Citation: Ma Z-x, Chen B, Li T-j (2016) A taxonomic account of the genus Stenodynerus from China, with descriptions of five new species (Hymenoptera, Vespidae, Eumeninae). ZooKeys 595: 17–48. doi: 10.3897/zookeys.595.7734

Abstract

In this paper, 20 species of the genus Stenodynerus are reviewed and identified from China, including five new species: S. ninglangensis Ma & Li, sp. n., S. reflexus Ma & Li, sp. n., Stenodynerus similibaronii Ma & Li, sp. n., S. strigatus Ma & Li, sp. n., and S. tenuilamellatus Ma & Li, sp. n., and five new records: S. baronii Giordani Soika, S. bluethgeni van der Vecht, S. picticus (Thomson), S. pullus Gusenleitner and S. nepalensis Giordani Soika. The five new species are described and illustrated in detail. Moreover, the diagnostic characters of all new records and known species from China are provided, with a key to the Chinese species of Stenodynerus.

Keywords

Hymenoptera, Vespidae, Eumeninae, Stenodynerus, new species, China, distribution

Introduction

The genus Stenodynerus of potter wasps was established by de Saussure (1863). This genus includes 161 species with 26 subspecies worldwide, and is distributed in the Nearctic, Neotropical, Palearctic and Oriental regions. These known species were described or revised by Bohart (1943, 1944, 1948, 1949, 1966, 1980), Buck (2008), Gusenleitner
So far, ten species with two subspecies have been recorded from China (de Saussure 1863, 1867; André 1884; Morawitz 1889; Giordani Soika 1976; Kurzenko 1977; Giordani Soika 1979; Li 1985; Gusenleitner 2003, 2012; Kim and Yamane 2004). In this study, a total of 20 species of *Stenodynerus* is recognized, including five new species and five newly recorded species. These five new species are described and illustrated in detail, and the diagnostic characters of new records and all known species from China provided. In addition, a key to the Chinese species of *Stenodynerus* is updated. The diagnostic characters and the key were produced based on specimen examination and the information extracted from the literature.

**Materials and methods**

Descriptions were made under a stereomicroscope (Olympus SZ61). Measurements were taken as the maximal length of body parts under an image analyzer (LY-M-Tupuwiew), and all figures were taken with a stereomicroscope (LY-WN-YH) attached to a computer. The ratios used throughout the descriptions were measured in the same magnification of the stereomicroscope. Body length was measured from the anterior margin of head to the posterior margin of metasomal tergum II. For the density description of punctures, “sparsely” means that the interspaces are larger than one puncture diameter, “moderately” means equal to the diameter, and “densely” means the interspaces are less than one puncture diameter. Terminology principally follows Carpenter (1982) and Kim and Yamane (2004). Specimens examined are deposited in the Institute of Entomology and Molecular Biology, Chongqing Normal University, Chongqing, China (CQNU).

**Taxonomy**

*Stenodynerus de Saussure, 1863*

*Stenodynerus* de Saussure, 1863: 228; Gusenleitner 1981: 221; Giordani Soika 1994: 133. *Nannodynerus* Blüthgen, 1938 (1937): 281. *Parhypodynerus* Giordani Soika, 1973: 110.

**Type species.** *Odynerus chinensis* de Saussure, 1863, designated by Bohart, 1939.

**Diagnosis.** Body generally small and slender (Figs 1, 7, 14–15, 23, 30, 37, 63, 73); anterior surface of pronotum usually with a pair of median foveae, which sometimes contiguously forms U-shaped (Fig. 69), V-shaped (Figs 3, 18, 40, 48, 52, 57, 60, 65, 75) or a transverse fovea; tegula campanulate, broadest in the middle, length
somewhat more than width; parategula just reaching apex of tegula; tergum I generally without a basal transverse carina (Figs 5, 10, 26, 33, 50, 59, 71, 78), but in some Nearctic species present; tergum II without an acarinarium; the terminal segment of male antenna bent backward like a hook, apex usually reaching the base or middle of the segment XI (Fig. 19). This genus is similar in some characters to Parancistrocerus Bequaert, which can be distinguished by the presence of an acarinarium on the metasomal tergum II in Parancistrocerus.

**Distribution.** Nearctic, Neotropic, Palearctic and Oriental regions.

**Stenodynerus ninglangensis** Ma & Li, sp. n.
http://zoobank.org/E2130F59-2C6F-494A-891D-A0E2597FFFCD
Figs 1–6

**Material examined.** Holotype, ♀, China, Yunnan Prov., Lijiang City, Ninglang County, Daxing Town, 27°16'37.68"N, 100°51'03.11"E, 2252 m, 26.VII. 2011, Tingjing Li, No. 1004068 (CQNU). Paratype: 1 ♀, same data as holotype, No. 1004069 (CQNU).

**Description.** Female (Figs 1–6): body length 7.2 mm, forewing length 5.6 mm. Black; a basal band on clypeus except median interruption (Fig. 2) and inter-antennal spot yellow; the outer margin of mandible yellow to brown; the spots pale ferruginous: ventral scape, apex of ocular sinus (Fig. 2), transverse post-ocular spot, a band on dorsal surface of pronotum, mesepisternal spot, parategula, metanotum except posterior apex ventrally, apexes of femora, all tibiae and tarsi, and apical bands on metasomal terga I–II and sternum II; tegula brown.

**Head.** Clypeus strongly punctate, with dense setae, its width much more than length (width 1.25 × length), apex emarginated, apical width: emargination depth = 0.20: 0.04, total width: apical width = 0.86: 0.20 (Fig. 2); frons densely punctate, punctures on vertex somewhat sparser than those on frons; frons and vertex with very sparse and short setae; cephalic fovea obsolete.

**Mesosoma.** Pronotum, mesoscutum and scutellum densely punctate and reticulate, punctures somewhat larger and sparser than those on the head; punctures on metanotum sparser than those on other parts of the mesosoma. Anterior surface of pronotum shining, almost vertical, with few minute punctures, median foveae contiguous and V-shaped, pronotal carina complete (Fig. 3); scutellum distinct convex; metanotum oblique; dorsal and lateral surfaces of propodeum reticulate-punctate, dorsal surface broad with a weak shelf, posterior surface concave with long and transverse rugae and a median longitudinal carina (Fig. 4).

**Metasoma.** In dorsal view, tergum I domed, densely punctate, width 1.31 × length and 0.85 × width of tergum II; tergum II with smaller and sparser punctures than tergum I, apex with deeper and denser punctures than other parts of tergum II, and apical margin without a distinct lamella, (Fig. 5); sternum II sparsely punctate, with a long median longitudinal furrow basally, and its anterior surface sloping (Fig. 6).
Male. Unknown.

**Remarks.** This species is easily distinguished from all the other members of *Stenodynerus* by the following character combinations: a basal band on clypeus except median interruption yellow (Fig. 2), apex of ocular sinus ferruginous (Fig. 2), apical margin of tergum II without a distinct lamella (Fig. 5), sternum II with a long median longitudinal furrow basally, and its anterior surface sloping (Fig. 6).
**Distribution.** China (Yunnan).

**Etymology.** The specific name *ninglangensis* is the Latin adjective of the region from which the type specimens were collected.

Stenodynerus reflexus Ma & Li, sp. n.
http://zoobank.org/18D6BDFC-DD54-4DAA-8B2D-38E7B0670C63
Figs 7–13

**Material examined.** Holotype, ♀, China, Yunnan Prov., Baoshan City, Tengchong County, Beihai Village, 25°16'48.82"N, 98°34'49.16"E, 1783 m, 13.VII.2011, Xin Zhou, No. 1004070 (CQNU).

**Description.** Female (Figs 7–13): body length 7.4 mm, forewing length 5.8 mm. Black; with the following spots ferruginous: clypeus except median interruption basally (Fig. 8), inter-antennal spot, ventral scape, post-ocular spot, a broad band on the pronotal dorsum, mesepisternal spot, parategula, metanotum except posterior apex ventrally, apical bands on metasomal terga I–II and sternum II, a long band on the dorsal surface of the fore tibia; tegula brown.

Head. Clypeus with sparse punctures, and with setae basally and laterally, its width much more than length (width 1.24 × length), apex moderately emarginated, apical width: emargination depth = 0.25: 0.08, total width: apical width = 0.88: 0.25 (Fig. 8); frons densely punctate, punctures on vertex somewhat weaker than those on frons; frons and vertex with dense setae; cephalic fovea obsolete.

Mesosoma. Masosoma densely punctate and reticulate except metanotum, punctures generally larger than those on the head; punctures on metanotum sparser and shallower than those on other parts of the mesosoma. Anterior surface of pronotum slightly sloping, distinctly punctate, and with a pair of round separated median foveae, the interspace between these two median foveae less than one fovea diameter, pronotal carina complete (Fig. 9); scutellum distinctly convex; metanotum nearly vertical; dorsal and lateral surface of propodeum reticulate-punctate, dorsal surface narrow with a developed shelf, posterior surface concave with long and transverse rugae and a median longitudinal carina (Fig. 11).

Metasoma. In dorsal view, tergum I campanulate, coarsely punctate, width 1.37 × length and 0.85 × width of tergum II, anterior surface vertical, almost impunctate, and with a median longitudinal carina in upper half (Fig. 10); tergum II with smaller and sparser punctures than tergum I, and with a broad reflex apical lamella, dense and deep punctures forming a wide transverse groove on the base of lamella (Fig. 13); sternum II sparsely punctate, basally with a very short median longitudinal furrow, and its anterior surface almost vertical (Fig. 12).

Male. Unknown.

**Remarks.** This species is similar to *S. pappi* by having the propodeal shelf developed, a median longitudinal carina on propodeal concavity (Fig. 11, 81), anterior vertical surface of tergum I with a longitudinal median carina in upper half (Fig. 10). It
Figures 7–13. Female of *Stenodynerus reflexus* Ma & Li, sp. n.

is different from *S. pappi* and other members of the genus in the following characters: clypeus basally ferruginous except median interruption (Fig. 8), a broad band on pronotum (Fig. 9), and sternum II with a very short median longitudinal furrow basally, and its anterior surface almost vertical (Fig. 12).

**Distribution.** China (Yunnan).

**Etymology.** The specific name is the Latin adjective *reflexus*, which refers to the apical lamella of metasomal tergum II broadly reflexed.

*Stenodynerus similibaronii* Ma & Li, sp. n.

Figs 14–22, 45

**Material examined.** Holotype, ♀, China, Yunnan Prov., Baoshan City, Tengchong County, Shangying Village, 25°0’54.72”N, 98°39’12.86”E, 1823 m, 31.VII.2015, Zhenxia Ma & Long Li, No. 1004071 (CQNU). Paratypes: 1 ♀ 2 ♂, the same data as holotype, Nos. 1004072, 10040743, 1004074 (CQNU).

**Description.** Female (Figs 14, 16, 18, 21–22, 45): body length 7.0 mm, forewing length 6.5 mm. Black; with the following spots pale ferruginous: a basal band of clypeus (Fig. 16), ventral scape, inter-antennal spot, post-ocular spot, spots on outsides of tegula anteriorly and posteriorly, parategula, apexes of femora to terminal tarsi, and apical bands on metasomal terga I–II and sternum II; a band on dorsal surface of pronotum except median interruption (Fig. 18), and metanotum except posterior apex ventrally dark ferruginous (Fig. 21); tegula brown.

**Head.** Clypeus with moderate punctures, lateral surface with sparse setae, its width somewhat more than length (width 1.09 × length), apex slightly emarginated, apical width: emargination depth = 0.33: 0.07, total width: apical width = 1.00: 0.33 (Fig. 16); frons and vertex densely punctate and reticulate; frons with sparse and very short setae, setae on vertex denser than those on frons.

**Mesosoma.** Masosoma densely punctate and reticulate; punctures generally larger than those on the head; punctures on pronotal dorsum and mesoscutum somewhat denser than those on other parts of the masosoma (Fig. 14). Anterior surface of pronotum almost vertical with few small punctures, median foveae contiguous and V-shaped, a few short transverse carinae above median foveae, pronotal carina interrupted medially (Fig. 18); scutellum distinctly convex; metanotum oblique; dorsal and lateral surfaces of propodeum reticulate-punctate, dorsal surface broad with a weak shelf, posterior surface concave with long and transverse rugae and a median longitudinal carina (Fig. 21).

**Metasoma.** In dorsal view, tergum I domed, densely punctate, width 1.35 × length and 0.84 × width of tergum II; tergum II with smaller and sparser punctures than tergum I, apex with deeper and denser punctures than other parts of tergum II, and apical margin without a distinct lamella (Fig. 45); sternum II sparsely punctate, with a long median longitudinal furrow basally, and its anterior surface sloping (Fig. 22).
Figures 14–22. *Stenodynerus similibaronii* Ma & Li, sp. n. 14, 16, 18, 21–22 female, 15, 17, 19–20 male. 14 habitus of holotype (dorsal view) 15 habitus of paratype (dorsal view) 16 clypeus 17 clypeus 18 anterior surface of pronotum 19 antennal segment (lateral view) 20 genitalia (ventral view) 21 metanotum and propodeum 22 metasoma (ventral view).
Male (Figs 15, 17, 19, 20): body length 6.8 mm, forewing length 5.6 mm. Sculpture, punctuation, setae and coloration similar to those of female except the follows: entire clypeus, mandible except apical portion, ventral scape and inter-antennal spot yellow; clypeus strongly, convex medially, with sparse and small punctures, its width equal to length, apex deeply emarginated and U-shaped, apical width: emargination depth = 0.27: 0.12, total width: apical width = 0.8: 0.27 (Fig. 17); punctures on apex of tergum II deeper than those in female; width of tergum I 1.45 × length and 0.79 × width of tergum II; the terminal segment of antenna bent backward like a hook, apex reaching the base of segment XI (Fig. 19). Male genitalia as in Fig. 20, volsella with setae and slightly truncate apically, parallel spines elongate without setae, penis valve rounded apically.

Remarks. This species is similar to *S. baronii* by a basal band of clypeus (Fig. 16), metasomal sternum II with a long median longitudinal furrow basally (Fig. 22), and propodeal concavity with a median longitudinal carina (Fig. 21). It is different from *S. baronii* and other members of the genus in the following characters: anterior surface of pronotum with wider V-shaped median foveae (Fig. 18), punctures on apex of metasomal tergum II sparser (Fig. 45), and male volsella of genitalia narrower and slightly truncate apically than the corresponding parts in *S. baronii* (Figs 20, 41).

Distribution. China (Yunnan).

Etymology. The specific name *similibaronii* is a Latin adjective which refers to the similar species of *S. baronii*.

---

**Stenodynerus strigatus** Ma & Li, sp. n.

http://zoobank.org/45B4C174-8CAA-4972-8642-91F292686599

Figs 23–29

Material examined. Holotype, ♀, China, Shaanxi Prov., Ankang City, Langao County, Huanli Town, 32°12’52.77”N, 109°0’17.90”E, 1808 m, 7.VIII.2015, Yan Peng & Wenkai Zhou, No. 1004075 (CQNU).

Description. Female (Figs 23–29): body length 8.3 mm, forewing length 7.7 mm. Black; the following spots yellow: a basal transverse median spot and two small obscure apical spots on clypeus (Fig. 24), inter-antennal spot, and scape ventrally; small postocular spot, pronotal dorsum except posterior apex, mesepisternal spot, parategula, metanotum largely (Fig. 27), apical bands on metasomal terga I–II and sternum II, and a long band on fore and mid tibiae dorsally ferruginous; tegula brown.

Head. Clypeus convex medially, moderately punctate, somewhat reticulate, with sparse and short setae, its width more than length (width 1.25 × length), apex slightly emarginated, apical width: emargination depth = 0.29: 0.06, total width: apical width = 1.02: 0.29 (Fig. 24); frons and vertex densely punctate, with short setae; cephalic fovea obsolete.

Mesosoma. Masosoma densely punctate and reticulate, punctures generally larger than those on the head; punctures on pronotal dorsum denser than those on others
Figures 23–29. Female of *Stenodynerus strigatus* Ma & Li, sp. n. 23 habitus of holotype (dorsal view) 24 clypeus 25 anterior surface of pronotum 26 metasomal tergum 1 (dorsal view) 27 metanotum and propodeum 28 metasomal (ventral view) 29 metasoma (dorsal view).
parts of the masosoma (Fig. 23). Anterior surface of pronotum sloping, shining, with few punctures and a pair of round separated median foveae, the interspace between these two median foveae much more than one diameter, pronotal carina complete (Fig. 25); scutellum distinctly convex; metanotum nearly vertical; dorsal and lateral surfaces of propodeum reticulate-punctate, dorsal surface narrow with a weak shelf, posterior surface concave with long and transverse rugae and a median longitudinal carina (Fig. 27).

Metasoma. In dorsal view, tergum I campanulate, coarsely punctate, width 1.58 × length and 0.81 × width of tergum II, anterior surface vertical, almost impunctate, and with a median longitudinal carina and two transverse striations (Fig. 26); tergum II with smaller and sparser punctures than tergum I, and with a broad reflex apical lamella, dense and deep punctures forming a wide transverse groove on the base of lamella (Fig. 29); sternum II sparsely punctate, without a median longitudinal furrow basally, and its anterior surface almost vertical (Fig. 28).

Male. Unknown.

Remarks. This species is similar to *S. pappi* by a median longitudinal carina on propodeal concavity (Fig. 27), anterior vertical surface of tergum I with a longitudinal median carina in upper half (Fig. 26), and tergum II with a broad reflex apical lamella (Fig. 29). It is different from *S. pappi* and other members of the genus in the following characters: a transverse median spot and two obscure apical spots on clypeus basally yellow (Fig. 24), pronotal dorsum mostly ferruginous (Fig. 25), the interspace of pronotal median foveae much more than one fovea diameter (Fig. 25), anterior vertical surface of tergum I with two transverse striations (Fig. 26), and sternum II without a median longitudinal furrow basally, and its anterior surface almost vertical (Fig. 28).

Distribution. China (Shaanxi).

Etymology. The specific name is the Latin adjective *strigatus*, which refers to the anterior vertical surface of tergum I with two transverse striations.

### Stenodynerus tenuilamellatus Ma & Li, sp. n.

http://zoobank.org/3691DE51-0508-4583-913B-C873FC5E66AD

Material examined. Holotype, ♀, China, Yunnan Prov., Baoshan City, Tengchong County, Zhonghe Village, 25°31'55.10"N, 98°23'44.21"E, 1663 m, 29.VII.2015, Zenghui Huang & Siyu Xie, No. 1004076 (CQNU). Paratype: 1 ♀, China, Yunnan Prov., Baoshan City, Tengchong County, Jietou Village, 25°25'11.18"N, 98°39'42.75"E, 1631 m, 15.VII.2006, Li Ma, No. 1004077 (CQNU).

Description. Female (Figs 30–36): body length 8.0 mm, forewing length 6.7 mm. Black; a minute spot on clypeus basally, inter-antennal spot, and scape ventrally yellow; with the following parategula, metanotum except posterior apex ventrally, apical bands on metasomal terga I–II and sternum II, and the dorsal surface of fore femur; tegula brown.
Figures 30–36. Female of *Stenodynerus tenuilamellatus* Ma & Li, sp. n. 30 habitus of holotype (dorsal view) 31 clypeus 32 anterior surface of pronotum 33 metasomal tergum I (dorsal view) 34 metanotum and propodeum 35 metasomal (ventral view) 36 metasoma (dorsal view).
Head. Clypeus convex medially with sparse punctures and setae, its width somewhat more than length (width 1.08 × length), apex slightly emarginated, apical width: emargination depth = 0.26: 0.07, total width: apical width = 0.96: 0.26 (Fig. 31); frons and vertex densely punctate and reticulate, with short setae; cephalic fovea obsolete.

Mesosoma. Masosoma densely punctate and reticulate, punctures generally larger than those on the head; punctures on pronotal dorsum denser than those on other parts of the masosoma (Fig. 30). Anterior surface of pronotum somewhat sloping, with a few punctures and a pair of round separated median foveae, the interspace between two median foveae almost equal to one fovea diameter, pronotal carina complete (Fig. 32); scutellum distinctly convex; metanotum nearly vertical; dorsal and lateral surfaces of propodeum reticulate-punctate; dorsal surface narrow with a moderate shelf; posterior surface concave with long and transverse rugae and a median longitudinal carina (Fig. 34).

Metasoma. In dorsal view, tergum I campanulate, coarsely punctate, width 1.59 × length and 0.81 × width of tergum II, anterior surface vertical, almost impunctate, and with a median longitudinal carina in upper half (Fig. 33); tergum II with smaller and sparser punctures than tergum I, and with a narrow reflex apical lamella, a row of deep and dense punctures forming a narrow transverse groove on the base of lamella (Fig. 36); sternum II sparsely punctate, without a median longitudinal furrow basally, and its anterior surface vertical (Fig. 35).

Male. Unknown.

Remark. This species is similar to *S. pappi* by a median longitudinal carina on propodeal concavity (Fig. 34), and anterior vertical surface of tergum I with a longitudinal median carina in upper half (Fig. 33). It is different from *S. pappi* and other members of the genus in the following characters: clypeus with a minute spot basally (Fig. 31); propodeal shelf moderately (Fig. 34); apical lamella of metasomal tergum II distinctly narrower than that of *S. pappi* (Figs 36, 82), and sternum II without a median longitudinal furrow basally, and its anterior surface vertical (Fig. 35).

Distribution. China (Yunnan).

Etymology. The specific name *tenuilamellatus* is derived from two Latin words: *tenuis* (= narrow) and *lamellatus* (= lamella), which refers to metasomal tergum II with a narrow apical lamella.

Figures 56–59. Female of *Stenodynerus pullus*. 56 clypeus 57 anterior surface of pronotum 58 metasomal (ventral view) 59 metasomal (dorsal view).
**Diagnosis.** Cephalic fovea obsolete; clypeus black, medially convex, with small punctures (Fig. 56); pronotal dorsum with a pair of spots, anterior surface almost vertical, with a few small punctures, median foveae V-shaped, pronotal carina complete (Fig. 57); propodeum without shelf, propodeal concavity with a very short median longitudinal carina; metasomal tergum II without a distinct apical lamella (Fig. 59); sternum II with a very short median longitudinal furrow basally, and its anterior surface sloping (Fig. 58).

**Distribution.** China (new record: Inner Mongolia), Turkey, Russia, Mongolia, Korea.

*Stenodynerus tergitus* Kim, 1999, new record
Figs 60–62

*Stenodynerus tergitus* Kim, 1999: 349, 352; Kim and Yamane 2004: 238-239, 250.

**Material examined.** 1♀3♂, China, Shaanxi, Prov., Weinan City, Luonan County, Mantoushan, 8.VIII.2012, Xin Zhou & Cheng Yang.

**Diagnosis.** Cephalic fovea small and shallow, width less than the distance between posterior ocelli; clypeus black, medially convex, its width somewhat more than length; anterior surface of pronotum sloping, with a few small punctures, median foveae V-shaped, prontal carina complete (Fig. 60); tergum II with a broad reflex lamella apically, deep and dense punctures forming a broad transverse groove on the base of lamella (Fig. 61); sternum II with a median longitudinal furrow basally, and its anterior surface sloping (Fig. 62).

**Distribution.** China (new record: Shaanxi), Korea.

*Stenodynerus chinensis chinensis* (de Saussure, 1863)
Figs 63–68

*Odynerus chinensis* de Saussure, 1863: 230; von Schulthess 1934: 91; van der Vecht 1967: 32; Opinion 1970: 187, 189–191.

Figures 63–68. Female of Stenodynerus chinensis chinensis. 63 habitus (dorsal view) 64 clypeus 65 anterior surface of pronotum 66 metanotum and propodeum 67 apex of metasomal tergum II 68 metasomal (ventral view).

Diagnosis. Almost whole body covered with large and dense punctures, strongly sculptured (Fig. 63). Cephalic fovea small and shallow, width less than the distance between posterior ocelli; basal half of clypeus yellow, with sparse punctures (Fig. 64); anterior surface of pronotum sloping, with distinct and strong punctures, median foveae V-shaped (Fig. 65); propodeal shelf weak, posterior surface concave, with a median longitudinal carina in lower half (Fig. 66); metasomal tergum II without a distinct apical lamella, apex with deep punctures (Fig. 67); sternum II with a long median longitudinal furrow basally, and its anterior surface sloping (Fig. 68).
**Distribution.** China (Hebei, Sichuan; Shannxi, Henan, Yunnan, Chongqing, Guizhou, Taiwan).

**Stenodynerus copiosus** Gusenleitner, 2012

*Stenodynerus copiosus* Gusenleitner, 2012: 1132–1134.

**Material examined.** No specimens examined.

**Diagnosis.** Male: clypeus yellow, with small punctures, its width almost equal to length; pronotal carina interrupted medially; metasomal tergum II without a distinct apical lamella; sternum II with a median longitudinal furrow basally; female: unknown (Gusenleitner, 2012).

**Distribution.** China (Shanxi, Shaanxi).

**Stenodynerus frauenfeldi** (de Saussure, 1867)

Figs 69–72

**Diagnosis.** Body strongly sculptured, with large and strong punctures, and extensive spots (Figs 69–72). Cephalic fovea almost obsolete; anterior surface of pronotum vertical, median foveae shallow and slightly U-shaped, a few long parallel transverse carinae above median foveae, pronotal carina complete (Fig. 69); propodeal shelf weak (Fig. 70); metasomal tergum II without a distinct apical lamella (Fig. 71); median longitudinal furrow on metasomal sternum II basally weak, even obsolete, and its anterior surface sloping (Fig. 72).

**Distribution.** China (Sichuan, Jilin, Shaanxi, Chongqing, Guizhou, Jiangxi), Russia, Korea, Japan.
A taxonomic account of the genus Stenodynerus from China, with descriptions...

Stenodynerus funebris (André, 1884)
Figs 73–76

Odynerus funebris André, 1884: 729; Blüthgen 1955: 412.
Odynerus limbonatatus: Kostylev, 1940: 28.
Stenodynerus funebris: van der Vecht and Fischer 1972: 67; Gusenleitner 1981: 219, 243; Kim 1999: 347, 349, 350; Kim and Yamane 2004: 239, 255.

Material examined. 1 ♀ 1 ♂, China, Jilin Prov., Yanji City, Xiaoying Town, Minzhu Village, 3.VII.2012, Xin Zhou & Ju You.

Diagnosis. Body obviously black (Fig. 73), only with the following spots yellow: mandibular basally, scape ventrally, inter-antennal spot, a minute post-ocular spot, pronotum sometimes with a pair of small spots, apical bands on metasomal terga I–II and sternum II, a long band on fore tibiae dorsally; cephalic fovea small and shallow, width less than the distance between posterior ocelli; clypeus medically convex, apex moderately emarginated (Fig. 74); anterior surface of pronotum almost vertical, with V-shaped median foveae, pronotal carina complete (Fig. 75); propodeal shelf developed, posterior surface concave, with a very short median longitudinal carina in lower portion (Fig. 76); median longitudinal furrow on metasomal sternum II basally weak, even obsolete, and its anterior surface sloping.

Distribution. China (Shanxi, Jilin), Korea, Russia.

Stenodynerus incurvitus Gusenleitner, 2003

Stenodynerus incurvitus Gusenleitner, 2003: 855.

Material examined. No specimens examined.

Diagnosis. Clypeus yellow basally, with short setae, its width equal to its length; cephalic fovea comparatively larger, width more than the distance between posterior ocelli; propodeal concavity almost smooth; metasomal tergum II without a distinct apical lamella, punctures on apex deep; sternum II with a median longitudinal furrow basally, and its anterior surface sloping (Gusenleitner 2003).

Distribution. China (Taiwan).

Stenodynerus morawitzi Kurzenko, 1977

Stenodynerus morawitzi Kurzenko, 1977: 554; Gusenleitner 1981: 219, 266.

Material examined. No specimens examined.

Diagnosis. Clypeus yellow, with small punctures, its width somewhat more than length, apex deeply emarginated; pronotoal carina interrupted medially; tergum II with
Figures 73–76. Female of *Stenodynerus funebris*. 73 habitus (dorsal view) 74 clypeus 75 anterior surface of pronotum 76 metanotum and propodeum.

a broad reflex lamella apically. In male, metasomal terga I–VII and sterna II–III with yellow apical bands (Gusenleitner 1981).

**Distribution.** China (Inner Mongolia).

*Stenodynerus morbillosus* Giordani Soika, 1979

*Stenodynerus morbillosus* Giordani Soika, 1979: 250; Gusenleitner 1981: 220, 286.

**Material examined.** No specimens examined.

**Diagnosis.** Larger species, body length generally more than 10 mm. Clypeus yellow; pronotal carina less developed; metasomal tergum II without a distinct apical lamella; sternum II with a short median longitudinal furrow basally (Giordani Soika 1979; Gusenleitner 1981).

**Distribution.** China (northeast).
**Stenodynerus nudus** (Morawitz, 1889)

*Lionotus nudus* Morawitz, 1889: 164; Morawitz 1895: 463; von Schulthess 1934: 91.  
*Nannodynerus nudus*: Blüthgen 1942: 320.  
*Stenodynerus nudus*: van der Vecht and Fischer 1972: 68; Gusenleitner 1981: 219, 271.

**Material examined.** No specimens examined.

**Diagnosis.** Clypeus yellow except margin, with sparse and shallow punctures, its width much more than its length; metasomal tergum II without a distinct apical lamella; anterior surface of metasomal sternum II vertical. Metasomal terga I–V and sternae II–III with yellow apical bands (Gusenleitner 1981).

**Distribution.** China (Inner Mongolia), Turkmenistan, Kazakhstan, Mongolia.

**Stenodynerus pappi luteifasciatus** Kim & Yamane, 2004

*Stenodynerus pappi luteifasciatus* Kim & Yamane, 2004: 235, 238, 245.

**Material examined.** No specimens examined.

**Diagnosis.** The species differs from *S. p. pappi* as follows: body with extensive orange-yellow spots; a broad band on pronotal dorsum and almost entire metanotum orange-yellow; punctures on anterior surface of pronotum sparser, apical band on tergum I broader and reflex apical lamella of metasomal tergum II narrower than the corresponding parts in *S. p. pappi* (Kim and Yamane 2004).

**Distribution.** China (Taiwan).

**Stenodynerus pappi pappi** Giordani Soika, 1976  
Figs 77–82

*Stenodynerus pappi* Giordani Soika, 1976: 290–291; Gusenleitner 1981: 219, 298; Kim 1999: 204; Kim and Yamane 2004: 237, 242.  
*Parancistrocerus ussuriensis* Kurzenko, 1982 (1981): 117–122.

**Material examined.** 2♀, China, Shaanxi prov., Baoji City, Taibai County, Taochuan town, 12.VIII.2015, Zhenxia Ma & Yan Peng; 1♀, China, Shaanxi prov., Yanan City, Huanglong County, Shibao Town, 2.VIII.2012, Xin Zhou; 1♀, China, Shaanxi prov., Weinan City, Hua County, Jindui Town, 7.VIII.2012, Ju You & Yuan Bai; 1♀, China, Chongqing, Shizhu County, Huangshui Town, 12.VIII.2008, Bin Chen & Tingjing Li.

**Diagnosis.** Cephalic fovea small and shallow, width less than the distance between posterior ocelli; clypeus black, sparsely punctate, with sparse setae, its width more than length (Fig. 77); anterior surface of pronotum sloping, with distinct punctures and

a pair of round contiguous median foveae, the interspace between these two median foveae less than one diameter, pronotal carina obsolete (Fig. 80); propodeal shelf developed, posterior surface concave, with a long median longitudinal carina (Fig. 81); anterior surface of metasomal tergum I vertical, almost impunctate, and with a median longitudinal carina in upper half (Fig. 78); metasomal tergum II with a broad reflex lamella apically, dense and deep punctures forming a wide transverse groove on the base of lamella (Fig. 82); sternum II with a short median longitudinal furrow basally, and its anterior surface sloping (Fig. 79).

**Distribution.** China (Zhejiang, Jiangxi, Shaanxi, Chongqing, Taiwan), Korea.

*Stenodynerus taiwanus* Kim & Yamane, 2004

*Stenodynerus taiwanus* Kim & Yamane, 2004: 235, 237, 241.

**Material examined.** No specimens examined.

**Diagnosis.** Anterior surface of pronotum distinctly punctate, with a pair of round contiguous median foveae, pronotal carina weak; propodeal shelf absent, posterior surface
A taxonomic account of the genus *Stenodynerus* from China, with descriptions...

concave, with a median longitudinal carina lost in upper half; anterior surface of meta-
somal tergum I almost impunctate, dorsal surface with weak and sparse punctures, the
interspaces between punctures more than one diameter. Whole body with sparse and long
setae (Kim and Yamane, 2004).

**Distribution.** China (Taiwan).

---

**Key to the Chinese species of the genus *Stenodynerus***

The characters are applicable to both sexes unless the sex is specified.

1. Metasomal tergum II with a lamella apically (Figs 13, 29, 36, 61, 82) ....... 2
   – Metasomal tergum II without a lamella apically (Figs 5, 44, 45, 50, 55, 59, 67, 71)............................. 8

2. Anterior surface of metasomal tergum I vertical, with few punctures and a
   median longitudinal carina in upper half (Figs 10, 26, 33, 78).............. 3
   – Anterior surface of metasomal tergum I with strong punctures, not vertical
   and somewhat rounded, without a median longitudinal carina.................. 7

3. Metasomal tergum II with a broad reflex lamella apically, the transverse
   groove on the base of lamella wider (Figs 13, 29, 82).............................. 4
   – Metasomal tergum II with a narrow reflex lamella apically, the transverse
   groove on the base of lamella narrower (Fig. 36).... *S. tenuilamellatus* sp. n.

4. In female, clypeus black (Fig. 77); in profile, anterior surface of metasomal
   sternum II sloping (Fig. 79)............................................................. *S. pappi*, 5
   – In female, clypeus with yellow or ferruginous spots (Figs 8, 24); in profile,
   anterior surface of metasomal sternum II vertical (Figs 12, 28)............... 6

5. Body with yellow spots; pronotum with a pair of small spots dorsally (Fig.
   80), metanotum with a yellow band anteriorly (Fig. 81), tergum I with a nar-
   rower apical band (Fig. 78)......................................................... *S. pappi pappi* Giordani Soika
   – Body with orange yellow spots; pronotal dorsum with a broad band, metano-
   tum almost entire orange yellow, tergum I with a broader apical band (Kim
   and Yamane2004).......................................................... *S. pappi luteifasciatus* Kim & Yamane

6. Anterior surface of pronotum with distinct punctures, the interspace be-
   tween median foveae less than one fovea diameter (Fig. 9); propodeal shelf
   developed (Fig. 11); anterior vertical surface of tergum I without a transverse
   striaion (Fig. 10); sternum II with a very short median longitudinal furrow
   basally (Fig. 12)............................................................................. *S. reflexus* sp. n.
   – Anterior surface of pronotum with few punctures, the interspace between me-
   dian foveae more than one fovea diameter (Fig. 25); propodeal shelf weak (Fig.
   27); anterior vertical surface of tergum I with two transverse striations (Fig. 26);
   sternum II without a median longitudinal furrow basally (Fig. 28)..........
   ............................................................................................. *S. strigatus* sp. n.

7. In female, clypeus yellow; in male, metasomal terga I–VII and sterna II–III
   with yellow apical bands (Giordani Soika 1981)..... *S. morawitzi* Kurzenko
– In female, clypeus black; in male, metasomal terga I–II and sternum II with yellow apical bands ...........................................\textit{S. tergitus} Kim (new record)

8 Larger species, body length generally more than 10 mm (Giordani Soika 1979; Giordani Soika 1981) ................................. \textit{S. morbillosus} Giordani Soika

– Smaller species, body length generally less than 10 mm ................. 9

9 Apical bands of metasomal terga I–V yellow or orange-yellow .............. 10

– Apical bands of metasomal terga I–II yellow or ferruginous .............. 11

10 In profile, anterior surface of metasomal sternum II sloping (Fig. 53) ...........

...................................................\textit{S. nepalensis} Giordani Soika (new record)

– In profile, anterior surface of metasomal sternum II vertical (Gusenleitner 1981) ................................................................. \textit{S. nudus} (Morawitz)

11 Propodeal concavity almost smooth (Gusenleitner 2003) ......................

.................................................................\textit{S. incurvitus} Gusenleitner

– Propodeal concavity with long and transverse rugae ...................... 12

12 Anterior surface of pronotum with a pair of round contiguous median foveae; anterior surface of metasomal tergum I almost impunctate (Kim and Yamane 2004) ........................................... \textit{S. taiwanus} Kim & Yamane

– Pronotal median foveae contiguous and forming U-shaped or V-shaped; anterior surface of metasomal tergum I with strong punctures (Figs 5, 59, 71) ................................ 13

13 Pronotal median foveae shallow and slightly U-shaped (Fig. 69) ..............

......................................................\textit{S. frauenfeldi} (de Saussure)

– Pronotal median foveae distinct and V-shaped (Figs 3, 18, 40, 48, 57, 65, 75) ........................................................................................................ 14

14 Clypeus with yellow or ferruginous spots; metasomal sternum II with a long median longitudinal furrow basally .................................. 15

– Clypeus black; metasomal sternum II with a very short median longitudinal furrow basally, sometimes obsolete .............................. 18

15 Body with large and dense punctures, strongly sculptured (Fig. 63); anterior surface of pronotum sloping, and with distinct and strong punctures (Fig. 65) ........................................ \textit{S. chinensis chinensis} (de Saussure, 1863)

– Body with comparatively smaller punctures, moderately sculptured; anterior surface of pronotum almost vertical, with few punctures (Figs 3, 18, 40) ................... 16

16 Clypeus strongly punctate (Fig. 2); apex of ocular sinus pale ferruginous; pronotal carina complete ......................................................\textit{S. ningliangensis} sp. n.

– Clypeus moderately punctate (Figs 16, 39); apex of ocular sinus black; pronotal carina interrupted medially .......................................................... 17

17 Anterior surface of pronotum with wider V-shaped median foveae (Fig. 18); apex of metasomal tergum II with somewhat shallower and sparser punctures (Fig. 45); in male, volsella slightly truncate apically (Fig. 20) ................................ \textit{S. similibaronii} sp. n.

– Anterior surface of pronotum with narrower V-shaped median foveae (Fig. 40); apex of metasomal tergum II with strongly deep and dense punctures (Fig. 44); in male, volsella with rounded apically (Figs 38, 41) ........................................ \textit{S. baronii} Giordani Soika (new record)

18 Body with pale yellow spots; metasomal sternum II black except lateral surface (Fig. 49); metasomal tergum II slightly punctate (Fig. 50); sternum II without a median longitudinal furrow basally (Fig. 49)..........................
S. bluethgeni van der Vecht (new record)
– Body with yellow spots; metasomal sternum II with a narrow apical band (Fig. 58); metasomal tergum II strongly punctate (Figs 59, 73); sternum II with a very short median longitudinal furrow basally (Fig. 58) ................

19 Anterior surface with a few short transverse carinae above median foveae (Fig. 75); propodeal shelf developed (Fig. 76) .....................S. funebris (André)
– Anterior surface without a transverse carina above median foveae (Fig. 57); propodeal shelf obsolete .....................S. pullus Gusenleitner (new record)

Acknowledgements

We are very grateful to Prof. James M. Carpenter (American Museum of Natural History, New York, USA) for providing copies of many references and important comments and to Dr. P. Girish Kumar (Hymenoptera Section, Zoological Survey of India, Kolkata, India) for copies of many references. We also express our hearty thanks to Prof. Meicai Wei (Central South University of Forestry and Technology, Changsha, China) and Prof. Qiang Li (Yunnan Agricultural University, Kunming, China) for providing the specimens deposited in their Insect Collection. This study was funded by the National Natural Science Foundation of China (Nos: 31372247, 31000976, 31372265), Chongqing Science and Technology Commission (cstc2013jcyjA80015), Young Talent Incubation Program of Chongqing Normal University (14CSDG07), and the Par-Eu Scholars Program.
