}$-operation on $M_{A6}$, we can define the UV-finite quantity $\Delta M_{A6}$ as

$$\Delta M_{A6} = M_{A6} - L_2^{UV(2,3)} M_{8LLJ}^{(1,4,5)} - L_2^{(1,2,3,4)} M_2^{(5)} - L_2^{(2,3,4,5)} M_2^{(1)} + L_2^{UV(2,3)} L_{6LL(5)}^{(4,5)} M_2^{(1)} + L_2^{UV(2,3)} L_{6LL(5)}^{(1,4)} M_2^{(5)}.$$  \hspace{1cm} (A33)

Substituting (A33) in (A32), we obtain

$$a_{A6} = \Delta M_{A6} - L_2^R M_{8LLJ}^{(1,4,5)} + L_2^R L_{6LL(5)}^{(4,5)} M_2 + L_2^R L_{6LL(5)}^{(1,4)} M_2 = \Delta M_{A6} - L_2^R \Delta M_{8LLJ}. \hspace{1cm} (A34)$$

Similar consideration for the diagrams $B6$ and $C6$ yields

$$a_{B6} = \Delta M_{B6} - L_2^R M_{8LLL}^{(1,4,5)} + L_2^R L_{6LL(3)}^{(4,5)} M_2 + L_2^R L_{6LL(3)}^{(1,4)} M_2 = \Delta M_{B6} - L_2^R \Delta M_{8LLL}, \hspace{1cm} (A35)$$

and

$$a_{C6} = \Delta M_{C6} - L_2^R M_{8LKK}^{(1,4,5)} + L_2^R L_{6LL(3)}^{(4,5)} M_2 + L_2^R L_{6LL(3)}^{(1,4)} M_2 = \Delta M_{C6} - L_2^R \Delta M_{8LKK}. \hspace{1cm} (A36)$$

From (A34), (A35), and (A36), we obtain

$$\sum_{\alpha=A}^C a_{\alpha6} = \sum_{\alpha=A}^C \Delta M_{\alpha6} - L_2^R \Delta M_{8JKL}. \hspace{1cm} (A37)$$

7. $A7$, $B7$, $C7$

The diagram $A7$ has two vertex subdiagrams $(1,2,3,4)$ and $(2,3,4,5)$, besides the $l-l$ subdiagram (6,7,8,9). Thus the renormalized amplitude $a_{A7}$ can be written as

$$a_{A7} = M_{A7} - L_{8LLG(7)}^{(1,2,3,4)} M_2^{(5)} - L_{8LLG(7)}^{(2,3,4,5)} M_2^{(1)}.$$  \hspace{1cm} (A38)

We define the UV-finite quantity $\Delta M_{A7}$ by

$$\Delta M_{A7} = M_{A7} - L_{8LLG(7)}^{(1,2,3,4)} M_2^{(5)} - L_{8LLG(7)}^{(2,3,4,5)} M_2^{(1)},$$  \hspace{1cm} (A39)

where $L_{8LLG(7)}$ is not decomposed into UV-divergent and UV-finite parts. Thus we have

$$a_{A7} = \Delta M_{A7}. \hspace{1cm} (A40)$$

Similar relation holds for $a_{B7}$ and $a_{C7}$. Thus we have

$$\sum_{\alpha=A}^C a_{\alpha7} = \sum_{\alpha=A}^C \Delta M_{\alpha7}. \hspace{1cm} (A41)$$

21
8. **A₈, B₈, C₈**

The diagram \( A₈ \) has a self-energy subdiagram (3) and two vertex subdiagrams \((1,2,3,4)\) and \((2,3,4,5)\), besides the \( l-l \) subdiagram \((6,7,8,9)\). Thus, its renormalization structure is similar to that of the diagram \( A₅ \):

\[
a_{A₈} = M_{A₈} - L_{LLL(I)}^{(1,2,3,4)} M_{2}^{(5)} - L_{LLL(I)}^{(2,3,4,5)} M_{2}^{(1)} - B_2^{(3)} M_{LLLJ} - \delta m_2^{(3)} M_{LLLJ}^{(1,2,4,5)} \\
+ B_2^{(3)} L_{6LL(5)}^{(1,2,4)} M_2^{(5)} + \delta m_2^{(3)} L_{6LL^*(5)}^{(1,2,4)} M_2^{(5)} \\
+ B_2^{(3)} L_{6LL(5)}^{(2,4,5)} M_2^{(1)} + \delta m_2^{(3)} L_{6LL^*(5)}^{(2,4,5)} M_2^{(1)}.
\]  

(A42)

Applying the \( K_3 \)-operation to the self-energy subdiagram (3), we obtain

\[
\Delta M_{A₈} = M_{A₈} - L_{LLL(I)}^{(1,2,3,4)} M_{2}^{(5)} - L_{LLL(I)}^{(2,3,4,5)} M_{2}^{(1)} - B_2^{(3)UV} M_{LLLJ}^{(1,2,4,5)} - \delta m_2^{(3)} M_{LLLJ}^{(1,2,4,5)} \\
+ B_2^{(3)UV} L_{6LL(5)}^{(1,2,4)} M_2^{(5)} + \delta m_2^{(3)} L_{6LL^*(5)}^{(1,2,4)} M_2^{(5)} \\
+ B_2^{(3)UV} L_{6LL(5)}^{(2,4,5)} M_2^{(1)} + \delta m_2^{(3)} L_{6LL^*(5)}^{(2,4,5)} M_2^{(1)}.
\]  

(A43)

Substituting \( A43 \) in \( A42 \), we obtain

\[
a_{A₈} = \Delta M_{A₈} - B_2^{R} \Delta M_{LLLJ}^{(1,2,3,4,5)} + B_2^{R} l_{6LL(5)}^{(1,2,4)} \Delta M_{2}^{(5)} + B_2^{R} l_{6LL^*(5)}^{(2,4,5)} \Delta M_{2}^{(1)} \\
= \Delta M_{A₈} - B_2^{R} \Delta M_{LLLJ}^{(1,2,3,4,5)}.
\]  

(A44)

Applying the same consideration to the diagrams \( B₈ \) and \( C₈ \), and adding them to \( A44 \), we obtain

\[
\sum_{\alpha=A}^{C} a_{\alpha₈} = \sum_{\alpha=A}^{C} \Delta M_{\alpha₈} - B_2^{R} \Delta M_{SJKL}.
\]  

(A45)

9. **Sum**

Taking into account that integrals for diagrams such as \( A₁ \) actually represent \( 2 \times 2 \times 5 \) vertex diagrams, the sum of all diagrams of Set III(c) can be written as

\[
A_{1}^{(10)}[\text{Set III(c)}(l_{1}l_{2})] = \sum_{\alpha=A}^{C} \sum_{i=1}^{8} \eta_i \Delta M_{\alpha i}^{(l_{1}l_{2})} - 3\Delta L B_2 \Delta M_{SJKL}^{(l_{1}l_{2})},
\]  

(A46)

where \( l_{1} \) refers to the open lepton line and \( l_{2} \) refers to the closed lepton line. \( \Delta L B_2 \equiv L_2^{R} + B_2^{R} \), and \( \eta_i = 2 \) for \( i = 4,7,8 \), \( \eta_i = 4 \) for \( i = 1,2,3,5,6 \).
