Applications of differential equations to characterize the base of warped product submanifolds of cosymplectic space forms

Akram Ali1, Fatemah Mofarreh2*, Wan Ainun Mior Othman3 and Dhriti Sundar Patra4

Abstract
In the present, we first obtain Chen–Ricci inequality for C-totally real warped product submanifolds in cosymplectic space forms. Then, we focus on characterizing spheres and Euclidean spaces, by using the Bochner formula and a second-order ordinary differential equation with geometric inequalities. We derive the characterization for the base of the warped product via the first eigenvalue of the warping function. Also, it proves that there is an isometry between the base $N_1$ and the Euclidean sphere $S^{m_1}$ under some different extrinsic conditions.

Keywords: Warped product submanifolds; Cosymplectic space forms; Obata differential equation; Isometric; Geometric inequalities

1 Introduction and motivations
The seminal work of Obata [30] has become a basic tool of investigation in geometric analysis. Obata [30] provided a characterization theorem for the standard sphere in terms of a differential equation, nowadays famous as Obata equation. If $(\Omega^n, g)$ is a complete manifold, then the function $\omega$ is nonconstant and satisfying the ODE

$$\text{Hess}(\omega) + c\omega g = 0 \quad (1.1)$$

if and only if there is an isometry between $(\Omega^n, g)$ and the sphere $S^n(c)$, where $c$ denotes the sectional curvature. If $c = 1$, then $(\Omega^n, g)$ and the unit sphere $S^n$ are congruent. Many investigations have been dedicated to this subject, and therefore, characterization of the Euclidean space $\mathbb{R}^n$, the Euclidean sphere $S^n$, and the complex projective space $\mathbb{C}P^n$ are recognized fields in differential geometry and studied in some researches, e.g., [1–10, 13–15, 20–25]. In particular, the Euclidean space $\mathbb{R}^n$ is designated through the differential equation $\nabla^2 \omega = cg$, where $c$ is a positive constant, which was proven by Tashiro [32]. In [27], Lichnerowicz established that if the first nonzero eigenvalue $\mu_1$ of Laplace operator of the compact manifold $(\Omega^n, g)$ with $Ric \geq n - 1$ is $\mu_1 = n$, then $(\Omega^n, g)$ is isometric to the sphere $S^n$. Hence, Obata’s theorem can be utilized to address the equality condition of Lichnerowicz’s eigenvalue. Deshmukh–Al-Solamy [25] proved that an $n$-dimensional
Riemannian manifold \((\Omega^n, g)\) satisfying \(0 < \text{Ric} \leq (n-1)(2 - \frac{m}{\mu_1}c)\) for a constant \(c\), where \(\mu_1\) is the first eigenvalue of the Laplacian, is isometric to \(S^n(c)\) if \(\Omega^n\) admits a nonzero conformal gradient vector field. They also proved that if \(\Omega^n\) is an Einstein manifold such that Einstein constant is \(\mu = (n-1)c\), then \(\Omega^n\) is isometric to \(S^n(c)\) with \(c > 0\) if it admits a conformal gradient vector field. Taking account of ODE (1.1), Barros et al. [11] showed that the gradient almost Ricci soliton \((\Omega^n, g, \nabla \omega, \lambda)\) that is compact is isometric to the Euclidean sphere with Codazzi–Ricci tensor and constant sectional curvature. For more terminology of Obata equation, see [30]. Motivated by the previous studies, we will establish the following results:

**Theorem 1.1** Let \(\Upsilon: \Omega^n = N_1 \times_f N_2 \rightarrow M^{2m+1}(c)\) be a \(C\)-totally real isometric embedding of the warped product submanifold \(\Omega^n\) into a cosymplectic space form \(M^{2m+1}(c)\) with nonnegative Ricci curvature. Then, the compact and minimal base \(N_1\) is isometric to the Euclidean sphere \(S^{m_1}(\sqrt{\frac{\lambda_1}{m_1}})\) if the following equality holds:

\[
|\text{Hess}(\omega)|^2 = \frac{\lambda_1}{m_1 m_2}\left\{\epsilon(1-n-m_1 m_2) - n^2|\mathbb{II}|^2\right\},
\]

where \(\lambda_1 > 0\) is the eigenvalue connected to the eigenfunction \(\omega = \ln f\) and \(\text{Hess}(\omega)\) is a Hessian tensor for the function \(\omega\). Moreover, here the constant curvature \(c\) is equal to \(\sqrt{\frac{\lambda_1}{m_1}}\). In particular, if \(\lambda_1 = m_1\) satisfies the condition

\[
|\text{Hess}(\omega)|^2 = \frac{1}{m_2}\left\{\epsilon(1-n-\lambda_1 m_2) - n^2|\mathbb{II}|^2\right\},
\]

then the base \(N_1\) is isometric to the standard sphere \(S^{m_1}\).

From the Bochner formula, we are able to prove the following result:

**Theorem 1.2** Let \(\Upsilon: \Omega^n = N_1 \times_f N_2 \rightarrow M^{2m+1}(c)\) be a \(C\)-totally real isometric embedding for the warped product submanifold \(\Omega^n\) to the cosymplectic space form \(M^{2m+1}(c)\) with base \(N_1\) being minimal and compact. If the Ricci curvature of \(\Omega^n\) is nonnegative, then \(N_1\) is isometric to the sphere \(S^{m_1}(c)\) with constant curvature equal to \(c = \sqrt{\frac{\lambda_1}{m_1}}\) if the following equality holds:

\[
|\mathbb{II}|^2 = \frac{\epsilon(1-m_1 m_2 - n)}{n^2},
\]

where \(\lambda_1 > 0\) is an eigenvalue associated with the eigenfunction \(\omega = \ln f\). Moreover, \(n = \dim \Omega, m_1 = \dim N_1,\) and \(m_2 = \dim N_2\).

**Remark 1.1** For examples of \(C\)-totally real isometric immersions from warped product manifolds, see [31, 34].

### 2 Preliminaries and notations

Let \((\tilde{M}, g)\) be an odd-dimensional \(C^\infty\)-manifold equipped with an almost contact structure \((\varphi, \kappa, \eta)\) such that

\[
\varphi^2 = -I + \eta \otimes \kappa, \quad \eta(\kappa) = 1,
\]
for any $\mathcal{W}_1, \mathcal{W}_2 \in \Gamma(T\tilde{M})$. Of course, the notations are well known: $\kappa$ is a structure vector field, $(1, 1)$-type tensor field is denoted by $\varphi$, and $\eta$ is the dual 1-form. Moreover, the torsion equation for a cosymplectic manifold [7] with the structure $(\varphi, \kappa, \eta)$ is given by

$$\tilde{\nabla}_{\mathcal{W}_1} \varphi \mathcal{W}_2 = 0$$  \hspace{1cm} (2.3)

if we choose two vector fields $\mathcal{W}_1, \mathcal{W}_2$ over $\tilde{M}$ such that $\tilde{\nabla}$ is the Riemannian connection corresponding to $g$. Assume that $\tilde{M}^{2m+1}(\epsilon)$ is a cosymplectic space form with constant $\varphi$-sectional curvature $\kappa$, then its curvature tensor $\tilde{R}$ is

$$\tilde{R}(\mathcal{W}_1, \mathcal{W}_2, \mathcal{W}_3, \mathcal{W}_4) = \frac{\epsilon}{4} \left\{ g(\mathcal{W}_2, \mathcal{W}_3)g(\mathcal{W}_1, \mathcal{W}_4) - g(\mathcal{W}_1, \mathcal{W}_3)g(\mathcal{W}_2, \mathcal{W}_4) ight. + \eta(\mathcal{W}_1)\eta(\mathcal{W}_3)g(\mathcal{W}_2, \mathcal{W}_4) + \eta(\mathcal{W}_4)\eta(\mathcal{W}_2)g(\mathcal{W}_1, \mathcal{W}_3)$$

$$- \eta(\mathcal{W}_1)\eta(\mathcal{W}_3)g(\mathcal{W}_2, \mathcal{W}_4) - \eta(\mathcal{W}_4)\eta(\mathcal{W}_2)g(\mathcal{W}_1, \mathcal{W}_3) + g(\varphi \mathcal{W}_2, \mathcal{W}_4)g(\varphi \mathcal{W}_1, \mathcal{W}_3) - g(\varphi \mathcal{W}_1, \mathcal{W}_3)g(\varphi \mathcal{W}_2, \mathcal{W}_4)$$

$$+ 2g(\mathcal{W}_1, \varphi \mathcal{W}_2)g(\varphi \mathcal{W}_3, \mathcal{W}_4) \right\}$$  \hspace{1cm} (2.4)

for all $\mathcal{W}_1, \mathcal{W}_2, \mathcal{W}_3, \mathcal{W}_4 \in \Gamma(T\tilde{M})$. Moreover, if the structure vector field $\kappa$ belongs to the normal space of $\Omega^m$, then $\Omega^m$ is said to be a $C$-totally real submanifold; for more details, see [7, 26, 28, 32, 33]. It should be noted that the curvature tensor $\tilde{R}$ for $\Omega^m$ in cosymplectic space form $\tilde{M}^{2m+1}(\epsilon)$ is defined as

$$\tilde{R}(\mathcal{W}_1, \mathcal{W}_2, \mathcal{W}_3, \mathcal{W}_4) = \frac{\epsilon}{4} \left\{ g(\mathcal{W}_2, \mathcal{W}_3)g(\mathcal{W}_1, \mathcal{W}_4) - g(\mathcal{W}_1, \mathcal{W}_3)g(\mathcal{W}_2, \mathcal{W}_4) \right\}. \hspace{1cm} (2.5)$$

Suppose $\Omega^m$ is a Riemannian submanifold of a Riemannian manifold $\tilde{M}$ and $\Omega^m$ is a totally umbilical if $\xi(\mathcal{W}_1, \mathcal{W}_2) = g(\mathcal{W}_1, \mathcal{W}_2)\mathbb{II}$ and totally geodesic if $\xi(\mathcal{W}_1, \mathcal{W}_2) = 0$.
for any \( W_1, W_2 \in \mathcal{X}(\Omega) \). Furthermore, \( \Omega^n \) is minimal if \( H = 0 \). Here,

\[
\mathcal{N}_X = \{ X \in T_x \Omega | \zeta(W_1, W_2) = 0 \text{ for all } W_2 \in T_x \Omega \}
\]

(2.7)
gives the second fundamental form kernel of \( \Omega^n \) over \( x \). If the plane section is spanned by \( e_\ell \) and \( e_\gamma \) over \( x \) in \( \mathcal{M}^{2m+1} \) then such a curvature is called sectional curvature and it is denoted by \( \bar{K}_{\ell\gamma} \). The relation between the scalar curvature \( \bar{\tau}(T_x \mathcal{M}) \) of \( \mathcal{M}^{2m+1} \) and \( \bar{K}_{\ell\gamma} \) at some \( x \) in \( \mathcal{M}^{2m+1} \) is represented by

\[
\bar{\tau}(T_x \mathcal{M}) = \sum_{1 \leq \ell < \gamma \leq 2m+1} \bar{K}_{\ell\gamma}.
\]

(2.8)
The equality in (2.8) is equivalent to the following:

\[
2\bar{\tau}(T_x \mathcal{M}) = \sum_{1 \leq \ell < \gamma \leq n} \bar{K}_{\ell\gamma}, \quad 1 \leq \ell, \gamma \leq n.
\]

(2.9)
The latter relation will be utilized in the subsequent proofs. Similarly, the scalar curvature \( \bar{\tau}(L_x) \) of an \( L \)-plane is expressed as

\[
\bar{\tau}(L_x) = \sum_{1 \leq \ell < \gamma \leq m} \bar{K}_{\ell\gamma}.
\]

(2.10)
Let \( \{ e_1, \ldots, e_n \} \) be an orthonormal frame of the tangent space \( T_x \Omega \) and \( e_r = (e_{n+1}, \ldots, e_{2m+1}) \) be an orthonormal frame of the normal space \( T^\perp \Omega \). Hence we have

\[
\zeta_{\ell\gamma} = g(\zeta(e_\ell, e_\gamma), e_r) \quad \text{and}
\]

\[
\|\zeta\|^2 = \sum_{\ell, \gamma=1}^{n} g(\zeta(e_\ell, e_\gamma), \zeta(e_\ell, e_\gamma)) = \sum_{\ell, \gamma=1}^{n} (\zeta_{\ell\gamma})^2.
\]

(11.1)
Let \( K_{\ell\gamma} \) and \( \bar{K}_{\ell\gamma} \) be the sectional curvature of a submanifold \( \Omega^n \) and \( \mathcal{M}^{2m+1} \), respectively, then we have following relation due to the Gauss equation (2.6):

\[
2\tau(T_x \Omega^n) = K_{\ell\gamma} = 2\bar{\tau}(T_x \Omega^n) + \sum_{r=n+1}^{2m+1} (\zeta_{\ell\gamma}^{(\ell\gamma)} - (\zeta_{\ell\gamma})^2)
\]

(12.1)
Furthermore, the Ricci tensor is defined for an orthonormal basis \( \{ e_1, \ldots, e_n \} \) of \( \Omega^n \) as

\[
\bar{S}(W_1, W_2) = \sum_{i=1}^{n} \{ g(\bar{R}(e_i, W_1)W_2, e_i) \}, \quad W_1, W_2 \in \Gamma(T_x \Omega^n).
\]

(13.1)
Using the distinct indices for vector fields \( \{ e_1, \ldots, e_n \} \) on \( \Omega^n \) from \( e_n \), which is governed by \( W \), then the Ricci curvature is given as

\[
\bar{R}ic(W) = \sum_{\ell=1}^{n} K(e_\ell \wedge e_n).
\]

(14.1)
Therefore, equation (2.9) can be written as

\[
\tilde{\tau}(T\Omega^n) = \sum_{1 \leq \ell < \gamma \leq n} K(e_\ell \wedge e_\gamma) = \frac{1}{2} \sum_{A=1}^{n} \tilde{R}ic(e_A).
\] (2.15)

Hence,

\[
2\tilde{\tau}(T\Omega^n) = \sum_{1 \leq \ell < \gamma \leq n} K(e_\ell \wedge e_\gamma) = \frac{1}{2} \sum_{u=1}^{n} \tilde{R}ic(e_u),
\] (2.16)

which will be frequently used in the following study. For a \(k\)-plane \(L_k\) of \(T\Omega^n\), suppose \(\{e_1, \ldots, e_k\}\) is an orthonormal frame of \(L_k\), thus for a fixed \(u \in \{1, \ldots, k\}\), the \(k\)-Ricci curvature \(\tilde{R}ic_{L_k}(e_u)\) of \(L_k\) is defined by

\[
\tilde{R}_{L_k}(e_u) = \sum_{\ell \neq u}^{k} K(e_\ell \wedge e_u).
\] (2.17)

The gradient squared-norm of the positive smooth function \(\omega\) of the orthonormal basis \(\{e_1, \ldots, e_n\}\) is given by

\[
\|\nabla\omega\|^2 = \sum_{i=1}^{n} (e_i(\omega))^2.
\] (2.18)

Assume that \(\mathbb{N}_1\) and \(\mathbb{N}_2\) are Riemannian manifolds with Riemannian metrics \(g_1\) and \(g_2\), respectively. Suppose \(f\) is a differentiable function in \(\mathbb{N}_1\). Then, the manifold \(\mathbb{N}_1 \times \mathbb{N}_2\) equipped with the Riemannian metric \(g = g_1 + f^2 g_2\) is referred to as the warped product manifold and defined as \(\Omega^n = \mathbb{N}_1 \times_f \mathbb{N}_2\) (for details, see [17]). Assume that \(\Omega^n = \mathbb{N}_1 \times_f \mathbb{N}_2\) is a nontrivial warped product, then \(\forall W_1 \in \Gamma(\mathbb{N}_1)\) and \(W_2 \in \Gamma(\mathbb{N}_2)\), we have

\[
\nabla_{W_2} W_1 = \nabla_{W_1} W_2 = (\nabla W_1 \ln f) W_2.
\] (2.19)

The following relation was proved in (see (3.3) in [17]) as follows:

\[
\sum_{\ell=1}^{m_1} \sum_{\gamma=1}^{m_2} K(e_\ell \wedge e_\gamma) = \frac{m_2 \Delta(f)}{f} = m_2 (\Delta(\ln f) - \|\nabla(\ln f)\|^2).
\] (2.20)

**Remark 2.1** \(\Omega^n = \mathbb{N}_1 \times_f \mathbb{N}_2\) is a Riemannian product manifold if \(f\) is a constant.

**Lemma 2.1** Suppose \(\Upsilon : \Omega^n = \mathbb{N}_1 \times_f \mathbb{N}_2 \rightarrow \mathbb{M}^{2m+1}(\epsilon)\) is a \(C\)-totally real warped product immersed submanifold into a cosymplectic space form \(\mathbb{M}^{2m+1}\) whose base \(\mathbb{N}_1\) is minimal. Then, for all unit vectors \(W \in T_{\mathbb{N}_1} \Omega^n\), the Ricci inequality

\[
\tilde{R}ic(W) + m_2 \Delta \ln f \leq \frac{n^2}{4} \|\nabla f\|^2 + m_2 \|\nabla \ln f\|^2 + \frac{\epsilon}{4} [m_1 m_2 + n - 1],
\] (2.21)

holds, where \(m_1 = \dim \mathbb{N}_1\) and \(m_2 = \dim \mathbb{N}_2\). Furthermore,
In case that \( H(x) = 0 \), for \( x \in \Omega^n \) there exists a unit vector \( \overline{W} \) satisfying the equality in (2.21) if and only if \( \Omega^n \) is mixed totally geodesic and \( \overline{W} \) lies in \( \mathcal{N}_x \) at \( x \).

If \( \Omega^n \) is \( N_1 \)-minimal, then

(a) The equality in (2.21) remains true for any unit tangent vectors at \( N_1 \) and any \( x \in \Omega^n \) \( \iff \) \( \Omega^n \) is totally geodesic and \( N_1 \)-totally geodesic WP in \( \overline{M}^{2m+1} \).

(b) The equality in (2.21) remains true for any unit tangent vectors at \( N_2 \) and any \( x \in \Omega^n \) \( \iff \) \( \Omega^n \) is totally geodesic, and either an \( N_2 \)-totally geodesic WPS, or an \( N_2 \)-totally umbilical WPS in \( x \in \overline{M}^{2m+1} \) such that \( \dim N_2 = 2 \).

(2) The equality in (2.21) is satisfied for any unit tangent vectors at \( \Omega^n \) and any \( x \in \Omega^n \) \( \iff \) \( \Omega^n \) is either totally geodesic or totally umbilical, mixed totally geodesic and \( N_1 \)-totally geodesic WPS such that \( \dim N_2 = 2 \).

**Proof** Assume that \( \Omega^n \) is \( N_1 \)-minimal C-totally real warped product. An analogous technique will be used for similar cases. Utilizing Gauss equation (2.6), we derive

\[
n^2 \| \overline{H} \|^2 = 2 \tau (T_x \Omega^n) + \| \xi \|^2 - 2 \tau (T_x \Omega^n). \tag{2.22}
\]

Assume \( \{e_1, \ldots, e_m, e_{m+1}, \ldots, e_n\} \) are the local orthonormal frame fields of \( \overline{X}(\overline{M}^{2m+1}) \) in which \( \{e_1, \ldots, e_m\} \) are tangent to \( N_1 \) and \( \{e_{m+1}, \ldots, e_n\} \) are tangent to \( N_2 \). Hence, for the unit tangent vector \( \overline{W} = e_u \in \{e_1, \ldots, e_n\} \), we can expand (2.22) as follows:

\[
n^2 \| \overline{H} \|^2 = 2 \tau (T_x \Omega^n) + \frac{1}{2} \sum_{r=n+1}^{2m+1} \left\{ (\xi_{11}^r + \cdots + \xi_{mm}^r)^2 + (\xi_{uu}^r)^2 \right\}
- \sum_{r=n+1}^{2m+1} \sum_{1 \leq \ell \leq n} \xi_{\ell \ell}^r \xi_{\gamma \gamma}^r - 2 \tau (T_x \Omega^n).
\]

It is equivalent to

\[
n^2 \| \overline{H} \|^2 = 2 \tau (T_x \Omega^n) + \sum_{r=n+1}^{2m+1} \sum_{1 \leq \ell \leq n} \left( \xi_{\ell \ell}^r \right)^2 - 2 \sum_{r=n+1}^{2m+1} \sum_{1 \leq \ell \leq n} \xi_{\ell \ell}^r \xi_{\gamma \gamma}^r - \frac{\epsilon}{4} n(n-1).
\]

As we assumed the warped product submanifold \( \Omega^n \) to be \( N_1 \)-minimal, we derive

\[
n^2 \| \overline{H} \|^2 + \frac{\epsilon}{4} n(n-1)
= \sum_{r=n+1}^{2m+1} \sum_{1 \leq \ell \leq n} \left( \xi_{\ell \ell}^r \right)^2 - \sum_{r=n+1}^{2m+1} \sum_{1 \leq \ell \leq n} \xi_{\ell \ell}^r \xi_{\gamma \gamma}^r
= \sum_{r=n+1}^{2m+1} \sum_{a \neq u} \left( \xi_{uu}^r \right)^2 + \sum_{r=n+1}^{2m} \sum_{1 \leq \ell \leq n} \left( \xi_{\ell \ell}^r \right)^2 - \sum_{r=n+1}^{2m+1} \sum_{1 \leq \ell \leq n} \xi_{\ell \ell}^r \xi_{\gamma \gamma}^r \tag{2.23}
\]
In view of (2.12), we obtain

$$
\sum_{r=n+1}^{2n+1} \sum_{1 \leq \ell, \gamma \leq n} \left( \zeta_{\ell\gamma}^r \right)^2 - \sum_{r=n+1}^{2n+1} \sum_{1 \leq \ell, \gamma \leq n} \zeta_{\ell\gamma}^r \zeta_{\ell\gamma}^{r'} = \sum_{1 \leq \ell, \gamma \leq n} \tilde{K}_{\ell\gamma} - \sum_{1 \leq \ell, \gamma \leq n} K_{\ell\gamma}. \tag{2.24}
$$

From fact that the base $N_1$ is minimal, and putting (2.24) in (2.23), we deduce

$$
\frac{1}{2} n^2 \| \mathbb{E} \|^2 + \frac{\epsilon}{4} n(n-1) = 2\tau \left( T_s \Omega^n \right) + \frac{1}{2} \sum_{r=n+1}^{2n+1} \left( 2\zeta_{uu}^r - \left( \zeta_{u1}^{r'} + \cdots + \zeta_{uu}^{r'} \right) \right)^2
$$

$$
+ \sum_{r=n+1}^{2n+1} \sum_{1 \leq \ell, \gamma \leq n} \left( \zeta_{\ell\gamma}^r \right)^2 - \sum_{r=n+1}^{2n+1} \sum_{1 \leq \ell, \gamma \leq n} \zeta_{\ell\gamma}^r \zeta_{\ell\gamma}^{r'}
$$

$$
+ \sum_{r=n+1}^{2n+1} \sum_{1 \leq \ell, \gamma \leq n} \left( \zeta_{uu}^r \right)^2 + \sum_{1 \leq \ell, \gamma \leq n} \tilde{K}_{\ell\gamma} - \sum_{1 \leq \ell, \gamma \leq n} K_{\ell\gamma}. \tag{2.25}
$$

On the other hand, using (2.8), we define

$$
\tau \left( T_s \Omega^n \right) = \sum_{1 \leq \ell, \gamma \leq n} K(e_\ell \wedge e_\gamma)
$$

$$
= \sum_{i=1}^{m_1} \sum_{j=m_1+1}^{n} K(e_i \wedge e_j) + \sum_{1 \leq i, j \leq n} K(e_i \wedge e_j)
$$

$$
+ \sum_{m_1+1 \leq i, j \leq n} K(e_i \wedge e_j). \tag{2.26}
$$

From (2.20) and (2.8), we get

$$
\tau \left( T_s \Omega^n \right) = \frac{m_2 \Delta f}{f} + \tau \left( T_s \mathbb{N}_1^{m_1} \right) + \tau \left( T_s \mathbb{N}_2^{m_2} \right). \tag{2.27}
$$

Now it suffices to combine (2.25), (2.26), (2.27), and use (2.11) to arrive at the following result:

$$
\frac{1}{2} n^2 \| \mathbb{E} \|^2 + \frac{\epsilon}{4} n(n-1) = \frac{m_2 \Delta f}{f} - 2\tau \left( T_s \Omega^n \right) + \sum_{1 \leq \ell, \gamma \leq n} \tilde{K}_{\ell\gamma} + \tau \left( T_s \mathbb{N}_1^{m_1} \right) + \tau \left( T_s \mathbb{N}_2^{m_2} \right)
$$

$$
+ \sum_{r=n+1}^{2n+1} \sum_{1 \leq \ell, \gamma \leq n} \left( \zeta_{\ell\gamma}^r \right)^2 - \sum_{1 \leq \ell, \gamma \leq n} \zeta_{\ell\gamma}^r \zeta_{\ell\gamma}^{r'}
$$

$$
+ \sum_{r=n+1}^{2n+1} \sum_{1 \leq \ell, \gamma \leq n} \left( \zeta_{uu}^r \right)^2 + \sum_{r=n+1}^{2n+1} \sum_{1 \leq i, j \leq p} \left( \zeta_{ii}^r \zeta_{jj}^r - \zeta_{ij}^r \zeta_{ji}^r \right)^2
$$
we obtain
\[ W \]
and consider two cases. Therefore, using (2.30) in (2.29), we obtain
\[
\sum_{r=n+1}^{2m+1} \sum_{m_1+1 \leq j \leq n} (\xi_{r}^j - (\xi_{r}^{m_1+1} + \cdots + \xi_{r}^{m}))^2
\]
\[
+ \frac{1}{2} \sum_{r=n+1}^{2m+1} (2\xi_{r}^m - (\xi_{r}^{m_1+1} + \cdots + \xi_{r}^{m}))^2.
\]
(2.28)

Now we note that \( e_u \) is either tangent to base \( N_1 \) or to fiber \( N_2 \). We show this by considering two cases.

Case I. Let \( e_u \) be tangent to \( N_1 \). Fix the unit tangent vector from \( \{e_1, \ldots, e_{m_1}\} \) to be \( e_u \), and consider \( W = e_u = e_1 \). Then, from (2.14) and (2.28), we get
\[
\frac{1}{2} n^2 \|\mathcal{H}\|^2 + \frac{\epsilon}{4} n(n-1)
\]
\[
\geq \mathcal{R}ic(W) + \frac{m_2 \Delta f}{f} - 2\bar{\kappa}(T, \Omega^2) + \bar{\kappa}(T, N_1^{m_1}) + \bar{\kappa}(T, N_2^{m_2})
\]
\[
+ \sum_{2 \leq \ell \leq \gamma \leq n} \bar{\kappa}_{\ell \gamma} + \frac{1}{2} \sum_{r=n+1}^{2m+1} (2\xi_{r}^{1} - (\xi_{r}^{m_1+1} + \cdots + \xi_{r}^{m}))^2
\]
\[
+ \sum_{r=n+1}^{2m+1} \sum_{2 \leq \ell \leq \gamma \leq n} (\xi_{r}^{\ell})^2 - \sum_{r=n+1}^{2m+1} \sum_{1 \leq i < j \leq m_1} (\xi_{i}^{j})^2 - \sum_{m_1+1 \leq i < j \leq n} (\xi_{i}^{j})^2
\]
\[
+ \sum_{r=n+1}^{2m+1} \sum_{1 \leq i < j \leq m_1} \xi_{i}^{j} \xi_{r}^{j} + \sum_{r=n+1}^{2m+1} \sum_{m_1+1 \leq i < j \leq n} \xi_{i}^{j} \xi_{r}^{j} - \sum_{2 \leq \ell \leq \gamma \leq n} \xi_{\ell}^{r} h_{\ell \gamma}.
\]
(2.29)

Substituting \( W_1 = W_2 = e_1 \) and \( W_2 = W_2 = e_1 \) for \( 1 \leq \ell, \gamma \leq n \) in (2.6), and summing up, we obtain
\[
\sum_{1 \leq \ell \leq \gamma \leq n} \bar{R}(e_1, e_\ell, e_i, e_\gamma) = \frac{\epsilon}{4} n(n-1).
\]
(2.30)

Therefore, using (2.30) in (2.29), we obtain
\[
\mathcal{R}ic(W) \leq \frac{n^2}{2} \|\mathcal{H}\|^2 + \frac{m_2 \Delta f}{f} + \frac{\epsilon}{4} (m_1 m_2 + n - 1)
\]
\[
- \frac{1}{2} \sum_{r=n+1}^{m} (2\xi_{r}^{1} - (\xi_{r}^{m_1+1} + \cdots + \xi_{r}^{m}))^2
\]
\[
+ \sum_{r=n+1}^{2m+1} \sum_{1 \leq i < j \leq m_1} (\xi_{i}^{j})^2 + \sum_{m_1+1 \leq i < j \leq n} (\xi_{i}^{j})^2
\]
\[
- \sum_{r=n+1}^{2m+1} \sum_{1 \leq i < j \leq m_1} \xi_{i}^{j} \xi_{r}^{j} + \sum_{r=n+1}^{2m+1} \sum_{m_1+1 \leq i < j \leq n} \xi_{i}^{j} \xi_{r}^{j}
\]
\[
+ \sum_{r=n+1}^{2m+1} \sum_{2 \leq \ell \leq \gamma \leq n} \xi_{\ell}^{r} h_{\ell \gamma} - \sum_{r=n+1}^{2m+1} \sum_{2 \leq \ell \leq \gamma \leq n} (\xi_{\ell}^{r})^2.
\]
(2.31)
The calculation of the last two terms of (2.31) implies

\[
\sum_{r=n+1}^{2m+1} \left\{ \sum_{1 \leq i \leq m_1} (\xi_{i}^{r})^2 + \sum_{m_1+1 \leq i \leq n} (\xi_{i}^{r})^2 \right\} - \sum_{r=n+1}^{2m+1} \sum_{1 \leq \ell \leq \gamma \leq n} (\xi_{\ell}^{r})^2

= \sum_{r=n+1}^{2m+1} \sum_{\ell=1}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{\ell}^{r})^2. \tag{2.32}
\]

In a similar way, we obtain

\[
\sum_{r=n+1}^{2m+1} \left\{ \sum_{1 \leq i < j \leq m_1} \left( \sum_{1 \leq i \leq m_1} \sum_{m_1+1 \leq s \leq t \leq n} (\xi_{rs}^{r})^2 + \sum_{m_1+1 \leq s \leq t \leq n} (\xi_{st}^{r})^2 \right) - \sum_{2 \leq \ell < \gamma \leq n} \sum_{m_1+1 \leq s \leq t \leq n} (\xi_{\ell s}^{r})^2 \right\}

= \sum_{r=n+1}^{2m+1} \left( \sum_{\ell=2}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{\ell}^{r})^2 - \sum_{\ell=2}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{\ell}^{r})^2 \right). \tag{2.33}
\]

Using (2.33) in (2.29) leads to

\[
\nabla \text{ic}(\mathcal{W}) \leq \frac{1}{2} n^2 \| \mathbb{H} \|^2 - \frac{m_2}{f} \frac{\Delta f}{|f|^2} + \epsilon \left( \frac{m_1 m_2 + n - 1}{2} \right)

- \sum_{r=n+1}^{2m+1} \left( \sum_{\ell=1}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{\ell}^{r})^2 + \sum_{l=2}^{m_1} (\xi_{l1}^{r} \xi_{l1}^{r}) + \sum_{l=2}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{l}^{r} \xi_{\ell}^{r}) \right)

- \frac{1}{2} \sum_{r=n+1}^{2m+1} \left( 2(\xi_{11}^{r})^2 - (\xi_{m_1+1}^{r} + \cdots + \xi_{m_1+1}^{r})^2 \right). \tag{2.34}
\]

As for the warped product submanifold \( \Omega^n \) such that the base is minimal in \( \Omega^n \), we compute the following simplification:

\[
\sum_{r=n+1}^{2m+1} \sum_{\ell=2}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{\ell}^{r} \xi_{\gamma}^{r}) = - \sum_{r=n+1}^{2m+1} \sum_{\ell=2}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{11}^{r} \xi_{\gamma}^{r}). \tag{2.35}
\]

Similarly, we have

\[
\sum_{r=n+1}^{2m+1} \sum_{\ell=2}^{m_1} \sum_{\gamma=m_1+1}^{n} (\xi_{11}^{r} \xi_{l}^{r}) = - \sum_{r=n+1}^{2m+1} (\xi_{11}^{r})^2. \tag{2.36}
\]

At the same time, utilizing the minimality of the base manifold \( \mathbb{N}_1 \), we deduce that

\[
\frac{1}{2} \sum_{r=n+1}^{2m+1} (2(\xi_{11}^{r})^2 - (\xi_{m_1+1}^{r} + \cdots + \xi_{m_1+1}^{r})^2) + \sum_{r=n+1}^{2m+1} \sum_{\gamma=m_1+1}^{n} (\xi_{11}^{r} \xi_{\gamma}^{r})

= 2 \sum_{r=n+1}^{2m+1} (\xi_{11}^{r})^2 + \frac{1}{2} n^2 \| \mathbb{H} \|^2. \tag{2.37}
\]
Utilizing (2.35), (2.36) and (2.37), (2.34), will lead to

\[
\mathcal{Ric}(\mathbb{W}) \leq \frac{\varepsilon}{4} (m_1 m_2 + n - 1) - \frac{m_2 \Delta f}{f} + \sum_{r = n+1}^{2m+1} \left\{ \sum_{\gamma = m_1+1}^{n} \xi_{\gamma}^r - (\xi^{r}_{11})^2 \right\}.
\]  

(2.38)

The above inequality is equivalent to the following:

\[
\mathcal{Ric}(\mathbb{W}) \leq \frac{\varepsilon}{4} (m_1 m_2 + n - 1) - \frac{m_2 \Delta f}{f} + \sum_{r = n+1}^{2m+1} \sum_{\gamma = 2}^{n} \xi_{\gamma}^r \xi_{\gamma}^r.
\]

(2.39)

Using (2.20) gives inequality (2.21).

Case II. Assume that \( e_u \) is tangent \( N_2 \). Fix a unit tangent vector field from \( e_{m_1+1}, \ldots, e_{m_1} \) in which \( \mathbb{W} = e_u = e_u \). Utilizing (2.14)–(2.29) and following a similar technique as in Case I implies

\[
\frac{1}{2} n^2 \| \mathbb{H} \|^2 \geq \mathcal{Ric}(\mathbb{W}) + \frac{m_2 \Delta f}{f} - 2 \mathcal{R}(T, \mathbb{W}) + \mathcal{R}(T, N_{m_1}) + \mathcal{R}(T, \mathbb{W}^m)
\]

\[
+ \frac{1}{2} \sum_{1 \leq \ell, \gamma \leq n-1} \mathbb{H}_{\ell\gamma} + \frac{1}{2} \sum_{r = n+1}^{2m+1} \left( 2 \xi_{\gamma}^r - (\xi_{m_1+1m_1+1}^r + \cdots + \xi_{m}^r) \right)^2
\]

\[
+ \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{n-1} \xi_{\gamma}^r \xi_{\gamma}^r + \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{m} \sum_{\ell = m_1+1}^{n} (\xi_{\ell\gamma}^r)^2 - \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{n-1} \sum_{\ell = m_1+1}^{n-1} \xi_{\ell \gamma}^r \xi_{\ell \gamma}^r.
\]

Using (2.30), we obtain

\[
\mathcal{Ric}(\mathbb{W}) \leq \frac{1}{2} n^2 \| \mathbb{H} \|^2 - \frac{m_2 \Delta f}{f} + \frac{\varepsilon}{4} (m_1 m_2 + n - 1)
\]

\[
- \frac{1}{2} \sum_{r = n+1}^{2m+1} \left( 2 \xi_{\gamma}^r - (\xi_{m_1+1m_1+1}^r + \cdots + \xi_{m}^r) \right)^2 - \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{n-1} \xi_{\gamma}^r \xi_{\gamma}^r
\]

\[
- \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{m} \sum_{\ell = m_1+1}^{n} (\xi_{\ell\gamma}^r)^2 + \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{n-1} \sum_{\ell = m_1+1}^{n-1} \xi_{\ell \gamma}^r \xi_{\ell \gamma}^r.
\]

(2.40)

As the base of \( \Omega^q \) is minimal,

\[
\sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{m_1} \sum_{\ell = m_1+1}^{n-1} \xi_{\ell \gamma}^r \xi_{\ell \gamma}^r = 0.
\]

(2.41)

By a similar technique from first case, using (2.41) in (2.40), we get

\[
\mathcal{Ric}(\mathbb{W}) + \frac{m_2 \Delta f}{f} \leq \frac{1}{2} n^2 \| \mathbb{H} \|^2 + \frac{\varepsilon}{4} (m_1 m_2 + n - 1)
\]

\[
- \frac{1}{2} \sum_{r = n+1}^{2m+1} \left( 2 \xi_{\gamma}^r - (\xi_{m_1+1m_1+1}^r + \cdots + \xi_{m}^r) \right)^2
\]

\[
- \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{n-1} \sum_{\ell = m_1+1}^{n-1} \xi_{\ell \gamma}^r \xi_{\ell \gamma}^r - \sum_{r = n+1}^{2m+1} \sum_{\gamma = 1}^{m} \sum_{\ell = m_1+1}^{n} (\xi_{\ell\gamma}^r)^2.
\]

(2.42)
After some calculations, we obtain

\[
\sum_{r=n+1}^{2m+1} \left\{ \frac{1}{2} \left( \zeta_{m+1}^r + \cdots + \zeta_{mn}^r \right) - 2 \zeta_{mn}^r \right\}^2 + \sum_{\gamma=n+1}^{n-1} \zeta_{mn}^r \xi_{\gamma r}^r = 2m+1 \left( \zeta_{m+1}^r + \cdots + \zeta_{mn}^r \right)^2 + 2 \sum_{r=n+1}^{2m+1} \left( \zeta_{mn}^r \right)^2
\]

Performing more calculations on the last two terms gives

\[
2m+1 \sum_{r=n+1}^{n-1} \zeta_{mn}^r \xi_{\gamma r}^r - \sum_{r=n+1}^{2m+1} \sum_{\gamma=n+1}^{n-1} \zeta_{mn}^r \xi_{\gamma r}^r = 2m+1 \sum_{r=n+1}^{2m+1} \left( \zeta_{mn}^r \right)^2.
\]

Thus (2.43) can be reduced, using the above relation, to

\[
2m+1 \sum_{r=n+1}^{2m+1} \left\{ \frac{1}{2} \left( \zeta_{m+1}^r + \cdots + \zeta_{mn}^r \right) - 2 \zeta_{mn}^r \right\}^2 + \sum_{\gamma=n+1}^{n-1} \zeta_{mn}^r \xi_{\gamma r}^r
\]

\[
= \sum_{r=n+1}^{2m+1} \left\{ \frac{1}{2} \left( \zeta_{m+1}^r + \cdots + \zeta_{mn}^r \right)^2 + \left( \zeta_{mn}^r \right)^2 - \sum_{\gamma=n+1}^{n-1} \zeta_{mn}^r \xi_{\gamma r}^r \right\}.
\]

Therefore, using (2.44) in inequality (2.42), we deduce that

\[
\mathcal{R}ic(W) \leq \frac{1}{2} n^2 \| \mathcal{H} \|^2 + \frac{\epsilon}{f} \left( mn_1^2 + n - 1 \right) - \frac{m_2 \Delta f}{f} - \frac{1}{4} \sum_{r=n+1}^{2m+1} \left( \zeta_{m+1}^r + \cdots + \zeta_{mn}^r \right)^2
\]

\[
- \sum_{r=n+1}^{2m+1} \left( \zeta_{mn}^r \right)^2 - \sum_{\gamma=n+1}^{n-1} \zeta_{mn}^r \xi_{\gamma r}^r + \frac{1}{4} \left( \zeta_{m+1}^r + \cdots + \zeta_{mn}^r \right)^2.
\]

From the minimality of the base of the warped product submanifold \( \Omega^n \), we get

\[
\mathcal{R}ic(X) \leq \frac{\epsilon}{4} \left( mn_1^2 + n - 1 \right) - \frac{m_2 \Delta f}{f} - \sum_{r=n+1}^{2m+1} \left( \zeta_{mn}^r - \sum_{\gamma=n+1}^{n-1} \zeta_{mn}^r \xi_{\gamma r}^r \right).
\]

This gives the proof of inequality (2.21). We will use the technique adopted for case (1) to get inequality (2.21) when \( \Omega^n \) is \( \mathbb{N}_2 \)-minimal. Now equality (2.21) can be verified similarly as in [3, 4, 29].

For completely minimal submanifolds, Lemma 2.1 will lead to the following result.

**Lemma 2.2** Assume \( \omega : \Omega^n = \mathbb{N}_1 \times \mathbb{N}_2 \rightarrow \tilde{M}^{2m+1} \) is a C-totally real minimal isometric embedding of a warped product \( \Omega^n \) to the cosymplectic space form \( \tilde{M}^{2m+1} \). Then, for any...
unit vector $\mathbb{V} \in T_{x} \Omega^{n}$, the following Ricci inequality is satisfied:

\[
\mathcal{R}ic(\mathbb{V}) + m_{2} \Delta \ln f \leq m_{2} \| \nabla \ln f \|^{2} + \frac{\epsilon}{4} \{ m_{1} m_{2} + n - 1 \},
\]

(2.46)

where $m_{1} = \dim \mathbb{N}_{1}$ and $m_{2} = \dim \mathbb{N}_{2}$.

3 Proof of the main results

3.1 Proof of Theorem 1.1

Consider the following equation with $\omega = \ln f$:

\[
\left| \nabla^{2} \omega + t \omega I \right|^{2} = \left| \nabla^{2} \omega \right|^{2} + m_{1} t^{2} \omega^{2} - 2 t \omega \Delta \omega.
\]

(3.1)

But we know that $|I|^{2} = \text{trace}(I^{*}) = m_{1}$ and $g(\nabla^{2} \omega, I^{*}) = \text{tr}(\nabla^{2} \omega) = \text{tr} \nabla^{2} \omega$.

Then the preceding equation takes the form

\[
\left| \nabla^{2} \omega + t \omega I \right|^{2} = \left| \nabla^{2} \omega \right|^{2} + m_{1} t^{2} \omega^{2} - 2 t \omega \Delta \omega.
\]

(3.2)

If $\lambda_{1}$ is an eigenvalue of the eigenfunction $\omega$, then $\Delta \omega = \lambda_{1} \omega$. Thus we get

\[
\left| \nabla^{2} \omega + t \omega I \right|^{2} = \left| \nabla^{2} \omega \right|^{2} + (m_{1} t^{2} - 2 t \lambda_{1}) \omega^{2}.
\]

(3.2)

On the other hand, we obtain

\[
\Delta \frac{\omega^{2}}{2} = \omega \Delta \omega - |\nabla \omega|^{2}.
\]

Again using $\Delta \omega = \lambda_{1} \omega$, with integration, we arrive at

\[
\frac{\Delta \omega^{2}}{2} = \omega \lambda_{1} \omega - |\nabla \omega|^{2},
\]

which implies that

\[
\int_{\Omega^{n}} \omega^{2} \, dV = \frac{1}{\lambda_{1}} \int_{\Omega^{n}} |\nabla \omega|^{2} \, dV.
\]

(3.3)

It follows from (3.2) and (3.3) that

\[
\int_{\Omega^{n}} \left| \nabla^{2} \omega + t \omega I \right|^{2} \, dV = \int_{\Omega^{n}} \left| \nabla^{2} \omega \right|^{2} \, dV + \int_{\Omega^{n}} \left( \frac{m_{1} t^{2}}{\lambda_{1}} - 2 t \right) |\nabla \omega|^{2} \, dV.
\]

(3.4)

In particular, taking $t = \frac{\lambda_{1}}{m_{1}}$ in (3.4) and integrating, we get

\[
\int_{\Omega^{n}} \left| \nabla^{2} \omega + \frac{\lambda_{1}}{m_{1}} \omega I \right|^{2} \, dV = \int_{\Omega^{n}} \left| \nabla^{2} \omega \right|^{2} \, dV - \frac{\lambda_{1}}{m_{1}} \int_{\Omega^{n}} |\nabla \omega|^{2} \, dV.
\]

(3.5)

Again integrating (2.21) and involving the Green lemma, we have

\[
\int_{\Omega^{n}} \mathcal{R}ic_{M}(\mathbb{V}) \, dV \leq \frac{\mu^{2}}{4} \int_{\Omega^{n}} |\mathbb{V}|^{2} \, dV + m_{2} \int_{\Omega^{n}} |\nabla \omega|^{2} \, dV
\]

\[
+ \int_{\Omega^{n}} \frac{\epsilon}{4} (m_{1} m_{2} + n - 1) \, dV.
\]

(3.6)
From (3.5) and (3.6), we derive
\[
\frac{1}{q} \int_{\Omega^n} \mathcal{R}ic_M(W) \, dV \leq \frac{n^2}{4m_2} \int_{\Omega^n} |\mathbb{H}|^2 \, dV - \frac{m_1}{\lambda_1} \int_{\Omega^n} |\text{Hess}(\omega) + \frac{\lambda_1}{n} \omega I|^2 \, dV \\
+ \frac{m_1}{\lambda_1} \int_{\Omega^n} |\text{Hess}(\omega)|^2 \, dV + \int_{\Omega^n} \frac{\epsilon}{4} \left( m_1 + 1 + \frac{m_1 - 1}{m_2} \right) \, dV.
\]

Under the assumption that the Ricci curvature is greater than or equal to zero, i.e., \( \mathcal{R}ic(W) \geq 0 \), the latter equation implies
\[
\int_{\Omega^n} \left| \text{Hess}(\omega) + \frac{\lambda_1}{m_1} \omega I \right|^2 \, dV \leq \int_{\Omega^n} |\text{Hess}(\omega)|^2 \, dV \\
+ \frac{\lambda_1}{4m_1} \int_{\Omega^n} \left( \frac{n^2}{m_2} |\mathbb{H}|^2 + \epsilon \left( m_1 + 1 + \frac{m_1 - 1}{m_2} \right) \right) \, dV.
\]

which is equivalent to the following:
\[
\int_{\Omega^n} \text{Hess}(\omega) + \frac{\lambda_1}{m_1} \omega I \, dV \leq \int_{\Omega^n} |\text{Hess}(\omega)|^2 \, dV \\
+ \frac{\lambda_1}{4m_1} \int_{\Omega^n} \left( \frac{n^2}{m_2} |\mathbb{H}|^2 + \epsilon \left( m_1 + 1 + \frac{m_1 - 1}{m_2} \right) \right) \, dV. \tag{3.7}
\]

If the following equality holds by assumption
\[
\int_{\Omega^n} |\text{Hess}(\omega)|^2 \, dV = \frac{\lambda_1}{4m_1 m_2} \int_{\Omega^n} \left( \epsilon(1 - n - m_1 m_2) - n^2 |\mathbb{H}|^2 \right) \, dV, \tag{3.8}
\]
then equations (3.7) and (3.8) imply that
\[
\int_{\Omega^n} \left| \text{Hess}(\omega) + \frac{\lambda_1}{m_1} \omega I \right|^2 \, dV \leq 0. \tag{3.9}
\]

But it is clear that
\[
\int_{\Omega^n} \left| \text{Hess}(\omega) + \frac{\lambda_1}{m_1} \omega I \right|^2 \, dV \geq 0. \tag{3.10}
\]

Combining Eqs. (3.9) and (3.10), we get
\[
\left| \text{Hess}(\omega) + \frac{\lambda_1}{n} \omega I \right|^2 = 0 \implies \text{Hess}(\omega) = -\frac{\lambda_1}{m_1} \omega I. \tag{3.11}
\]

Since the WF \( \omega = \ln f \) of the nontrivial WPS \( \Omega^n \) is nonconstant, Eq. (3.11) reduces to Obata’s differential equation where \( c = \sqrt{\frac{\lambda_1}{m_1}} > 0 \) with \( \lambda_1 > 0 \). Hence, \( N_1 \) is isometric to \( S^p(\sqrt{\frac{L_1}{m_1}}) \). This completes the proof of the first part. On the other hand, if we have \( \lambda_1 = m_1 \), then from (3.11) we get
\[
\text{Hess}(\omega)(\mathbb{W}_1, \mathbb{W}_2) = -\text{og}(\mathbb{W}_1, \mathbb{W}_2), \tag{3.12}
\]
for any \( \mathbb{W}_1, \mathbb{W}_2 \in \Gamma(N_1) \). The proof of this theorem is now complete.
3.2 Proof of Theorem 1.2

If $\omega$ is a positive differentiable function on a Riemannian manifold $N_1$, then Bochner formula is given as

$$\frac{1}{2} \Delta |\nabla \omega|^2 = |\text{Hess}(\omega)|^2 + \mathcal{Ric}(\nabla \omega, \nabla \omega) + g(\nabla \omega, \nabla \Delta \omega).$$

Integrating along the volume element and using Stokes’ theorem, we get

$$\int_{\tilde{\Omega}^n} \left( |\text{Hess}(\omega)|^2 + \mathcal{Ric}(\nabla \omega, \nabla \omega) + g(\nabla \omega, \nabla \Delta \omega) \right) dV = 0.$$

Assuming that $\lambda_1$ is an eigenvalue of the eigenfunction $\omega$ with $\Delta \omega = \lambda_1 \omega$, we can conclude that

$$\int_{\tilde{\Omega}^n} |\text{Hess}(\omega)|^2 = - \int_{\tilde{\Omega}^n} \mathcal{Ric}(\nabla \omega, \nabla \omega) dV - \lambda_1 \int_{\tilde{\Omega}^n} |\nabla \omega|^2 dV.$$

Inserting the above equation into (3.5), we achieve

$$\int_{\tilde{\Omega}^n} \left| \text{Hess}(\omega) + \frac{\lambda_1 \omega \mathcal{I}}{m_1} \right|^2 dV = - \int_{\tilde{\Omega}^n} \mathcal{Ric}(\nabla \omega, \nabla \omega) dV - \lambda_1 \left( \frac{m_1 + 1}{m_1} \right) \int_{\tilde{\Omega}^n} |\nabla \omega|^2 dV.$$

Utilizing (3.6) in the above equality, we arrive at

$$\frac{1}{q} \int_{\tilde{\Omega}^n} \mathcal{Ric}(\nabla \omega) dV + \frac{m_1}{\lambda_1 (m_1 + 1)} \int_{\tilde{\Omega}^n} \left| \text{Hess}(\omega) + \frac{\lambda_1 \omega \mathcal{I}}{m_1} \right|^2 dV$$

$$+ \frac{m_1}{\lambda_1 (m_1 + 1)} \int_{\tilde{\Omega}^n} \mathcal{Ric}(\nabla \omega, \nabla \omega) dV$$

$$\leq \frac{n^2}{4m_2} \int_{\tilde{\Omega}^n} |\mathcal{H}|^2 dV + \frac{(m_1 m_2 + n - 1)}{m_2} \int_{\tilde{\Omega}^n} \epsilon dV.$$

It can be simplified as

$$\int_{\tilde{\Omega}^n} \left| \text{Hess}(\omega) + \frac{\lambda_1 \omega \mathcal{I}}{m_1} \right|^2 dV + \frac{\lambda_1 (m_1 + 1)}{m_1 m_2} \int_{\tilde{\Omega}^n} \mathcal{Ric}(\nabla \omega) dV + \int_{\tilde{\Omega}^n} \mathcal{Ric}(\nabla \omega, \nabla \omega) dV$$

$$\leq \frac{\lambda_1 n^2 (m_1 + 1)}{4m_1 m_2} \int_{\tilde{\Omega}^n} |\mathcal{H}|^2 dV$$

$$+ \frac{\lambda_1 (m_1 m_2 + n - 1)(m_1 + 1)}{m_1 m_2} \int_{\tilde{\Omega}^n} \epsilon dV.$$ (3.13)

Following our assumption that the Ricci curvature is nonnegative, i.e., $\mathcal{Ric} \geq 0$, we derive

$$\int_{\tilde{\Omega}^n} \left| \text{Hess}(\omega) + \frac{\lambda_1 \omega \mathcal{I}}{m_1} \right|^2 dV \leq \frac{\lambda_1 (m_1 + 1)}{4m_1 m_2} \int_{\tilde{\Omega}^n} n^2 |\mathcal{H}|^2 + \epsilon (m_1 m_2 + n - 1) dV.$$ (3.14)

By the hypothesis, the extrinsic condition (1.4) holds, thus

$$\text{Hess}(\omega)(\mathcal{W}_1, \mathcal{W}_2) = -\frac{\lambda_1 \omega \mathcal{I}}{m_1} g(\mathcal{W}_1, \mathcal{W}_2),$$ (3.15)
for any $\mathbb{W}_1, \mathbb{W}_2 \in \Gamma(N_1)$. This is again Obata’s ODE [30] which implies that the base $N_1$ is isometric to the Euclidean sphere $\mathbb{S}^{m_1}$. The proof is completed.

Using the fact that the warped product submanifold $\Omega^n$ is minimal, we give the following corollary of Theorem 1.1.

**Corollary 3.1** Let $\mathbb{M}^{2m+1}(\epsilon)$ be a cosymplectic space form and $\Upsilon : \Omega^n = \mathbb{N}_1 \times_f \mathbb{N}_2 \rightarrow \mathbb{M}^{2m+1}(\epsilon)$ be a C-totally real minimal isometric embedding of the warped product submanifold $\Omega^n$ into $\mathbb{M}^{2m+1}(\epsilon)$ with a nonnegative Ricci curvature. Then, there is an isometry between the compact base $N_1$ and the sphere $\mathbb{S}^{m_1}$ if the following is true:

\[
|\text{Hess}(\omega)|^2 = \frac{1}{2m_2} \left\{ \epsilon (1 - n - \lambda_1m_2) \right\}.
\] (3.16)

**Proof** Assuming $\Upsilon$ is minimal and $\lambda_1 = m_1$, from (3.7), we get

\[
\int_{\Omega^n} |\text{Hess}(\omega) + \omega I|^2 \, dV \leq \int_{\Omega^n} |\text{Hess}(\omega)|^2 \, dV + \frac{1}{2} \int_{\Omega^n} \epsilon \left( \lambda_1 + 1 + \frac{\lambda_1 - 1}{m_2} \right) \, dV. \tag{3.17}
\]

If the assumption (3.16) holds, we get the following from (3.17):

\[
\text{Hess}(\omega)(\mathbb{W}_1, \mathbb{W}_2) = -\omega g(\mathbb{W}_1, \mathbb{W}_2),
\]

for a nonconstant function $\omega = \ln f$. Hence, using the arguments as in [30] completes the proof of the corollary. \hfill \square

### 4 Some physical applications

In this section, we investigate the Dirichlet energy that satisfies the following for a compact submanifold $\Omega$ and differentiable function $\theta : \Omega \rightarrow \mathbb{R}$:

\[
E(\theta) = \frac{1}{2} \int_{\Omega} \|\nabla \theta\|^2 \, dV, \tag{4.1}
\]

where $dV$ is a volume element. From this motivation, we give the following corollary by combining (2.21) and (4.1).

**Corollary 4.1** Let $\Omega^n = \mathbb{N}_1 \times_f \mathbb{N}_2$ be a compact C-totally real warped product submanifold embedded into a cosymplectic space form $\mathbb{M}^{2m+1}(\epsilon)$. Then

(i) The following inequality holds:

\[
E(\ln f) \geq \frac{1}{2m_2} \int_{\Omega^n} \left\{ \text{Ric}(\mathbb{W}) - \frac{\epsilon}{4} \|\mathbb{W}\|^2 - \frac{\epsilon}{4} (m_1m_2 + n - 1) \right\}. \tag{4.2}
\]

(ii) If $\Omega^n$ is minimal then we have

\[
E(\ln f) \geq \frac{1}{2m_2} \int_{\Omega^n} \left\{ \text{Ric}(\mathbb{W}) - \frac{\epsilon}{4} (m_1m_2 + n - 1) \right\}, \tag{4.3}
\]

where $E(\ln f)$ is the Dirichlet energy of the warping function $\ln f$. 

5 Conclusions

In brief, it is well known that a cosmological model of the universe consisting of a perfect fluid whose molecules are galaxies is a Robertson–Walker spacetime. For example, if $S^3$ indicates a three-dimensional manifold with constant curvature $\kappa = -1, 0, 1$ and $I$ denotes an open interval in the real line $\mathbb{R}$, then a warped product of the form $\Omega(\kappa, f) = \mathbb{I} \times_f S^3$ with its metric $ds^2 = -dt^2 + f^2 ds^2_{S^3}$ is a Robertson–Walker spacetime. Therefore, the concept of a warped product submanifold is useful because of its importance in mathematical physics [5, 6, 12, 16, 18, 19]. In the present work, we have combined the ordinary differential equation with warped product submanifolds. Therefore, the paper presents excellent combinations of ordinary differential equation with Riemannian geometry.

Acknowledgements

The authors are grateful to the anonymous reviewer for careful reading of the manuscript and valuable suggestions that improved the presentation of the work. This research was funded by the Deanship of Scientific Research at Princess Nourah bint Abdullah University through the Fast-track Research Funding Program.
