Abstract

For an abelian category \( A \), we establish the relation between its derived and extension dimensions. Then for an artin algebra \( \Lambda \), we give the upper bounds of the extension dimension of \( \Lambda \) in terms of the radical layer length of \( \Lambda \) and certain relative projective (or injective) dimension of some simple \( \Lambda \)-modules, from which some new upper bounds of the derived dimension of \( \Lambda \) are induced.

1 Introduction

Given a triangulated category \( T \), Rouquier introduced in [20, 21] the dimension \( \dim T \) of \( T \) under the idea of Bondal and van den Bergh in [7]. This dimension and the infimum of the Orlov spectrum of \( T \) coincide, see [11, 13]. Roughly speaking, it is an invariant that measures how quickly the category can be built from one object. This dimension plays an important role in representation theory. For example, it can be used to compute the representation dimension of artin algebras ([20, 15]). Many authors have studied the upper bound of \( \dim T \), see [4, 6, 8, 10, 17, 20, 21, 24] and so on.

There are a lot of triangulated categories having infinite dimension; for instance, Oppermann and Šťovíček proved in [17] that all proper thick subcategories of the bounded derived category of finitely generated modules over a Noetherian algebra containing perfect complexes have infinite dimension. Let \( \Lambda \) be an artin algebra and \( \text{mod} \Lambda \) the category of finitely generated right \( \Lambda \)-modules. It was proved in [21, Propositions 7.37 and 7.4] that the dimension of the bounded derived category \( D^b(\text{mod} \Lambda) \) is at most

\[
\min \{\text{LL}(\Lambda) - 1, \text{gl.dim} \Lambda\},
\]

where \( \text{LL}(\Lambda) \) and \( \text{gl.dim} \Lambda \) are the Loewy length and global dimension of \( \Lambda \) respectively.

As an analogue of the dimension of triangulated categories, the (extension) dimension \( \text{ext.dim} \mathcal{A} \) of an abelian category \( \mathcal{A} \) was introduced by Beligiannis in [5], also see [9]. Let \( \Lambda \) be an artin algebra. Note that the representation dimension of \( \Lambda \) is at most two (that is, \( \Lambda \) is of finite representation type) if and only if \( \text{ext.dim} \mod \Lambda = 0 \) ([5]). So, like the representation dimension of \( \Lambda \), the extension dimension \( \text{ext.dim} \mod \Lambda \) is also an invariant that measures how far \( \Lambda \) is from of finite representation type. It was proved in [5, 25] that \( \text{ext.dim} \mod \Lambda \leq \min \{\text{LL}(\Lambda) - 1, \text{gl.dim} \Lambda\} \), which is a counterpart of the above result of Roquier. In [24, 25], we obtained many upper bounds of \( \dim D^b(\text{mod} \Lambda) \) and \( \text{ext.dim} \mod \Lambda \) in terms of the radical layer length of \( \Lambda \) and the projective (or injective) dimension of some simple \( \Lambda \)-modules, such that the upper bounds \( \text{LL}(\Lambda) - 1 \) and \( \text{gl.dim} \Lambda \) are special cases.

In this paper, for an abelian category $\mathcal{A}$, we establish the relation between the dimensions of $\mathcal{A}$ and the bounded derived category $D^b(\mathcal{A})$ of $\mathcal{A}$. Then for an artin algebra $\Lambda$, we give the upper bounds of $\text{ext.dim} \mod \Lambda$ in terms of the radical layer length of $\Lambda$ and certain relative projective (or injective) dimension of some simple $\Lambda$-modules, from which some new upper bounds of $\dim D^b(\mod \Lambda)$ are induced.

The paper is organized as follows.

In Section 2, we give some terminology and some preliminary results.

Let $\mathcal{A}$ be an abelian category. The dimensions of $D^b(\mathcal{A})$ and $\mathcal{A}$ are usually called the derived and extension dimensions of $\mathcal{A}$, and denoted by $\text{der.dim} \mathcal{A}$ and $\text{ext.dim} \mathcal{A}$ respectively. In Section 3, we get that $\text{der.dim} \mathcal{A} \leq 2 \text{ext.dim} \mathcal{A} + 1$ (Theorem 3.3). Let $\Lambda$ be an artin algebra and $V$ a certain class of simple $\Lambda$-modules. Then for a subcategory $X$ of $\mod \Lambda$ of finite type, we give an upper bound of $\text{ext.dim} \mod \Lambda$ in terms of the $X$-projective (or $X$-injective) dimension of $V$ and the radical layer length of $\Lambda$ (Theorem 3.12). Combining this result with Theorem 3.3, we get some new upper bounds of $\text{der.dim} \mod \Lambda$ (Theorem 3.18).

In Section 4, we give two examples to illustrate that in some cases, the upper bounds obtained in this paper are more precise, even arbitrarily smaller, than that in the literature known so far, and that we may obtain the exact value of the derived dimension of some certain algebras.

## 2 Preliminaries

Throughout this paper, $\mathcal{A}$ is an abelian category and all subcategories of $\mathcal{A}$ involved are full, additive and closed under isomorphisms and direct summands, and all functors between categories are additive.

For a subclass $\mathcal{U}$ of $\mathcal{A}$, we use $\text{add} \mathcal{U}$ to denote the subcategory of $\mathcal{A}$ consisting of direct summands of finite direct sums of objects in $\mathcal{U}$.

### 2.1 The extension dimension of an abelian category

Let $\mathcal{U}_1, \mathcal{U}_2, \cdots, \mathcal{U}_n$ be subcategories of $\mathcal{A}$. Define

$$\mathcal{U}_1 \bullet \mathcal{U}_2 := \text{add} \{ A \in \mathcal{A} \mid \text{there exists an exact sequence } 0 \rightarrow U_1 \rightarrow A \rightarrow U_2 \rightarrow 0 \text{ in } \mathcal{A} \text{ with } U_1 \in \mathcal{U}_1 \text{ and } U_2 \in \mathcal{U}_2 \}.$$

For any subcategories $\mathcal{U}, \mathcal{V}$ and $\mathcal{W}$ of $\mathcal{A}$, by [9, Proposition 2.2] we have

$$(\mathcal{U} \bullet \mathcal{V}) \bullet \mathcal{W} = \mathcal{U} \bullet (\mathcal{V} \bullet \mathcal{W}).$$

Inductively, we define

$$\mathcal{U}_1 \bullet \mathcal{U}_2 \bullet \cdots \bullet \mathcal{U}_n := \text{add} \{ A \in \mathcal{A} \mid \text{there exists an exact sequence } 0 \rightarrow U \rightarrow A \rightarrow V \rightarrow 0 \text{ in } \mathcal{A} \text{ with } U \in \mathcal{U}_1 \text{ and } V \in \mathcal{U}_2 \bullet \cdots \bullet \mathcal{U}_n \}.$$

For a subcategory $\mathcal{U}$ of $\mathcal{A}$, set $[\mathcal{U}]_0 = 0$, $[\mathcal{U}]_1 = \text{add} \mathcal{U}$, $[\mathcal{U}]_n = [\mathcal{U}]_1 \bullet [\mathcal{U}]_{n-1}$ for any $n \geq 2$, and $[\mathcal{U}]_\infty = \bigcup_{n \geq 0} [\mathcal{U}]_n$ (5).

**Definition 2.1.** ([5]) The extension dimension $\text{ext.dim} \mathcal{A}$ of $\mathcal{A}$ is defined to be

$$\text{ext.dim} \mathcal{A} := \inf \{ n \geq 0 \mid \mathcal{A} = [\mathcal{A}]_{n+1} \text{ with } A \in \mathcal{A} \},$$

or $\infty$ if no such an integer exists.
The following lemma is used frequently in the sequel.

**Lemma 2.2.** ([25 Corollary 2.3(1)]) For any $A_1, A_2 \in \mathcal{A}$ and $m, n \geq 1$, we have

$$[A_1]_m \bullet [A_2]_n \subseteq [A_1 \oplus A_2]_{m+n}.$$ 

### 2.2 The dimension of a triangulated category

Let $\mathcal{T}$ be a triangulated category and $\mathcal{I} \subseteq \text{Ob} \mathcal{T}$. Let $\langle \mathcal{I} \rangle_1$ be the full subcategory of $\mathcal{T}$ consisting of all direct summands of finite direct sums of shifts of objects in $\mathcal{I}$. Given two subclasses $\mathcal{I}_1, \mathcal{I}_2 \subseteq \text{Ob} \mathcal{T}$, we use $\mathcal{I}_1 \ast \mathcal{I}_2$ to denote the full subcategory of all extensions between them, that is,

$$\mathcal{I}_1 \ast \mathcal{I}_2 = \{ X \mid \text{there exists a distinguished triangle } X_1 \rightarrow X \rightarrow X_2 \rightarrow X_1[1] \text{ in } \mathcal{T} \text{ with } X_1 \in \mathcal{I}_1 \text{ and } X_2 \in \mathcal{I}_2 \}.$$ 

We write $\mathcal{I}_1 \circ \mathcal{I}_2 := \langle \mathcal{I}_1 \ast \mathcal{I}_2 \rangle_1$. Then for any subclasses $\mathcal{I}_1, \mathcal{I}_2$ and $\mathcal{I}_3$ of $\mathcal{T}$, we have

$$\langle \mathcal{I}_1 \circ \mathcal{I}_2 \rangle \circ \mathcal{I}_3 = \mathcal{I}_1 \circ (\mathcal{I}_2 \circ \mathcal{I}_3)$$

by the octahedral axiom. In addition, we write

$$\langle \mathcal{I} \rangle_0 := 0, \langle \mathcal{I} \rangle_1 := \langle \mathcal{I} \rangle \text{ and } \langle \mathcal{I} \rangle_{n+1} := \langle \mathcal{I} \rangle_n \circ \langle \mathcal{I} \rangle_1 \text{ for any } n \geq 1.$$

**Definition 2.3.** ([14] [15] [20])

1. The **dimension** $\dim \mathcal{T}$ of a triangulated category $\mathcal{T}$ is defined to be

$$\dim \mathcal{T} := \inf \{ n \geq 0 \mid \mathcal{T} = \langle T \rangle_{n+1} \text{ for some } T \in \mathcal{T} \},$$

or $\infty$ if no such an integer exists.

2. For a subcategory $\mathcal{C}$ of $\mathcal{T}$, the **dimension** of $\mathcal{C}$ is defined to be

$$\dim_{\mathcal{T}} \mathcal{C} := \inf \{ n \geq 0 \mid \mathcal{C} \subseteq \langle T \rangle_{n+1} \text{ for some } T \in \mathcal{T} \},$$

or $\infty$ if no such an integer exists.

3. For an abelian category $\mathcal{A}$, the bounded derived category $D^b(\mathcal{A})$ of $\mathcal{A}$ is a triangulated category. We call $\text{der.dim} \mathcal{A} := \dim D^b(\mathcal{A})$ the **derived dimension** of $\mathcal{A}$.

The following lemma is an analogue of Lemma 2.2.

**Lemma 2.4.** ([19 Lemma 7.3]) For any $T_1, T_2 \in \mathcal{T}$ and $m, n \geq 1$, we have

$$\langle T_1 \rangle_m \circ \langle T_2 \rangle_n \subseteq \langle T_1 \oplus T_2 \rangle_{m+n}.$$ 

### 2.3 Radical layer lengths and torsion pairs

We recall some notions from [?]. Let $\mathcal{C}$ be a **length-category**, that is, $\mathcal{C}$ is an abelian, skeletally small category and every object of $\mathcal{C}$ has a finite composition series. We use $\text{End}_Z(\mathcal{C})$ to denote the category of all additive functors from $\mathcal{C}$ to $\mathcal{C}$, and use $\text{rad}$ to denote the Jacobson radical lying in $\text{End}_Z(\mathcal{C})$. For any $\alpha \in \text{End}_Z(\mathcal{C})$, set the $\alpha$-**radical functor** $F_\alpha := \text{rad} \circ \alpha$. 
Definition 2.5. ([11] Definition 3.1]) For any \(\alpha, \beta \in \text{End}_Z(C)\), we define the \((\alpha, \beta)\)-layer length \(\ell\ell_{\alpha}^\beta : C \rightarrow \mathbb{N} \cup \{\infty\}\) via \(\ell\ell_{\alpha}^\beta(M) = \inf\{i \geq 0 \mid \alpha \circ \beta^i(M) = 0\}\); and the \(\alpha\)-radical layer length \(\ell\ell_{\alpha}^\beta := \ell\ell_{\alpha}^\beta\).

Lemma 2.6. ([24] Lemma 2.6]) Let \(\alpha, \beta \in \text{End}_Z(C)\). For any \(M \in C\), if \(\ell\ell_{\alpha}^\beta(M) = n\), then \(\ell\ell_{\alpha}^\beta(M) = \ell\ell_{\alpha}^{\beta^i}(M) + j\) for any \(0 \leq j \leq n\); in particular, if \(\ell\ell_{\alpha}^\beta(M) = n\), then \(\ell\ell_{\alpha}^\beta(F_\alpha^n(M)) = 0\).

Recall that a torsion pair (or torsion theory) for \(C\) is a pair of classes \((\mathcal{T}, \mathcal{F})\) of objects in \(C\) satisfying the following conditions.

1. \(\text{Hom}_C(M, N) = 0\) for any \(M \in \mathcal{T}\) and \(N \in \mathcal{F}\);
2. an object \(X \in \mathcal{C}\) is in \(\mathcal{T}\) if \(\text{Hom}_C(X, -)|_\mathcal{F} = 0\);
3. an object \(Y \in \mathcal{C}\) is in \(\mathcal{F}\) if \(\text{Hom}_C(-, Y)|_\mathcal{T} = 0\).

For a subfunctor \(\alpha\) of the identity functor \(1_C\), we write \(q_\alpha := 1_C/\alpha\). Let \((\mathcal{T}, \mathcal{F})\) be a torsion pair for \(C\). Recall that the torsion radical \(t\) is a functor in \(\text{End}_Z(C)\) such that

\[0 \rightarrow t(M) \rightarrow M \rightarrow q_\alpha(M) \rightarrow 0\]

is a short exact sequence and \(q_\alpha(M) = M/t(M) \in \mathcal{F}\).

2.4 Homologically finite subcategories

Let \(\Lambda\) be an artin algebra and \(\text{mod}\ \Lambda\) the category of finitely generated right \(\Lambda\)-modules. Let \(M, N \in \text{mod}\ \Lambda\). Recall that a homomorphism \(f : N \rightarrow M\) in \(\text{mod}\ \Lambda\) is called right minimal if every \(h \in \text{End}(N, \Lambda)\) such that \(fh = f\) is an automorphism. Let \(\mathcal{X}\) be a subcategory of \(\text{mod}\ \Lambda\) and \(M \in \text{mod}\ \Lambda\).

A homomorphism \(f : X \rightarrow M\) in \(\text{mod}\ \Lambda\) is called a right \(\mathcal{X}\)-approximation of \(M\) if \(X \in \mathcal{X}\) and the sequence \(\text{Hom}_\Lambda(X', f)\) is epic for any \(X' \in \mathcal{X}\). The category \(\mathcal{X}\) is called a contravariantly finite subcategory of \(\text{mod}\ \Lambda\) if each module in \(\text{mod}\ \Lambda\) admits a right \(\mathcal{X}\)-approximation. Dually, (minimal) left \(\mathcal{X}\)-approximations and covariantly finite subcategories are defined ([3]). If \(f : X \rightarrow M\) in \(\text{mod}\ \Lambda\) is a minimal right \(\mathcal{X}\)-approximation of \(M\) and \(n \geq 1\), then we write \(\Omega_{\mathcal{X}}^1(M) := \text{Ker} f\) and \(\Omega_{\mathcal{X}}^n(M) := \Omega_{\mathcal{X}}^1(\Omega_{\mathcal{X}}^{n-1}(M))\). Dually, if \(f : M \rightarrow X\) in \(\text{mod}\ \Lambda\) is a minimal left \(\mathcal{X}\)-approximation of \(M\), then we write \(\Omega_{\mathcal{X}}^{-1}(M) := \text{Coker} f\) and \(\Omega_{\mathcal{X}}^{-n}(M) := \Omega_{\mathcal{X}}^1(\Omega_{\mathcal{X}}^{-n-1}(M))\). In particular, \(\Omega_{\mathcal{X}}^0(M) := M\).

Recall that a subcategory \(\mathcal{X}\) of \(\text{mod}\ \Lambda\) is called resolving if \(\mathcal{X}\) contains all projective modules in \(\text{mod}\ \Lambda\), and \(\mathcal{X}\) is closed under extensions and kernels of epimorphisms; and \(\mathcal{X}\) is called coresolving if \(\mathcal{X}\) contains all injective modules in \(\text{mod}\ \Lambda\), and \(\mathcal{X}\) is closed under extensions and cokernels of monomorphisms.

Let \(M \in \text{mod}\ \Lambda\). If \(\mathcal{X}\) is a contravariantly finite and resolving subcategory of \(\text{mod}\ \Lambda\), then there exists an exact sequence

\[
\cdots \rightarrow X_n \xrightarrow{f_n} X_{n-1} \rightarrow \cdots \rightarrow X_1 \xrightarrow{f_1} X_0 \xrightarrow{f_0} M \rightarrow 0
\]

in \(\text{mod}\ \Lambda\) such that each \(X_i \rightarrow \text{Im} f_i\) is a (minimal) right \(\mathcal{X}\)-approximation of \(\text{Im} f_i\). In this case, we call this exact sequence a (minimal) \(\mathcal{X}\)-resolution of \(M\).

Let \(\mathcal{X}\) be a subcategory of \(\text{mod}\ \Lambda\) and \(M \in \text{mod}\ \Lambda\). If \(\mathcal{X}\) is contravariantly finite and resolving, then the \(\mathcal{X}\)-projective dimension \(\text{pd}_{\mathcal{X}} M\) of \(M\) is defined as \(\inf\{n \mid \Omega_{\mathcal{X}}^n(M) \in \mathcal{X}\}\), and set \(\text{pd}_{\mathcal{X}} M = \infty\) if no such an integer exists. Dually, if \(\mathcal{X}\) is covariantly finite and coresolving, then the \(\mathcal{X}\)-injective dimension \(\text{id}_{\mathcal{X}} M\) of \(M\) is defined as \(\inf\{n \mid \Omega_{\mathcal{X}}^{-n}(M) \in \mathcal{X}\}\), and set \(\text{id}_{\mathcal{X}} M = \infty\) if no such an integer exists. In particular, set \(\text{pd}_{\mathcal{X}} M = -1 = \text{id}_{\mathcal{X}} M\) if \(M = 0\).
3 Main results

3.1 A relation between the derived and extension dimensions

The following lemma is essentially contained in the proof of [10, Theorem].

**Lemma 3.1.** For any bounded complex \( X = (X_n, f_n)_{n \in \mathbb{Z}} \) over \( A \), we have

\[
X \in \left\langle \bigoplus_{n \in \mathbb{Z}} Y_n[n] \right\rangle_1 \circ \left\langle \bigoplus_{n \in \mathbb{Z}} Z_n[n] \right\rangle_1
\]

in \( D^b(A) \), where \( Y_n = \text{Ker} f_n \) and \( Z_n = \text{Im} f_n \) for any \( n \in \mathbb{Z} \), and both \( \bigoplus_{n \in \mathbb{Z}} Y_n[n] \) and \( \bigoplus_{n \in \mathbb{Z}} Z_n[n] \) have only finitely many nonzero summands.

We also need the following lemma.

**Lemma 3.2.**

1. For an object \( M \in A \), if \( M \in \langle T \rangle_{n+1} \) for some \( T \in A \), then \( M \in \langle T \rangle_{n+1} \) in \( D^b(A) \) with \( M \) and \( T \) stalk complexes in degree zero.

2. \( \dim_{D^b(A)} A \leq \min\{\text{der.dim } A, \text{ext.dim } A\} \).

**Proof.** (1) Let \( M \in \langle T \rangle_{n+1} \). Then we have the following exact sequence

\[
0 \rightarrow Y_i \rightarrow Z_{i-1} \oplus Z'_{i-1} \rightarrow Z_i \rightarrow 0
\]

in \( A \) with \( Z_0 = M, Y_i \in \langle T \rangle_1 \) and \( Z_i \in \langle T \rangle_1 \) for any \( 1 \leq i \leq n \). It induces a triangle

\[
\begin{array}{ccc}
Y_i & \rightarrow & Z_{i-1} \oplus Z'_{i-1} \\
& \rightarrow & Z_i \\
& \rightarrow & Y_i[1]
\end{array}
\]

in \( D^b(A) \) for any \( 1 \leq i \leq n \). Thus \( \langle Z_{i-1} \rangle_1 \subseteq \langle Y_i \rangle_1 \circ \langle Z_i \rangle_1 \) for any \( 1 \leq i \leq n \), and therefore

\[
M \in \langle Z_0 \rangle_1 \subseteq \langle Y_1 \rangle_1 \circ \langle Y_2 \rangle_1 \circ \cdots \circ \langle Y_n \rangle_1 \circ \langle Z_n \rangle_1 \subseteq \langle T \rangle_1 \circ \langle T \rangle_1 \circ \cdots \circ \langle T \rangle_1 \subseteq \langle T \rangle_{n+1}.
\]

(2) By (1) and Definition 2.3. \( \square \)

We establish a relation between the derived and extension dimensions of \( A \).

**Theorem 3.3.** We have

\[
\dim_{D^b(A)} A \leq \text{der.dim } A \leq 2 \dim_{D^b(A)} A + 1 \leq 2 \text{ext.dim } A + 1.
\]

**Proof.** By Lemma 3.2 (2), it suffices to prove \( \text{der.dim } A \leq 2 \dim_{D^b(A)} A + 1 \). Without loss of generality, suppose that \( \dim_{D^b(A)} A = m < \infty \) and \( A \subseteq \langle T \rangle_{m+1} \) for some \( T \in D^b(A) \). For any \( X \in D^b(A) \), by Lemma 3.1 we have

\[
X \in \left\langle \bigoplus_{n \in \mathbb{Z}} Y_n[n] \right\rangle_1 \circ \left\langle \bigoplus_{n \in \mathbb{Z}} Z_n[n] \right\rangle_1
\]

in \( D^b(A) \), where \( Y_n, Z_n \in A \) for any \( n \in \mathbb{Z} \), and \( \bigoplus_{n \in \mathbb{Z}} Y_n[n] \) and \( \bigoplus_{n \in \mathbb{Z}} Z_n[n] \) have only finitely many nonzero direct summands.
By Lemma 3.2, we have \( Z_\alpha[n] \in (T)_{m+1} \) and \( \oplus_{n \in \mathbb{Z}} Z_\alpha[n] \in (T)_{m+1} \), and then \( \oplus_{n \in \mathbb{Z}} Z_\alpha[n] \subseteq (T)_{m+1} \). Similarly, we have \( \oplus_{n \in \mathbb{Z}} Y_\alpha[n] \subseteq (T)_{m+1} \). It follows from Lemma 2.4 that \( X \subseteq (\oplus_{n \in \mathbb{Z}} Y_\alpha[n]) \subseteq (T)_{m+1} \) and \( \dim \Lambda = \deg X \). Thus \( \Lambda \) is a generator of \( \text{mod} \, \Lambda \).

Let \( \Lambda \) be an artin algebra. For simplicity, we write \( \dim \Lambda := \text{dim} \, \Lambda \) and \( \dim \Lambda := \text{der} \, \Lambda \).

Recall from [2] that the **representation dimension** \( \text{rep.dim} \, \Lambda \) of \( \Lambda \) is defined as

\[
\text{rep.dim} \, \Lambda := \begin{cases} 
\inf \{ \dim \, \text{End} \, \Lambda(M) \mid M \text{ is a generator-cogenerator for } \text{mod} \, \Lambda \} & \text{if } \Lambda \text{ is non-semisimple;}
1 & \text{if } \Lambda \text{ is semisimple}.
\end{cases}
\]

In [14, p.70], Oppermann posed an open question:

*Are there non-semisimple artin algebras \( \Lambda \), such that the equality holds in the inequality

\[
\text{rep.dim} \, \Lambda \geq \text{der} \, \Lambda?
\]

Let \( \Lambda \) be a non-semisimple artin algebra of finite representation type. It is well known that \( \text{rep.dim} \, \Lambda = 2 \).

By [10, Theorem], we have \( \text{der} \, \Lambda \leq 1 \). Thus, in this case, \( \text{rep.dim} \, \Lambda > \text{der} \, \Lambda \). Here, we give the following example in which \( \Lambda \) is of infinite representation type such that \( \text{rep.dim} \, \Lambda > \text{der} \, \Lambda \).

**Example 3.4.** Let \( \Lambda \) be the Beilinson algebra \( kQ/I \) with \( Q \) the quiver

\[
\begin{array}{ccccccc}
0 & \xrightarrow{x_0} & 1 & \xrightarrow{x_0} & 2 & \xrightarrow{x_0} & \cdots & n - 1 & \xrightarrow{x_0} & n \\
\downarrow{x_0} & & \downarrow{x_0} & & \downarrow{x_0} & & \cdots & \downarrow{x_0} & & \downarrow{x_0} \\
x_n & & x_n & & x_n & & \cdots & x_n & & x_n
\end{array}
\]

and \( I = (x_ix_j - x_jx_i) \) (where \( 0 \leq i, j \leq n \)) (see [16, Example 3.7]). Then \( \dim \, \Lambda = n \). From [16, Theorem 4.15] and its proof, we know that \( \text{rep.dim} \, \Lambda = n + 2 \) and \( \dim \text{mod} \, \Lambda \) \( \text{mod} \, \Lambda \) \( \geq n \). Then \( \text{ext.dim} \, \Lambda \geq n \) by Lemma 3.2. On the other hand, we have \( \text{ext.dim} \, \Lambda \leq \text{rep.dim} \, \Lambda - 2 = (n + 2) - 2 = n \) by [25, Corollary 3.6]. Thus \( \text{ext.dim} \, \Lambda = n \). Note that \( \dim \, \Lambda \leq \dim \, \Lambda = n \) (see [15, Lemma 2.11] or [21, Proposition 7.4]). Now Lemma 3.2 induces the following equality

\[
\dim \text{mod} \, \Lambda = \text{ext.dim} \, \Lambda = \text{der} \, \Lambda = \dim \, \Lambda = \dim \, \Lambda = \text{rep.dim} \, \Lambda - 2 = n.
\]

### 3.2 Syzygies and cosyzygies

Let \( M \in \mathcal{A} \). If \( \mathcal{A} \) has enough projective objects, then there exists an exact sequence

\[
\cdots \rightarrow P_1 \rightarrow \cdots \rightarrow P_1 \rightarrow P_0 \rightarrow M \rightarrow 0
\]

in \( \mathcal{A} \) with all \( P_i \) projective. We write \( \Omega^n(M) := \text{Im}(P_n \rightarrow P_{n-1}) \) for any \( n \geq 1 \). Dually, if \( \mathcal{A} \) has enough injective objects, then there exists an exact sequence

\[
0 \rightarrow M \rightarrow I^0 \rightarrow I^1 \rightarrow \cdots \rightarrow I^i \rightarrow \cdots
\]

in \( \mathcal{A} \) with all \( I^i \) injective. We write \( \Omega^{-n}(M) := \text{Im}(I^n \rightarrow I^{n-1}) \) for any \( n \geq 1 \). In particular, we write \( \Omega^0(M) := M \).
Lemma 3.5.

(1) If $\mathcal{A}$ has enough projective objects and

$$0 \to M \to X^0 \to X^1 \to \cdots \to X^n \to 0,$$

is an exact sequence in $\mathcal{A}$ with $n \geq 0$, then

$$M \in [\Omega^n(X^n)]_1 \cdot [\Omega^{n-1}(X^{n-1})]_1 \cdot \cdots \cdot [\Omega^1(X^1)]_1 \cdot [X^0]_1 \subseteq [\oplus_{i=0}^{n} \Omega^i(X^i)]_{n+1}.$$

(2) If $\mathcal{A}$ has enough injective objects and

$$0 \to X_n \to \cdots \to X_1 \to X_0 \to M \to 0,$$

is an exact sequence in $\mathcal{A}$ with $n \geq 0$, then

$$M \in [X_0]_1 \cdot [\Omega^{-1}(X_1)]_1 \cdot \cdots \cdot [\Omega^{-n}(X_n)]_1 \subseteq [\oplus_{i=0}^{n} \Omega^{-i}(X_1)]_{n+1}.$$

Proof. The assertion (1) is [4] Lemma 5.8, and (2) is dual to (1).

Lemma 3.6. Let $X, Y \in \mathcal{A}$ satisfy $[X]_{n_1} \subseteq [Y]_{n_2}$ with $n_1, n_2 \geq 1$. Then for any $m \geq 0$, we have

(1) If $\mathcal{A}$ has enough projective objects, then $[\Omega^m(X)]_{n_1} \subseteq [\Omega^m(Y)]_{n_1n_2}$.

(2) If $\mathcal{A}$ has enough injective objects, then $[\Omega^{-m}(X)]_{n_1} \subseteq [\Omega^{-m}(Y)]_{n_1n_2}$.

Proof. We only prove (1), and we get (2) dually.

We proceed by induction on $n_1$. Let $n_1 = 1$ and $W \in [\Omega^m(X)]_1$. Then

$$W \oplus W_1 \cong (\Omega^m(X))^{(l)} (\cong \Omega^m(X^{(l)}))$$

for some $l \geq 1$ and $W_1 \in \mathcal{A}$. Since $X^{(l)} \in [X]_1 \subseteq [Y]_{n_2}$ by assumption, we have the following exact sequences

$$0 \to Y_1' \to X^{(l)} \oplus Z_1 \to Y_1 \to 0,$$

$$0 \to Y_2' \to Y_1 \oplus Z_2 \to Y_2 \to 0,$$

$$0 \to Y_3' \to Y_2 \oplus Z_3 \to Y_3 \to 0,$$

$$\cdots \cdots$$

$$0 \to Y_{n_2-1}' \to Y_{n_2-2} \oplus Z_{n_2-1} \to Y_{n_2-1} \to 0,$$

where $Z_i \in \mathcal{A}$, $Y_i' \in [Y]_1$ and $Y_i \in [Y]_{n_2-i}$ for any $1 \leq i \leq n_2 - 1$. By the horseshoe lemma, we have

$$0 \to \Omega^m(Y_1') \to \Omega^m(X^{(l)}) \oplus \Omega^m(Z_1) \oplus P_1 \to \Omega^m(Y_1) \to 0,$$

$$0 \to \Omega^m(Y_2') \to \Omega^m(Y_1) \oplus \Omega^m(Z_2) \oplus P_2 \to \Omega^m(Y_2) \to 0,$$

$$0 \to \Omega^m(Y_3') \to \Omega^m(Y_2) \oplus \Omega^m(Z_3) \oplus P_3 \to \Omega^m(Y_3) \to 0,$$

$$\cdots \cdots$$

$$0 \to \Omega^m(Y_{n_2-1}') \to \Omega^m(Y_{n_2-2}) \oplus \Omega^m(Z_{n_2-1}) \oplus P_{n_2-1} \to \Omega^m(Y_{n_2-1}) \to 0,$$
where all $P_i$ are projective. Then we have
\[
\Omega^m(X^{(l)}) \in [\Omega^m(Y'_1), [\Omega^m(Y_1)]]_1 \\
\subseteq [\Omega^m(Y'_1), [\Omega^m(Y'_2), [\Omega^m(Y_2)]]_1 \\
\subseteq [\Omega^m(Y'_1), [\Omega^m(Y'_2), [\Omega^m(Y'_3), [\Omega^m(Y_3)]]_1 \\
\cdots \\
\subseteq [\Omega^m(Y'_1), [\Omega^m(Y'_2), \cdots [\Omega^m(Y'_{n_2-1}), [\Omega^m(Y_{n_2-1})]]_1 \\
\subseteq [[\Omega_{i=1}^{n_2-1} \Omega^m(Y'_i) \oplus \Omega^m(Y_{n_2-1})]_n_2 \\
\subseteq [\Omega^m(Y)]_{n_2},
\]
and hence $W \in [\Omega^m(Y)]_{n_2}$. The case for $n_1 = 1$ is proved.

Now suppose $n_1 \geq 2$ and $W \in [\Omega^m(X)]_{n_1}$. By [25, Proposition 2.2(3)] and assumption, we have
\[
[X]_1 \subseteq [X]_{n_1-1} \subseteq [X]_{n_1} \subseteq [Y]_{n_2}.
\]
Then by the induction hypothesis, we have
\[
[\Omega^m(X)]_1 \subseteq [\Omega^m(Y)]_{n_2} \text{ and } [\Omega^m(X)]_{n_1-1} \subseteq [\Omega^m(Y)]_{(n_1-1)n_2}.
\]
Thus
\[
W \in [\Omega^m(X)]_{n_1} \\
= [\Omega^m(X)]_1 \bullet [\Omega^m(X)]_{n_1-1} \\
\subseteq [\Omega^m(Y)]_{n_2} \bullet [\Omega^m(Y)]_{(n_1-1)n_2} \text{ (by [25, Proposition 2.2(1)])} \\
= [\Omega^m(Y)]_{n_1n_2}.
\]
The proof is finished. \(\square\)

### 3.3 $t_V$-radical layer length and extension dimension

From now on, $\Lambda$ is an artin algebra. Then the category $\text{mod}\, \Lambda$ of finitely generated right $\Lambda$-modules is a length-category. We use $\text{rad}\, \Lambda$ to denote the Jacobson radical of $\Lambda$. For a module $M$ in $\text{mod}\, \Lambda$, we use $\text{top}\, M$ to denote the top of $M$.

Let $S$ be the set of all pairwise non-isomorphic simple modules in $\text{mod}\, \Lambda$ and $V$ a subset of $S$. We write $\mathfrak{F}(V) := \{ M \in \text{mod}\, \Lambda \mid \text{there exists a finite chain} \}
\[
0 = M_0 \subseteq M_1 \subseteq \cdots \subseteq M_m = M
\]
of submodules of $M$ such that each quotient $M_i/M_{i-1}$ is isomorphic to some module in $V$. By [11, Lamma 5.7 and Proposition 5.9], we have that $(\mathcal{T}_V, \mathfrak{F}(V))$ is a torsion pair, where
\[
\mathcal{T}_V = \{ M \in \text{mod}\, \Lambda \mid \text{top}\, M \in \text{add}\, V \text{ with } V' = S\setminus V \}.
\]
We use $t_V$ to denote the torsion radical of the torsion pair $(\mathcal{T}_V, \mathfrak{F}(V))$. Then $t_V(M) \in \mathcal{T}_V$ and $q_{t_V}(M) \in \mathfrak{F}(V)$ for any $M \in \text{mod}\, \Lambda$. By [11, Proposition 5.3], we have
\[
\mathfrak{F}(V) = \{ M \in \text{mod}\, \Lambda \mid t_V(M) = 0 \},
\]
\[
\mathcal{T}_V = \{ M \in \text{mod}\, \Lambda \mid t_V(M) \cong M \}.
\]
We have the following easy observation.
Lemma 3.7. Let $\mathcal{V}$ be a subset of $\mathcal{S}$. Then for any $M \in \text{mod } \Lambda$ and $i \geq 0$, we have the following exact sequences

\[
0 \to t_{\mathcal{V}}F_{t_{\mathcal{V}}}^i(M) \to F_{t_{\mathcal{V}}}^i(M) \to q_{t_{\mathcal{V}}}F_{t_{\mathcal{V}}}^i(M) \to 0,
\]

\[
0 \to F_{t_{\mathcal{V}}}^{i+1}(M) \to t_{\mathcal{V}}F_{t_{\mathcal{V}}}^i(M) \to \text{top } t_{\mathcal{V}}F_{t_{\mathcal{V}}}^i(M) \to 0,
\]

where $F_{t_{\mathcal{V}}} = \text{rad } \circ t_{\mathcal{V}}$.

Lemma 3.8. Let $\mathcal{V}$ be a subset of $\mathcal{S}$ and $M \in \text{mod } \Lambda$.

1. If $\ell t_{\mathcal{V}}(M) = 0$, then $M \in \mathfrak{F}(\mathcal{V})$ and $M \cong q_{t_{\mathcal{V}}}(M)$.
2. If $\ell t_{\mathcal{V}}(\Lambda) = n$, then $\ell t_{\mathcal{V}}(F_{t_{\mathcal{V}}}^n(M)) = 0$; in particular, $F_{t_{\mathcal{V}}}^n(M) \in \mathfrak{F}(\mathcal{V})$.
3. If $M = \bigoplus_{i=1}^n M_i$, then $\ell t_{\mathcal{V}}(M) = \max\{\ell t_{\mathcal{V}}(M_i) \mid 1 \leq i \leq n\}$.

Proof. (1) If $\ell t_{\mathcal{V}}(M) = 0$, then $t_{\mathcal{V}}(M) = 0$ and $M \in \mathfrak{F}(\mathcal{V})$. Putting $i = 0$ in the first exact sequence in Lemma 3.7, we have $M \in \mathfrak{F}(\mathcal{V})$.

(2) By [11, Lemma 3.4(b)], we have $\ell t_{\mathcal{V}}(M) \leq \ell t_{\mathcal{V}}(\Lambda) = n$. Thus $\ell t_{\mathcal{V}}(F_{t_{\mathcal{V}}}^n(M)) = 0$ by Lemma 2.6.

(3) It follows from [11, Lemma 3.4(a)].

Lemma 3.9. Let $\mathcal{V}$ be a subset of $\mathcal{S}$. Then the following statements are equivalent.

1. $\mathcal{V} = \mathcal{S}$.
2. $\ell t_{\mathcal{V}}(\Lambda) = 0$.
3. $\ell t_{\mathcal{V}}(M) = 0$ for any $M \in \text{mod } \Lambda$.
4. $\mathfrak{F}(\mathcal{V}) = \text{mod } \Lambda$.

Proof. The implications (1) $\iff$ (4) and (3) $\implies$ (2) are trivial. By [24, Proposition 3.4], we have (2) $\implies$ (3).

Since $\mathfrak{F}(\mathcal{V}) = \text{mod } \Lambda$ if and only if $t_{\mathcal{V}}(M) = 0$ for any $M \in \text{mod } \Lambda$, we have (3) $\iff$ (4).

For a subcategory $\mathcal{X}$ of $\text{mod } \Lambda$, we write

\[\mathcal{X}^\perp := \{ Z \in \text{mod } \Lambda \mid \text{Ext}_\Lambda^i(X,Z) = 0 \text{ for any } X \in \mathcal{X} \text{ and } i \geq 1\} \]

Lemma 3.10. Let $\mathcal{X}$ be a contravariantly finite and resolving subcategory of $\text{mod } \Lambda$ and

\[0 \to C_1 \to C_2 \to C_3 \to 0\]

an exact sequence in $\text{mod } \Lambda$. Then there exists the following commutative diagram with exact columns and rows

\[
\begin{array}{cccccccc}
0 & \to & X_1^n & \to & X_2^n & \to & X_3^n & \to & C_1 \to 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
\cdots & \to & X_1^\prime & \to & X_2^\prime & \to & X_3^\prime & \to & C_1 \to 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
\cdots & \to & X_2^\prime & \to & X_3^\prime & \to & C_2 & \to & 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
\cdots & \to & X_3^\prime & \to & C_3 & \to & 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & 0 \\
0 & \to & 0 & \to & 0 & \to & 0 & \to & 0
\end{array}
\]
satisfying the following conditions.

(1) The top and bottom rows are minimal $\mathcal{X}$-resolutions of $C_1$ and $C_3$ respectively, and the middle row is an $\mathcal{X}$-resolution of $C_2$.

(2) For any $i \geq 1$, set $Y^i := \ker(X_2^{i-1} \to X_2^{i-2})$ (note: $X_2^{i-1} = C_2$). Then $Y^i = \Omega^i_\mathcal{X}(C_2) \oplus X^i$ for some $X^i \in \mathcal{X}$, and all $\Omega^i_\mathcal{X}(C_1)$, $\Omega^i_\mathcal{X}(C_3)$ and $Y^i$ are in $\mathcal{X}^\perp$. Moreover, for any $i \geq 1$, we have the following exact sequence

$$0 \to \Omega^i_\mathcal{X}(C_1) \to Y^i(= \Omega^i_\mathcal{X}(C_2) \oplus X^i) \to \Omega^i_\mathcal{X}(C_3) \to 0. \quad (3-i)$$

In particular, if $\Omega^n_\mathcal{X}(C_3) \in \mathcal{X}$ for some $n \geq 1$, then the sequence (3-n) splits.

Proof. Since $\mathcal{X}$ is a contravariantly finite and resolving subcategory of mod $\Lambda$, by [3, Proposition 3.3(c)] we have minimal $\mathcal{X}$-resolutions

$$\cdots \to X^n_1 \to X^{n-1}_1 \to \cdots \to X^1_1 \to X^0_1 \to C_1 \to 0,$$

$$\cdots \to X^n_3 \to X^{n-1}_3 \to \cdots \to X^1_3 \to X^0_3 \to C_3 \to 0$$

of $C_1$ and $C_3$ respectively with all $\Omega^i_\mathcal{X}(C_1)$ and $\Omega^i_\mathcal{X}(C_3)$ are in $\mathcal{X}^\perp$. Then by [3, Proposition 3.6], we get the commutative diagram as above such that all $Y^i$ are in $\mathcal{X}^\perp$, where $Y^i = \ker(X_2^{i-1} \to X_2^{i-2})$ (note: $X_2^{i-1} = C_2$). It follows that the middle row in the above diagram is an $\mathcal{X}$-resolutions of $C_2$ and $Y^i = \Omega^i_\mathcal{X}(C_2) \oplus X^i$ with $X^i \in \mathcal{X}$ for any $i \geq 1$. In particular, we have the following exact sequence

$$0 \to \Omega^i_\mathcal{X}(C_1) \to Y^i(= \Omega^i_\mathcal{X}(C_2) \oplus X^i) \to \Omega^i_\mathcal{X}(C_3) \to 0$$

for any $i \geq 1$, which induces an exact sequence

$$0 \to \text{Hom}_\Lambda(\Omega^i_\mathcal{X}(C_3), \Omega^j_\mathcal{X}(C_1)) \to \text{Hom}_\Lambda(\Omega^i_\mathcal{X}(C_3), Y^j) \to \text{Hom}_\Lambda(\Omega^i_\mathcal{X}(C_3), \Omega^j_\mathcal{X}(C_3)) \to \text{Ext}^1_\Lambda(\Omega^i_\mathcal{X}(C_3), \Omega^j_\mathcal{X}(C_1)).$$

If $\Omega^n_\mathcal{X}(C_3) \in \mathcal{X}$ for some $n \geq 1$, then $\text{Ext}^1_\Lambda(\Omega^n_\mathcal{X}(C_3), \Omega^j_\mathcal{X}(C_1)) = 0$ and the exact sequence (3-n) splits. □

Let $\mathcal{B}$ be a subclass of mod $\Lambda$. If $\mathcal{X}$ is a contravariantly finite and resolving subcategory of mod $\Lambda$, then the $\mathcal{X}$-projective dimension $\text{pd}_\mathcal{X} \mathcal{B}$ of $\mathcal{B}$ is defined as

$$\text{pd}_\mathcal{X} \mathcal{B} = \begin{cases} \sup\{\text{pd}_\mathcal{X} M \mid M \in \mathcal{B}\}, & \text{if } \mathcal{B} \neq \emptyset; \\ -1, & \text{if } \mathcal{B} = \emptyset. \end{cases}$$

If $\mathcal{X}$ is a covariantly finite and coresolving subcategory of mod $\Lambda$, then the $\mathcal{X}$-injective dimension $\text{id}_\mathcal{X} \mathcal{B}$ of $\mathcal{B}$ is defined as

$$\text{id}_\mathcal{X} \mathcal{B} = \begin{cases} \sup\{\text{id}_\mathcal{X} M \mid M \in \mathcal{B}\}, & \text{if } \mathcal{B} \neq \emptyset; \\ -1, & \text{if } \mathcal{B} = \emptyset. \end{cases}$$

Lemma 3.11. Let $\mathcal{V}$ be a subset of $\mathcal{S}$ and $M \in \mathfrak{F}(\mathcal{V})$. Then we have

(1) $\text{pd}_\mathcal{X} M \leq \text{pd}_\mathcal{X} \mathcal{V}$; in particular, $\text{pd}_\mathcal{X} q_{t \mathcal{V}}(M) \leq \text{pd}_\mathcal{X} \mathcal{V}$.

(2) $\text{id}_\mathcal{X} M \leq \text{id}_\mathcal{X} \mathcal{V}$; in particular, $\text{id}_\mathcal{X} q_{t \mathcal{V}}(M) \leq \text{id}_\mathcal{X} \mathcal{V}$.

Proof. (1) Let $M \in \mathfrak{F}(\mathcal{V})$. Then there exists a finite chain

$$0 = M_0 \subseteq M_1 \subseteq \cdots \subseteq M_m = M$$

of submodules of $M$ such that each quotient $M_i/M_{i-1}$ is isomorphic to some module in $\mathcal{V}$. It follows from Lemma 3.10(2) that $\text{pd}_\mathcal{X} M \leq \text{pd}_\mathcal{X} \mathcal{V}$. In particular, $\text{pd}_\mathcal{X} q_{t \mathcal{V}}(M) \leq \text{pd}_\mathcal{X} \mathcal{V}$ since $q_{t \mathcal{V}}(M) \in \mathfrak{F}(\mathcal{V})$.

(2) It is dual to (1). □
Recall that a category $\mathcal{X}$ of mod $\Lambda$ is said to be of finite type if there are only finitely many pairwise non-isomorphic indecomposable modules in $\mathcal{X}$. Also recall that $\mathcal{S}$ denotes the set of all pairwise non-isomorphic simple modules in mod $\Lambda$. We are in a position to prove the following result.

**Theorem 3.12.** Let $\mathcal{V}$ be a subset of $\mathcal{S}$ and $\mathcal{X}$ a subcategory of mod $\Lambda$ of finite type.

(1) If $\mathcal{X}$ is resolving, then $\text{ext.dim} \Lambda \leq pd_{\mathcal{X}} \mathcal{V} + \ell t^v(\Lambda)$.

(2) If $\mathcal{X}$ is coresolving, then $\text{ext.dim} \Lambda \leq id_{\mathcal{X}} \mathcal{V} + \ell t^v(\Lambda)$.

**Proof.** Set $\ell t^v(\Lambda) = n$. Since $\mathcal{X}$ is of finite type, we have that $\mathcal{X}$ is contravariantly and covariantly finite and $\mathcal{X} = \text{add} X$ for some $X \in \text{mod} \Lambda$.

If $n = 0$, that is, $\ell t^v(\Lambda) = 0$, then $M \cong q_{t^v} t^v(M)$ by Lemmas 3.9 and 3.8(1), and hence $pd_{\mathcal{X}} M = pd_{\mathcal{X}} q_{t^v} t^v(M) \leq pd_{\mathcal{X}} M$ and $id_{\mathcal{X}} M = id_{\mathcal{X}} q_{t^v} t^v(M) \leq id_{\mathcal{X}} M$ by Lemma 3.11. The case for $n = 0$ is proved.

Now suppose $n \geq 1$.

(1) Let $pd_{\mathcal{X}} \mathcal{V} = p < \infty$. By Lemma 3.11(1), we have $pd_{\mathcal{X}} q_{t^v} t^v(M) \leq p$ and $\Omega^{p+1}_{\mathcal{X}}(q_{t^v} t^v(M)) = 0$ for any $0 \leq i \leq n - 1$. By Lemma 3.8(2), we have $F_{t^v}(M) \in \mathfrak{S}(\mathcal{V})$. It follows from Lemma 3.11(1) that $pd_{\mathcal{X}} F_{t^v}(M) \leq p$. Thus $\Omega^{p+1}_{\mathcal{X}}(F_{t^v}(M)) \in V$ and $\Omega^{p+1}_{\mathcal{X}}(F_{t^v}(M)) = 0$.

By Lemmas 3.7 and 3.10 we have

$$\Omega^{p+1}_{\mathcal{X}}(t^v F_{t^v}(M)) \cong \Omega^{p+1}_{\mathcal{X}}(F_{t^v}(M)) \oplus X_i, \quad (3.1)$$

$$0 \to \Omega^{p+1}_{\mathcal{X}}(F_{t^v}(M)) \to \Omega^{p+1}_{\mathcal{X}}(t^v F_{t^v}(M)) \oplus X_i' \to \Omega^{p+1}_{\mathcal{X}}(\text{top} t^v F_{t^v}(M)) \to 0 \quad (3.2)$$

with $X_i, X_i' \in \text{add} X = \mathcal{X}$ for any $0 \leq i \leq n - 1$. In particular, when $i = n - 1$ in (3.2), we have

$$\Omega^{p+1}_{\mathcal{X}}(t^v F_{t^v}(M)) \oplus X_i' \cong \Omega^{p+1}_{\mathcal{X}}(\text{top} t^v F_{t^v}(M)). \quad (3.3)$$

It follows that

$$[\Omega^{p+1}_{\mathcal{X}}(M)]_1 \subseteq [\Omega^{p+1}_{\mathcal{X}}(t^v(M))]_1 \quad \text{(putting } i = 0 \text{ in (3.1))}$$

$$\subseteq [\Omega^{p+1}_{\mathcal{X}}(F_{t^v}(M))]_1 \cdot [\Omega^{p+1}_{\mathcal{X}}(\text{top} t^v(M))]_1 \quad \text{(putting } i = 0 \text{ in (3.2))}$$

$$\subseteq [\Omega^{p+1}_{\mathcal{X}}(t^v F_{t^v}(M))]_1 \cdot [\Omega^{p+1}_{\mathcal{X}}(\text{top} t^v(M))]_1 \quad \text{(putting } i = 1 \text{ in (3.1))}$$

$$\subseteq [\Omega^{p+1}_{\mathcal{X}}(t^v F_{t^v}(M))]_1 \cdot [\Omega^{p+1}_{\mathcal{X}}(\Lambda/\text{rad} \Lambda)]_1. \quad (3.4)$$

By replacing $M$ with $F_{t^v}(M)$ for any $1 \leq i \leq n - 1$ and iterating the above process, we have

$$[\Omega^{p+1}_{\mathcal{X}}(M)]_1 \subseteq [\Omega^{p+1}_{\mathcal{X}}(t^v F_{t^v}(M))]_1 \cdot [\Omega^{p+1}_{\mathcal{X}}(\Lambda/\text{rad} \Lambda)]_{n-1}$$

$$\subseteq [\Omega^{p+1}_{\mathcal{X}}(\text{top} t^v F_{t^v}(M))]_1 \cdot [\Omega^{p+1}_{\mathcal{X}}(\Lambda/\text{rad} \Lambda)]_{n-1} \quad \text{(by (3.3))}$$

$$\subseteq [\Omega^{p+1}_{\mathcal{X}}(\Lambda/\text{rad} \Lambda)]_1 \cdot [\Omega^{p+1}_{\mathcal{X}}(\Lambda/\text{rad} \Lambda)]_{n-1}$$

$$\subseteq [\Omega^{p+1}_{\mathcal{X}}(\Lambda/\text{rad} \Lambda)]_n. \quad (3.4)$$

Consider the following exact sequence

$$0 \to \Omega^{p+1}_{\mathcal{X}}(M) \to X_p \to X_{p-1} \to \cdots \to X_1 \to X_0 \to M \to 0$$
in mod $\Lambda$ with all $X_i$ in add $X = \mathcal{X}$. Thus we have

\[
[M]_1 \subseteq [X_0]_1 \bullet [\Omega^{-1}(X_1)]_1 \bullet \cdots \bullet [\Omega^{-p}(X_p)]_1 \bullet [\Omega^{-(p+1)}(\Omega^{p+1}_X(M))]_1 \quad \text{(by Lemma 3.5(2))}
\]

\[
\subseteq [\oplus_{i=0}^p \Omega^{-i}(X)]_{p+1} \bullet [\Omega^{-(p+1)}(\Omega^{p+1}_X(M))]_1 \quad \text{(by Lemma 2.2)}
\]

\[
\subseteq [\oplus_{i=0}^p \Omega^{-i}(X)]_{p+1} \bullet [\Omega^{-(p+1)}(\Omega^{p+1}_X(\Lambda/\rad \Lambda))]_n \quad \text{(by (3.4) and Lemma 3.6(1))}
\]

\[
\subseteq [\oplus_{i=0}^p \Omega^{-i}(X) \oplus \Omega^{-(p+1)}(\Omega^{p+1}_X(\Lambda/\rad \Lambda))]_{p+1+n}. \quad \text{(by Lemma 2.2)}
\]

It follows that

\[
\text{mod } \Lambda = [\oplus_{i=0}^p \Omega^{-i}(X) \oplus \Omega^{-(p+1)}(\Omega^{p+1}_X(\Lambda/\rad \Lambda))]_{p+1+n}
\]

and ext.dim $\Lambda \leq p + n$.

(2) The proof is dual to that of (1), but we still give it here for the readers’ convenience.

Let $\id_{\mathcal{X}} \mathcal{V} = p < \infty$. By Lemma 3.11(2), we have $\id_{\mathcal{X}} q_{t_V} F_{t_V}^i (M) \leq p$ and $\Omega^{-(p+1)}(q_{t_V} F_{t_V}^i (M)) = 0$ for any $0 \leq i \leq n - 1$. By Lemma 3.8(2), we have $F_{t_V}^n (M) \in \mathfrak{F}(\mathcal{V})$. Then by Lemma 3.11(2), we have $\id_{\mathcal{X}} F_{t_V}^n (M) \leq p$. Thus $\Omega^{p}(F_{t_V}^n (M)) \in \mathcal{X}$ and $\Omega^{-(p+1)}(F_{t_V}^n (M)) = 0$.

By Lemma 3.7 and the dual of Lemma 3.10 we have

\[
\Omega^{-(p+1)}(t_V F_{t_V}^i (M)) \cong \Omega^{-(p+1)}(F_{t_V}^i (M)) \oplus X_i, \quad (3.5)
\]

\[
0 \rightarrow \Omega^{-(p+1)}(F_{t_V}^{i+1}(M)) \rightarrow \Omega^{-(p+1)}(t_V F_{t_V}^i (M)) \oplus X_i \rightarrow \Omega^{-(p+1)}(t_V F_{t_V}^i (M)) \rightarrow 0 \quad \text{(exact)} \quad (3.6)
\]

with $X_i, X_i' \in \text{add } X = \mathcal{X}$ for any $0 \leq i \leq n - 1$. In particular, when $i = n - 1$ in (3.6), we have

\[
\Omega^{-(p+1)}(t_V F_{t_V}^{n-1}(M)) \oplus X_{n-1}' \cong \Omega^{-(p+1)}(t_V F_{t_V}^{n-1}(M)). \quad (3.7)
\]

It follows that

\[
[\Omega^{-(p+1)}(M)]_1 \subseteq [\Omega^{-(p+1)}(t_V(M))]_1 \quad \text{(putting } i = 0 \text{ in (3.5))}
\]

\[
\subseteq [\Omega^{-(p+1)}(F_{t_V}(M))]_1 \bullet [\Omega^{-(p+1)}(t_V(M))]_1 \quad \text{(putting } i = 0 \text{ in (3.6))}
\]

\[
\subseteq [\Omega^{-(p+1)}(t_V F_{t_V}(M))]_1 \bullet [\Omega^{-(p+1)}(t_V(M))]_1 \quad \text{(putting } i = 1 \text{ in (3.5))}
\]

\[
\subseteq [\Omega^{-(p+1)}(t_V F_{t_V}(M))]_1 \bullet [\Omega^{-(p+1)}(\Lambda/\rad \Lambda)]_1. \quad \text{(by Lemma 2.2)}
\]

By replacing $M$ with $F_{t_V}^i (M)$ for any $1 \leq i \leq n - 1$ and iterating the above process, we have

\[
[\Omega^{-(p+1)}(M)]_1 \subseteq [\Omega^{-(p+1)}(t_V F_{t_V}^{n-1}(M))]_1 \bullet [\Omega^{-(p+1)}(\Lambda/\rad \Lambda)]_{n-1}
\]

\[
\subseteq [\Omega^{-(p+1)}(t_V F_{t_V}^{n-1}(M))]_1 \bullet [\Omega^{-(p+1)}(\Lambda/\rad \Lambda)]_{n-1} \quad \text{(by (3.7))}
\]

\[
\subseteq [\Omega^{-(p+1)}(\Lambda/\rad \Lambda)]_1 \bullet [\Omega^{-(p+1)}(\Lambda/\rad \Lambda)]_{n-1}
\]

\[
\subseteq [\Omega^{-(p+1)}(\Lambda/\rad \Lambda)]_n. \quad \text{(by Lemma 2.2)} \quad (3.8)
\]

Consider the following exact sequence

\[
0 \rightarrow M \rightarrow X^0 \rightarrow X^1 \rightarrow \cdots \rightarrow X^p \rightarrow \Omega^{-(p+1)}(M) \rightarrow 0
\]

in mod $\Lambda$ with all $X^i$ in add $X = \mathcal{X}$. Thus we have

\[
[M]_1 \subseteq [X^0]_1 \bullet [\Omega^{-1}(X^1)]_1 \bullet \cdots \bullet [\Omega^{-p}(X^p)]_1 \bullet [\Omega^{p+1}(\Omega^{-(p+1)}(M))]_1 \quad \text{(by Lemma 3.5(1))}
\]

\[
\subseteq [\oplus_{i=0}^p \Omega^{-i}(X)]_{p+1} \bullet [\Omega^{-(p+1)}(\Omega^{p+1}_X(M))]_1
\]

\[
\subseteq [\oplus_{i=0}^p \Omega^{-i}(X)]_{p+1} \bullet [\Omega^{-(p+1)}(\Omega^{p+1}_X(\Lambda/\rad \Lambda))]_n \quad \text{(by (3.8) and Lemma 3.6(2))}
\]

\[
\subseteq [\oplus_{i=0}^p \Omega^{-i}(X) \oplus \Omega^{-(p+1)}(\Omega^{p+1}_X(\Lambda/\rad \Lambda))]_{p+1+n}. \quad \text{(by Lemma 2.2)}
\]
It follows that

$$\text{mod } \Lambda = \left[ \bigoplus_{i=0}^{p} \Omega^i(X) \oplus \Omega^{p+1}(\Omega_{\Lambda}^{-}(p+1)(\Lambda/\text{rad } \Lambda)) \right]_{p+1+n}$$

and $\text{ext.dim } \Lambda \leq p + n$. \(\square\)

By using exactly the same method, it can be proved that Theorem 3.12 holds true in the following more general case.

**Remark 3.13.** Let $\langle \mathcal{T}, \mathcal{F} \rangle$ be a torsion pair in $\text{mod } \Lambda$ and $t$ its torsion radical, and let $\mathcal{X}$ be a subcategory of $\text{mod } \Lambda$ of finite type.

(1) If $\mathcal{X}$ is resolving, then $\text{ext.dim } \Lambda \leq \text{pd}_{\mathcal{X}} \mathcal{F} + \ell t^t(\Lambda)$.

(2) If $\mathcal{X}$ is coresolving, then $\text{ext.dim } \Lambda \leq \text{id}_{\mathcal{X}} \mathcal{F} + \ell t^t(\Lambda)$.

### 3.4 Some applications

**Corollary 3.14.** Let $\mathcal{X}$ be a subcategory of $\text{mod } \Lambda$ of finite type.

(1) If $\mathcal{X}$ is resolving, then $\text{ext.dim } \Lambda \leq \text{pd}_{\mathcal{X}} \mathcal{S}$.

(2) If $\mathcal{X}$ is coresolving, then $\text{ext.dim } \Lambda \leq \text{id}_{\mathcal{X}} \mathcal{S}$.

**Proof.** It follows from Theorem 3.12 and Lemma 3.9. \(\square\)

If $\mathcal{X}$ is the subcategory of $\text{mod } \Lambda$ consisting of projective (resp. injective) modules, then the $\mathcal{X}$-projective dimension $\text{pd}_{\mathcal{X}} M$ (resp. $\mathcal{X}$-injective dimension $\text{id}_{\mathcal{X}} M$) of a module $M$ in $\text{mod } \Lambda$ is exactly its projective dimension $\text{pd } M$ (resp. injective dimension $\text{id } M$). In this case, for a subclass of $\text{mod } \Lambda$, we write

$$\text{pd } \mathcal{B} := \text{pd}_{\mathcal{X}} \mathcal{B} \text{ and } \text{id } \mathcal{B} := \text{id}_{\mathcal{X}} \mathcal{B}.$$  

**Corollary 3.15.**

(1) $\text{der.dim } \Lambda \leq 2 \text{ext.dim } \Lambda + 1$.

(2) For any subset $\mathcal{V}$ of $\mathcal{S}$, we have

(2.1) $\text{ext.dim } \Lambda \leq \min\{\text{pd } \mathcal{V}, \text{id } \mathcal{V}\} + \ell t^t(\Lambda)$.

(2.2) $\text{der.dim } \Lambda \leq 2\{\min\{\text{pd } \mathcal{V}, \text{id } \mathcal{V}\} + \ell t^t(\Lambda)\} + 1$.

(3) ([12, 4.5.1(3)]) $\text{ext.dim } \Lambda \leq \text{gl.dim } \Lambda$.

**Proof.** The assertion (1) is a direct consequence of Theorem 3.3. The assertion (2.1) follows from Theorem 3.3.12 and (2.2) follows from (1) and (2.1). Since $\text{gl.dim } \Lambda = \text{pd } \mathcal{S} = \text{id } \mathcal{S}$, the assertion (3) is a special case of Corollary 3.14. \(\square\)

**Corollary 3.16.** ([11, Theorem]) If $\Lambda$ is of finite representation type, then $\text{der.dim } \Lambda \leq 1$.

**Proof.** It is easy to see that $\Lambda$ is of finite representation type if and only if $\text{ext.dim } \Lambda = 0$ ([3, Example 1.6(i)]). Now the assertion follows from Corollary 3.15(1). \(\square\)
For any \( n \geq 0 \), recall from [23] that \( \Lambda \) is called \( n \)-Igusa-Todorov if there exists \( U \in \text{mod} \Lambda \) such that for any \( M \in \text{mod} \Lambda \), there exists an exact sequence

\[
0 \to U_1 \to U_0 \to \Omega^n(M) \oplus P \to 0
\]

in \( \text{mod} \Lambda \) with \( U_1, U_0 \in \text{add} U \) and \( P \) projective. The class of Igusa-Todorov algebras includes algebras with representation dimension at most 3, algebras with radical cube zero, monomial algebras, left serial algebras and syzygy finite algebras ([23]).

**Corollary 3.17.**

1. If \( \Lambda \) is an \( n \)-Igusa-Todorov algebra, then \( \text{der.dim} \Lambda \leq 2n + 3 \).
2. \( \text{der.dim} \Lambda \leq 5 \) if \( \Lambda \) is one class of the following algebras.
   1. monomial algebras;
   2. left serial algebras;
   3. \( \text{rad}^{2n+1} \Lambda = 0 \) and \( \Lambda/\text{rad}^n \Lambda \) is of finite representation type;
   4. 2-syzygy finite algebras.

**Proof.** (1) If \( \Lambda \) is \( n \)-Igusa-Todorov, then \( \text{ext.dim} \Lambda \leq n + 1 \) by [25, Proposition 3.15(2)]. Thus \( \text{der.dim} \Lambda \leq 2n + 3 \) by Corollary 3.15(1).

(2) The assertion follows from [25, Corollary 3.16] and Corollary 3.15(1).

Set

\[
u_1 := 2(\min\{\text{pd} V, \text{id} V\} + \ell \ell V(\Lambda)) + 1, \quad \nu_2 := (\min\{\text{pd} V, \text{id} V\} + 2)(\ell \ell V(\Lambda) + 1) - 2.
\]

Then \( \nu_2 - \nu_1 = (\min\{\text{pd} V, \text{id} V\})(\ell \ell V(\Lambda) - 1) - 1 \). Thus \( \nu_2 - \nu_1 \geq 0 \) if and only if \( \min\{\text{pd} V, \text{id} V\} \geq 1 \) and \( \ell \ell V(\Lambda) \geq 2 \). Now, combining Corollary 3.16(2.2) with [24, Theorem 3.12], we get our main result as follows.

**Theorem 3.18.** Let \( V \) be a subset of \( \mathcal{S} \), and let \( \min\{\text{pd} V, \text{id} V\} = d \) and \( \ell \ell V(\Lambda) = n \). Then we have

\[
\text{der.dim} \Lambda \leq \begin{cases} 2(d + n) + 1, & \text{if } d \geq 1 \text{ and } n \geq 2; \\ (d + 2)(n + 1) - 2, & \text{otherwise}. \end{cases}
\]

Now we compare the upper bounds obtained in the above theorem with those known upper bounds for \( \text{der.dim} \Lambda \).

**Remark 3.19.** Keeping the notation as above, the following results have been known.

1. \( \text{der.dim} \Lambda \leq \text{LL}(\Lambda) - 1 \) ([20, Proposition 7.37]);
2. \( \text{der.dim} \Lambda \leq \text{gl.dim} \Lambda \) ([20, Proposition 7.4] and [13, Proposition 2.6]);
3. \( \text{der.dim} \Lambda \leq (d + 2)(n + 1) - 2 \) ([24, Theorem 3.12]).

According to the argument before Theorem 3.18, we have that when \( d \geq 1 \) and \( n \geq 2 \), the upper bounds in Theorem 3.18 are at most that in (3), with equality if \( d = 1 \) and \( n = 2 \); otherwise, they coincide.

It was pointed out in [24, Remark 3.16] that if \( V = \emptyset \), then the upper bounds in (1) and (3) coincide; and if \( V = \mathcal{S} \), then the upper bounds in (2) and (3) coincide. By choosing suitable \( V \), the upper bounds in (3) are smaller than that in (1) and (2) and the difference may be arbitrarily large; see [24, Examples 4.1 and 4.2].
4 Examples

In this section, we give some examples to illustrate our results.

Example 4.1. Let $k$ be an algebraically closed field and $\Lambda = kQ/I$, where $Q$ is the quiver

$$\begin{array}{c}
1 \xrightarrow{\alpha} 2 \xrightarrow{\beta} 3 \xrightarrow{\delta} 4 \\

\mu_1 \quad \mu_2 \\

n+4 \xrightarrow{\rho_n} n+3 \xrightarrow{\rho_{n-1}} n+2 \xrightarrow{\rho_{n-2}} \cdots \xrightarrow{\rho_4} 7 \xrightarrow{\rho_3} 6 \xrightarrow{\rho_2} 5
\end{array}$$

and $I$ is generated by \{\(\alpha^m, \alpha\beta, \gamma_1\delta - \gamma_2\delta, \rho_n\mu_1\alpha, \rho_n\mu_2\alpha, \mu_1\beta - \mu_2\beta\} with $m \geq 4$ and $n \geq 1$ (note: following [1, 22, we concatenate the arrows from left to right). Then the indecomposable projective $\Lambda$-modules are

$$\begin{array}{c}
P(1) = 1 \quad 2 \quad 3 \\

P(2) = 4 \\

P(3) = 4 \\

P(n+4) = 1 \quad 1
\end{array}$$

and $P(i) = \text{rad } P(i-1)$ for each $4 \leq i \leq n+3$. It is straightforward to verify that

$$\text{pd } S(i) = \begin{cases} 
\infty, & \text{if } i = 1, n+3; \\
2, & \text{if } i = 2, n+4; \\
1, & \text{if } 3 \leq i \leq n+2.
\end{cases}$$

Let $\mathcal{V} := \{S(i) \mid 3 \leq i \leq n+2\}$. Then $\text{pd } \mathcal{V} = 1$. Let $\mathcal{V}'$ be all the others simple modules in mod $\Lambda$, that is, $\mathcal{V}' = \{S(1), S(2), S(n+3), S(n+4)\}$. Since $\Lambda = \oplus_{i=1}^{n+4} P(i)$, we have

$$\ell \ell_{\mathcal{V}}(\Lambda) = \max\{\ell \ell_{\mathcal{V}}(P(i)) \mid 1 \leq i \leq n+4\}$$

by [11, Lemma 3.4(a)].

In order to compute $\ell \ell_{\mathcal{V}}(P(1))$, we need to find the least non-negative integer $i$ such that $t_{\mathcal{V}} F_{\mathcal{V}}(P(1)) = 0$. Since $\text{top } P(1) = S(1) \in \text{add } \mathcal{V}'$, we have $t_{\mathcal{V}}(P(1)) = P(1)$ by [11, Proposition 5.9(a)]. Thus

$$F_{\mathcal{V}}(P(1)) = \text{rad } t_{\mathcal{V}}(P(1)) = \text{rad } P(1) = T_{m-1} \oplus P(2),$$
where $T_{m-1} = \begin{array}{c} 1 \\ \vdots \\ 1 \end{array}$ (the number of 1 is $m - 1$).

Since $\top T_{m-1} = S(1) \in \mathcal{V}$, we have $t_V(T_{m-1}) = T_{m-1}$ by [11 Proposition 5.9(a)] again. Similarly, $t_V(P(2)) = P(2)$. Thus we have

$$t_V F_{t_V}(P(1)) = t_V(T_{m-1} \oplus P(2)) = t_V(T_{m-1}) \oplus t_V(P(2)) = T_{m-1} \oplus P(2),$$

$$F_{t_V}^2(P(1)) = \text{rad} t_V F_{t_V}(P(1)) = \text{rad}(T_{m-1} \oplus P(2)) = \text{rad}(T_{m-1}) \oplus \text{rad}(P(2)) = T_{m-2} \oplus M,$$

where $M = \begin{array}{c} 5 \\ \vdots \\ n+2 \\ n+3 \\ n+4 \\ 1 \\ 1. \end{array}$

Thus

$$t_V F_{t_V}^2(P(1)) = t_V(T_{m-2} \oplus M) = t_V(T_{m-2}) \oplus t_V(M) = T_{m-2} \oplus P(n+3).$$

Repeating the process, we get that $S(1)$ is a direct summand of $t_V F_{t_V}^{m-1}(P(1))$, that is, $t_V F_{t_V}^{m-1}(P(1)) \neq 0$ and $t_V F_{t_V}^m(P(1)) = 0$. It follows that $\ell t_V(P(1)) = m$. Similarly, we have

$$\ell t_V(P(i)) = \begin{cases} 4, & \text{if } i = 2; \\ 3, & \text{if } 3 \leq i \leq n+3; \\ m+1, & \text{if } i = n+4. \end{cases}$$

Consequently, we conclude that

$$\ell t_V(\Lambda) = \max\{\ell t_V(P(i)) \mid 1 \leq i \leq n+4\} = m+1.$$

(1) Since $\text{LL}(\Lambda) = n+5$ and $\text{gl.dim} \Lambda = \infty$, by [5 Example 1.6(ii)] we have

$$\text{ext.dim} \Lambda \leq \text{LL}(\Lambda) - 1 = \max\{m-1, n+5\} - 1 = \max\{m-2, n+4\}.$$

(2) By Corollary 3.15(2.1), we have

$$\text{ext.dim} \Lambda \leq \text{pd} \mathcal{V} + \ell t_V(\Lambda_A) = 1 + (1+m) = m+2.$$
(3) By [24, Theorem 3.12], we have
\[
\text{der.dim } \Lambda \leq (\text{pd } V + 2) (\ell_\text{et} (\Lambda) + 1) - 2 = (1 + 2)(m + 1 + 1) - 2 = 3m + 4.
\]

(4) By Corollary 3.15(2.2), we have
\[
\text{der.dim } \Lambda \leq 2(\text{pd } V + \ell_\text{et} (\Lambda)) + 1 = 2 \times (2 + m) + 1 = 2m + 5.
\]

Thus, it is clear that by choosing suitable \(m\) and \(n\), the upper bounds obtained in this paper are more precise, even arbitrarily smaller, than that in the literature known so far.

The following example shows that we may obtain the exact value of the derived dimension of some certain algebras.

**Example 4.2.** Let \(k\) be an algebraically closed field and \(\Lambda = kQ/I\), where \(Q\) is the quiver
\[
\begin{array}{c}
\circlearrowleft \\
\end{array}
\]
and \(I\) is generated by \(\{\alpha_1\}\) with \(r \geq 2\). Then the indecomposable projective (also injective) \(\Lambda\)-module is
\[
P(1) = I(1) = \begin{array}{c}
1 \\
1 \\
1 \\
\vdots \\
1 \\
\end{array}
\]

It is verified directly that the injective and projective dimensions of \(S(1)\) are infinite and \(\text{gl.dim } \Lambda = \infty\), and that \(\Lambda\) is a self-injective algebra of finite CM-type. By [25, Corollary 3.7], we have \(\text{ext.dim } \Lambda = 0\). It follows from Corollary 3.15(1) that \(\text{der.dim } \Lambda \leq 1\). On the other hand, \(\text{der.dim } \Lambda \geq 1\) by [8]. Thus we conclude that \(\text{der.dim } \Lambda = 1\).

**Acknowledgements.** This work was partially supported by NSFC (Grant Nos. 11971225, 12001508, 12171207). The authors thank Hanpeng Gao for discussion of Remark 3.13, and also thank the referee for useful suggestions.
