Abstract

There are ethnic-based medicinal herbs which can be used to treat or prevent CAD with narrow to moderate range of statistical significance. We compared Rosuvastatin 10 mg with Indian dates (Jujubes) as hypolipidemic agents. This research was conducted at Ghurki Trust Teaching Hospital, jalo park, Lahore, Pakistan. Duration of study was two months. Twenty to seventy years old 60 hyperlipidemic patients of both genders were included in research work with written consent. We divided these patients in two equal groups. Group-I was advised to take Tablet Rosuvastatin 10 mg, twice daily for two months. Group-II was advised to take 500 grams Indian dates for two months. Their baseline parameters like LDL-cholesterol, HDL-cholesterol, systolic/diastolic blood pressure was determined in the hospital laboratory. Separate file was maintained for their name, age, sex, occupation, and address. After two months therapy we compiled data related to tested parameters. Paired t-test was applied to compare changes in all parameters. Their mean values with ± SD before and after treatment were compared and analyzed statistically. It was observed that Rosuvastatin significantly decreased systolic/diastolic blood pressure, LDL-cholesterol, and increased HDL-cholesterol in 27 hyperlipidemic/hypertensive patients. Indian dates used in 30 hyperlipidemic patients significantly decreased systolic blood pressure, and LDL-cholesterol, but insignificant changes were seen in diastolic blood pressure, and HDL-cholesterol. We concluded from the research work that Rosuvastatin is potent hypolipidemic and hypotensive medicine as compared to Indian dates.

Introduction

With a low calorie count and a higher protein and fiber level, Indian date helps to satisfy nutritional needs and fill up, which prevent from snacking in between meals. This will help maintain diet or prevent any additional weight gain [1-10]. Indian dates i.e. Jujube is one of the good sources of antioxidant content, like vitamin C, vitamin A, and numerous organic compounds. Antioxidants help to neutralize free radicals, the dangerous byproducts of cellular respiration, which are liable for several chronic diseases and illness within the body. Vitamin C also encourages the production of white blood cells, the first line of defense of human body immune system [11,12]. The use of statin agents in patients with acute coronary syndromes (ACSs) remains an area of intense clinical interest [13]. Statin therapy has an established secondary preventive benefit in patients with coronary artery disease, and its extension to acute coronary syndrome seems logical [14]. A number of observational studies have shown an association between initiation of statin therapy early in acute coronary syndrome and improved clinical outcome. Four randomized controlled trials have examined the use of statin therapy for acute coronary syndrome: The Myocardial Ischemia Reduction with Aggressive Cholesterol Lowering study, the Pravastatin Turkish Trial, the Rosuvastatin on Risk Diminishing After Acute Myocardial Infarction study, and the Lipid-Coronary Artery Disease study. Three of these trials showed a benefit with early initiation of statin therapy, whereas one trial demonstrated neither benefit nor harm [15]. To reversing the inhibitory effect of oxidized LDL on nitric oxide synthase-3, Rusuvastatin also have direct antioxidant effects on LDL in vitro and ex vivo. Metabolites of Rusuvastatin, but not the parent compound, inhibit oxidation of both LDL and very-low-density lipoprotein as well as high-density lipoprotein [16]. Metabolites, representing 70% of active Rusuvastatin in plasma, demonstrate free radical-scavenging abilities that may contribute to inhibition of lipoprotein oxidation [17]. Rusuvastatin also indirectly affect normal oxidative

DOI: 10.32474/OAJOM.2020.03.000163
mechanisms by curbing the ability of macrophages to oxidize lipoproteins [18].

Subjects and Method

The research was conducted at Ghurki Trust Teaching Hospital, Lahore-Pakistan from January to June 2019. Sixty primary and secondary hyperlipidemic and hypertensive patients were selected from Ghurki Trust Teaching Hospital, Lahore, Pakistan. The research aim was to compare hypolipidemic and hypertensive effects of Rosuvastatin 10 mg and Ziziphus Jujubes (Indian dates) in these patients. Both male and female patients suffering from primary or secondary hyperlipidemia were selected. The age limit for patients was 20 to 70 years. Patients suffering from any major organ disease like liver, lungs, kidney, thyroid, heart and eye complications were excluded from the research. Written consent was taken from all participants. Baseline Lipid Profile was determined in Biochemistry lab of the Hospital. Serum cholesterol was estimated by enzymatic method using kit Cat. No: 303113050 by Eli Tech Diagnostic, France. Serum HDL-cholesterol was determined by using kit Cat No: 303210040 by Eli Tech Diagnostic, France. Chyloomicrons, low density lipoprotein and very low density lipoprotein are specially precipitated with phosphotungstic acid and magnesium ions can then be removed by centrifugation, while high density lipoproteins remain in the supernatant. Cholesterol included in this phase is measured by an enzymatic method. LDL-cholesterol was calculated according to Friedwald formula [16] i.e. LDL= TC-(TG/5+ HDL-C).

Table 1: Showing group 1 s (n= 27) mean values ± SD of all parameters tested, changes in parameters, and its statistical significance in change.

| Parameter | At Starting of Treatment | After Two Months | Change in Parameter | Statistical Significance (P-Value) |
|-----------|--------------------------|-----------------|---------------------|-----------------------------------|
| SBP       | 150.22±1.11              | 120.11±1.91     | 30.1                | <0.001                            |
| DBP       | 97.91±1.21               | 88.21±1.11      | 9.7                 | <0.01                             |
| LDL-C     | 210.16±2.11              | 180.97±2.22     | 29.2                | <0.001                            |
| HDL-C     | 37.91±1.91               | 45.21±2.19      | 7.3                 | <0.01                             |

Table 2: Showing group 2 s (n=30) mean values ± SD of all parameters tested, changes in parameters, and its statistical significance in change.

| Parameter | At Starting of Treatment | After Two Months | Change in Parameter | Statistical Significance (P-Value) |
|-----------|--------------------------|-----------------|---------------------|-----------------------------------|
| SBP       | 141.71±2.21              | 130.78±1.11     | 10.9                | <0.01                             |
| DBP       | 93.61±2.00               | 88.54±1.10      | 5.1                 | <0.05                             |
| LDL-C     | 198.82±2.17              | 190.91±1.73     | 7.9                 | <0.01                             |
| HDL-C     | 38.61±2.19               | 41.91±2.97      | 3.3                 | <0.05                             |

Discussion

In our results two months therapy by Rosuvastatin 10 mg when used in 27 hyperlipidemic patients, it affected, when statistically analyzed, all tested parameters included systolic/diastolic blood pressure, LDL-cholesterol and HDL-cholesterol. Indian dates proved no significant changes in 30 hyperlipidemic patients in their diastolic blood pressure and LDL-cholesterol, but did affect systolic blood pressure and LDL-cholesterol significantly, with p-values <0.01. Bihva C et al. [19] explained same mechanism of action of Rosuvastatin as described in textbooks of medicines, pharmacology and therapeutics that it inhibits HMG-CoA reductase enzyme which is responsible to synthesize cholesterol in human body. They proved same effects of this drug on 56 hyperlipidemic patients. Cella V et al. [20] proved 30.99 mg/dl reduction in LDL-cholesterol when they used Rosuvastatin 10 mg once daily for three months in 109 hyperlipidemic patients. Mekatal Y et al. [21] said in their conclusion that statins are the best among hypolipidemic agents used in patients suffering from primary or secondary hyperlipidemia. Ketylu V et al. [22] emphasized to use Rosuvastatin in those patients who are victimized by metabolic syndrome with increased oxidative stress causing lethality in these patients due to myocardial infarction. Burden of free radical formation, diabetes, obesity, hypertension, hypor or hyperthyroidism, excessive inflammatory reactions in body, and utilization of fatty foods may cause, rather do cause coronary artery syndrome, which is
difficult to treat, but not impossible. Statins like Rosuvastatin is the best example of drugs used in these patients [23]. Kakati PY et al. [24] have provided other options of treating patients suffering from hyperlipidemia, other than allopathic drug regimens. They recommended herbal medicines or medicinal plants to treat complicated cases of hyperlipidemia. They used Indian dates in 46 hyperlipidemic patients one kg daily for three days and proved LDL-cholesterol reduction 8 mg/dl. No HDL-cholesterol increase was seen by them. Lomateevassel IO et al. [25] proved 2.06 mg/dl reduction in LDL-cholesterol when 400 grams indian dates were used in 22 hyperlipidemic patients for two months. They also proved reduction in blood pressure significantly in their patients. Blood pressure significant effect is not proved in many studies conducted on indian dates [26].
