Are European HIV cohort data within EuroCoord representative of the diagnosed HIV population?

Georgia Vourli, Anastasia Pharris, Francoise Cazein, Dominique Costagliola, Francois Dabis, Julia Del Amo, Valerie Delpech, Asuncion Díaz, Enrico Girardi, Annabelle Gourlay, Barbara Gunsenheimer-Bartmeyer, Victoria Hernando, Georgios Nikolopoulos, Kholoud Porter, Magdalena Rosińska, Caroline Sabin, Barbara Suligo, Virginie Supervie, Ferdinand Wit and Giota Touloumi

Objective: HIV cohorts are an important source of clinical data for informing public health policies and programmes. However, the generalizability of cohort findings to the wider population of people diagnosed with HIV in each country remains unclear. In this work, we assessed the representativeness of six large national HIV cohorts within Europe.

Design and methods: Individual-level cohort data were provided from national cohorts in France, Germany, Greece, Italy, Spain and the United Kingdom. Analysis focused on new HIV diagnoses reported to The European Surveillance System (TESSy) during three time periods (2000–2004, 2005–2009 and 2010–2013), to allow for temporal changes. Cohort and TESSy records were matched and compared by age, sex, transmission mode, region of origin and CD4+ cell count at diagnosis. The probability of being included in each cohort given demographic characteristics was estimated and used to generate weights inversely proportional to the probability of being included.

Results: Participating cohorts were generally representative of the national HIV-diagnosed population submitted to TESSy. However, people who inject drugs, those born in...
a country other than that reporting the data, those with low CD4\(^+\) cell counts at diagnosis, and those more than 55 years were generally underrepresented in the cohorts examined.

**Conclusion:** These European cohorts capture a representative sample of the HIV-diagnosed populations in each country; however some groups may be underrepresented.

Keywords: cohorts, HIV, representativeness, surveillance

### Introduction

HIV infection continues to be of major public health importance worldwide, notably because significant numbers of new infections and premature deaths continue to occur [1]. In the era of test and treat approaches and of biomedical prevention [2], the development and assessment of effective public health responses requires the monitoring of not only new diagnoses and routes of transmission, but also other key markers including linkage to care, treatment uptake and viral suppression.

HIV surveillance in Europe is carried out by the European Centre for Disease Prevention and Control (ECDC) and the WHO Regional Office for Europe. HIV cases reported annually by European Union Member States to The European Surveillance System (TESSy), hosted at ECDC, remain the best estimate of the number of people diagnosed with HIV, although underreporting does occur in some Member States. Although the demographic data collected by TESSy provides important information for monitoring, data on clinical indicators are often lacking. EuroCoord was a Network of Excellence established by several of the largest HIV cohorts and collaborations within Europe – as part of this collaborative effort, EuroCoord supported the development of a combined dataset including individual demographic data and clinical indicators for almost 300,000 HIV-positive adults and children [3].

HIV cohorts are an important source of data for informing policy. However, cohorts may systematically exclude specific groups of individuals, those less likely to access care, such as people who inject drugs (PWID) [4–6]. The representativeness of each cohort is usually assessed by comparing the characteristics of cohort participants to those of corresponding reference populations [7–10]. Several methods to account for selection bias have been proposed [11–13].

The aim of the present work was to assess the representativeness of several large cohorts of HIV-positive adult individuals followed within EuroCoord by comparing their characteristics with those diagnosed from the same countries as submitted to TESSy. These findings can inform our understanding of whether, and in which settings and population groups, results based on cohort data can be generalized to the wider population, allowing ECDC, European Union Member States, and the European Commission to confidently use cohort data to provide guidance on issues of public health importance with regard to HIV infection.

### Methods

Seven cohorts within EuroCoord that do not form the basis of their respective national surveillance systems were included in analyses: the French Hospitals Database on HIV ANRS CO4 and Aquitaine ANRS CO3 from France [14,15], Clinical Surveillance of HIV Disease (ClinSurv) from Germany [16], Athens Multicentre AIDS Cohort Study (AMACS) from Greece, Italian Cohort Naïve Antiretrovirals (ICONA) from Italy [17], Cohort of the Spanish HIV Research Network (CoRIS) from Spain, and the UK Collaborative HIV Cohort (UK CHIC) from the United Kingdom [18].

TESSy data of individuals diagnosed up to 2013 and reported up to 2015 in these six countries were provided by ECDC under agreement for data confidentiality. Anonymized data with variables on age, sex, transmission mode, country/region of origin, year of diagnosis and CD4\(^+\) cell counts at diagnosis were included. Individual cohort data on the same variables were provided from each participating country. All participating cohorts had approval from relevant country authorities.

### Statistical analysis

TESSy data were considered as the gold standard against which the characteristics of cohort participants were compared. Analyses focused on HIV cases diagnosed during the time periods 2000–2004, 2005–2009 and 2010–2013 to account for changes in individual characteristics over time. Each country and time period was analysed separately.
In general, the cohorts captured the main characteristics of the HIV-diagnosed individuals in the corresponding countries (Table 1). Main trends over time observed in TESSy were also seen in the cohorts. However, specific subgroups were underrepresented (Fig. 1). PWID born in another country, those with low CD4\(^+\) cell counts at diagnosis, older individuals and women were, in general, underrepresented in the cohorts, but in different degrees across different countries (Fig. 1). PWID were underrepresented in France, Greece, Spain and the United Kingdom. In Germany, this finding held only for the 2005–2009 period. In Italy, Spain and the United Kingdom, individuals reporting other transmission mode were underrepresented; in France and Greece individuals originated from other than the reporting country and in Spain those originated from another (nonreporting) European country were also underrepresented; individuals who were older than 55 years were underrepresented in Italy, Spain, the United Kingdom and, to some extent, in Greece. Women were also slightly underrepresented in most countries including Italy, Spain and the United Kingdom, whereas in Greece, women were underrepresented only in the 2005–2009 period.

Although the degree of underrepresentation or overrepresentation was quite low when we considered each variable separately, it varied substantially when we considered the degree of representation by covariate patterns (i.e. combining all variables). In France, PWID originated from outside the country were highly underrepresented (stabilized weights: 1.8–13.1), as were MSM originated from Africa, Asia or Latin America (stabilized weights: 1.2–4.6). Similarly, in Greece, PWID originated from other European countries were substantially underrepresented (stabilized weights: 1.6–4.9). In Spain, PWID originated from other countries were also underrepresented (stabilized weights: 1.5–3.4).

Application of inclusion weights efficiently compensated for observed imbalances and reproduced the structure of the corresponding diagnosed population (Appendix, Fig. A1, http://links.lww.com/QAD/B370).

**Discussion**

This is the first effort to assess the representativeness of European HIV cohorts within EuroCoord compared with the wider population of HIV-diagnosed individuals reported to TESSy. Our findings suggest that, whilst cohort participants are a fairly representative sample of HIV-diagnosed individuals, some groups remain underrepresented or overrepresented within these cohorts.

All participating cohorts, other than CoRIS in which participants are also recruited from an STI clinic, are HIV clinic-based. Thus, differences between cohorts and TESSy data may reflect differences between individuals who are and are not linked to care. PWID tended to be underrepresented in all cohorts and time periods, except in ICONA. Impaired access to care and retention in care for PWID is a global challenge [6,20,21]. Older individuals also tended to be underrepresented in some cohorts. Results from previous studies are conflicting, reporting either higher or lower probability of inclusion.
Table 1. Demographic characteristics in cohort and The European Surveillance System data for individuals diagnosed between 2000 and 2013, Germany, Greece and the United Kingdom; for France, only individuals diagnosed between 2003 and 2013 were included and for Italy only data for 2010–2013, whereas in Spain only individuals diagnosed between 2005 and 2013 are included.

| Transmission mode | France | Germany | Greece | Italy | Spain | United Kingdom |
|-------------------|--------|---------|--------|-------|-------|----------------|
| MSM               | 11 066 (38.5) | 20 238 (34.0) | 8206 (58.0) | 21 730 (64.2) | 1637 (49.6) | 6232 (40.5) |
| PWID              | 577 (2.0) | 2105 (3.9) | 4992 (35.3) | 10 096 (29.8) | 1465 (44.4) | 8250 (53.4) |
| Other             | 17 114 (59.5) | 36 937 (62.1) | 4992 (35.3) | 10 096 (29.8) | 1465 (44.4) | 8250 (53.4) |

| Sex              | France | Germany | Greece | Italy | Spain | United Kingdom |
|------------------|--------|---------|--------|-------|-------|----------------|

PWID, people who inject drugs.

*aFor France CD4+ cell counts concern only on the last study period (2008–2013).
for older individuals [5, 22]. However, it has been reported previously that older age is significantly associated with late diagnosis [23]. As previously described [5], women were also slightly underrepresented in most cohorts. In accordance with previous studies that report suboptimal access to care among migrants, there were indications that migrants were underrepresented [24, 25]. Individuals with low CD4$^+$ cell counts were less likely to be included in most cohorts, possibly because they may die shortly after their diagnosis, or because they often start combined antiretroviral treatment (cART) immediately and are perhaps excluded from cohorts recruiting cART-naive individuals (e.g. ICONA, CoRIS). Underrepresentation of individuals with a low CD4$^+$ cell count in cohorts has also been reported [5].

In this work, TESSy data were considered the gold standard with which cohort data were compared. However, surveillance data also have limitations. Changes over time were taken into account by analysing each study period separately. To account for reporting delays, we analysed data up to 2013, whereas the average delays in the analysed countries are less than 6 months [26]. Surveillance data included in TESSy may underestimate the number of people diagnosed with HIV in some countries, because of underreporting (as in France, underreporting was estimated at 29.6% for 2010–2013 in France). Additional limitations include a lack of data on migrant status as well as misclassified and/or missing data that are more likely to occur in surveillance settings than in cohorts. Thus, differences between cohort and surveillance data may be due to the different conditions under which data collection is performed by cohorts and surveillance systems.

The observed differences may also reflect delayed enrolment into the cohorts. In cases of recent epidemics in specific groups, enhanced linkage to care is essential so that these newly infected individuals are promptly provided access to ART and clinical follow-up and, where relevant, included in HIV cohorts.

In summary, our findings indicate that the main European cohorts capture a representative sample of the HIV-
diagnosed population. Nevertheless, the sample of individuals participating in HIV cohorts within EuroCoord may differ systematically from the population of HIV-diagnosed individuals reported to ECDC through TESSy. Given that vulnerable patients tend to be underrepresented, estimation of public health indices based on cohort data could lead to overoptimistic conclusions. Provided that cohorts are able to capture data on all characteristics associated with inclusion into the cohort, weighted analyses are likely to provide more unbiased estimates of public health-indices [12,13]. Supplementing surveillance data with annual updates of public health relevance such as treatment uptake and viral suppression should be the gold standard of HIV surveillance. This information can be provided from existing clinical cohorts and should ideally be expanded to all patients accessing HIV care in a given country. Therefore, the results of this project could be used to more effectively triangulate HIV surveillance and cohort data for public health action.

Hospital San Cecilio (Granada): Federico Garcia, Jose Hernandez, Alejandro Peña, Leopoldo Muñoz, Jorge Parra, Marta Alvarez, Natalia Chueca, Vicente Guillot, David Vinuesa, Jose Angel Fernández. Centro Sanitario Sandoval (Madrid): Jorge Del Romero, Carmen Rodriguez, Teresa Puerta, Juan Carlos Carrió, Mar Vera, Juan Ballesteros. Hospital de la Santa Creu i Sant Pau (Barcelona): Pere Domingo, Mª Antonia Sanibea, Karuna Lamarca, Graci
The current work was supported by the European Centre for Disease Prevention and Control (contract number ECD. 5665).

Authors’ contribution: G.V.: performed the statistical analysis and drafted the article. A.P., A.G., K.P., M.R. and M.R. described in detail the statistical analysis. D.C., F.D., J.D.A., V.D., E.G., B.G.B., M.R., T.H., S. Johnson, M. Youle, F. Lampe, C. Smith, R. Tsintas, C. Orkin, J. Lynch, J. Hand, C. de Souza, H. Spencer, R. Jones; Barts and The London NHS Trust, London (C. Orkin, J. Lynch, J. Hand, C. de Souza); Homerton University Hospital NHS Trust, London (J. Anderson, S. Munshi); North Middlesex University Hospital NHS Trust, London (J. Ainsworth, A. Schwenk, S. Miller, C. Wood); The Lothian University Hospitals NHS Trust, Edinburgh (C. Leen, A. Wilson, S. Morris); North Bristol NHS Trust (M. Gompels, S. Allan); Leicester, University Hospitals of Leicester NHS Trust (A. Palfreeman, K. Memon, A. Lewszuk); Middlesbrough, South Tees Hospitals NHS Foundation Trust (D. Chadwick, E. Cope, J. Gibson); Woolwich, Lewisham and Greenwich NHS Trust (S. Kegg, P. Main, D. Mitchell, D. Hunter); St George’s Healthcare NHS Trust (P. Hay, M. Dhillon); York Teaching Hospital NHS Foundation Trust (F. Martin, S. Russell-Sharpe); Coventry, University Hospitals Coventry and Warwickshire NHS Trust (S. Allan, A. Harte, S. Clay); Wolverhampton, The Royal Wolverhampton Hospitals NHS Trust (A. Tariq, H. Spencer, R. Jones); Chertsey, Ashford and St Peter’s Hospitals NHS Foundation Trust (J. Pritchard, S. Cumming, C. Atkinson); Public Health England, London (V. Delpech); UK Community Advisory Board (R. Trevelion).

UK CHIC Participating Centres: Brighton and Sussex University Hospitals NHS Trust (M. Fisher, N. Perry, S. Tilbury, E. Youssef, D. Churchill); Chelsea and Westminster Hospital NHS Foundation Trust, London (B. Gazzard, M. Nelson, R. Everett, D. Asboe, S. Mandala); King’s College Hospital NHS Foundation Trust, London (F. Post, H. Korat, C. Taylor, Z. Gleisner, F. Ibrahim, L. Campbell); Mortimer Market Centre, University College London (R. Gilson, N. Brima, I. Williams); Royal Free NHS Foundation Trust/University College London (M. Johnson, M. Youle, F. Lampe, C. Smith, R. Tsintas, C. Chaloner, S. Hutchinson, C. Sabin, A. Phillips, T. Hill, S. Jose, A. Thornton, S. Huntingdon); Imperial College Healthcare NHS Trust, London (J. Walsh, N. Mackie, A. Winston, J. Weber, F. Ramzan, M. Carder); Barts and The London NHS Trust, London (C. Orkin, J. Lynch, J. Hand, C. de Souza); Homerton University Hospital NHS Trust, London (J. Anderson, S. Munshi); North Middlesex University Hospital NHS Trust, London (J. Ainsworth, A. Schwenk, S. Miller, C. Wood); The Lothian University Hospitals NHS Trust, Edinburgh (C. Leen, A. Wilson, S. Morris); North Bristol NHS Trust (M. Gompels, S. Allan); Leicester, University Hospitals of Leicester NHS Trust (A. Palfreeman, K. Memon, A. Lewszuk); Middlesbrough, South Tees Hospitals NHS Foundation Trust (D. Chadwick, E. Cope, J. Gibson); Woolwich, Lewisham and Greenwich NHS Trust (S. Kegg, P. Main, D. Mitchell, D. Hunter); St George’s Healthcare NHS Trust (P. Hay, M. Dhillon); York Teaching Hospital NHS Foundation Trust (F. Martin, S. Russell-Sharpe); Coventry, University Hospitals Coventry and Warwickshire NHS Trust (S. Allan, A. Harte, S. Clay); Wolverhampton, The Royal Wolverhampton Hospitals NHS Trust (A. Tariq, H. Spencer, R. Jones); Chertsey, Ashford and St Peter’s Hospitals NHS Foundation Trust (J. Pritchard, S. Cumming, C. Atkinson); Public Health England, London (V. Delpech); UK Community Advisory Board (R. Trevelion).

UK CHIC Steering Committee: Jonathan Ainsworth, Sriss Allan, Jane Anderson, Abdel Babiker, David Chadwick, V.D., David Dunn, Martin Fisher, Brian Gazzard, Richard Gilson, Mark Gompels, Phillip Hay, Teresa Hill, Margaret Johnson, Sophie Jose, Stephen Kegg, Clifford Leen, Fabiola Martin, Mark Nelson, Chloe Orkin, Adrian Palfreeman, Andrew Phillips, Deenan Pillay, Frank Post, Jillian Pritchard, C.S., Memory Sachikonye, Achim Schwenk, Anjum Tariq, Roy Trevelion, John Walsh.
discussed the corresponding characteristics of their countries’ National surveillance systems. G.T. supervised the study design and analysis and coauthored the draft article. All authors contributed substantially in finalizing the article.

Conflicts of interest
A.P. is employed by the ECDC. D.C. reports grants from Janssen-Cilag (2017–2018), Merck-Sharp & Dohme-Chibret (2015–2017), ViViD (2015), personal fees from Janssen-Cilag (2016, 2018) and Merck-Sharp & Dohme-Chibret (2015, 2017) for lectures, personal fees from ViViD (2015), for travel/accommodations/meeting expenses, personal fees from Gilead France from 2011 until December 2015 for French HIV board, personal fees from Innavarix (2015 and 2016) and Merck Switzerland (2017) for consultancy, outside the submitted work. J.D.A. has received teaching fees from MSD, Gilead and ViViV Healthcare. E.G. has received personal fees from Gilead Sciences, Janssen, Otsuka Novel Products and Angelini for consultancy or lectures outside the submitted work. A.G. has participated in an advisory board for ViViV Healthcare (2016). K.P. has served on advisory boards for ViViV Healthcare. M.G. reports grants from the European Centre for Disease Prevention and Control paid to her institution. C.S. has received funding for the membership of Data Safety and Monitoring Boards, Advisory Boards, Speaker Panels and for the preparation of educational materials from Gilead Sciences, ViViV Healthcare and Janssen-Cilag. V.S. has served on advisory boards for ViViV Healthcare (2016) and Gilead (2018) and reports lecture fees from MSD (2014), Gilead (2014, 2015, 2017), Abbvie (2018) and Janssen (2018), outside the submitted work. G.T. has received grants unrelated to this study from Gilead Sciences Europe, UCL, ECDC and EU and National fund. All other authors have no conflicts of interest to declare.
