Fig. S1. Detection of tail BLI signal following i.p. infection with B. melitensis in different doses. Day 7 post infection with indicated doses of B. melitensis GR023. Note (arrows) discrete infectious foci in the tails independent of bacterial dose.
Fig. S2. Tail lesion co-localized with BLI signal. Day 7 post infection with 108 B. melitensis GR023. Visible lesions in the tail were associated with high bioluminescent signal (arrows).
