Abstract

In this paper, the boundary layer equations (abbreviation BLE) for exterior flow around an obstacle are established using semi-geodesic coordinate system ($S$-coordinate) based on the curved two dimensional surface of the obstacle. BLE are nonlinear partial differential equations on unknown normal viscous stress tensor and pressure on the obstacle and the existence of solution of BLE is proved. In addition a dimensional split method for dimensional three Navier-Stokes equations is established by applying several 2D-3C partial differential equations on two dimensional manifolds to approach 3D Navier-Stokes equations. The examples for the exterior flow around spheroid and ellipsoid are presents here.

Keywords

Boundary Layer Equations, Dimensional Split Method, Navier-Stokes Equations, Dimensional Two Manifold

1. Introduction

In computational fluid dynamics, one need to compute the drag exerted on a body in flow field; in particular, optimal shape design has received considerable attention already, see Li and Huang \cite{1}, Li, Chen and Yu \cite{2},
and Li, Su, Huang [3]. It has become vast enough to branch into several disciplines on the theoretical side, many results deal with the existence of solutions to the problem or its relaxed form, on the practical side, topological shape optimization which solves numerically the relaxed problem or by local shape variation. In this case we have to compute the velocity gradient $u_i = \frac{\partial u}{\partial n}$ along the normal to the surface of the boundary and normal stress tensor $\sigma_n$ to the surface. All those computations have to do in the boundary layer. Therefore this leads to make very fine mesh; for example, 80% nodes will be concentrated in a neighborhood of the surface of the body.

In this paper a boundary layer equations for $u_0, p_0 = p|_{\partial \Omega}$ on the surface will be established using local semi-geodesic coordinate system based on the surface, provide the computational formula for the drag functional. In addition, a dimensional split method for three dimensional Navier-Stokes equations is established by applying several 2D-3C partial differential equations on the two dimensional manifolds to approximate 3D Navier-Stokes equation.

The Dimensional Slitting Methods deal, for examples, with thin domain problem as elastic shell (see Ciarlet [4], Li, Zhang and Huang [5]), Temam and Ziane [6], and with boundary value problem with complexity boundary geometry (see [7]-[10]).

The content of the paper is organized as the followings. Section 2 establishes semi-geodesic coordinate system and related the Navier-Stokes equations; Section 3 assumes that the solutions of Navier-Stokes equations in the boundary layer can be made Taylor expansion with respect to transverse variable, derive the equations for the terms of Taylor expansion; Section 4 proves the existence of the solutions of the BLE; Section 5 provides the computational formula of the drag functional; Section 6 provides a dimensional splitting method for 3D Navier-Stokes equations; Section 7 provides some examples.

2. Navier-Stokes Equations and Its Variational Formulation in a Semi-Geodesic Coordinate System

Through this paper, we consider state steady incompressible Navier-Stokes equations and its variational formulation in a thin domain $\Omega_\delta$, a strip with thickness $\delta$ and by a Lipchitz continuous boundary $\partial \Omega = \Gamma = \Gamma_0 \cup \Gamma_1$,

\[
\begin{align*}
-\mu \Delta u + (uV)u + \nabla p &= f, \\
\text{div } u &= 0, \\
|u|_{\Gamma_0} &= 0, \text{ essential boundary condition,} \\
|\sigma \cdot n|_{\Gamma_1} &= h, \text{ Nature boundary condition,}
\end{align*}
\]

or

\[
\begin{align*}
-2\mu \nabla \cdot (uV) + (uV)u + g_{ij} \nabla_j p &= f^i, \\
\text{div } u &= 0, \\
|u|_{\Gamma_0} &= 0, \text{ essential boundary condition,} \\
|\sigma \cdot n|_{\Gamma_1} &= h, \text{ Nature boundary condition,}
\end{align*}
\]

which are invariant form in any curvilinear coordinate system. Let

\[
\begin{align*}
V(\Omega_\delta) &= \left\{ u \in H^1(\Omega_\delta), \ |u|_{\Gamma_0} = 0 \right\} \\
M(\Omega_\delta) &= \left\{ q \in L^2(\Omega_\delta), \ \int_{\Omega_\delta} q dx = 0 \text{ if } \text{meas } \Gamma_1 = 0 \right\}
\end{align*}
\]

At first, we introduce semi-geodesic coordinate system (abbreviation $S$-coordinate). As well known that boundary layer $\Omega_\delta \in \mathbb{E}^2$ in 3D Euclidean space bounded by $\Gamma_b = \mathcal{S}$ and $\Gamma_t$ where $\mathcal{S} = \cup_S S_{\eta}$ is bottom of the boundary layer, a surface of solid boundary of the flow fluid, and $\Gamma_t = \mathcal{S} + n\delta := \mathcal{S}(\delta)$ is a top boundary of $\Omega_\delta$, an artificial interface of the flow fluid where $n$ is unit normal vector to $\mathcal{S}$ and $\delta$ is a parameter, the
thickness of the strip, the boundary layer. Assume that there exists a smooth immersion \( \theta(x^1, x^2) : \mathcal{D} \subset \mathbb{R}^2 \mapsto \mathcal{J} \subset \mathbb{R}^3 \) such that \( \forall \left( x^1, x^2 \right) \in \mathcal{D}, \mathbf{e}_a = \frac{\partial \theta}{\partial x^a} \) are linearly independent where \( \mathcal{D} \subset \mathbb{R}^2 \) is a Lipschitz domain with boundary \( \gamma = \partial \mathcal{D} \) and \( \{ x^1, x^2 \} \) are parameters which are called Gaussian coordinate on the surface \( \mathcal{J} \). It is obvious that \( \mathbf{e}_a \) are basis. So the geometry of the surface \( \mathcal{J} \) is given by first fundamental form and second fundamental form and third fundamental form which coefficients are metric tensor \( a_{\alpha\beta} = \mathbf{e}_\alpha \mathbf{e}_\beta \) and curvature tensor \( b_{\alpha\beta} = -\mathbf{n}_a \mathbf{e}_\beta \) and tensor \( c_{\alpha\beta} = \mathbf{n}_a \mathbf{n}_\beta \) respectively where \( \mathbf{n} \) is unit normal vector to \( \mathcal{J} \) 

\[
\mathbf{n} = \frac{\mathbf{e}_1 \times \mathbf{e}_2}{|\mathbf{e}_1 \times \mathbf{e}_2|}, \quad a = \det(a_{\alpha\beta}) > 0
\]

Their contravariant components \( a^{\alpha\beta}, b^{\alpha\beta}, c^{\alpha\beta} \) are given by 

\[
a^{\alpha\beta} a_{\mu\nu} = \delta^\alpha_{\mu}, \quad b^{\alpha\beta} = a^{a\beta} a^{\beta\sigma} b_{a\sigma}, \quad c^{\alpha\beta} = a^{a\alpha} a^{\beta\sigma} c_{a\sigma}
\]

What’s follows that we will frequently used the inverse matrix \( (b^{\alpha\beta}, c^{\alpha\beta}) \) of \( (b_{\alpha\beta}, c_{\alpha\beta}) \):

\[
(b^{\alpha\beta}, c^{\alpha\beta}) = (b_{\alpha\beta}, c_{\alpha\beta})^{-1}
\]

Now, assume that there exists an unique normal vector \( \mathbf{n} \) to \( \mathcal{J} \) from each point \( P \in \mathcal{J} \) such that (see Figure 1)

\[
\mathbf{OP} = \mathbf{OP}_0 + \mathbf{n}(x^\alpha) \xi, \quad 0 \leq \xi \leq \delta
\]

where \( O \) is origin. Thereby, point \( P \) is determined by triple numbers \( \left( x^\alpha, \xi \right) \). Inversely, a triple numbers \( \left( x^\alpha, \xi, \left( x^\alpha \right) \in \mathcal{J}, 0 \leq \xi \leq \delta \right) \) can determine uniquely a point \( P \in \mathcal{J} \). Curvilinear coordinate \( \left( x^1, x^2, \xi \right) \) in \( \mathbb{E}^3 \) is called semi-geodesic coordinate based on the surface \( \mathcal{J} \). Its bases vectors are \( \left( \mathbf{e}_\alpha, \mathbf{n} \right) \) and the metric tensor \( g_{ij} \) of 3D Euclidean space \( \mathbb{E}^3 \) in this semi-geodesic coordinate are given by 

\[
g_{ij} = \frac{\partial \Theta}{\partial x^i} \frac{\partial \Theta}{\partial x^j}, \quad g_{13} = g_{31} = \frac{\partial \Theta}{\partial x^i} \frac{\partial \Theta}{\partial \xi}, \quad g_{33} = \frac{\partial \Theta}{\partial \xi} \frac{\partial \Theta}{\partial \xi},
\]

contravariant components \( g^i g_{ij} = \delta^i_j \),

\[
\Theta = \theta + \xi \mathbf{n},
\]

Therefore, the metric tensor of \( \mathbb{E}^3 \) can be expressed by the metric tensor of \( \mathcal{J} \) in the semi-geodesic coordinate system:

![Figure 1. The diagram of semi-geodesic coordinate system.](image-url)
\[
\begin{align*}
\frac{\partial}{\partial x^\alpha} \left( \varphi(x^\alpha) + \xi^\alpha \right) &= a_{\alpha\beta}(x) \left( \varphi(x^\beta) + \xi^\beta \right), \\
g_{\alpha\beta} &= \delta_{\alpha\beta} \left( \varphi(x^\alpha) + \xi^\alpha \right) \left( \varphi(x^\beta) + \xi^\beta \right) = a_{\alpha\beta}(x) - 2\xi^\beta \delta_{\alpha\beta} + \xi^2 \delta_{\alpha\beta}, \\
g_{\alpha\beta}(x, \xi) &= g_{\alpha\beta}(x, \xi) = 0, \quad g_{\alpha\beta}(x, \xi) = 1, \\
\varphi(x, \xi) &= \det(g_{\alpha\beta}) = \theta^\alpha a(x), \quad a = \det(a_{\alpha\beta}), \\
g^{\alpha\beta}(x, \xi) &= \theta^{-2} \left( a^{\alpha\beta}(x) - 2Kb^{\alpha\beta}(x) + K^2 \xi^2 \delta^{\alpha\beta} \right), \\
\varphi^{\alpha\beta}(x, \xi) &= g^{\alpha\beta}(x, \xi) = 0, \quad g^{\alpha\beta}(x, \xi) = 1, \\
\varphi &= 1 - 2H \xi + K \xi^2, \\
p(\xi) &= 1 - 4H \xi + 4H^2 - K \xi^2, \\
q(\xi) &= 2\xi - 2H \xi^2.
\end{align*}
\]

(see ref. [1]) where \( H, K \) are mean curvature and Gaussian curvature of \( \mathcal{M} \). Throughout this paper, we employ semi-geodesic coordinate system \((x^\alpha, x^3 := \xi) \) based on the surface \( \mathcal{M} \) (see [1] and Figure 1) (later on, denote \( S \)-coordinate). The metric tensor of \( E^3 \) in this coordinate are denoted by \( g_{\alpha\beta}, g^{\alpha\beta} \). It is obvious that the determinate \( g = \det(g_{\alpha\beta}) = a\theta^\alpha > 0 \) if \( \xi \) is small enough. Hence coordinate \((x^\alpha, \xi) \) is nonsingular.

In addition, we review the main notation. Greek indices and exponents belong to the set \( \{1, 2\} \), while Latin indices and exponents (except when otherwise indicated, as when they are used to index sequences) belong to the set \( \{1, 2, 3\} \), and the summation convention with respect to repeated indices and exponents is systematically used. Symbols such as \( \delta^\alpha_\beta \) or \( \delta^i_j \) designate the Kronecker’s symbol. The Euclidean scalar product and the exterior product of \( a, b \in E^3 \) are noted \( a \cdot b \) and \( a \times b \); the Euclidean norm of \( a \in R^3 \) is noted \( |a| \). Furthermore, the physical or geometric quantities with the asterisk \( * \) express the quantities on the manifold \( \mathcal{M} \), for example, \( \nabla_a \) is covariant derivative on \( \mathcal{M} \). Furthermore, the physical or geometric quantities with the asterisk \( * \) express the quantities on the manifold \( \mathcal{M} \), for example, \( \nabla_a \) is covariant derivative on \( \mathcal{M} \). Furthermore, the notations \( e^{\alpha\beta}, e_{\alpha\beta} \) are given contravariant components and covariant components of the permutation tensor on \( \mathcal{M} \).

\[
\begin{align*}
e^{\alpha\beta} &= \begin{cases}
\sqrt{a}, & (\alpha, \beta) : \text{odd permutation of } (1, 2), \\
-\sqrt{a}, & (\alpha, \beta) : \text{even permutation of } (1, 2), \\
0, & \text{otherwise},
\end{cases}

e_{\alpha\beta} &= \begin{cases}
\frac{1}{\sqrt{a}}, & (\alpha, \beta) : \text{odd permutation of } (1, 2), \\
-\frac{1}{\sqrt{a}}, & (\alpha, \beta) : \text{even permutation of } (1, 2), \\
0, & \text{otherwise},
\end{cases}
\end{align*}
\]

There are following relations of the first, second and third fundamental forms (ref. [1])
\[
\begin{align*}
\begin{cases}
\varphi^{\alpha\beta}, & a^{\alpha\beta} - 2Hb^{\alpha\beta} + K\varphi^{\alpha\beta} = 0; \\
2Hb^{\alpha\beta} - a^{\alpha\beta} - K\varphi^{\alpha\beta} = 0; \\
\left( K - 4H^2 \right) a^{\alpha\beta} + 2Hb^{\alpha\beta} + K^2 \varphi^{\alpha\beta} = 0;
\end{cases}
\end{align*}
\]

The following give the relations of differential operators in the space and on \( \mathcal{M} \) (see [1]). For example, under the \( S \)-coordinate system, the Christoffel symbols of \( E^3 \) and \( \mathcal{M} \) satisfy
\[
\Gamma^\gamma_{\alpha\beta} = \Gamma^\gamma_{\beta\alpha} + \theta^{-1} R^\gamma_{\alpha\beta}, \quad \Gamma^\alpha_{\beta\gamma} = \theta^{-1} I^\alpha_{\beta\gamma}, \quad \Gamma^\alpha_{\beta\gamma} = J^\alpha_{\beta\gamma}, \quad \Gamma^a_{\beta\gamma} = \Gamma^3_{\beta\gamma} = \Gamma^3_{\gamma\beta} = \Gamma^a_{\gamma\beta} = 0,
\]
and covariant derivatives of the vector field are given by
\[
\nabla\mu^\gamma = \frac{\partial \mu^\gamma}{\partial x^\gamma} + \Gamma^\gamma_{\beta\gamma} u^\beta, \quad \forall \mu \in H^1(\Omega); \quad \nabla_a u^\beta = \frac{\partial u^\beta}{\partial x^a} + \Gamma^\beta_{\alpha\beta} u^\alpha, \quad \forall u \text{ on } T\mathcal{M};
\]
\[
\nabla(u) = \nabla\mu^\gamma = \frac{1}{\sqrt{a}} \frac{\partial}{\partial x^\gamma} \left( \sqrt{a} u^\gamma \right); \quad \nabla u = \nabla_a u^\alpha = \frac{1}{\sqrt{a}} \frac{\partial}{\partial x^a} \left( \sqrt{a} u^\alpha \right);
\]
\[
\nabla(\mu) = \nabla \times u = e^{\alpha\beta}\nabla_a u^\beta; \quad \nabla(\mu) = e^{\alpha\beta}\nabla_a u^\beta.
\]
where $u_j = g_{ij} u^i$ is covariant component of vector $u$. The strain tensor of vector field in $\mathbb{R}^3$ and on $\mathcal{I}$ are given by respectively

$$e_j(u) = \frac{1}{2} \left( \nabla u_j + \nabla u_j \right) = \frac{1}{2} \left( \delta_j^\alpha g_{\beta \gamma} + \delta_j^\beta g_{\alpha \gamma} \right) \nabla u^\gamma;$$

$$e_{\alpha \beta}(u) = \frac{1}{2} \left( \nabla_{\alpha} u_{\beta} + \nabla_{\beta} u_{\alpha} \right) = \frac{1}{2} \left( \delta_{\alpha \beta} a_{\rho \sigma} + \delta_{\beta \alpha} a_{\rho \sigma} \right) \nabla \lambda u^\lambda;$$

Of course, $\text{div}(u) = g^{\alpha \beta} e_{\alpha \beta}(u)$; $\text{div}(u) = a^{\alpha \beta} e_{\alpha \beta}(u)$. Under the $S$-coordinate system there are following formula for the covariant derivatives of the vectors in the space $\mathbb{R}$ and on the $\mathcal{I}$ (ref. [1])

$$\nabla_j u^\beta = \tilde{\nabla}_j u^\beta + \Theta^{-1} \left( I^\beta_{\alpha} u^\gamma + R^\beta_{\alpha \gamma} u^\gamma \right), \quad \nabla_j u^3 = \frac{\partial u^3}{\partial \xi^j} + J_{\alpha \beta} u^\gamma,$$

$$\nabla_{\alpha} u^\beta = \frac{\partial u^\beta}{\partial \xi^\alpha} + \Theta^{-1} I^\beta_{\alpha} u^\gamma, \quad \nabla_{\gamma} u^3 = \frac{\partial u^3}{\partial \xi^\gamma},$$

$$\text{div} u = \text{div} (u) - \frac{\partial u^3}{\partial \xi^\gamma} + \Theta^{-1} \left[ -2 H u^3 \left( 2 K u^3 - 2 u^3 \tilde{\nabla}_j H \right) \xi + u^3 \tilde{\nabla}_j K \xi^2 \right],$$

$$I^\alpha_{\beta} = -b^\alpha_{\beta} + K \xi^\sigma \delta^\alpha_{\beta}, \quad J_{\alpha \beta} = b_{\alpha \beta} - \xi c_{\alpha \beta},$$

$$R^\alpha_{\beta \rho \sigma} = -\nabla_{\alpha} b^\rho_{\beta} \xi + K b^\rho_{\mu} \nabla_{\sigma} b^\mu_{\beta} \xi^2 = -\nabla_{\alpha} b^\rho_{\beta} \xi + \left( 2 H \delta^\rho_{\mu} - b^\rho_{\mu} \right) \nabla_{\alpha} b^\mu_{\beta} \xi^2. \quad \text{(2.3)}$$

The strain tensors of the vectors in $\mathbb{R}$ and on $\mathcal{I}$ can be expressed as

$$e_{\alpha \beta}(u) = \frac{1}{2} \left( \nabla_{\alpha} u_{\beta} + \nabla_{\beta} u_{\alpha} \right) = \gamma_{\alpha \beta}(u) + \gamma_{\alpha \beta}^1 (u) \xi + \gamma_{\alpha \beta}^2 (u) \xi^2;$$

$$e_{\alpha 3}(u) = \frac{1}{2} \left( g_{\alpha \beta} \frac{\partial u^\beta}{\partial \xi^3} + \tilde{\nabla}_\alpha u^3 \right) = \gamma_{\alpha 3}^1 (u) + \gamma_{\alpha 3}^2 (u) \xi + \gamma_{\alpha 3}^3 (u) \xi^2;$$

$$e_{33}(u) = \nabla_3 u^3 = \frac{\partial u^3}{\partial \xi^3}; \quad \text{(2.4)}$$

where

$$\gamma_{\alpha \beta}(u) = e_{\alpha \beta}(u) - b_{\alpha \beta} u^3, \quad \gamma_{\alpha \beta}^1 (u) = -\left( b_{\alpha \beta} \tilde{\nabla}_\gamma u^\gamma + b_{\beta \alpha} \tilde{\nabla}_\gamma u^\gamma \right) + c_{\alpha \beta} u^3 - \tilde{\nabla}_\gamma b_{\alpha \beta} u^\gamma;$$

$$\gamma_{\alpha 3}^2 (u) = \frac{1}{2} \left( c_{\alpha \beta} \tilde{\nabla}_\gamma u^\gamma + c_{\beta \alpha} \tilde{\nabla}_\gamma u^\gamma + \tilde{\nabla}_\gamma c_{\alpha \beta} u^\gamma \right);$$

$$\gamma_{33}^1 (u) = \gamma_{33}^2 (u) = \frac{1}{2} \left( a_{\alpha \beta} \frac{\partial u^\beta}{\partial \xi^3} + \tilde{\nabla}_\alpha u^3 \right),$$

$$\gamma_{33}^2 (u) = \frac{\partial u^3}{\partial \xi^3}, \quad \gamma_{33}^3 (u) = \gamma_{33}^4 (u) = 0.$$

$$\gamma_{\alpha \beta}^{\alpha \gamma} (u) = a^{\alpha \nu} a^{\beta \rho} \gamma_{\nu \rho}(u). \quad \text{(2.5)}$$

In the semi-geodesic coordinate system (see next section), define the bilinear form $a(\cdot, \cdot)$ and trilinear form $b(\cdot, \cdot, \cdot)$.
\[
a(u, v) = \int_{\Omega} \mu \nabla u \nabla v \, d^3 x + \int_{\Omega} \mu' \nabla u \nabla v \, d^3 x,
\]
or
\[
a(u, v) = \int_{\Omega} 2 \mu' \epsilon^3 (u) \epsilon^3 (v) \sqrt{g} \, d^3 x = \int_{\Omega} 2 \mu' \epsilon^3 e_{\text{en}} (u) \epsilon^3 (v) \partial \sqrt{g} \, d^3 x,
\]
(2.6)
\[
b(u, u, v) = \int_{\Omega} u' \nabla u \nabla v \sqrt{g} \, d^3 x,
\]
\[
\{F(v) = (f, v) + \{\sigma \cdot n, v\} = (f, v) + \{h, v\}\}_{\partial \Omega},
\]

Then, the primitive variable variational formulation for Navier-Stokes Equations (2.1') is given by
\[
\begin{aligned}
&\text{Find } (u, p) \in V(\Omega) \times M(\Omega) \text{ such that } \\
&a(v, v) + b(u, u, v) - \{p, \text{div} v\} = (F, v), \quad \forall v \in V(\Omega), \\
&\{q, \text{div} u\} = 0, \quad \forall q \in M(\Omega),
\end{aligned}
\]
(2.7)

while the Navier-Stokes Equations (2.7) in semi-geodesic coordinate system are expressed as
\[
\begin{aligned}
&-\mu \frac{\partial^2 u^a}{\partial \xi^2} + 4 \theta^i R^i_{\beta \rho \sigma} \frac{\partial u^a}{\partial \xi} + g^{a \rho} \frac{\partial u_b}{\partial \xi} \frac{\partial u^b}{\partial \xi} + u^a \frac{\partial u^b}{\partial \xi} + \mathcal{L}'(u) + g^{a \rho} \frac{\partial u_b}{\partial \xi} p + u^a \frac{\partial u_b}{\partial \xi} u^a = f^a,
&\text{div} u = \frac{\partial u^a}{\partial \xi} \text{div} u + \Theta^i \left[ -2 \theta H + 2 \left( K u^3 - u^a \frac{\partial u_b}{\partial \xi} H \right) \xi + u^a \frac{\partial u_b}{\partial \xi} K \xi^2 \right] = 0,
&\mathcal{L}'(u) := -2 \mu \left( g^{a \rho} \frac{\partial u_b}{\partial \xi} \sum_{k=0}^{L} \frac{\partial \gamma^k_{\beta \rho \alpha}}{\partial \xi} (u) \right) \xi^a + \Theta^i R^i_{\beta \rho \sigma} \frac{\partial u_b}{\partial \xi},
&\mathcal{L}'(u) := -2 \mu \left[ \frac{1}{2} g^{a \rho} \frac{\partial u_b}{\partial \xi} \sum_{k=0}^{L} \frac{\partial \gamma^k_{\beta \rho \sigma}}{\partial \xi} (u) \right] \xi^a - \frac{1}{2} g^{a \rho} \Theta^i R^i_{\beta \rho \sigma} \frac{\partial u_b}{\partial \xi} u^a,
\end{aligned}
\]
(2.8)

3. Boundary Layer Equations

Assume that \( \mathcal{S} \) is a two dimensional manifold parameterized by \( \mathcal{R}(\xi) \). In the neighborhood of the orientate surface \( \mathcal{S}(\delta) \) let define a surface \( \mathcal{S}(\delta) \):
\[
\mathcal{S}(\delta) = \{ \mathcal{S}(\delta) (x) = \mathcal{R}(\xi) + \delta \hat{n}(x), \forall x \in D \subset \mathbb{E}^3 \}, \quad \hat{n} \text{ is unit outward normal vector to } \mathcal{S}
\]
It is obvious that \( \mathcal{S}(\delta) \) is a geodesic parallel surface of \( \mathcal{S} \) and the geodesic distance each other is equal to \( \delta \) where \( \delta \) is a small constant. In this paper we only consider exterior flow around a body occupied by \( \Omega \) with a two dimensional manifold \( \mathcal{S} = \partial \Omega \) without boundary. The boundary layer domain
\[
\Omega_0 = \{ \mathcal{S}(\xi, \delta) = \mathcal{S}(\xi) + \xi \hat{n}, \quad 0 \leq \xi \leq \delta, \quad \forall x \in D \subset \mathbb{E}^3 \} \text{ bounded by } \mathcal{S} \cup \mathcal{S}(\delta)
\]
Domain \( \Omega_\delta \) is called the "stream layer".

Assumption AI assume that the solutions \( (u, p) \) of Navier-Stokes Equation (2.7) in boundary layer \( \Omega_\delta \) in semi-geodesic coordinate system and right term \( f \) can be made Taylor expansion with respect to the transverse variable \( 0 \leq \xi \leq \delta \)
\[
\begin{aligned}
u(x, \xi) &= u_0 (x) \xi + u_2 (x) \xi^2 + \ldots, \\
p(x, \xi) &= p_0 (x) + p_1 (x) \xi + p_2 (x) \xi^2 + \ldots, \\
f(x, \xi) &= f_0 (x) + f_1 (x) \xi + f_2 (x) \xi^2 + \ldots,
\end{aligned}
\]
(3.1)
In same time, the test vector also can be made Taylor expansion
\[ \mathbf{v} = \mathbf{v}_1(x)\xi + \mathbf{v}_2(x)\xi^2 + \cdots, \quad q = q_0(x) + q_1(x)\xi + q_2(x)\xi^2 + \cdots \]

**Theorem 1** In a boundary layer domain \( \Omega_\delta \) with non-slip boundary condition \( \mathbf{u}_n = 0 \), if the Assumption AI (3.1) is satisfied, then nine unknown of \((\mathbf{u}, \mathbf{v}, p_0, p_1, p_2)\) satisfy following a system of three partial differential equations which are called **boundary layer equations I** (BLE I):

\[
\left[-\frac{\mu\delta^3}{3}\left[ \Delta u_\alpha + a^{\alpha\beta} \nabla_\beta \mathbf{v} \right] + a^{\alpha\beta} \eta_{\beta\alpha} u_\alpha - \frac{\delta^3}{3} a^{\alpha\beta} \nabla_\beta p_1 + \frac{\delta^4}{4} \mathbf{u}_1 \cdot \nabla_\beta u_\alpha - u_\alpha \nabla \mathbf{v} \right] + 2H\delta^3 a^{\alpha\beta} \nabla_\beta p_0 = \mathcal{A}^{\alpha}(\mathbf{u}_2),
\]

\[
-\frac{\delta^3}{3} \Delta p_0 + M(\mathbf{u}_1) = F_\beta, \quad u_1^i = 0,
\]

\[\left(\mathbf{u}_1, p_0\right)_{\Omega_\delta} \text{ satisfies periodic boundary condition.}\]

and five algebraic equations

\[
\frac{2\mu\delta^3}{3} u_2^i = a^{\alpha\beta} F_\beta^2 - a^{\alpha\beta} q_{\beta\alpha} u_\alpha^i + \frac{\delta^3}{3} a^{\alpha\beta} \nabla_\beta p_0,
\]

\[2u_1^i + \nabla \mathbf{v}_1 = 0,
\]

\[
\frac{\delta^3}{3} p_1 + 2\left(\frac{\delta^3}{2} - 7H\delta^3 \right) \mathbf{v}_1 = F_3^i,
\]

\[5 \mathbf{u}_1 + 2\left(\frac{\delta^3}{2} - 3H\delta^3 \right) p_0 + \frac{9}{2} \frac{\delta^3}{3} \nabla \mathbf{v}_1 = F_3^i,
\]

Associated variational formulations with (3.2) is given by

\[
\int (\mathbf{u}, p_0) \in V(D) \times M(D) \text{ such that } \frac{\delta^3}{3} a(\mathbf{u}_1, \mathbf{v}_1) + (\eta_{\beta\alpha} u_\alpha^i, v_\beta^i) + \frac{\delta^4}{4} \left( a^{\alpha\beta} \mathbf{u}_1 \cdot \nabla_\beta u_\alpha - u_\alpha \nabla \mathbf{v} \right) + \frac{\delta^3}{3} p_1 \nabla \mathbf{v}_1 = F_3^i,
\]

\[\frac{\delta^3}{3} \left( \nabla p_0, \nabla q \right) + M(\mathbf{u}_1, q) = F_3^i, \quad \forall q \in M(D),
\]

where the bilinear forms defined by

\[a(\mathbf{u}, \mathbf{v}) = \left(a^{\alpha\beta\gamma\delta} \mathbf{e}_{\alpha\beta}(\mathbf{u}) \cdot \mathbf{e}_{\gamma\delta}(\mathbf{v})\right)\]

\[(\cdot, \cdot) = \int \mathbf{x} \cdot \sqrt{\mathbf{a}} dx\]

and

\[\eta_{\beta\alpha} = \frac{\mu}{2} \left( \delta^2 - \frac{2H\delta^3}{3} \right) a_{\beta\alpha} + \frac{6H\delta^3}{3} b_{\beta\alpha}, \quad q_{\beta\alpha} = \frac{\mu}{2} \left( \frac{\delta^2}{2} - \frac{2H\delta^3}{3} \right) a_{\beta\alpha} - \frac{4\delta^3}{3} b_{\beta\alpha},
\]

\[M(\mathbf{u}_1) = \frac{\mu}{2} \left( \delta^2 + \frac{12H\delta^3}{3} \right) \nabla \mathbf{v}_1 \cdot -10\mu \nabla \mathbf{v} + \frac{2\mu\delta^3}{3} b_{\beta\alpha} \nabla_\beta u_\alpha^i, \quad F_\beta = a^{\alpha\beta} \nabla_\beta F_\beta^2,
\]

\[\mathcal{A}^{\alpha}(\mathbf{u}_2) = -a^{\alpha\beta} \left[ \frac{\mu}{2} \left( \delta^2 + \frac{4H\delta^3}{3} \right) a_{\beta\alpha} + \frac{3\delta^3}{3} b_{\beta\alpha} \right] u_\alpha^i + \frac{\mu\delta^3}{3} \mathbf{v}_1 \cdot \left( a^{\alpha\beta} \nabla_\beta u_\alpha^i \right) + a^{\alpha\beta} F_\beta^i,
\]
where

\[ F^1 = h\delta + \frac{f_0\delta^2}{2} + \frac{f_1\delta^3}{3}, \quad F^2 = h\delta^2 + \frac{f_0\delta^3}{3} \]

\( h \) is normal stress tensor at \( \Gamma_t \) (top boundary of boundary layer), \( f_i \) are defined by (3.1).

Next, let consider interface equation. In this case \( \mathcal{I} \) is a flexible surface (slip and passing through conditions).

**Assumption AI** Assume that the solutions \((u, p)\) of Navier-Stokes Equation (2.1) in stream layer \( \Omega_{x/2} = \left\{ \mathcal{R}(x) = \mathcal{R}(x) + \xi n, \quad -\frac{1}{2} \leq \xi \leq \frac{1}{2}, \quad x \in D \right\} \) in semi-geodesic coordinate system based on \( \mathcal{I} \) and right term \( f \) can be made Taylor expansion with respect to the transverse variable \( \xi \)

\[
\begin{align*}
    u(x, \xi) &= u_0(x) + u_1(x) \xi + u_2(x) \xi^2 + \cdots, \\
p(x, \xi) &= p_0(x) + p_1(x) \xi + p_2(x) \xi^2 + \cdots, \\
f(x, \xi) &= f_0(x) + f_1(x) \xi + f_2(x) \xi^2 + \cdots,
\end{align*}
\]

(3.7)

**Theorem 2** Assume that the **Assumption II** is satisfied. Then six unknown of \( (u, p, k, 0 = 1, 2) \) in (3.7) satisfy following system of the nonlinear partial differential equations which are called stream layer equations II (abbreviation SLE II) (interface equations):

\[
\begin{align*}
    &-\mu \delta \left[ \Delta u_0^a + a^{\alpha\beta} \nabla_{\alpha} \text{div} u_0 + Ku_0^a \right] + 4a^{\alpha\beta} \nabla_{\alpha} H u_0^b + 2b^{\alpha\beta} \nabla_{\beta} p_0^b - \delta a^{\alpha\beta} \nabla_{\alpha} p_0 = a^{\alpha\beta} F_\alpha^b, \\
    &-2\mu \delta \Delta u_0^3 + 2\mu \delta H u_0^3 + \delta^2 \left[ u_0^3 \nabla_{\alpha} u_0^3 + b_{\alpha\beta} u_0^3 u_0^3 \right] - 2H \delta p_0 - 2\mu \delta h_{\alpha}^b \nabla_{\alpha} u_0^3 - \delta \text{div} u_0 = F_3^3, \\
    &\text{div} u_0 - 2Hu_0^3 + u_0^3 = 0,
\end{align*}
\]

(3.8)

\[
\begin{align*}
    &\mu \left( \left( \delta - \frac{H \delta^2}{2} \right) \frac{\partial^2}{\partial^2 \beta_0^a} u_0^a + \frac{\mu \delta^2}{2} a^{\alpha\beta} \nabla_{\alpha} u_0^a \frac{\partial^2}{\partial \beta_0^a} u_0^a \right) - \mu \delta^2 \left[ \Delta u_0^a + a^{\alpha\beta} \nabla_{\alpha} \text{div} u_0 + Ku_0^a \right] \\
    &+ 4a^{\alpha\beta} \nabla_{\alpha} H u_0^b + 2b^{\alpha\beta} \nabla_{\beta} p_0^b + \delta^2 \left[ u_0^3 \nabla_{\alpha} u_0^3 + b_{\alpha\beta} u_0^3 u_0^3 \right] - 2H \delta p_0 - 2\mu \delta h_{\alpha}^b \nabla_{\alpha} u_0^3 = a^{\alpha\beta} F_3^a, \\
    &-\frac{\delta^2}{2} \beta_0 \left( \delta - \frac{4H \delta^2}{2} \right) p_0 - \frac{\mu \delta^2}{2} \beta_0 (u_0) - \frac{\mu \delta^2}{2} \Delta u_0^3 + \frac{\delta^2}{2} \left( u_0^3 \nabla_{\alpha} u_0^3 + b_{\alpha\beta} u_0^3 u_0^3 \right) = F_3^3.
\end{align*}
\]

(3.9)

The right terms

\[
\begin{align*}
    F_0^a &= a_{\alpha\beta} (h_{\alpha}^a - h_{0}^a), \quad F_1^3 = h_1^3, \quad F_2^3 = h_2^3, \quad F_3^3 = a_{\alpha\beta} h_{\alpha}^3, \\
    h_0^a &= \mu \mu_1 \left[ \frac{1}{\tau} \right], \quad h_2^3 = -p_0 \left| \frac{1}{\tau^2} \right|, \\
    h_1^3 &= (-p_0 + 2\mu \mu_1) \left[ \frac{1}{\tau} \right], \quad h_2^3 = \mu \left( u_0^3 + a^{\alpha\beta} \nabla_{\alpha} u_0^3 - b_{\alpha\beta} u_0^3 \right) \left| \frac{1}{\tau^2} \right|.
\end{align*}
\]

(3.10)

In particular, for flexible (slip condition \( u_0 \neq 0 \)) boundary surface \( \mathcal{I} \), neglect hight order terms and keep one order term of \( \delta \), then (3.3) (3.4) and (3.5) become

**The Proof of Theorems 1 and 2** is neglected.
4. The Existence of the Solution

In this section we prove the existence of the weak solution of (3.2). To do that we consider variational formulation of (3.2). Let $V(\mathcal{I}) = H^1_0(D) \times H^1_0(D)$ where $H^1_0(D)$ is a sobolev space of 1-order with periodic boundary condition. Since ([14], Th.1.8.6) we claim

$$\frac{1}{2} \left[ \Delta u_1^g + a^{ijkl} \nabla \cdot u_1^g - Ku_1^g \right] = \nabla \cdot e^{\ast\beta}(u_1)$$

where

$$e^{\ast\beta}(u_1) = \frac{1}{2} \left[ a^{ijkl} \nabla \cdot u_1^g + a^{ijkl} \nabla \cdot u_1^g \right]$$

Let define bilinear form: \( \forall u, v \in V(\mathcal{I}), \)

$$a(u,v) = \frac{\delta^3}{32} \left( \delta^{\ast\beta}(u), \delta^{\ast\beta}(v) \right) = \frac{\delta^3}{32} \left( a^{ijkl} \delta^{\ast\beta}(u), \delta^{\ast\beta}(v) \right) + \left( Q_{ab} u_1^g, v^g \right)$$

$$a_0(p,q) = \frac{\delta^3}{3} \left( \nabla \cdot p, \nabla \cdot q \right) = \frac{\delta^3}{3} \left( a^{ijkl} \nabla \cdot p, \nabla \cdot q \right), \ \forall p, q \in L^2(D),$$

$$\langle U, V \rangle = a_0(a(u,v) + \beta_0(a_0(p,q), V) + \beta_0(M_0(u,v), q) = (F, V), \ \forall V \in V(D) \times L^2(D),$$

where \( (\alpha_0, \beta_0) \) are two positive constants and \( U = (u, p), V = (v, q) \) and

$$\langle \cdot, \cdot \rangle = \int_D \langle \cdot, \cdot \rangle \sqrt{dx}$$

Then corresponding variational formulation for (3.2) is given by

$$\begin{array}{l}
\text{Find } U = (u_1^g, a = 1, 2, p_0) \in V(D) \times L^2(D) \text{ such that } \\
\langle U, V \rangle + a_0(a(u_1^g, u_1^g, v) + a_0 \left( \cap_\beta(p_0, v^g) \right) + \beta_0(M_0(u_1^g, q) = (F, V), \forall V \in V(D) \times L^2(D),
\end{array}$$

where

$$\begin{array}{l}
\cap_\beta(u_1^g, u_1^g, v) = \frac{\delta^3}{4} \left( a_{ab} \left( u_1^g \nabla \cdot u_1^g - \frac{1}{2} u_1^g \nabla \cdot u_1^g \right), v^g \right) \\
B_\beta(u_1^g, u_1^g) = \frac{\delta^3}{4} a_{ab} \left( u_1^g \nabla \cdot u_1^g - \frac{1}{2} u_1^g \nabla \cdot u_1^g \right), B^a(u_1^g, u_1^g) = a^{ijkl} B_\beta(u_1^g, u_1^g), \\
B_\beta(u_1^g, u_1^g) = \frac{\delta^3}{4} b_{ab} u_1^g u_1^g, \\
\cap_\beta(p_0) = d_{ab} \nabla \cdot p_0 - \frac{4 \delta^3}{3} \nabla \cdot p_0, \\
(F, V) = a_0 \left( \int F_\beta - \frac{\eta^a}{4} \mu \delta^3 \frac{F_\beta - \delta^3}{3} \nabla \cdot p_0, V^g \right) + \beta_0 \left( a^{ijkl} \nabla \cdot F_\beta^g, q \right).
\end{array}$$

**Lemma 1** Assume that the metric tensor and curvature tensor of \( \mathcal{I} \) satisfy \( a_{ab} \in C^1(D) \) and \( b_{ab} \in C^0(D) \) respectively. Then viscosity tensor of \( \mathcal{I} \), \( \mu a^{ijkl} a_{ab} \) and metric tensor \( a^{ijkl} \) are positive definition, i.e. for any symmetric matrix \( \left( t_a^a \right) \), there exist two constants \( \lambda_0(D, \mathcal{I}), \lambda_0 \) independent of \( \left( t_a^a \right) \) such that

$$2 \mu a^{ijkl} a_{ab} t_a^a t_b^b \geq \mu \lambda_0 \sum_a |t_a|^2,$$

$$a^{ijkl} t_a^a t_b^b \geq \lambda_0 \sum_a |t_a|^2,$$

(4.4)
\[ a_\alpha(u, v) = \left( a^\alpha_{\beta\gamma} a_\delta \nabla_\alpha V^\gamma_\beta, \nabla_\beta V^\gamma_\delta \right) \geq 2\mu \lambda_0 \sum_{\alpha, \beta} \left\| \nabla_\alpha V^\gamma_\beta \right\|_{V,D}^2 := 2\mu \lambda_0 \left\| V^\gamma_\beta \right\|_{V,D}^2. \]

Furthermore, if \( H, K \in C^1(D) \) and the thickness \( \delta \) of boundary domain small enough, then bilinear form \( (Q_{\alpha\beta} u^\alpha, v^\beta) \) is positive
\[ \left( Q_{\alpha\beta} u^\alpha, v^\beta \right) \geq 2\mu \delta \left\| u \right\|_{V,D}, \quad \forall u \in V(D) \] 

**Proof** The proof of (4.4) can be found in ([1] [4]). It remains to prove (4.6). By virtue of the positive definition of metric tensor \( a_{\alpha\beta} \) and assumption of lemma and using Hoelder inequality, we assert that
\[ \left( Q_{\alpha\beta} u^\alpha, u^\beta \right) = 2\mu \delta \left[ a_{\alpha\beta} u^\alpha, u^\beta + \left( \frac{3H^2 - 2K}{2} + (4K - 2H^2) \right) \delta^2 \right] a_{\alpha\beta} u^\alpha, u^\beta \geq 2\mu \left( \frac{3H^2 - 2K}{2} + (4K - 2H^2) \right) \delta^2 \left\| u \right\|_{V,D}^2, \quad \forall u \in V(D), \quad \text{if } C\delta \leq \frac{1}{8}, \]
where \( C \) is a constant independent of \( u \) depending \( (H, K), \lambda_0 \). The proof is complete. 

**Lemma 2** Assume that the two-dimensional manifold \( \mathcal{M} \) is smooth enough such that the metric tensor \( a_{\alpha\beta} \) and curvature tensor \( b_{\alpha\beta} \) satisfy \( a_{\alpha\beta}, b_{\alpha\beta} \in C^1(D) \). Then the bilinear forms \( a(u, v), \mathcal{A}(U, V) \) defined by (4.1): \( W(D) := H^1_p(D) \times H^1(D) \Rightarrow \mathcal{R} \) is symmetric, continuous
\[ \left[ \begin{array}{l} a(u, v) = a(v, u), \quad \mathcal{A}(U, V) = \mathcal{A}(V, U), \quad \forall U, V \in W(D), \\
\left\| a(u, v) \right\| \leq \delta C \left\| u \right\|_{V,D} \left\| v \right\|_{V,D} \end{array} \right. \]
\[ \left[ \begin{array}{l} \left\| \mathcal{A}(U, V) \right\| \leq \alpha_0 \frac{2\mu \delta \delta^2 C \left\| u \right\|_{V,D} \left\| v \right\|_{V,D} \right. + \beta_0 \frac{\delta^2 C \left\| p \right\|_{V,D} \left\| q \right\|_{V,D} \right. \quad \forall U, V \in W(D), \end{array} \right. \]
where \( H^1_p(D) = \left\{ u \in H^1(D), u \right\} \) satisfying \( P.B.C. \). Furthermore if \( \delta \) is smaller enough such that
\[ \delta \leq \min \left\{ \frac{1}{\sqrt{2}}, \frac{1}{8C} \right\} \]
then they are also coercive respectively
\[ \left[ \begin{array}{l} a(u, u) \geq 2\mu \frac{\delta^2}{3} C \left\| u \right\|_{V,D}^2, \quad \forall U \in W(D) \end{array} \right. \]
\[ \left[ \begin{array}{l} \mathcal{A}(U, U) \geq 2\mu \alpha_0 \left( \frac{\delta^2}{3} C \left\| u \right\|_{V,D}^2, \quad \forall U \in W(D) \end{array} \right. \]
where \( C \) is a constant independent of \( U, V \) having different meaning at different place and
\[ \left\{ \begin{array}{l} \left\| C \right\|^2 = \alpha_0 \left\| u \right\|_{V,D}^2 + \beta_0 \left\| p \right\|_{V,D}, \quad \left\| V \right\|^2 = \alpha_0 \left\| v \right\|_{V,D}^2 + \beta_0 \left\| q \right\|_{V,D}, \quad \forall U = (u, p), \quad V = (v, q) \end{array} \right. \]

**Proof** Indeed it is enough to prove the coerciveness (4.8) since the continuous and symmetric are obvious by Hoelder inequality. Since **Lemma 1**,
In view of Korn inequality on Riemann manifold (see [4] Th.1.7.9)

$$\nabla u \leq C \left( \| u \|_{L^2(D)} + \sum_{\alpha, \beta} \| e_{\alpha \beta} (u) \|_{L^2(D)} \right), \quad \sum_{\alpha, \beta} \| e_{\alpha \beta} (u) \|_{L^2(D)} \geq \frac{1}{C} \| \nabla u \|_{L^2(D)} - \| u \|_{L^2(D)},$$

we assert that

$$a(u, u) \geq \frac{2 \mu \delta^3}{3} |C| \| u \|^2_{L^2(D)} + 2 \mu \delta (1 - \delta^2 \gamma) \| u \|^2_{L^2(D)} \geq \frac{2 \mu \delta^3}{3} |C| \| u \|^2_{L^2(D)} + 2 \mu \delta \| u \|^2_{L^2(D)},$$

$$(4.10)$$

if $\delta$ satisfies $\delta^2 \leq (\lambda_1)^{-1}$. To sum up, we conclude our proof. #

Next we consider variational problem (4.2) corresponding to boundary layer Equation (3.4). Let

$$A(U, V) = \mathcal{L}(U, V) + \alpha_0 \left[ \mathcal{L}(u, u, v) + (\beta_0 (p_0), v) \right] + \beta_0 \left( M_0 (u), q \right),$$

$$\forall U, V \in W(D) = V(D) \times L^2(D),$$

Lemma 3 Assume that the manifold $\mathbb{M}$ satisfies that $a_{\alpha \beta}, b_{\alpha \beta}, H, K \in C^1(\overline{D})$ such that there exists a constant $C_\delta > 0$

$$\max \left\{ |a_{\alpha \beta}|, |a_{\alpha \beta}^\prime|, |b_{\alpha \beta}|, |K|, |H| \right\} \leq C_\delta$$

The thickness $\delta$ of the boundary layer is small enough. Then bilinear form $A(\cdot, \cdot) : W(D) := H^1_0(D) \times H^1_0(D) \Rightarrow \mathbb{R}$ defined by (4.11) is continuous:

$$A(U, W) \leq C \left[ 2 \mu \alpha_0 \left( \delta^3 \| u \|^2_{L^2(D)} + \delta \| u \|^2_{L^2(D)} \right) + \delta^2 \beta_0 \| p_0 \|^2_{L^2(D)} \right] + \left( \delta^2 \| u \|^2_{L^2(D)} + \delta \| u \|^2_{L^2(D)} \right) \| q \|^2_{L^2(D)},$$

$$\forall U, W \in W(D),$$

where $\| U \|^2_{L^2(D)} := \| u \|^2_{L^2(D)} + \| p_0 \|^2_{L^2(D)}$ and also satisfies following inequality

$$\mathcal{L}(U, U) + \alpha_0 \left[ \mathcal{L}(p_0, u)^\prime \right] + \beta_0 \left( M_0 (u), p_0 \right) \geq \mu \delta^3 \| u \|^2_{L^2(D)} + \mu \alpha_0 \delta \| u \|^2_{L^2(D)} + \frac{1}{4} \delta^3 \beta_0 \lambda_0 \| p_0 \|^2_{L^2(D)},$$

$$(4.13)$$

where $\delta$ is small enough and parameters $(\alpha_0, \beta_0)$ satisfy

$$\delta \leq \frac{3}{4} \min \left\{ \frac{\beta_0}{\lambda_0}, \frac{\alpha_0}{\alpha_0 + \mu \beta_0} \right\} \min \left\{ \frac{\beta_0}{\lambda_0}, \frac{\alpha_0}{\alpha_0 + \mu \beta_0} \right\} \min \left\{ 1, \frac{1}{\sqrt{\lambda_0}}, \frac{1}{2 \lambda_0}, \frac{1}{2 \lambda_0}, \frac{1}{4 \lambda_0}, \frac{1}{4 \lambda_0}, \frac{1}{4 \lambda_0}, \frac{1}{4 \lambda_0} \right\},$$

$$(4.14)$$

Proof It is easy to verify (4.12) by applying H"{o}lder inequality and Poincaré inequality. It remains to prove (4.13). At the first, we recall that the assumptions of the lemma shows

$$\left\{ \frac{2}{3} \delta \leq \beta_0 \leq \frac{\lambda_0}{2 \mu \alpha_0} \right\} \cap \left\{ \frac{3}{4} \delta \leq \alpha_0 \right\}.$$
Taking (4.8) into account, from (4.10) it infers

\[
A(U, U) \geq \mathcal{D}(U, U) - \alpha_0 \left[ \langle \langle u, u, v \rangle \rangle - \left\| \nabla \phi (p_0) \right\| \right] - \beta_0 \left\| M_0 (u_1) \right\|
\]

(4.15)

(1) Since Lemma 1 and (4.3) we have

\[
\left( \begin{array}{c} 

\phi (p_0), u_1 

\end{array} \right) = \left( \begin{array}{c} 

a^\alpha \nabla \phi (p_0), u_1, u_1, u_1 \n
\end{array} \right) = \left( \begin{array}{c} 

\frac{4 \delta^3}{3} \nabla \phi (H p_0, \text{div} u) + \left( \frac{3 \delta^2}{2} \delta^\alpha + \frac{\delta^3}{4} (H \delta^\alpha - b_\phi^\alpha) \right) \nabla \phi (p_0, u_1) 

\end{array} \right)
\]

Moreover, using Godazzi formula \( \nabla \phi b_\phi u \nabla \phi b_\phi u \), we obtain

\[
\left( \begin{array}{c}

b^\alpha \nabla \phi (p_0, u_1) 

\end{array} \right) = \nabla \phi (b^\alpha u_1, u_1, u_1) - u_1 \nabla \phi b^\alpha = \nabla \phi (b^\alpha u_1, u_1, u_1) - 2 H u_1 \nabla \phi H, 3
\]

Therefore

\[
I = \alpha_0 \left( \phi (p_0, u_1) \right) + \beta_0 \left( \phi (u_1, u_1) \right) = \left( \begin{array}{c} 

\frac{2 \mu b_0 \delta^2}{2} - \frac{4 \delta^3}{3} (\alpha_0 - 2 \mu b_0) H \right) p_0, \text{div} u_1 

\end{array} \right)
\]

Thanks to

\[
\text{div} u_1 = \nabla \phi b_\phi u_1 - \nabla \phi \ln \sqrt{a} u_1
\]

\[
I = \left( \begin{array}{c} 

\frac{2 \mu b_0 \delta^2}{2} - \frac{4 \delta^3}{3} (\alpha_0 - 2 \mu b_0) H \right) p_0, \text{div} u_1 

\end{array} \right)
\]

\[
= I_1 + I_2 + I_3,
\]

We assert that

\[
I_1 = \mu b_0 \delta^2 \left( \begin{array}{c} 

1 + \frac{4}{3} \delta (\alpha_0 - 2 \mu b_0) H \right) \mu b_0 \right) \leq \mu b_0 \delta^2 \left( \begin{array}{c} 

1 + \frac{4}{3} \delta (\alpha_0 - 2 \mu b_0) H \right) \mu b_0 \right) \leq 2 C \mu b_0 \delta^2 \left[ p_0 \right]_{h,p} \left[ u_1 \right]_{h,p} 
\]

Second inequality shows
Using Young inequality
\[ ab \leq \frac{1}{4\varepsilon} b^2 + \varepsilon a^2 \]
we have
\[ I_i \leq \frac{1}{4} \delta^3 \frac{\beta_0}{\lambda_0} |p_0|^2_{H,|D|} + \frac{\delta}{\lambda_0} \mu^2 \varepsilon \delta |u_i|^2_{H,|D|} \]  
(4.18)

By similar manner,
\[
\begin{align*}
I_2 &= \frac{3}{4} \alpha_0 \delta^2 \left( \left( \delta^2 + \frac{4}{9} \delta \left( \alpha_0 H \delta^2 + (\alpha_0 + 4\mu \beta_0) b^2 \right) \right)^2 \nu_0 \|u_i\|_{H,|D|}^2 \\
&\leq \frac{3}{4} \alpha_0 \delta^2 \left( 1 + \frac{4}{9} \delta C_{\delta} \left( \alpha_0 + 4\mu \beta_0 \right) \right) \|p_0\|_{H,|D|} \|u_i\|_{H,|D|} \\
&\leq \alpha_0 \delta^2 |p_0|_{H,|D|} \|u_i\|_{H,|D|} \leq \frac{1}{4} \delta^3 \frac{\beta_0}{\lambda_0} |p_0|^2_{H,|D|} + \frac{\alpha_0^2}{\lambda_0} \|u_i\|_{H,|D|}^2, \\
&\text{if } \delta \leq \frac{3}{4} C_{\delta} \left( \alpha_0 + 4\mu \beta_0 \right).
\end{align*}
\]  
(4.19)

Substituting (4.18-4.20) into (4.16) leads to
\[
\begin{align*}
I &= \frac{3}{4} \delta^3 \frac{\beta_0}{\lambda_0} |p_0|^2_{H,|D|} + \frac{12}{\lambda_0} \mu^2 \varepsilon \delta |u_i|^2_{H,|D|} + \delta \frac{\alpha_0^2}{\lambda_0} \frac{\mu \beta_0^2}{\lambda_0} \|u_i\|_{H,|D|}^2, \\
&\text{if } \delta \leq \frac{3}{4} C_{\delta} \min \left\{ \frac{\beta_0}{\lambda_0}, \frac{\alpha_0}{\lambda_0}, \frac{\mu \beta_0}{\lambda_0} \right\}.
\end{align*}
\]  
(4.21)

Taking (4.9) into account, it yield
\[
\begin{align*}
\mathcal{D} (U,U) + I &\geq 2\mu \delta \left( \delta^2 - \frac{\beta_0}{\lambda_0} \alpha_0 \mu \right) |p_0|^2_{H,|D|} + 2\mu \alpha_0 \delta \left( 1 - \frac{\alpha_0^2}{2\mu \beta_0} \right) \|u_i\|_{H,|D|}^2 + \frac{1}{4} \delta^3 \frac{\beta_0}{\lambda_0} \|p_0\|_{H,|D|}^2, \\
&\text{if } \delta \leq \frac{3}{4} C_{\delta} \min \left\{ \frac{\beta_0}{\lambda_0}, \frac{\alpha_0}{\lambda_0}, \frac{\mu \beta_0}{\lambda_0} \right\}, \quad \delta \leq \min \left\{ \frac{1}{\sqrt{2}, \frac{1}{8}} \right\}.
\end{align*}
\]  
(4.22)
\[
\frac{C\mu\beta_0}{\lambda_0\alpha_0} \leq \frac{\delta^2}{2}, \quad \frac{\alpha_0 + \mu\beta_0}{2\mu\alpha_0\beta_0} \leq \frac{1}{2}
\] (4.23)

Then

\[
\mathcal{J}(U, U) + I \geq \mu\delta^3 |\mathbf{u}_i|_{L,D}^4 + \mu\alpha_0\delta |\mathbf{u}_i|_{L,D}^4 + \frac{1}{4}\delta^3 \beta_0\lambda_0 |\mathbf{p}_0|_{L,D}^4,
\]

\[
\text{if } \delta \leq \frac{3}{4C_\delta} \min \left\{ \frac{\beta_0}{(\alpha_0 + 3\mu\beta_0)}, \frac{\alpha_0}{(\alpha_0 + 4\mu\beta_0)}, \frac{\mu\beta_0}{(\alpha_0 + 2\mu\beta_0)} \right\}, \quad \delta \leq \min \left\{ \frac{1}{\sqrt{\lambda}}, \frac{1}{8C} \right\}.
\] (4.24)

It is easy to verify that (4.23) is satisfied if the parameters \((\alpha_0, \beta_0)\) in the definition (4.1) are held

\[
\frac{2}{3}\frac{1}{\mu\alpha_0} \leq \beta_0 \leq \frac{2}{\mu}\alpha_0, \quad \frac{3}{\lambda_0} \leq \alpha_0
\] (4.25)

Next we consider trilinear form. Taking into account of

\[
\nabla \cdot \mathbf{u}_i = \partial_\alpha \mathbf{u}_i + \partial_\sigma \ln|\mathbf{u}_i|, \quad \partial_\alpha \mathbf{u}_i = \partial_\alpha \mathbf{u}_i + \mathbf{u}_i \ln|\mathbf{u}_i|
\]

we claim that

\[
|\mathcal{J}(\mathbf{u}, \mathbf{u}, \mathbf{u})| = \frac{\delta^4}{4}\left| \nabla \cdot \mathbf{u}_i \mathbf{u}_i - \mathbf{u}_i \mathbf{u}_i \mathbf{u}_i \right|
\]

\[
\leq \frac{\delta^4}{4}\left[ (\mathbf{u}_i \partial_\alpha \mathbf{u}_i - \mathbf{u}_i \partial_\alpha \mathbf{u}_i, a_{\alpha\beta} \mathbf{u}_i^\beta) + \left( \frac{\alpha_0}{\lambda_0} - \partial_\alpha \ln|\mathbf{u}_i| \right) \mathbf{u}_i \mathbf{u}_i \mathbf{u}_i \right] \leq \frac{\delta^4}{4} C \left( |\mathbf{u}_i|_{L,D} + |\mathbf{u}_i|_{L,D} \right) |\mathbf{u}_i|_{L,D}^2
\] (4.26)

By Ladyzhenskya inequality (Temam [11])

\[
|\mathbf{u}_i|_{L,D}^4 \leq 2|\mathbf{u}_i|_{L,D}^4 \|
abla \mathbf{u}_i\|_{L,D}^4 = 2|\mathbf{u}_i|_{L,D}^4 |\mathbf{u}_i|_{L,D}^2
\] (4.27)

it infers that

\[
|\mathcal{J}(\mathbf{u}, \mathbf{u}, \mathbf{u})| \leq \frac{C\delta^4}{4} \left( |\mathbf{u}_i|_{L,D}^4 + |\mathbf{u}_i|_{L,D}^4 |\mathbf{u}_i|_{L,D}^4 \right)
\] (4.28)

Combining (4.15) (4.24) and (4.27), we obtain

\[
A(U, U) \geq \mu\delta^3 (1 - C\delta |\mathbf{u}_i|_{L,D}) |\mathbf{u}_i|_{L,D}^4 + \mu\alpha_0\delta (1 - C\delta^3 |\mathbf{u}_i|_{L,D}) |\mathbf{u}_i|_{L,D}^4 + \frac{1}{4}\delta^3 \beta_0\lambda_0 |\mathbf{p}_0|_{L,D}^4
\] (4.29)

This complete our proof. #

**Theorem 3** Assume that the hypotheses in Lemma 3 are satisfied and the mapping

\[
\mathbf{u}_i \to \mathcal{J}(\mathbf{u}_i, \mathbf{u}_i, \mathbf{v}) \quad \forall \mathbf{v} \in V(D)
\]

is sequentially weakly continuous in \(V(D)\)

weak limit \(\mathbf{u}_i \mathbf{m} = \mathbf{u}_i\) in \(V(D)\) implies limit \(B(\mathbf{u}_i \mathbf{m}, \mathbf{u}_i \mathbf{m}, \mathbf{v}) = B(\mathbf{u}_i, \mathbf{u}_i, \mathbf{v})\), \(\forall \mathbf{v} \in V(D)\)

Then there exists at least one solution \(U = (\mathbf{u}_i, \mathbf{p}_0)\) of (4.2) satisfying

\[
|\mathbf{u}_i|_{L,D} + |\mathbf{p}_0|_{L,D} \leq \rho, \quad \rho := \left\| \mathbf{F} \right\| M,
\]

\[
M = \max \left\{ \frac{1}{2}\mu\delta^3, \frac{1}{2}\mu\alpha_0\delta, \frac{1}{4}\beta_0\lambda_0\delta^3 \right\}
\]

where \(\delta\) is the thickness of boundary layer, \(C_1, \lambda, \lambda_0\) are constants defined in the followings.
Proof We begin with constructing a sequence of approximate solutions by Galerkin’s method. Since the space $\mathbf{Y}(D) = \mathbf{W}(D)$ is a separable Hilbert space, there exist sequence $(\Phi_i, i \geq 1)$ in $\mathbf{Y}(D)$ such that: 1) for all $i \geq 1$, the elements $\Phi_1, \Phi_2, \ldots$ are linearly independent; 2) the finite linear combinations of the $\Phi_i$ are dense in $\mathbf{Y}(D)$. Such sequence $(\Phi_i, i \geq 1)$ are called a basis of the separable space. Denote by $\mathbf{Y}_m(D)$ the subspace of $\mathbf{Y}(D)$ spanned by finite sequence $\Phi_1, \Phi_2, \ldots, \Phi_m$. Then we solve an approximate problem of (4.2)

$$\begin{align*}
\text{Find } U_m = (u_{m}, P_{om}) \in \mathbf{Y}_m(D) \text{ such that } \\
A(U_m, W_m) = (F, W), \quad \forall W = (v, q) \in \mathbf{Y}_m(D),
\end{align*}$$

(4.30)

Setting

$$U_m = \sum_{i=1}^{m} \zeta_i \Phi_i$$

Problem (4.30) is equivalent to a system of nonlinear equations with $m$ unknowns $C$. For each $m$ problem (4.30) has at least one solution. In fact, when defining a mapping $\mathcal{M}_m : \mathbf{Y}_m(D) \to \mathbf{Y}_m(D)$ by

$$(\mathcal{M}_m(U_m), \Phi_i) = A(U_m, \Phi_i) - (F, \Phi_i), \quad 1 \leq i \leq m$$

where $(\cdot, \cdot)$ is the scalar product in $\mathbf{Y}(D)$, $U_m \in \mathbf{Y}_m(D)$ is a solution of problem (4.30) if only if $\mathcal{M}_m(U_m) = 0$. Since

$$(\mathcal{M}_m(U), U) = A(U, U) - (F, U), \quad \forall U \in \mathbf{Y}_m(D)$$

it follows from (4.28)

$$\left(\mathcal{M}_m(U), U\right) \geq \mu \delta^5 \left(1-C\sigma \left\| u \right\|_{\mathbf{L}_D} \right) \left\| u \right\|_{\mathbf{h}_D}^2 \left(1-C\delta \left\| u \right\|_{\mathbf{L}_D} \right) \left\| u \right\|_{\mathbf{h}_D}^2 + \frac{1}{4} \delta^3 \beta \delta \lambda \left\| u \right\|_{\mathbf{h}_D}^2 - (F, W)$$

Let $\left\| u \right\|_{\mathbf{h}_D} \leq \rho$, $\left\| u \right\|_{\mathbf{L}_D} \leq \rho$, $\left\| P_{om} \right\|_{\mathbf{h}_D} \leq \rho$, $\left\| P_0 \right\|_{\mathbf{h}_D} \leq \rho$. Furthermore, assume that

$$1-C\sigma \rho \geq \frac{1}{2}, \quad 1-C\delta \rho \geq \frac{1}{2}, \quad \text{i.e. } \delta \leq \left(\frac{1}{2\rho}\right)^{\frac{3}{2}}$$

(4.31)

if $\delta$ is small enough. Then

$$\left(\mathcal{M}_m(U), U\right) \geq \frac{1}{2} \mu \delta^5 \left\| u \right\|_{\mathbf{h}_D}^2 + \frac{1}{2} \mu \sigma \delta \left\| u \right\|_{\mathbf{h}_D}^2 + \frac{1}{4} \delta^3 \beta \delta \lambda \left\| u \right\|_{\mathbf{h}_D}^2 - \left\| F \right\|_{\mathbf{L}_D} \left\| U \right\|_{\mathbf{L}_D}$$

$$\geq M \left\| U \right\|_{\mathbf{L}_D}^2 - \left\| F \right\|_{\mathbf{L}_D} \left\| U \right\|_{\mathbf{L}_D} \geq 0,$$

if

$$\begin{align*}
\left\| U \right\|_{\mathbf{L}_D} \leq \rho, \\
M = \max \left\{ \frac{1}{2} \mu \delta^3, \frac{1}{2} \mu \sigma \delta, \frac{1}{4} \delta^3 \beta \delta \lambda \right\}.
\end{align*}$$

(4.32)

(4.33)

Hence, we conclude

$$\text{If } \left\| U \right\|_{\mathbf{L}_D} \leq \rho, \text{ Then } \left(\mathcal{M}_m(U), U\right) \geq 0$$

(4.34)

Moreover, $\mathcal{M}_m$ is continuous in a finite dimension space $\mathbf{Y}_m$, we can apply following lemma ([12]).

Lemma 4 Let $H$ be a finite dimensional Hilbert space whose scalar product is denoted by $(\cdot, \cdot)$ and the corresponding norm by $\left\| \cdot \right\|$. Let $\Psi$ be a continuous mapping from $H$ into $H$ with the following property: there exists $\zeta > 0$ such that

$$\left( \Psi(f), f \right) \geq \zeta \forall f \in H \text{ with } \left| f \right| = \zeta$$

(4.35)
Then, there exists an element \( f \) in \( H \) such that
\[
\Psi(f) = 0, \quad |f| \leq \zeta
\]  
(4.36)

Therefore there exists a solution \( U_m \) for problem (4.30) with
\[
\|U_m\|_{\rho} \leq \rho
\]  
(4.37)

This shows that the sequence \( (U_m) \) of the solutions to (4.30) in \( Y_m \) are uniformly bounded. Therefore we can extract a subsequence (still denoted by \( U_m \)) such that
\[
U_m \rightharpoonup (\text{weakly}) U_* \quad \text{in} \quad Y(D) \quad \text{as} \quad m \to \infty
\]

Then, the compactness of the embedding of \( Y(D) \) into \( L^2(D)^3 \) implies that
\[
U_m \to (\text{strongly}) U_* \quad \text{in} \quad L^2(D)^3 \quad \text{as} \quad m \to \infty
\]

Since \( Y_m \) is dense in \( Y(D) \), it is obvious that if
\[
B(u_0,u_*,v) = \lim_{m \to \infty} B(u_{0m},u_{1m},v)
\]

Taking the limit of both sides of (4.30) implies
\[
A(U_*,W) = (F,W), \quad \forall W \in Y_m(D)
\]

therefore
\[
A(U_*,W) = (F,W), \quad \forall W \in Y(D)
\]

Then \( U_* \) is a solution of (4.2) and which satisfies
\[
\|U_*\|_{\rho} \leq \rho
\]

The proof is complete. #

Remark The mapping \( \mathcal{F}(u_1,u_1,v) \forall v \in V(D) \) is sequentially weakly continuous in \( V(D) \) can be found in [3].

5. Dimensional Split Method for Exterior Flow Problem around an Obstacle and A Two Scale Parallel Algorithms

In this section, we propose a dimensional split algorithm for the three dimensional exterior flow around an obstacle occupied by \( \Omega \subset \mathbb{R}^3 \). \( \mathcal{I} = \partial \Omega \) is a smooth surface of the obstacle and \( \mathbb{R}^3 = \Omega \cup \hat{\Omega} \). Assume that \( \Omega \) is decomposed by a series of geometric parallel surfaces \( \mathcal{I}_i, i=1,2,\cdots \) into a series of stream layer \( \Omega_{i,i+1} \) bounded by \( \mathcal{I}_i, \mathcal{I}_{i+1} \) such that \( \hat{\Omega}_{i,i+1} = \mathcal{I}_i \cup \mathcal{I}_{i+1} \).

On every surface \( \mathcal{I}_i, k=0,1,2,\cdots,N \) it generalises a global system including one system of BLE I on the boundary surface \( \mathcal{I} \) of the obstacle and \( N-1 \) systems of flexible boundary equations BLE II on \( \mathcal{I}_i, \mathcal{I}_2,\cdots,\mathcal{I}_{N-1} : \)
\[
\begin{align*}
\text{BLEI}(u^a, p_h) &= F^0, \\
\text{SLEII}(u^a, p_h) &= F^1, \cdots, \text{SLEII}(u^a, p_h) = F^{N-1},
\end{align*}
\]

where right terms are given by
\[
\begin{align*}
P^1 = \delta a_{\alpha\beta} h^\alpha, & \quad P^1 = \delta h^\beta, \quad P^2 = \delta^2 a_{\alpha\beta} h^\alpha, \quad P^3 = \delta^2 h^\beta, \quad P^0 = a_{\alpha\beta} \left( h^\alpha - h^\beta \right), \quad P^0 = h^\beta - h^\alpha, \\
h^\alpha & = \mu u^\alpha |_{\mathcal{I}}, \quad u^\beta = -p_h |_{\mathcal{I}}, \\
h^\beta & = \mu \left( u^\alpha + a_{\alpha\beta} \nabla \beta u^\beta - h^\alpha u^\beta \right) |_{\mathcal{I}}, \\
h^\beta & = -p_h + 2 \mu u^\beta |_{\mathcal{I}},
\end{align*}
\]
The features of these systems are that the right terms of them depend upon the solution of next system, for example, the right term of \( k \)th-system depend upon the solution of \( (k+1) \)th. system. It is better to apply alternative iteration algorithm to solve these systems. That is

1. Suppose that right hands \( F^0, F^1, F^2, \cdots \), are known;
2. Solve system of \( BLEI, BLEII(k), k = 1, 2, \cdots, N - 1 \)
3. Modifying \( F^0, F^1, F^2 \) by using results obtained, then goto (2) to be continuous until reach certainly accuracy.

In order to find solution of Navier-Stokes equations at any point \( P \) in Exterior domain \( \Omega \in \mathbb{R}^3 \)

- Identify point \( P \) in which stream layer \( \mathcal{I}_{i}^1 \) bounded by \( \mathcal{I}_{i}^1 \cup \mathcal{I}^i \), then set \( \alpha_\xi \) in local coordinate system;
- \( u_1^i, u_2, u_3, p \) are solution of BLE on \( \mathcal{I}_{i}^1 \).

In details,

(I) For \( i = 0 \) i.e. solid surface with non-slip boundary condition, we give the boundary layer equations BLE I (3.2) on the boundary surface \( \mathcal{I}_{i}^1 \) of obstacle. from Theorem 2, three unknown \( (u_0^i, p_0) \) solve

\[
\begin{align*}
\frac{\mu \delta^3}{3} & \left[ \Delta u_1^i + a_{31} \nabla \cdot \text{div} u_1^i + Ku_1^i \right] + a_{32} Q_{i \alpha \beta} u_1^i + \frac{\delta^3}{3} a_{33} \nabla \cdot p_1 \\
+ & \frac{\delta^3}{3} a_{33} \nabla \cdot u_1^i - u_1^i \text{div} u_1^i + a_{32} \nabla \cdot p_0 - \frac{4\delta^3}{3} a_{32} \nabla \cdot (H p_0) = a_{33} \nabla \cdot F_1^i, \\
\end{align*}
\]

(5.1)

and six unknown \( (u_1^i, u_2, p_1, p_2) \) can be found by six algebraic equations

\[
\begin{align*}
u_1^i & = 0, \quad \frac{2\mu \delta^3}{3} u_2^i = a_{33} F_2 - a_{33} \nabla \cdot u_1^i - \frac{\delta^3}{3} a_{33} \nabla \cdot p_0, \\
2u_2^i + \text{div} (u_1^i) & = 0, \\
\frac{\delta^3}{3} p_2 + \left( \frac{\delta^3}{2} - \frac{4H \delta^3}{3} \right) p_1 & + \kappa_1 p_0 - \frac{\delta^3}{4} a_{32} u_1^i u_3^i + \frac{2\mu \delta^3}{3} \beta_0 (u_1^i) = -F_3^i, \\
\frac{2\delta^3}{3} p_1 & + 2 \left( \frac{\delta^3}{2} - \frac{3H \delta^3}{3} \right) p_0 - 5\frac{\mu \delta^3}{3} \text{div} u_1^i = F_2^i, \\
\end{align*}
\]

(5.2)

Associated variational formulations with (5.1) is given by

\[
\begin{align*}
\text{Find } (u_1^i, p_1) & \in V(D) \times M(D) \text{ such that} \\
A_i \left( (u_1^i, p_1), (v_1, q) \right) + & b(u_1^i, u_1^i, v_1) + \frac{\alpha_1 \delta^3}{3} \left( H p_0 - p_1 \right) \cdot \text{div} (v_1) \\
- & \alpha_0 \left( p_0, \nabla (d_{11} u_1^i) \right) + \beta_0 \left( M_{i1} (u_1^i), q \right) = \alpha_0 \left( \nabla \cdot v_1 \right), \quad \forall (v_1, q) \in V(D) \times M(D), \\
\end{align*}
\]

(5.3)

where \( \alpha_0, \beta_0 \) are two positive arbitrary constants, the bilinear forms and trilinear form are

\[
\begin{align*}
A_i \left( (u_1^i, p_1), (v_1, q) \right) & = \frac{2\alpha_0 \delta^3}{3} \left( a_{33} a_{32} a_{31} (u_1^i), e_{33} (v_1) \right) + \alpha_0 \left( Q_{i \alpha \beta} u_1^i, v_1^i \right) + \frac{\delta^3}{3} \beta_0 \left( \nabla \cdot p_0, \nabla \cdot q \right), \\
b(u_1^i, u_1^i, v_1) & = \frac{\alpha_0 \delta^3}{4} \left( u_1^i \nabla \cdot u_1^i - u_1^i \text{div} u_1^i, a_{32} u_1^i \right), \\
\end{align*}
\]

(5.4)
\[ \zeta_{ab} = 2\mu \left[ \frac{\delta^2}{2} - \frac{2H\delta^3}{3} \right] a_{ab} + \frac{2\delta^3}{3} b_{ab}, \]
\[ Q_{ab} = 2\mu \left[ \frac{1}{8} - \frac{3H\delta^2}{2} + \frac{(4K-2H^2)\delta^3}{3} \right] a_{ab} + \left( \frac{\delta^2}{2} - \frac{11H\delta^3}{3} \right) b_{ab}, \]
\[ d_{ab} = \left( \frac{3\delta^2}{2} + H\delta^3 \right) a_{ab} - \frac{\delta^3}{3} b_{ab}, \]
\[ M_{ab}(u_t) = 2\mu \left( \frac{\delta^2}{2} - \frac{4H\delta^3}{3} \right) \nabla a \nabla u_t + \frac{4\mu\delta^3}{3} b_{ab} \nabla u_t + \frac{12\mu\delta^3}{3} u_t \nabla_H H, \]
\[ F_{ab} = a_{ab} \nabla_H F_{ab}^2, \]
\[ a^\alpha_{ab}\delta_{\beta} = a_{ab} F_{ab}^1 - \frac{3}{4} \delta^{-1} a_{ab} \left( Ha_{ab} + b_{ab} \right) F_{ab}^2 + \frac{\mu}{2} \delta^3 \nabla_H \nabla_{\beta} u_t^2, \]

The right terms are given by
\[ a_{ab} F_{ab}^1 = \delta h^2, \quad F^1 = \delta h^3, \quad a_{ab} F_{ab}^2 = \delta^2 h^5, \quad F^2 = \delta^2 h^6, \]
\[ h^\alpha = \mu \left( u_t^3 + a_{ab} \nabla_H u_t - b_{ab} u_t^3 \right) \left( \nabla_{(\delta)} \right), \quad h^2 = \left( -p_0 + 2\mu u_t \right) \left( \nabla_{(\delta)} \right), \]

where \( \mathcal{S}(\delta) = \mathcal{S}_i \).

(II) For \( i = 1, 2, \ldots, N-1 \), i.e. on flexible surfaces, corresponding boundary layer equations SLE II (for \( u_i, u_{i+1}, p_i \)) at flexible surface (artificial interface) \( \mathcal{S}_i \), \( i = 1, 2, \ldots, N-1 \) are given by (3.8) and (3.9)
\[ -\mu \nabla \nabla_H + a_{ab} \nabla_H u_t + \nabla_H H u_i^3 + 2b_{ab} \nabla_H u_t \nabla_H u_t + \delta \left( u_t^3 + \nabla_H u_t - b_{ab} u_t^3 \right) \]
\[ -\delta_{\alpha} a_{ab} \nabla_H p_0 = a_{ab} F_{ab}^2, \]
\[ -2\mu \nabla \nabla_H (u_t) + \delta \left( u_t^3 + \nabla_H u_t - b_{ab} u_t^3 \right) - 2H\delta p_0 - \mu \delta \nabla u_t = F_{ab}^2, \]
\[ \mu \delta u_t^3 = a_{ab} F_{ab}^1, \quad -\delta p_0 = F_{ab}^1, \quad u_t^3 + \gamma_0 (u_t) = 0 \]
\[ F_{ab}^1 = a_{ab} (h^2 - h^3), \quad F_{ab}^2 = h^3 - h^3, \quad F_{ab}^1 = a_{ab} h^2 \delta, \quad F_{ab}^1 = h^3, \]
\[ h^2 = \mu a_{ab} (u_t), \quad h^2 = -p_0 (u_t), \quad h^2 = \frac{1}{2} \left( [-p_0 + 2\mu u_t] + [-p_0 + 2\mu u_t] \right)(k+1), \]
\[ h^2 = \frac{1}{2} \left( [u_t^3 + a_{ab} \nabla_H u_t - b_{ab} u_t^3] (k+1) + [u_t^3 + a_{ab} \nabla_H u_t - b_{ab} u_t^3] (k-1) \right), \]

On the other hand we can improve (5.7). To do that, making covariant derivative \( \nabla_H \) on both sides of the first equation in (3.9) and combining last equation in (3.9), \( (p_0, p_i, u_t) \) can be found by
\[ -\frac{\delta^2}{2} \Delta p_0 = -\mu \left( \nabla_H (2H u_t) - 2K u_t^3 - 4H \gamma_0 (u_t) \right) \nabla_H F_{ab}^1, \]
satisfies periodic boundary conditions on \( \partial D, \)
\[ -\frac{\delta^2}{2} p_0 = \left( \delta - \frac{H \delta^2}{2} \right) p_0 + \frac{\mu\delta^2}{2} \nabla_H (u_t) + \frac{\mu\delta^2}{2} \Delta u_t^3 + \frac{\delta^2}{2} \left( u_t^3 + \nabla_H u_t + b_{ab} u_t^3 \right) F_{ab}^1, \quad u_t^3 = -\gamma_0 (u_t), \]
\[ \mu \delta u_t^3 = \frac{\mu\delta^2}{2} \left( [u_t^3 + a_{ab} \nabla_H u_t + b_{ab} u_t^3] (k+1) + [u_t^3 + a_{ab} \nabla_H u_t + b_{ab} u_t^3] (k-1) \right), \]
\[ + \frac{\delta^2}{2} \left( u_t^3 + \nabla_H u_t + b_{ab} u_t^3 \right) + a_{ab} F_{ab}^1, \]
The variational formulations corresponding to (5.7) and (5.1) are given respectively by

\[
\begin{align*}
\delta A_0((u_0, u^0_0), (v_0, v^0_0)) &+ \delta b((u_0, u_0), (v_0, v_0)) + \delta \alpha_0 \left( p_0, \tilde{\text{div}} v_0 \right) \\
-2 \mu \delta \tau (\beta_0(u_0), v_0^0) &+ \delta b((u_0, u_0), (v_0, v_0)) - \tau \delta (2Hp_0, v_0^0) \\
&= \alpha_0 \left( F^0_0, v_0^0 \right) - \delta (u_0^0 u_0^0, a_{\alpha\beta} v_0^0) + \tau \left( \delta \text{div} u_i + F^0_3, v_0^0 \right), \quad \forall (v_0, v_0^0) \in V(D) \times H^1_0(D),
\end{align*}
\] 

(5.12)

and

\[
\begin{align*}
\delta \mu \left( \tilde{\nabla} p_0, \tilde{\nabla} q \right) &= -\mu \delta \left( \text{div}(2Hu_0) - 2Ku_0^0 - 4H \gamma_0(u_0) \right) + a_{\alpha\beta} \delta \left( F_{\beta}^1, q \right), \quad \forall q \in H^1_0(D),
\end{align*}
\] 

(5.12')

where the bilinear forms and linear form are defined by

\[
\begin{align*}
A_{\alpha}(u_0, v_0) &= \alpha_0 \left( \tilde{\nabla} u_0^\alpha, \tilde{\nabla} v_0^\alpha \right) + 2 \mu \tau \delta \left( \tilde{\nabla} u_0^\alpha, \tilde{\nabla} v_0^\alpha \right), \\
b(u_0, u_0, v_0) &= \alpha_0 \left( a_{\alpha\beta} u_0^\alpha \tilde{\nabla} u_0^\beta - 2 a_{\alpha\beta} a_{\alpha\beta} u_0^\alpha v_0^\alpha \right), \\
b_0(u_0, v_0) &= \tau \left( u_0^\alpha \tilde{\nabla} u_0^\beta + b_{\alpha\beta} u_0^\alpha u_0^\alpha v_0^\alpha \right).
\end{align*}
\] 

(5.13)

(III) For \( i = N \) i.e. a last artificial interface \( \mathcal{I} \). There are two choices to do that (1) assume that \( u = u_\infty \) on \( \mathcal{I} \) where \( u_\infty \) is known infinity upstream flow velocity. (2) we assume that the flow outside \( \mathcal{I} \) is governed by Oseen equation and give a boundary integrating equation on \( \mathcal{I} \) via fundamental solution of Oseen equations.

(1) Let \((x, y, z)\) is Cartesian coordinate and \( u_\infty = u_\infty k \) where \((i, j, k)\) are base vectors. The surface \( \mathcal{I} \) can be parametrization by \( r = x(x^1, x^2) i + y(x^1, x^2) j + z(x^1, x^2) k \) where \( x^\alpha \) are parameters, i.e. are Gaussian coordinate on \( \mathcal{I} \). Then base vectors \( e_\alpha \) and unit normal vector \( n \) in semi-coordinate on \( \mathcal{I} \) are given by

\[
\begin{align*}
e_\alpha &= x_i i + y_j j + z_k k, \\
n &= \frac{1}{\sqrt{a}} (e_i \times e_j) = \frac{1}{\sqrt{a}} \left[ (y_j z_k - z_j y_k) i + (z_i x_k - z_k x_i) j + (x_i y_j - y_j x_i) k \right] 
\end{align*}
\] 

(5.14)

while the metric tensor \( a_{\alpha\beta} \) and curvature tensor \( b_{\alpha\beta} \) are given

\[
\begin{align*}
a_{\alpha\beta} &= x_\alpha x_\beta + y_\alpha y_\beta + z_\alpha z_\beta, & a = \det(a_{\alpha\beta}), \\
b_{\alpha\beta} &= \frac{1}{\sqrt{a}} \begin{bmatrix} x_\alpha & y_\alpha & z_\alpha \\ x_\beta & y_\beta & z_\beta \end{bmatrix}, & c_{\alpha\beta} = a^{\alpha\beta} b_{\alpha\beta} b_{\beta\gamma},
\end{align*}
\] 

(5.15)

where \( x_\alpha = \frac{\partial x}{\partial x_\alpha}, x_\beta = \frac{\partial x}{\partial x_\beta} \). Our aim is to give boundary conditions on \( \mathcal{I} \). Owing to (4.12) we claim

\[
\begin{align*}
h^\alpha &= \mu \left( \frac{\partial u_\infty^\alpha}{\partial \xi} \right)_z, \\
h^\beta &= -p \left( \frac{\partial u_\infty^\beta}{\partial \xi} \right)_z = \frac{3}{2} u_\infty \text{grad} \frac{1}{r} + 2 \mu \left( \frac{\partial u_\infty^\beta}{\partial \xi} \right)_z, \\
\end{align*}
\]
On other hand, we show

\[
\begin{align*}
&\left. \frac{\partial u^\alpha}{\partial z} \right|_{z=0} = 2b^{\alpha\beta} z_\beta u^\alpha, \quad \left. \frac{\partial u^\alpha}{\partial \xi} \right|_{\xi=0} = 0, \\
&\left. u^\alpha \right|_{z=0} = a^{\alpha\beta} u_\xi \beta = a^{\alpha\beta} u_\xi \beta = a^{\alpha\beta} z_\beta u^\alpha, \\
&\left. u^\alpha \right|_{z=0} = u^\alpha kn = \frac{u^\alpha}{\sqrt{a}} (x_1 y_2 - y_1 x_2).
\end{align*}
\]

Indeed,

\[
\begin{align*}
&u^\alpha = g^{\alpha\beta} u_\xi \beta = g^{\alpha\beta} k \cdot e_\rho u^\rho = g^{\alpha\beta} z_\beta u^\alpha, \\
&\left. \frac{\partial g^{\alpha\beta}}{\partial \xi} \right|_{\xi=0} = 2b^{\alpha\beta} (\text{see (1.8.23) in [1]}), \quad \left. \frac{\partial u^\alpha}{\partial \xi} \right|_{\xi=0} = \frac{\partial g^{\alpha\beta}}{\partial \xi} z_\beta u^\alpha = 2b^{\alpha\beta} x_\beta u^\alpha, \\
&u^3 = u_\xi kn = \frac{u_\xi}{\sqrt{a}} (x_1 y_2 - y_1 x_2), \quad \frac{\partial u^3}{\partial \xi} \bigg|_{\xi=0} = \frac{\partial u^3}{\partial \xi} = 0.
\end{align*}
\]

Finally we imply

\[
h^\alpha (N) = \mu u_\xi \left( a^{\alpha\beta} \partial_\beta \left( \frac{x_1 y_2 - y_1 x_2}{\sqrt{a}} \right) + b^{\alpha\beta} z_\beta \right), \quad h^\alpha (N) = \frac{3}{2} u_\xi \text{grad} \frac{1}{r} = -\frac{3}{2} u_\xi \frac{z(x^\alpha)}{r} \quad (5.16)
\]

where \( \mathbf{r} = \mathbf{r}\left(x^\alpha\right) \) is describing \( \mathfrak{X}_N \). (5.16) will be used for solving BLE I on \( \mathfrak{X}_{N-1} \) with \( \mathbf{h}_N \).

(2). Let assume that the flow outside of \( \mathfrak{X}_N \) is governed by Oseen equation

\[
\begin{align*}
-\Delta u + b \cdot \nabla u + \nabla p &= f, \quad \text{in } \hat{\Omega}, \\
\text{div} u &= 0, \quad \text{in } \Omega, \\
\left. u^\alpha \right|_{\hat{\Gamma}_m} &= \left. u^\alpha \right|_{\partial \Omega}, \quad \sigma (u, p) \big|_{\hat{\Gamma}_m} = \sigma (u, p) \big|_{\partial \Omega} \quad \text{on } \mathfrak{X}_m, \\
\text{u_{x_{\xi}}} \text{ is known and } \mathbf{b} \text{ is a well known vector, for example } \mathbf{b} = \mathbf{u}_{x_{\xi}}, \text{ and } \hat{\Omega}_m = \hat{\Omega} \cup \bigcup_{\xi=1}^{m} \mathfrak{X}_{m, \xi}, \text{ and } \mathbf{u}_{x_m}, \mathbf{u}_1 \text{ are solutions of 2D-3C Navier-Stokes equations on the } \mathfrak{X}_{m-1}. \text{ Furthermore, } \sigma (u, p) \big|_{\hat{\Gamma}_m} = \mathbf{h} \text{ is normal stress tensor to be found in the section. Let } \mathbf{x} \text{ be a Cartesian coordinate. } \mathcal{U}_i, \mathcal{P}_k \text{ are fundamental solutions of the following equations}
\end{align*}
\]

\[
\begin{align*}
-\nu \mathcal{U}_i (x-y) + \frac{\partial \mathcal{P}_k}{\partial y_i} (x-y) + b \cdot \nabla \mathcal{U}_i (x-y) &= -\partial_{x_i} \Phi (x-y) \\
\frac{\partial \mathcal{U}_i}{\partial y_i} (x-y) &= 0.
\end{align*}
\]

\[
\begin{align*}
(\mathcal{U}_i, \mathcal{P}_k) \text{ can be expressed as}
\end{align*}
\]

\[
\nu \mathcal{U}_i (x-y) = \frac{\partial \mathcal{P}_k}{\partial y_i} (x-y) = -\partial_{x_i} \left( \Lambda + \mathbf{b} \cdot \nabla \right) \Phi (x-y) \quad (5.18)
\]

where \( \Phi \) is a fundamental solution of following equation

\[
\begin{align*}
(\Lambda + \mathbf{u}_{x_{\xi}} \cdot \nabla) \Phi = \delta (x-y), \quad \Phi (x-y) &= -\frac{1}{|\mathbf{b}|} \left[ \frac{b(x-y)}{|\mathbf{b}|} \right] \left[ \Phi_2 - \Phi_1 \right] dt \quad (5.20)
\end{align*}
\]

where for \( \mathbf{b} \neq 0 \)
\( \Phi_1(x - y) = \frac{1}{2\pi} \left( \frac{|b|}{4\pi |x - y|} \right)^{n-2} K_{n-2}^2 \left( \frac{|b||x - y|}{2} \right) \exp\left( -\frac{1}{2} b \cdot (x - y) \right), \quad n \geq 3 \)

\[
\Phi_2(x - y) = \begin{cases} 
\frac{\Gamma \left( \frac{n}{2} \right)}{2\pi^{n/2}} (n - 2) |x - y|^{n-2}, & n \geq 3, \\
\frac{1}{2\pi} \ln |x - y|, & n = 2,
\end{cases}
\]

where \( K_n \) is a Bessel function of second kind.

Then integral expressions of solutions of Oseen problem (5.9) are given by

\[
\begin{align*}
\eta(y)u(y) &= u_{\infty} - \int_{r_{\infty}} \left[ \mathcal{U} \cdot \sigma (u, p) - u \cdot \sigma (\mathcal{U}, P) \right] ds, \\
\eta(y) \rho(y) &= p_{\infty} - \int_{r_{\infty}} \left[ \mathcal{P} \cdot \sigma (u, p) - u \cdot \sigma (\mathcal{U}, P) \right] ds,
\end{align*}
\]

(5.22)

where \( \sigma \) is stress tensor

\[
\sigma_{ij}(u, p) = \left\{ \begin{array}{ll}
\delta_{ij} \rho + \mu \left( \partial_i u^j + \partial_j u^i \right), & x \in \text{Oseen Domain}; \\
\eta(x) = \left\{ \begin{array}{ll}
1, & x \in \text{Artificial Surface}.
\end{array} \right.
\end{array} \right.
\]

Here we employ Cartesian coordinate system \((x = (x^1, x^2, x^3))\) and artificial surface \(\Gamma_{\text{art}} = \mathcal{S}_{m} \) is a two dimensional manifold. The integrate representation (5.17) of the solution of Oseen problem is invariant, it is valid for any curvature coordinate. Since formula for fundamental solution \(\mathcal{K}_{\mathcal{S}}\) is represent at Cartesian coordinate. It also can be compute at any curvature coordinate according transformation rule of tensor of one order.

Vector \( \lambda \) in (5.17) is normal stress tensor at \(\mathcal{S} \). \( \lambda(u, p) = \{ \sigma_{ij}(u, p) n^i, i = 1, 2, 3 \} \) The normal stress tensor \( \lambda \) at \(\mathcal{S}_{m} \) is continuous \( \lambda|_{\mathcal{S}_{m} - \mathcal{S}_{m}} = \lambda|_{\mathcal{S}_{m}} = h \). This means that \( \lambda \) on both sides of \(\mathcal{S}_{m} \) are coincidental.

Normal stress tensor \( h \) on the artificial boundary \(\mathcal{S}_{m} \) satisfies following equation

\[
\begin{align*}
2c(h, \chi) - \{u, \chi\} + 2 \{Ku, \chi\} &= 0, \quad \forall \chi \in H^{-1/2}(\mathcal{S}_{m}), \\
2c(h, \chi) &= \int_{\mathcal{S}_{m}} h \mathcal{U} \chi ds + \int_{\mathcal{S}_{m}} \mathcal{K} \chi ds,
\end{align*}
\]

(5.23)

(5.23) can be rewrite in semi-geodesic coordinate based on \(\mathcal{S}_{m-1} \):

\[
\begin{align*}
2c(h, \chi) - \{u, \chi\} + 2 \{Ku, \chi\} &= 0, \quad \forall \chi \in H^{-1/2}(\mathcal{S}_{m})^l, \\
c(h, \chi) &= \int_{DD} \tilde{U}_y u^i \chi^j \sqrt{\text{ad}x}, \quad \{u, \chi\} = \int_{\mathcal{S}_{m}} a_{ij} u^i \chi^j + u^i \chi^i \sqrt{\text{ad}x},
\end{align*}
\]

(5.24)

where, \((x^i, x^j = \xi)\) is semi-geodesic coordinate. By the transformation of coordinate, \(\tilde{U}_y = \mathcal{U}_y \frac{\partial X^i}{\partial x^j} \frac{\partial X^j}{\partial x^i}\) where \(X^i \) are Cartesian coordinate and \(X^i = X^i(x)\) is the parametrization representation of the surface \(\mathcal{S}_{m-1} \).
Lemma 5 The bilinear form \( c(\cdot, \cdot) \) defined by (5.23) is symmetric, continuous and coercive from \( \mathbb{H}^{1/2}(\mathcal{M}) \times \mathbb{H}^{1/2}(\mathcal{M}) \) into \( \mathbb{R}^3 \):

\[
\begin{align*}
& c(X_1, X_2) = c(X_2, X_1), \quad \forall X_1, X_2 \in \mathbb{H}^{1/2}(\mathcal{M}), \\
& |c(X_1, X_2)| \leq C \|X_1\|_{1/2, \mathcal{M}} \|X_2\|_{1/2, \mathcal{M}}, \quad \forall X_1, X_2 \in \mathbb{H}^{1/2}(\mathcal{M}), \\
& |c(X_1, X_1)| \geq C \|X_1\|_{1/2, \mathcal{M}}^2, \quad \forall X_1 \in \mathbb{H}^{1/2}(\mathcal{M}).
\end{align*}
\]

Theorem 4 Assume that \( u_0, p_0 \) are smooth and bounded in \( \mathbb{H}_p^1(D) \) Then there exists a unique solution of following variational problem

\[
\begin{aligned}
& \text{Find } h \in \mathbb{H}^{1/2}(D) \text{ such that } \\
& c(h, X) = \frac{1}{2} (u_0, X) - (Ku_0, X), \quad \forall X \in \mathbb{H}^{1/2}(\mathcal{M}),
\end{aligned}
\]

(5.25)

Parallel algorithms. The domain is made partition by \( m \) interfaces surfaces and we obtain \( m + 1 \) the systems of BLE I and SLE II. Solving each BLE I and SLE II independently, then applying alternatively iterative algorithm are performance at the same time. On the other hand, the parallel algorithms for BLE I and SLE II can be used. Therefore, parallel algorithms are applied in two direction at the same time.

6. Computation of the Drag

The drag is a force exerted on a solid boundary surface, for example, \( \mathcal{M}_0 \). There is normal stress on \( \mathcal{M}_0 \) which can expressed under semi-geodesic coordinate based on \( \mathcal{M} \) by

\[
\int_{\mathcal{M}_0} \sigma^{ij}(u, p) n_i j \sqrt{g} dx
\]

The drag is a projection of normal stress on the direction of infinite stream flow \( u_\infty = u_{\infty k} \). Hence

\[
F_j = \int_{\mathcal{M}_0} \sigma^{ij}(u, p) n_i k_j \sqrt{g} dx
\]

(6.1)

Since unit normal vector at \( \mathcal{M}_0 \) is \( n = (0, 0, 1) \) and by (5.1)

\[
k_a = k e_a = z_a, \quad k_1 = k n = \frac{x_1 y_2 - y_1 x_2}{\sqrt{g}}
\]

(6.2)

Therefore

\[
\sigma^{ij}(u, p) n_i k_j = \sigma^{3a}(u, p) z_a + \sigma^{33}(u, p) \frac{x_1 y_2 - y_1 x_2}{\sqrt{g}}
\]

As well known that the stress tensor is given by

\[
\sigma^{ij}(u, p) = -p g^{ij} + 2 \mu g^{ij} e_{3m}(u)
\]

At surface \( \mathcal{M}_0 \)

\[
\sigma^{33}(u, p)|_{\mathcal{M}_0} = -p_0 + 2 \mu e_{31}(u)|_{\mathcal{M}_0} = -p_0 + 2 \mu \frac{i u_3}{\sqrt{g}}|_{i=0} = -p_0 + 2 \mu i = -p_0
\]

\[
\sigma^{3a}(u, p)|_{\mathcal{M}_0} = 2 \mu a_{3i} g^{ij} e_{3j}(u_0)
\]

Since

\[
e_{3i}(u) = \frac{1}{2} \left( g_{3i}^m \nabla_i u^m + g_{3m} \nabla_i u^3 \right) = \frac{1}{2} \left( g_{3i}^m \frac{\partial u^3}{\partial \xi^m} + \Theta^3 \tilde{I}_1 u^3 + \nabla_i u^3 + J_{3i} u^3 \right)
\]

\[
= \frac{1}{2} \left( g_{3i}^m \frac{\partial u^3}{\partial \xi^m} + \nabla_i u^3 \right) + \frac{1}{2} \left( \Theta^3 g_{3i}^m \tilde{I}_1 + J_{3i} \right) u^3 = \frac{1}{2} \left( g_{3i}^m \frac{\partial u^3}{\partial \xi^m} + \nabla_i u^3 \right),
\]

because of
\[ \theta^{-1} g_{\mu\nu} F^\mu_{\nu} + J_{\mu\nu} = 0, \quad \text{see Lemma 1.8.1 (Li[1])}, \]
\[ u_\mu\big|_{\partial_0} = 0, \quad u^\mu_\big|_{\partial_0} = 0, \quad e_{\mu\rho}(u)\big|_{\partial_0} = \frac{1}{2} a_{\mu\rho} u^\rho, \]
\[ \sigma^{\mu\nu}(u, p)\big|_{\partial_0} = \mu u^\mu. \]

Hence
\[ F_d = \int_{\partial_0} \left(-p_0 \frac{x_2 y_2 - x_1 y_1}{\sqrt{a}} + \mu u^\alpha z_\alpha \right) \sqrt{\alpha} d\alpha \] (6.3)

The drag is a force exerted on a solid boundary surface, for example, \( \mathcal{S}_0 \). There is normal stress on \( \mathcal{S}_0 \) which can be expressed under semi-geodesic coordinate based on \( \mathcal{S}_0 \) by \( \sigma^\mu(u, p)n_\sqrt{\alpha} d\alpha \). The drag is a projection of normal stress on the direction of infinite stream flow \( u_\mu = u_\mu k \). Hence
\[ F_d = \int_{\partial_0} \sigma^\mu(u, p)n_\sqrt{\alpha} d\alpha = \int_{\partial_0} \left(-p_0 \frac{X Y_2 - X_1 Y_1}{\sqrt{a}} + \mu u^\alpha Z_\alpha \right) \sqrt{\alpha} d\alpha \] (6.4)

where \( X(x), Y(x), Z(x) \) are parameter representation of \( \mathcal{S}_0 \).

7. Examples
7.1. The Flow around a Sphere

Assume that \((x, y, z)\) and \((x^3 = r, x^2 = \varphi, x^1 = \theta)\) are Cartesian and spherical coordinates respectively
\[ x = r \sin \vartheta \cos \varphi, \quad y = r \sin \vartheta \sin \varphi, \quad z = r \cos \vartheta, \quad \left(g_{\varphi}\right) = \begin{pmatrix} 1 & 0 & 0 \\ 0 & r^2 \sin^2 \vartheta & 0 \\ 0 & 0 & r^2 \end{pmatrix} \]

Simple calculations show that the metric tensor of spherical surface \( r = \text{const.} \) is given
\[ \begin{cases} a_{11} = r^2, & a_{12} = a_{21} = 0, \quad a_{22} = r^2 \sin^2 \vartheta, \quad a = \det a_{\varphi\varphi} = r^4 \sin^2 \vartheta, \\ a^{11} = r^{-2}, & a^{12} = a^{21} = 0, \quad a^{22} = \frac{1}{r^2 \sin^2 \vartheta}, \end{cases} \] (7.1)

The tensor of second fundamental form, i.e. curvature tensor of spherical surface is given by
\[ \begin{cases} h_{11} = r, & b_{22} = r \sin^2 \vartheta, \quad h_{12} = 0, \quad b_{12} = \frac{1}{r \sin \vartheta}, \quad b^{11} = \frac{1}{r^3}, \quad b^{12} = 0, \\ b_{1} = b_{2} = \frac{1}{r}, \quad b_{1} = b_{2} = 0, \quad b = \det(b_{\varphi\varphi}) = r^2 \sin^2 \vartheta, \end{cases} \] (7.2)

the base vectors of semi-geophysical coordinate system are given
\[ e_1 = r \cos \vartheta, e_2 = r \sin \vartheta, e_3 = k, \]
\[ n = \frac{r}{r}, \]

We remainder have to give the covariant derivatives of the velocity field, Laplace-Betrami operator and trace-Laplace operator. To do this we have to give the first and second kind of Christoffel symbols on the spherical surface \( \mathcal{S} \) as a two dimensional manifolds.
Then covariant derivatives of vector $\mathbf{u} = u^e \mathbf{e}_e + u^\mathbf{n} \mathbf{n}$ on the two dimensional manifold $\mathcal{M}$ is given by

$$\nabla_i \mathbf{u}^j = \partial_i \mathbf{u}^j + \Gamma^j_{ik} \mathbf{u}^k,$$

div $\mathbf{u} = \nabla_i \mathbf{u}^i = \partial_i \mathbf{u}^i + \partial_j \mathbf{u}^j + \cot \theta u^i,$

$$\mathbf{a}^j \nabla_k \mathbf{a}^k \mathbf{u}^i = \frac{1}{r^2} \left( \frac{\partial^2 u^i}{\partial \theta^2} + \frac{\partial^2 u^i}{\partial \phi \partial \theta} \right) \cot \theta - \frac{1}{\sin^2 \theta} u^i,$$

Nonlinear terms

$$u^i \nabla_i u^j - u^i \partial_i \mathbf{u}^j = u^i \left( \frac{\partial^2 u^j}{\partial \theta^2} + \frac{\partial^2 u^j}{\partial \phi \partial \theta} \right) - \frac{1}{2} \sin 2\theta u^j - \cot \theta u^i u^j, u^i \nabla_i u^j - u^i \partial_i \mathbf{u}^j = u^i \left( \frac{\partial^2 u^j}{\partial \theta^2} + \frac{\partial^2 u^j}{\partial \phi \partial \theta} \right) + \cot \theta u^i u^j,$$

and

$$Q_{11} = 2 \mu \left( \frac{1}{8} \delta r^2 + \frac{2r \delta^3}{2} + \frac{5 \delta^3}{3} \right), \quad Q_{22} = Q_{11} \sin^2 \theta, \quad Q_{22} = 0, M_0 (\mathbf{u}_1) = \frac{\mu \delta^3}{2} \left( \partial_i \mathbf{u}_1^i + \cot \theta \mathbf{u}_1^i \right)$$

The associated Laplace-Betrami operator and divergence operator on $\mathcal{M}$ are given by

$$\Delta p_o = \frac{1}{r^2 \sin \theta} \left[ \sin^2 \theta \left( \frac{\partial^2 p_o}{\partial \theta^2} + \frac{\partial^2 p_o}{\partial \phi \partial \theta} \right) + \cot \theta \frac{\partial p_o}{\partial \phi} \right]$$

while trace-Laplace operator on $\mathcal{M}$

$$\Delta u^i = \frac{1}{r^2} \frac{\partial^2 u^i}{\partial \theta^2} + \frac{1}{r^2} \sin^2 \theta \left( \frac{\partial^2 u^i}{\partial \theta^2} + \frac{\partial^2 u^i}{\partial \phi \partial \theta} \right) + \cot \theta \frac{\partial u^i}{\partial \phi} - \frac{2 \cot \theta \frac{\partial u^i}{\partial \theta}}{r^2} - \frac{\cot^2 \theta}{r^2} u^i,$$

$$\Delta u^2 = \frac{1}{r^2} \frac{\partial^2 u^2}{\partial \phi \partial \theta} + \frac{1}{r^2} \sin^2 \theta \left( \frac{\partial^2 u^2}{\partial \phi \partial \theta} + \frac{\partial^2 u^2}{\partial \phi \partial \phi} \right) + \cot \theta \frac{\partial u^2}{\partial \phi} + \frac{3 \cot \theta \frac{\partial u^2}{\partial \theta}}{r^2} - \frac{\sin^2 \theta \frac{\partial u^2}{\partial \phi}}{r^2} - \frac{u^2}{r^2},$$

(A) BLE I

Substituting previous formula into Theorem 1 we assert that

$$- \mu \delta^3 \left[ \frac{2}{r^2} \left( \frac{\partial^2 u^1}{\partial \theta^2} + \frac{\partial^2 u^1}{\partial \phi \partial \theta} \right) + \frac{1}{r^2 \sin \theta} \left( \frac{\partial^2 u^1}{\partial \theta^2} + \frac{\partial^2 u^1}{\partial \phi \partial \theta} \right) + \frac{2 \cot \theta}{r^2} \frac{\partial u^1}{\partial \phi} - \frac{2 \cot^2 \theta}{r^2} u^1 \right] + \mu \left( \delta^3 \frac{\partial}{\partial \theta} - \frac{4 \delta^3}{2} + \frac{6 \delta^3}{3} \right) u^1_i + \frac{1}{r} \psi \left[ \frac{\partial u^1}{\partial \phi} - \frac{1}{2} \sin 2\theta u^1_i - \cot \theta u^1_i \right] = \frac{1}{r} \psi F^1_i - \frac{\delta^3}{3} \frac{1}{r^2} \frac{\partial u^1_i}{\partial \theta} + \mathcal{L}^2 \left( \mathbf{u}_2 \right),$$

$$- \mu \delta^3 \left[ \frac{1}{r^2} \frac{\partial^2 u^2}{\partial \phi \partial \theta} + \frac{1}{r^2} \sin^2 \theta \frac{\partial^2 u^2}{\partial \phi \partial \theta} + \cot \theta \frac{\partial u^2}{\partial \phi} + \frac{3 \cot \theta \frac{\partial u^2}{\partial \theta}}{r^2} - \frac{\sin^2 \theta \frac{\partial u^2}{\partial \phi}}{r^2} - \frac{u^2}{r^2} \right] + \mu \left( \delta^3 \frac{\partial}{\partial \theta} - \frac{4 \delta^3}{2} + \frac{6 \delta^3}{3} \right) u^2_i + \frac{1}{r} \psi \left[ \frac{1}{2} \sin 2\theta u^2_i - \cot \theta u^2_i \right] = \frac{1}{r} \psi F^2_i - \frac{\delta^3}{3} \frac{1}{r^2} \frac{\partial u^2_i}{\partial \theta} + \mathcal{L}^2 \left( \mathbf{u}_2 \right),$$

$$- \frac{\delta^3}{3} \left( \frac{1}{r^2} \frac{\partial^2 p_o}{\partial \phi \partial \theta} + \frac{1}{r^2} \sin^2 \theta \frac{\partial^2 p_o}{\partial \phi \partial \theta} + \cot \theta \frac{\partial p_o}{\partial \phi} + \frac{2 \mu \delta^3}{2} \left( \frac{\partial u^1_i}{\partial \phi} + \frac{\partial u^2_i}{\partial \phi} \right) + \cot \theta u^1_i \right) = F^1_i,$$
In particular, if the flow is axial symmetric then

\[
\frac{2\mu\delta^3}{3} \left[ \frac{2}{r^2} \partial^2 u_i + \frac{2}{r^2} \cot\theta \partial \frac{\partial u_i}{\partial \theta} - \frac{2}{r^2} \cot^2 \theta \frac{\partial u_i}{\partial \theta} \right] + \frac{\mu}{2} \left( \delta - \frac{4}{r^2} \frac{\delta^2}{3} \right) u_i + \frac{1}{r} \left( \frac{3}{2} \delta^2 - \frac{4}{r^2} \right) \frac{\partial u_i}{\partial \theta} - \frac{1}{4} \left( \frac{1}{2} \sin 2\theta \frac{\partial^2 u_i}{\partial \theta^2} + \cot \theta \frac{\partial u_i}{\partial \theta} \right) \\
= \frac{1}{r^2} F_i^1 + \frac{\delta^3}{3} \frac{\partial p_0}{\partial \theta} + \mathcal{F}_1^{-1}(u_2),
\]

\[
-\frac{2\mu\delta^3}{3} \left[ \frac{1}{r^2} \partial^2 u_i - \frac{1}{r^2} \cot \theta \frac{\partial u_i}{\partial \theta} \right] + \frac{\mu}{2} \left( \delta - \frac{4}{r^2} \frac{\delta^2}{3} \right) u_i + \frac{\mu}{2} \left( \frac{3}{2} \frac{\partial^2 u_i}{\partial \theta^2} \right) \\
= \frac{1}{r^2} F_i^2 + \frac{1}{r^2} \frac{\partial p_0}{\partial \theta} + \mathcal{F}_2^{-1}(u_2),
\]

where

\[
\mathcal{F}_1^{-1}(u_2) = \frac{1}{r^2} \left( \frac{3}{2} \frac{\delta^3}{2} - \frac{1}{2} \right) F_i^1 + \frac{\mu}{2} \left( \frac{3}{2} \frac{\delta^3}{2} \right) \frac{\partial u_i}{\partial \theta} + \frac{5\mu}{3} \delta^3 \partial \frac{\partial u_i}{\partial \theta} + \frac{\delta^3}{2} \partial \frac{\partial u_i}{\partial \theta} + \frac{5\mu}{3} \delta^3 \partial \frac{\partial u_i}{\partial \theta} + \frac{\delta^3}{2} \partial \frac{\partial u_i}{\partial \theta},
\]

\[
\mathcal{F}_2^{-1}(u_2) = \frac{1}{r^2} \left( \frac{3}{2} \frac{\delta^3}{2} - \frac{1}{2} \right) F_i^2 + \frac{\mu}{2} \left( \frac{3}{2} \frac{\delta^3}{2} \right) \frac{\partial u_i}{\partial \theta} + \frac{5\mu}{3} \delta^3 \partial \frac{\partial u_i}{\partial \theta} + \frac{\delta^3}{2} \partial \frac{\partial u_i}{\partial \theta} + \frac{5\mu}{3} \delta^3 \partial \frac{\partial u_i}{\partial \theta} + \frac{\delta^3}{2} \partial \frac{\partial u_i}{\partial \theta},
\]

(5.7) is a two points boundary value problem for ordinary differential equations.

\[
\begin{align*}
\mu \delta^3 - v_i (u_i + r^2 \sin^2 \theta \partial u_i / \partial \theta) \rho_0 + \mu \delta^3 \partial \partial u_i / \partial \theta + \mu \delta^3 \partial \partial u_i / \partial \theta = F_i^1, \\
\mu \delta^3 - v_i (u_i + r^2 \sin^2 \theta \partial u_i / \partial \theta) \rho_0 + \mu \delta^3 \partial \partial u_i / \partial \theta + \mu \delta^3 \partial \partial u_i / \partial \theta = F_i^2,
\end{align*}
\]

(B) SLE II

The first, we note
\[
\begin{align*}
\mathbf{e}_1(u) &= r^2 \frac{\partial u^1}{\partial \theta}, \\
\mathbf{e}_2(u) &= \frac{1}{2} r^2 \left( \frac{\partial u^1}{\partial \phi} + \sin \theta \frac{\partial u^2}{\partial \theta} \right), \\
\mathbf{e}_{22}(u) &= r^2 \sin \theta \frac{\partial u^2}{\partial \phi} + r^2 \cos \theta u^1, \\
\gamma_1(u) &= r^2 \frac{\partial u^1}{\partial \theta} - ru^1_0, \\
\gamma_2(u) &= \gamma_{21}(u) = \frac{1}{2} r^2 \left( \frac{\partial u^1}{\partial \phi} + \sin \theta \frac{\partial u^2}{\partial \theta} \right), \\
\gamma_{22}(u) &= r^2 \sin \theta \frac{\partial u^2}{\partial \phi} + r^2 \cos \theta u^1 - u^1_0 \sin^2 \theta, \\
\end{align*}
\]

So that

\[
\begin{align*}
\mathbf{b}^{\alpha\beta}_\alpha(u_0) &= r \left( \frac{\partial u^1_0}{\partial \theta} + \frac{\partial u^2_0}{\partial \phi} \right) + \frac{\cot \theta}{\sin \theta} u^1_0 + \frac{2}{r^2} u^3_0, \\
\gamma_0(u_0) &= a^{\alpha\beta} \gamma_\alpha(u_0) = \frac{\partial u^1_0}{\partial \theta} + \frac{1}{\sin \theta \theta} \frac{\partial u^2_0}{\partial \phi} + \frac{\cot \theta}{\sin \theta} u^1_0 - \frac{2}{r} u^3_0, \\
\gamma_3(u_0, u_0) &= u^1_0 \frac{\partial u^1_0}{\partial \theta} + u^2_0 \frac{\partial u^2_0}{\partial \phi} + ru^1_0 + r \sin^2 \theta u^2_0. \\
\end{align*}
\]

Taking (5.7) into account, we claim that

\[
\begin{align*}
- \mu \delta \left[ \frac{2}{r^2} \left( \frac{\partial^2 u^1_0}{\partial \theta^2} + \frac{\partial^2 u^2_0}{\partial \phi^2} \right) + \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^1_0}{\partial \phi^2} + \frac{2 \cot \theta}{\sin \theta} \frac{\partial u^1_0}{\partial \phi} \right] - 2 \mu \delta \left( \frac{\partial u^1_0}{\partial \phi} \right) - \frac{2}{r^2} \frac{\partial u^1_0}{\partial \phi} \\
- \mu \delta \left[ \frac{1}{r^2} \frac{\partial^2 u^2_0}{\partial \phi^2} - \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial u^2_0}{\partial \phi} \right] + \frac{3 \cot \theta}{\sin \theta} \frac{\partial u^2_0}{\partial \phi} + \frac{1}{r} \sin^2 \theta \epsilon_{\alpha\beta} u^3_0 \\
- \frac{1}{r} \sin^2 \theta \frac{\partial p_0}{\partial \phi} + \frac{\partial}{\partial \phi} \left( u^1_0 \frac{\partial u^1_0}{\partial \phi} - u^2_0 \frac{\partial u^2_0}{\partial \phi} + \cot \theta u^1_0 u^2_0 + u^3_0 u^3_0 \right) = \frac{1}{r^2} \sin^2 \theta F^0_1, \\
- 2 \mu \delta \left[ \frac{1}{r^2} \frac{\partial^2 u^1_0}{\partial \theta^2} + \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial u^1_0}{\partial \phi} \right] - \frac{2}{r^2} \frac{\partial u^1_0}{\partial \phi} \\
+ \frac{1}{r^2} \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial u^2_0}{\partial \phi} \right] - 2 \mu \delta \left( \frac{\partial u^1_0}{\partial \phi} \right) + \frac{2}{r^2} \frac{\partial u^1_0}{\partial \phi} \\
- \frac{1}{2} \frac{\partial^2 p_0}{\partial \theta^2} + \frac{1}{r} \sin^2 \theta \frac{\partial^2 p_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial p_0}{\partial \phi} \right] - \frac{2}{r} p_0 = 2 \mu \delta \left( \partial \phi u^1_0 + \partial \phi u^2_0 + \cot \theta u^1_0 \right) + F^1_1, \\
- \frac{1}{2} \frac{\partial^2 p_0}{\partial \theta^2} + \frac{1}{r} \sin^2 \theta \frac{\partial^2 p_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial p_0}{\partial \phi} \right] = -2 \mu \delta \left( \partial \phi u^1_0 + \partial \phi u^2_0 + \cot \theta u^1_0 \right) + F^1_1.
\end{align*}
\]

Taking (7.10) into account, we claim that

\[
\begin{align*}
- \mu \delta \left[ \frac{2}{r^2} \left( \frac{\partial^2 u^1_0}{\partial \theta^2} + \frac{\partial^2 u^2_0}{\partial \phi^2} \right) + \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^1_0}{\partial \phi^2} + \frac{2 \cot \theta}{\sin \theta} \frac{\partial u^1_0}{\partial \phi} \right] - 2 \mu \delta \left( \frac{\partial u^1_0}{\partial \phi} \right) - \frac{2}{r^2} \frac{\partial u^1_0}{\partial \phi} \\
- \mu \delta \left[ \frac{1}{r^2} \frac{\partial^2 u^2_0}{\partial \phi^2} - \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial u^2_0}{\partial \phi} \right] + \frac{3 \cot \theta}{\sin \theta} \frac{\partial u^2_0}{\partial \phi} + \frac{1}{r} \sin^2 \theta \epsilon_{\alpha\beta} u^3_0 \\
- \frac{1}{r} \sin^2 \theta \frac{\partial p_0}{\partial \phi} + \frac{\partial}{\partial \phi} \left( u^1_0 \frac{\partial u^1_0}{\partial \phi} - u^2_0 \frac{\partial u^2_0}{\partial \phi} + \cot \theta u^1_0 u^2_0 + u^3_0 u^3_0 \right) = \frac{1}{r^2} \sin^2 \theta F^0_1, \\
- 2 \mu \delta \left[ \frac{1}{r^2} \frac{\partial^2 u^1_0}{\partial \theta^2} + \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial u^1_0}{\partial \phi} \right] - \frac{2}{r^2} \frac{\partial u^1_0}{\partial \phi} \\
+ \frac{1}{r^2} \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{1}{r} \sin^2 \theta \frac{\partial^2 u^2_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial u^2_0}{\partial \phi} \right] - 2 \mu \delta \left( \frac{\partial u^1_0}{\partial \phi} \right) + \frac{2}{r^2} \frac{\partial u^1_0}{\partial \phi} \\
- \frac{1}{2} \frac{\partial^2 p_0}{\partial \theta^2} + \frac{1}{r} \sin^2 \theta \frac{\partial^2 p_0}{\partial \phi^2} + \frac{\cot \theta}{\sin \theta} \frac{\partial p_0}{\partial \phi} \right] = -2 \mu \delta \left( \partial \phi u^1_0 + \partial \phi u^2_0 + \cot \theta u^1_0 \right) + F^1_1.
\end{align*}
\]

If the flow is symmetric then
\[
\begin{align*}
-\mu \delta &\left[ 2 \left( \frac{\partial^2 u_i^0}{\partial \theta^2} + \frac{1}{r^2} \left( 2 - \cot \theta \right) \frac{\partial u_i^0}{\partial \theta} + \frac{2 \cot \theta}{r^2} \left( \frac{\partial u_i^0}{\partial \theta} \right) + \frac{1}{r^2} \frac{\partial \mu_i}{\partial \theta} \right) \right] \\
&\quad - \frac{1}{r^2} \delta \left[ \frac{\partial^2 \theta}{\partial \theta^2} \right] + \delta \left[ -\frac{1}{2} \sin 2\theta \frac{\partial u_i^0}{\partial \theta} - \cot \theta \frac{\partial u_i^0}{\partial \theta} \right] + \delta u_i^0 = \frac{1}{r^2} F_i^0, \\
-\mu \delta &\left[ 2 \left( \frac{\partial^2 u_i^0}{\partial \theta^2} + \frac{1}{r^2} \left( 2 - \cot \theta \right) \frac{\partial u_i^0}{\partial \theta} + \frac{2 \cot \theta}{r^2} \left( \frac{\partial u_i^0}{\partial \theta} \right) + \frac{1}{r^2} \frac{\partial \mu_i}{\partial \theta} \right) \right] \\
&\quad - \frac{1}{r^2} \delta \left[ \frac{\partial^2 \theta}{\partial \theta^2} \right] + \delta \left[ -\frac{1}{2} \sin 2\theta \frac{\partial u_i^0}{\partial \theta} - \cot \theta \frac{\partial u_i^0}{\partial \theta} \right] + \delta u_i^0 = \frac{1}{r^2} \sin^2 \theta F_i^0, \\
&\quad (7.11)
\end{align*}
\]

and

\[
\begin{align*}
\mu \delta u_i^1 &= r^2 F_i^1 - \frac{\delta^2}{2} \left( \frac{\partial^2}{\partial \theta^2} + \frac{1}{r^2} \left( 2 - \cot \theta \right) \frac{\partial}{\partial \theta} + \frac{2 \cot \theta}{r^2} \frac{\partial}{\partial \theta} \right) \left[ \frac{u_i^0 \partial \mu_i}{\partial \theta} + \frac{\partial u_i^0}{\partial \theta} + \frac{1}{2} \sin 2\theta \frac{\partial u_i^0}{\partial \theta} - \frac{1}{r^2} \frac{\partial \mu_i}{\partial \theta} \right] \\
&\quad + \frac{\mu \delta^2}{2} \left[ \frac{\partial^2 u_i^0}{\partial \theta^2} + \frac{1}{r^2} \left( 2 - \cot \theta \right) \frac{\partial}{\partial \theta} + \frac{2 \cot \theta}{r^2} \frac{\partial}{\partial \theta} \right] \left[ \frac{\partial^2 u_i^0}{\partial \theta^2} + \frac{1}{r^2} \left( 2 - \cot \theta \right) \frac{\partial}{\partial \theta} + \frac{2 \cot \theta}{r^2} \frac{\partial}{\partial \theta} \right] \\
&\quad + \mu \delta \left[ -\frac{1}{2} \sin 2\theta \frac{\partial u_i^0}{\partial \theta} - \cot \theta \frac{\partial u_i^0}{\partial \theta} \right] + \delta u_i^0 = \frac{2 \mu \delta}{r^2} \left[ \frac{\partial \mu_i}{\partial \theta} + \cot \theta \frac{\partial u_i^0}{\partial \theta} \right] + \delta u_i^0, \\
\frac{\delta^2}{2} p_i &= F_i^1 - \left( \delta - \frac{4 \delta^2}{r^2} \right) p_i + 2 \mu \delta u_i^1 + \frac{\mu \delta^2}{2} \left[ \frac{u_i^0 \partial \mu_i}{\partial \theta} + \frac{\partial u_i^0}{\partial \theta} + \frac{1}{2} \sin 2\theta \frac{\partial u_i^0}{\partial \theta} - \frac{1}{r^2} \frac{\partial \mu_i}{\partial \theta} \right] \\
&\quad + \mu \delta \left[ -\frac{1}{2} \sin 2\theta \frac{\partial u_i^0}{\partial \theta} - \cot \theta \frac{\partial u_i^0}{\partial \theta} \right] + \delta u_i^0 = 0, \\

&\quad (k).
\end{align*}
\]

The drag is given by

\[
F_d = \left( -\frac{p_0 x_1^2 - x_2 y_1}{\sqrt{z_a}} + \mu u_i^0 \right) \sqrt{a} dx = -\int \left( p_0 \cos \theta + \mu u_i^0 \sin \theta \right) r^2 \sin \theta d\theta d\phi, \\
F_d = \frac{1}{5} \left( -p_0 \cos \theta + \mu u_i^0 \sin \theta \right) r^2 \sin \theta d\theta d\phi. \\
\]
7.2. The Flow around an Ellipsoid

Let parametric equation of the ellipsoid be given by
\[ \mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}, \]
\[ x = \alpha \cos \varphi \cos \theta, \quad y = \beta \sin \varphi \cos \theta, \quad z = \gamma \cos \theta, \]
where \( 0 < \gamma < \beta < \alpha, \quad \alpha, \beta, \gamma \) are constants.

The base vectors on the ellipsoid
\[ \mathbf{e}_1 = \partial_\varphi \mathbf{r} = \alpha \cos \varphi \cos \theta \mathbf{i} + \beta \sin \varphi \cos \theta \mathbf{j} - \gamma \sin \theta \mathbf{k}, \]
\[ \mathbf{e}_2 = \partial_\theta \mathbf{r} = -\alpha \sin \varphi \sin \theta \mathbf{i} + \beta \cos \varphi \sin \theta \mathbf{j}, \]
\[ n = \frac{1}{\sqrt{a}} \mathbf{e}_1 \times \mathbf{e}_2 = \frac{1}{\sqrt{a}} \left[ -\beta \gamma \cos \varphi \cos^2 \theta \mathbf{i} + \alpha \gamma \sin \varphi \sin^2 \theta \mathbf{j} + \alpha \beta \sin \varphi \cos \theta \mathbf{k} \right]. \]

The metric tensor of the ellipsoid is given by
\[ a_{ij} = \mathbf{e}_i \cdot \mathbf{e}_j, \]
\[ a_{11} = \Lambda(\varphi) \sin^2 \theta, \quad a_{12} = \Lambda(\varphi) \cos^2 \theta + \gamma^2 \sin^2 \theta, \]
\[ a_{12} = 0, \quad \Lambda(\varphi) = \alpha^2 \sin^2 \varphi + \beta^2 \cos^2 \varphi, \]
\[ a = \det(a_{ij}) = \alpha \sin^2 \theta, \quad a_0 = \Lambda(\varphi) \left[ \Lambda(\varphi) \cos^2 \theta + \gamma^2 \sin^2 \theta \right], \]
\[ a_{11} = a_{11}/a = a_{22}, \quad a_{12}/a = a_{11}, \quad a_{21} = a_{21}, \quad a_{22} = a_{22}, \quad 0, \]
\[ \text{(7.16)} \]

Curvature tensor, mean curvature and Gaussian curvature are given by
\[ b_{11} = b_{22} = \frac{\alpha \beta \gamma \sin^2 \theta}{a_0}, \quad b_{12} = 0, \quad b = \det(b_{ij}) = \frac{\alpha^2 \beta^2 \gamma^2 \sin^4 \theta}{a_0}, \]
\[ b_{11} = \frac{\alpha \beta \gamma \sin^2 \theta}{a_0}, \quad b_{22} = \frac{\alpha \beta \gamma \sin^2 \theta}{a_0}, \]
\[ b_{12} = b_{21} = 0, \quad b_{11} = \frac{\alpha \beta \gamma \Lambda(\varphi) + \gamma^2 \sin^2 \theta}{a_0}, \quad b_{22} = \frac{\alpha \beta \gamma \Lambda(\varphi) + \gamma^2 \sin^2 \theta}{a_0}, \]
\[ K = \frac{b}{a} = \frac{(\alpha \beta \gamma)^2 \sin^2 \theta}{a_0}, \quad H = \frac{\alpha \beta \gamma \Lambda(\varphi) + \gamma^2 \sin^2 \theta}{a_0} \]
\[ \text{(7.17)} \]

Semi-Geodesic Coordinate System Based on Ellipsoid \( 3 \)

That is
\[ x^2 = \varphi, \quad x^1 = \theta, \quad x^3 = \xi \]

The radial vector at any point in \( 9\mathbb{R}^1 \)
\[ \mathbf{R} = \mathbf{r} + \xi \mathbf{n} \]
\[ \mathbf{n} = \mathbf{e}_1 \times \mathbf{e}_2 / \sqrt{\mathbf{e}_1 \cdot \mathbf{e}_2} = \mathbf{e}_1 \times \mathbf{e}_2 / \sqrt{a_0} = \frac{1}{2} \mathbf{e}_0 \mathbf{e}_1 \times \mathbf{e}_2 \]
Corresponding metric tensor of \( 9\mathbb{R}^1 \) are given by (2.1). We remainder to give the covariant derivatives of the velocity field, Laplace-Betrami operator and trace-Laplace operator. To do this we have to give the first and second kind of Christoffel symbols on the ellipsoid \( 3 \) as a two dimensional manifolds
\[ \Gamma^1_{11} = \frac{1}{2} \left( \frac{\gamma^2 - \Lambda(\varphi)}{a_{11}} \right) \sin 2\theta, \quad \Gamma^1_{12} = \frac{\alpha^2 - \beta^2 \cos^2 \theta}{a_{11}} \sin 2\varphi, \quad \Gamma^2_{11} = -\frac{\alpha^2 - \beta^2 \sin^2 \varphi \cos^2 \theta}{a_{22}}, \]
\[ \Gamma^2_{12} = \cot \theta, \quad \Gamma^2_{22} = \frac{\alpha^2 - \beta^2 \sin^2 \theta}{a_{22}^2}, \quad \Gamma^4_{22} = -\frac{a_{22}}{a_{11}} \cot \theta, \]
Then covariant derivatives of vector \( \mathbf{u} = u^\alpha e^\alpha + u^1 \mathbf{n} \) on the two dimensional manifold \( \mathcal{M} \):

\[
\mathring{\nabla}_1 u^1 = \partial_\alpha u^1 + \frac{1}{2} \sin 2\theta \left( \frac{\gamma^2 - \Lambda(\phi)}{a_{11}} \right) u^1 + \frac{\alpha^2 - \beta^2 \cos 2\theta}{a_{11}} sin 2\varphi u^2,
\]

\[
\mathring{\nabla}_2 u^1 = \partial_\varphi u^1 + \frac{1}{a_{11}} \left[ \frac{\alpha^2 - \beta^2}{2} \cos 2\theta \sin 2\varphi u^1 - \Lambda(\phi) \sin 2\varphi u^2 \right],
\]

\[
\mathring{\nabla}_1 u^2 = \partial_\alpha u^2 + \left[ \frac{\beta^2 - \alpha^2 \sin 2\varphi \cos^2 \theta}{2a_{22}} u^1 + \cot \theta u^2 \right], \quad \mathring{\nabla}_2 u^2 = \partial_\varphi u^2 + \cot \theta u^1 + \frac{\alpha^2 - \beta^2}{a_{22}} \sin^2 \theta \sin 2\varphi u^2, \quad (7.18)
\]

\[
\text{div} \mathbf{u} = \partial_\alpha u^1 + \partial_\varphi u^2 + d_1 u^1 + d_2 u^2, \quad d_1 = \frac{1}{2} \left( \frac{\gamma^2 - \Lambda(\phi)}{a_{11}} \right) \sin 2\theta + \cot \theta,
\]

\[
d_2 = \frac{\alpha^2 - \beta^2}{2} \sin 2\varphi \left[ \frac{\cos^2 \theta}{a_{11}} + \frac{\sin^2 \theta}{a_{22}} \right],
\]

The associated Laplace-Betrami operator on \( \mathcal{M} \):

\[
\mathring{\Delta}_P_0 = \frac{1}{a_{11}} \partial_\alpha^2 p_0 + \frac{1}{a_{22}} \partial_\varphi^2 p_0 + C_1 \partial_\alpha \partial_\varphi + C_2 \partial_\varphi \partial_\varphi,
\]

\[
C_1 = \frac{\alpha^2 - \beta^2}{2a_{11}^2 \Lambda(\phi)} \left( a_{11} \sin 2\varphi + 2\Lambda(\phi) \cos^2 \theta \left( 1 - \ln \sqrt{a_{11}} \right) \right) \frac{\Lambda \ln \Lambda(\phi)}{2a_{11}^2} \sin 2\theta, \quad (7.19)
\]

\[
C_2 = \frac{\alpha^2 - \beta^2}{2a_{11} \Lambda^2(\phi)} \left( \Lambda(\phi) - \gamma^2 \right) \sin 2\varphi,
\]

Trace-Laplace operatore on \( \mathcal{M} \):

\[
\mathring{\Delta} u^\alpha = a^\alpha_a \frac{\partial^2 u^\alpha}{\partial x^a \partial x^a} + A_{\alpha \beta} \frac{\partial u^\alpha}{\partial x^\beta} + A_{\alpha}^\alpha u^\alpha,
\]

\[
A_{\alpha 1} = \frac{\gamma^2 - \Lambda(\phi)}{a_{11}^2} \cos^2 \theta \left( \Lambda(\phi) \cos^2 \theta + \gamma^2 \left( 1 - 3 \sin^2 \theta \right) \right) + \frac{\alpha^2 - \beta^2}{2a_{11}^2 \Lambda(\phi)} \left[ \Lambda^2(\phi) \sin 2\varphi \cot \theta \cos^2 \theta - \left( \alpha^2 + \beta^2 \right) \frac{\gamma^2 \sin 2\varphi - \Lambda(\phi) \sin^2 \theta}{8} \sin^2 2\theta \right],

b_{11} = \frac{\alpha \gamma \sin^2 \theta}{\sqrt{\alpha^2 \cos^2 \theta + \gamma^2 \sin^2 \theta}}, \quad b_{22} = b_{11}, \quad b_{12} = 0, \\
H = \frac{\gamma}{2} \left( \alpha^2 \cos^2 \theta + \gamma^2 \sin^2 \theta \right)^{\frac{3}{2}}, \quad K = \frac{\gamma^2 \sin^2 \theta}{\left( \alpha^2 \cos^2 \theta + \gamma^2 \sin^2 \theta \right)^2},
\end{aligned}
\]
The covariant derivatives become

\[ \nabla_1 u^i = \partial_{\theta} u^i + \frac{1}{2} \left( \frac{\gamma^2 - \alpha^2}{2(\gamma^2 \cos^2 \theta + \gamma^2 \sin^2 \theta)} \right) u^i, \quad \nabla_2 u^i = -\frac{\alpha^2 \sin^2 \theta}{(\alpha^2 \cos^2 \theta + \gamma^2 \sin^2 \theta)} u^i, \]

\[ \nabla_1 u^i = \partial_{\phi} u^i + \cot \theta u^i, \quad \nabla_2 u^i = \cot \theta u^i, \]

\[ \text{div} u = \partial_{\theta} u^i + \frac{\gamma^2 \sin^2 \theta + \alpha^2 \cot \theta \cos^2 \theta}{a_i} u^i, \]

\[ a_i^i \partial_{\phi} \text{div} u = \frac{1}{a_i} \frac{\partial^2 u^i}{\partial \theta^2} + d_{i1}^i \partial_{\phi} u^i + d_{i2}^i u^i, \]

\[ d_{i1}^i := \frac{1}{a_i} \left( \gamma^2 \sin^2 \theta + \alpha^2 \cot \theta \cos^2 \theta \right), \]

\[ d_{i2}^i := \frac{1}{a_i} \left( -2 \gamma^2 \sin^2 \theta (1 + \cos^2 \theta) + \alpha^4 \cos^2 \theta \left( 2 \cos^2 \theta - \cot^2 \theta \right) + \alpha^2 \gamma^2 \sin^2 \theta \cot \theta \left( 2 \cos^2 \theta - 3 \sin^2 \theta \right) \right), \]

\[ B^1 (u, u) = u^i \nabla_1 u^i - u^i \text{div} u = -\frac{1}{a_i} \left( \gamma^2 \sin^2 \theta + \alpha^2 \cot \theta \cos^2 \theta \right) u^i u^i + \alpha^2 \sin^2 \theta u^2 u^2, \]

\[ B^2 (u, u) = u^i \nabla_2 u^i - u^i \text{div} u = u^i \partial_{\phi} u^i + \cot \theta \left( u^i u^i + \alpha^2 \sin^2 \theta u^2 u^2 \right), \]

\[ \Delta P_0 = \frac{1}{a_i} \frac{\partial^2 P_0}{\partial \theta^2} - \frac{\alpha^2 \ln \alpha}{a_i} \sin^2 \theta, \quad (7.34) \]

\[ \Delta u^i = \frac{1}{a_i} \frac{\partial^2 u^i}{\partial \theta^2} + L_{i1} \partial_{\phi} u^i + L_{i2} u^i, \quad \Delta u^i = \frac{1}{a_i} \frac{\partial^2 u^i}{\partial \theta^2} + L_{i1} \partial_{\phi} u^i + L_{i2} u^i, \]

\[ L_{i1} := \frac{1}{a_i^2} \left[ \gamma^2 \sin^2 \theta + \alpha^2 \cot \theta (1 + \cos^2 \theta) \right], \]

\[ L_{i2} := \frac{1}{a_i} \left[ 3 \alpha^4 + 2 \gamma^2 - 4 + \alpha^2 \left( \gamma^2 + \gamma^2 \right) \cot \theta \right], \]

\[ L_{i1} := \frac{1}{a_i} \left[ 3 \alpha^4 + 2 \gamma^2 - 4 + \alpha^2 \left( \gamma^2 + \gamma^2 \right) \cot \theta \right], \]

\[ L_{i2} := \frac{1}{a_i} \left( \frac{\alpha^2 (\gamma^2 - \alpha^2)}{4} \sin^2 \theta + \alpha^2 a_i \right), \]

Let

\[ U^\alpha := u^\alpha, \quad \left( U^\alpha \right)^* = \partial_\phi U^\alpha, \quad \left( U^\alpha \right)^* = \partial_\phi U^\alpha, \quad \lambda = 0.1 \]

Then BLE I (7.23) and SLE II (7.27) become

\[ -\frac{\mu_0 \delta^3}{3} \left[ \frac{2}{a_1} \left( U_1^1 \right)^* + L_{i1}^1 \left( U_1^1 \right)^* + L_{i2}^1 U_1^1 \right] + \frac{Q_{i1}}{a_1} U_1^1 + \frac{\delta^3}{4} B^1 (u_1, u_1) + d_{i1}^1 \partial_{\phi} P_0 - \frac{4 \delta^3}{3} \frac{1}{a_1} \partial_{\phi} (H P_0) \]

\[ = \frac{1}{a_1} \left[ \frac{\gamma^3}{3} - \delta^3 \partial_{\phi} P_1 \right], \]

\[ -\frac{\mu_0 \delta^3}{3} \left[ \frac{1}{a_1} \left( U_2^1 \right)^* + L_{i1}^2 \left( U_2^1 \right)^* + L_{i2}^2 U_2^1 \right] + \frac{Q_{i2}}{a_2} U_2^1 + \frac{\delta^3}{4} B^2 (u_2, u_2) = \frac{1}{a_2} \gamma^2, \]

\[ \frac{1}{a_1} \frac{\partial^2 P_0}{\partial \theta^2} - \frac{\alpha^2 \ln \alpha}{a_1} \sin^2 \theta \partial_{\phi} P_0 + m_1 \partial_{\phi} u^i + m_2 u^i = F \]
The drag is given by

\[ F_d = -\pi \int_0^\alpha \sin(2\theta) \left[ \alpha^2 p_0(\theta) + \mu \alpha \sqrt{a_{12} U^2(\theta)} \right] d\theta \]  

(7.38)

In the following we concern with the axi-symmetric flow around an ellipsoid, which depends significantly on the Reynolds number and the geometry of the ellipsoid. And the boundary layer equations are solved with spectral method. The fluid approaches the ellipsoid with a uniform free-stream velocity from inlet to outlet. In order to compare with the results in reference conveniently, the results should be dimensionless. Therefore the other parametric equation of ellipsoid is proposed

\[ \xi = \tanh^{-1} (\alpha/\gamma), \quad \alpha = c \cosh \xi_0, \quad \gamma = c \sinh \xi_0 \]

where \( c \) a constant and the parameter \( \xi_0 \) defines the surface of the spheroid and is related to the axis ratio by \( \xi_0 \). A perfect sphere would be represented by \( \xi_0 \to \infty \) whereas a flat circular disk would be represented by \( \xi_0 = 0 \).

The Reynolds number based on the focal length, \( \text{i.e.} \quad \text{Re} = \frac{2c \rho U_\infty}{\mu} \), varies from 0.1 to 1.0. In the case the focal length \( 2\gamma \) is the reference length and inlet velocity \( U_\infty \) is the reference velocity. Let the total drag coefficient be,

\[ C_D = \frac{F_d c}{A \mu U_\infty} \]

where \( A = \pi c^2 \cosh^2 \xi_0 \) is the spheroid projected area. From BLE I the total drag includes two terms and the first term is the pressure part while the second term is the viscous part, \( \text{i.e.} \quad F_d = F_{dp} + F_{dv} \), which are defined as,

\[ F_{dp} = -\pi \int_0^\alpha \sin(2\theta) \left[ \alpha^2 p_0(\theta) \right] d\theta, \]

\[ F_{dv} = -\pi \int_0^\alpha \sin(2\theta) \left[ \mu \alpha \gamma \sqrt{a_{12} U^2(\theta)} \right] d\theta, \]

Therefore the total drag coefficient is also decomposed into pressure and viscous part: \( C_D = C_{Dp} + C_{Dv} \), in which,

\[ C_{Dp} = \frac{F_{dp}}{A \mu U_\infty}, \quad C_{Dv} = \frac{F_{dv}}{A \mu U_\infty}, \]
Firstly the numerical solution of boundary layer equations is validated quantitatively by comparison with results in references and finite element method. Table 1 presents results of pressure and total drag coefficients for various Reynolds numbers at $\xi_0 = 0.5$. Table 2 presents results of pressure and total drag coefficients for various values of $\xi_0$ at $Re = 1.0$. An excellent agreement between the present results and that of Allassar and Badr [13] are both achieved. And the normal stress tensor $\delta h^{(d)}$ to the super surface of boundary layer is considered as the boundary condition of boundary layer equations, which is obtained from the solutions of finite element method. According to Table 1 and Table 2 the precision of drag computation with boundary layer equations is higher than the finite element method, so the boundary layer equations could be used to improve the computation precision of flow in the boundary layer with low cost.

Figure 2 presents the nearly stationary streamline patterns and pressure distributions at different Reynolds numbers 10, 30, 60 and 100 respectively for $\xi_0 = 0.5$. Here we note that our streamline patterns are similar to those obtained by Rimon and Cheng [14] for the sphere, since the separation angles and wake lengths are in close agreement with each other. Figure 2(b) shows a clearly visible secondary vortex at $Re = 60$, in this regard our result is also consistent with Rimon and Cheng's [14] in spite of the difference in the size of the wake. Furthermore, Figure 2(d) shows a nice structure which corresponds to the a phenomenon observed for the flow around a circular cylinder. Since secondary vortices appear only at relatively high Reynolds number, we may conclude that the wake region is much more active at higher Reynolds number rather than that the wake length has to increase with the Reynolds number.

Figure 3 presents the nearly stationary streamline patterns and pressure distributions at different $\xi_0$ 0.25, 0.5, 1.0 and 1.5 respectively for $Re = 1.0$. As expected, no separation occurs at the low Re values.

Table 1. Comparison of drag coefficients for various Reynolds numbers at $\xi_0 = 0.5$.

| Re   | $C_p$       | $C_{dp}$       |
|------|-------------|----------------|
|      | Ref. [13]   | FEM            | BLE            | Ref. [13]   | FEM            | BLE            |
| 0.1  | 4.8934      | 4.9518         | 4.8734         | 2.6866      | 2.7615         | 2.6754         |
| 0.5  | 5.1638      | 5.3143         | 5.2036         | 2.8363      | 2.9146         | 2.8562         |
| 1.0  | 5.4700      | 5.6147         | 5.5813         | 3.0075      | 3.1164         | 3.0819         |

![Figure 2. Streamlines of the flow](image)

![Figure 3. Streamlines of the flow](image)
Then the flow details around the trailing edge of ellipsoid for $\text{Re} = 60$, $\zeta_0 = 0.5$ are given in Figure 4. It is obvious that the secondary vortex appears in the result of BLE, so more details could be computed by BLE than FEM. Although these flow details is obtained by FEM, its computational cost would be much more expensive than BLE. Let dimensionless pressure be $p'(\theta) = p'(\theta) - p'(\pi)$ and the definition of $p'$ is as follows,

$$p'(\theta) = \frac{p(\theta)c}{\mu U_e}$$

Figure 5 shows the surface dimensionless pressure distributions for the case $\zeta_0 = 0.5$ when $\text{Re} = 10$, 30, 60 and 100. As $\text{Re}$ increases, the difference in the pressure between the front and the rear stagnation points increases.

Figure 6 proposes the corresponding pressure distributions in 3D.
Figure 5. Surface pressure distribution for $\xi_0 = 0.5$.

Figure 6. Surface pressure distribution in 3D: (a) $Re = 10$; (b) $Re = 30$; (c) $Re = 60$; (d) $Re = 100$ for $\xi_0 = 0.5$. 
The effect of $\xi_0$ on the pressure distribution can be seen in Figure 7. The figure which show the results at $Re = 1.0$ when $\xi_0 = 0.25, 0.5, 1.0$ and 1.5 indicates that when $\xi_0$ decreases, a positive pressure gradient may be expected. The surface pressure distributions are compared between FEM and BLE in Figure 8 for the case $Re = 1.0$ when $\xi_0 = 0.25, 0.5, 1.0$ and 1.5. The pressure distributions obtained by FEM and BLE are almost the same, however the absolute value of pressure in FEM is generally a little higher than these in BLE, which is consistent with the results in Table 2.

Figure 9 proposes the corresponding pressure distributions in 3D.
Figure 9. Surface pressure distribution in 3D: (a) $\xi = 0.25$; (b) $\xi = 0.5$; (c) $\xi = 1.0$; (d) $\xi = 1.5$ for $Re = 1.0$.

| $\xi$ | $C_D$ | $C_{DP}$ |
|-------|-------|---------|
|       | Ref. [13] | FEM | BLE | Ref. [13] | FEM | BLE |
| 0.25  | 5.6995 | 5.8013 | 5.7124 | 4.0390 | 4.0928 | 4.0845 |
| 0.5   | 5.4700 | 5.6123 | 5.5167 | 3.0075 | 3.0967 | 3.0616 |
| 1.0   | 4.4265 | 4.5741 | 4.5638 | 1.8140 | 1.8816 | 1.8564 |
| 1.5   | 3.2020 | 3.3569 | 3.2964 | 1.1635 | 1.2001 | 1.1757 |

Finally, it has to be emphasized that since flow axisymmetry is assumed in the present study, none of our results give any indication about symmetry-breaking in a real flow. The presented method are, however, not restricted to axi-symmetric flow, the BLE I aforementioned could be used to compute the non-axisymmetric flow.
