(Communicated by Willy Sarlet)

Abstract. The aim of this paper is to write explicit expression in terms of a given principal connection of the Lagrange-d’Alembert-Poincarè equations by several stages. This is obtained by using a reduced Lagrange-d’Alembert’s Principle by several stages, extending methods known for the case of one stage in the previous literature. The case of Euler’s disk is described as an illustrative example.

1. Introduction. The topic of nonholonomic mechanical systems is an old one and has been very active for the last few decades. It is related to applications, like robotics, locomotion, phases and others and also to questions of a purely mathematical interest. Some references that one should keep in mind while reading the present paper are the following. General references on mechanics and nonholonomic systems are [1, 2, 8, 10, 11, 14, 16, 17, 22, 23, 25, 21, 26, 27]; applications of nonholonomic systems appear in [5, 9, 19, 20, 22, 25, 21]; recent studies of nonholonomic systems with symmetry and reduction relevant for the present paper appear in [3, 4, 6, 7, 10, 11, 12, 20, 22, 21]; while interesting more recent results appear in [24, 15, 13]. It is important to mention that a whole theory of Lagrangian reduction on Lie algebroids has been developed in several articles, for instance [13, 15, 24].

Let $Q$ be the configuration space of a mechanical system, $L : TQ \to \mathbb{R}$ and $D \subseteq TQ$ a nonholonomic distribution. The Lagrange-d’Alembert principle states that the evolution of the system is given by curves $q : [t_0, t_1] \to Q$ such that $\dot{q}(t) \in D_{q(t)}$ for all $t \in [t_0, t_1]$ and the following condition is satisfied

$$\delta \int_{t_0}^{t_1} L(q(t), \dot{q}(t))dt = 0,$$

for all variations $\delta q(t) \in D_{q(t)}$ and $\delta q(t_0) = 0, \delta q(t_1) = 0$. From this principle one obtains the Lagrange-d’Alembert Equations. In the particular case in which the distribution $D$ coincides with $TQ$, the Lagrange-d’Alembert principle coincides with the Hamilton principle and the Lagrange-d’Alembert equations coincide with the Euler-Lagrange equations.

Reduction of Euler-Lagrange and Lagrange-d’Alembert Equations by a group of symmetries is a fundamental issue in mechanics. The corresponding reduced

Key words and phrases. Lagrangian reduction, symmetry, mechanics.
equations are called Lagrange-Poincaré and Lagrange-d’Alembert-Poincaré equations. If, in addition, the configuration space coincides with the group of symmetry, the reduced equations are called Euler-Poincaré equations and Euler-d’Alembert-Poincaré equations (also known as Euler-Poincaré-Suslov equations).

This paper is devoted to a specific question, namely, to study the extension of the reduction theory (by one stage) developed in [10, 11] for the case of several stages.

Let us briefly explain some of the main results obtained in [10, 11]. Let $Q$ be a principal bundle with structure group $G$ acting on the left and let $\mathcal{A}$ be a principal connection. For a given $G$-invariant Lagrangian $L : TQ \to \mathbb{R}$ and using the identification $\alpha_{\mathcal{A}} : T(Q/G) \to T\mathcal{A} \oplus \tilde{\mathfrak{g}}$ one obtains a reduced Lagrangian function $l : T(Q/G) \oplus \tilde{\mathfrak{g}} \to \mathbb{R}$. Using the principal connection one obtains precise formulas for the horizontal and vertical components of the variations of curves on $Q$. The latter can be reduced by the symmetry group and one obtains reduced horizontal and vertical variations which are curves on the bundle $T(Q/G)\oplus\tilde{\mathfrak{g}}$. Using these reduced variations one obtains reduced horizontal and vertical Euler-Lagrange equations which are called horizontal Lagrange-Poincaré equations and vertical Lagrange-Poincaré equations, see [11]. For instance, in the case of a principal bundle where the base $Q/G$ is a point one obtains that the horizontal Lagrange-Poincaré equation is void and the vertical Lagrange-Poincaré equation is the Euler-Poincaré equation, see [18] and section 2. For a given nonholonomic distribution one can generalize the previous procedure and one obtains the horizontal Lagrange-d’Alembert-Poincaré equations and vertical Lagrange-d’Alembert-Poincaré equations, see [10] and section 2 for details. The particular case in which the distribution has maximal rank gives the horizontal Lagrange-Poincaré and vertical Lagrange-Poincaré equations, respectively.

In the present work we obtain explicit expressions for Lagrange-d’Alembert-Poincaré Equations by $n$ stages, where one has a given chain of subgroups of the given symmetry group $G$ such that $G = N_0 \triangleright N_1 \triangleright \ldots \triangleright N_{n+1} = \{e\}$, where, using a standard notation, $N_j \triangleright N_{j+1}$ means that $N_{j+1}$ is a normal subgroup of $N_j$, for $j = 0, \ldots, n$. This is clearly a natural way to extend the theory in [10, 11].

As in [10, 11], we will use the idea of reducing the variational principle rather than reducing the equations, which requires a detailed study of the geometry of variations and of reduced variations. This includes a careful study of the decomposition of variations in vertical and horizontal components relative to the principal connection, which, in addition, should be compatible with the several stages given by the chain of subgroups of the group of symmetries and also with the given nonholonomic distribution.

Using the reduced variations and, in addition, the usual integration by parts in the calculus of variations one obtains a decomposition by several stages of the horizontal Lagrange-d’Alembert-Poincaré equations and vertical Lagrange-d’Alembert-Poincaré equations, found in [10]. In order to prove the previous results we use local equations obtained in [10, 11] for trivial principal bundles with a not necessarily trivial connection. One of the main ingredients developed in the paper which is used in the proof of the main results, is a decomposition by several stages of the Lie bracket of sections of the Atiyah bundle obtained in [11].

The paper is self-contained and the results that constitute the basic background are clearly stated and their meaning and connection with references [11, 10] are explained in section 2. The contents of section 2 are part of the contents of references [10] and [11]. However, the purposes of [10] and [11] were different from the purposes...
of the present paper and the information contained in section 2 is organized and partially summarized in order to make the paper more readable. Section 2 may be also considered as a detailed guide to read those parts of references [10] and [11] which are essential to understand the paper. We recommend to start reading section 3 of the paper and use the cross references along the paper to section 2 as needed.

In section 3 we describe one of the main ingredients for the paper, namely, an explicit formula for the Lie bracket by several stages. In section 4 we study an important particular case of the general theory: the Euler-d’Alembert-Poincaré equations by stages. In sections 5 and 6 we obtain the main results of the paper, that is, the Lagrange-Poincaré and the Lagrange-d’Alembert-Poincaré equations by several stages. Our strategy is to work on local trivialization of the principal bundle, but the resulting equations will have a global character since they are written in terms of a globally defined principal connection and an affine connection on the base. In section 7 we describe the illustrative example of Euler’s Disk and we obtain reduced equations by two stages. These equations are the ones previously obtained in [9], which were solved by using hypergeometric functions.

Some future work may include establishing the connection with Hamiltonian reduction by stages [22] and, more generally, Dirac-Weinstein reduction by stages [12], as well as applying the theory to specific examples of interest in mechanics.

2. Background. As we have explained in the introduction, in this section we recall the main results of [10, 11] in order to use them in the paper. We recommend the reader to go directly to section 3 and come back to section 2 as needed.

2.1. Reduced connections. We shall recall some known facts on associated bundles and covariant derivatives. Proofs can be found in [11].

Let a left principal bundle $\pi: Q \to Q/G$ and $A$ a principal connection. Consider a left action $\rho: G \times M \to M$ of the Lie group $G$ on a manifold $M$. The associated bundle with standard fiber $M$ is, by definition, $Q \times_G M = (Q \times M)/G$, where the action of $G$ on $Q \times M$ is given by $g(q,m) = (gq, gm)$. The class (or orbit) of $(q, m)$ is denoted $[q, m]_G$. The projection $\pi_M: Q \times G \to Q/G$ is defined by $\pi_M([q, m]_G) = \pi(q)$ and it is easy to check that is well defined and is a surjective submersion.

Let $[q_0, m_0]_G \in Q \times_G M$ and let $x_0 = \pi(q_0) \in Q/G$. Let $x(t), t \in [a, b]$, be a curve on $Q/G$ and let $t_0 \in [a, b]$ be such that $x(t_0) = x_0$. The parallel transport of this element $[q_0, m_0]_G$ along the curve $x(t)$ is defined to be the curve $[q, m]_G(t) := [x^h_{q_0}(t), m_0]_G$, where $x^h_{q_0}(t)$ is the horizontal lift of the curve $x(t)$ with initial condition $q_0$.

For $t, t+s \in [a, b]$, we adopt the notation $\tau^t_{t+s} : \pi^{-1}_M(x(t)) \to \pi^{-1}_M(x(t+s))$ for the parallel transport map along the curve $x(s)$ of any point $[q(t), m(t)]_G \in \pi^{-1}_M(x(t))$ to the corresponding point $\tau^t_{t+s}[q(t), m(t)]_G \in \pi^{-1}_M(x(t+s))$. Thus, $\tau^t_{t+s}[q(t), m(t)]_G = [x^h_{q(t)}(t+s), m(t)]_G$.

From now on, we assume that $M$ is a vector space and $\rho$ is a linear representation. In this case, the associated bundle with standard fiber $M$ is naturally a vector bundle. We will use the identification $TM = M \times M$. We shall sometimes use the notation $\rho'(\xi)$ for the second component of the infinitesimal generator of an element $\xi \in \mathcal{G}$, that is, $\xi m = (m, \rho'(\xi)(m))$. Thus, we have a linear representation of the Lie algebra $\mathcal{G}$ on the vector space $M$, $\rho' : \mathcal{G} \to \text{End}(M)$ (the linear vector fields on $M$ are identified with the space of linear maps of $M$ to itself).
The operation of parallel transport establishes for each \( q \) and each \( X \), if it is tangent to a horizontal curve. Correspondingly, the horizontal space at a point \( v \in V \) is the space of all horizontal vectors at \( v \).

In the case of an associated bundle we recall from [11] the following formula that gives the relation between the covariant derivative of the affine connection and the

\[
\nabla_{\dot{q}(t)} \dot{v}(t) = \left. \frac{Dv(t)}{Dt} \right|_{t=t_0},
\]

where for each \( q_0 \in Q \), each \( X \in \mathfrak{X}(Q) \) and each \( v \in \Gamma(V) \), we have, by definition, that \( q(t) \) is any curve in \( Q \) such that \( \dot{q}(t_0) = X(q_0) \) and \( v(t) = \nu(q(t)) \) for all \( t \). This property establishes, in particular, the uniqueness of the connection associated to the covariant derivative \( D/Dt \). The notion of a horizontal curve \( \nu(t) \) on \( V \) is defined by the condition that its covariant derivative vanishes. A vector tangent to \( V \) is called horizontal if it is tangent to a horizontal curve. Correspondingly, the horizontal space at a point \( v \in V \) is the space of all horizontal vectors at \( v \).

In the case of an associated bundle we recall from [11] the following formula that gives the relation between the covariant derivative of the affine connection and the
principal connection:

\[ \frac{D[q(t), m(t)]_G}{Dt} = [q(t), -\rho'(A(q(t), \dot{q}(t))) m(t) + \dot{m}(t)]_G. \]

This gives an affine connection on \( Q \times_G M \), called \( \tilde{\nabla}^A \). More precisely, let \( \varphi : Q/G \to Q \times_G M \) be a section of the associated bundle and let \( X(x) \in T_x(Q/G) \) be a given vector tangent to \( Q/G \) at \( x \). Let \( x(t) \) be a curve in \( Q/G \) such that \( \dot{x}(0) = X(x) \); thus, \( \varphi(x(t)) \) is a curve in \( Q \times_G M \). The covariant derivative of the section \( \varphi \) with respect to \( X \) at \( x \) is then, by definition,

\[ \tilde{\nabla}^A_{X(x)} \varphi = \left. \frac{D\varphi(x(t))}{Dt} \right|_{t=0}. \]  

Notice that we only need to know \( \varphi \) along the curve \( x(t) \) in order to calculate the covariant derivative.

**Definition 2.2.** The associated bundle with standard fiber \( g \), where the action of \( G \) on \( g \) is the adjoint action, is called the **adjoint bundle**, and is sometimes denoted \( \text{Ad}(Q) \). We will use the notation \( \tilde{\mathfrak{g}} := \text{Ad}(Q) \) in this paper. We let \( \tilde{\pi}_G : \tilde{\mathfrak{g}} \to Q/G \) denote the projection given by \( \tilde{\pi}_G([q, \xi]_G) = [q]_G \).

The following properties hold.

(a) Let \( [q(s), \xi(s)]_G \) be any curve in \( \tilde{\mathfrak{g}} \). Then

\[ \frac{D[q(s), \xi(s)]_G}{Ds} = \left[ q(s), -[A(q(s), \dot{q}(s)), \xi(s)] + \dot{\xi}(s) \right]_G. \]

(b) Each fiber \( \tilde{\mathfrak{g}}_x \) of \( \tilde{\mathfrak{g}} \) carries a natural Lie algebra structure defined by

\[ [[q, \xi]_G, [q, \eta]_G] = [q, [\xi, \eta]]_G. \]

Let \( \pi : Q \to Q/G \) be a principal bundle with structure group \( G \), as before. The tangent lift of the action of \( G \) on \( Q \) defines an action of \( G \) on \( TQ \) and so we can form the quotient \( (TQ)/G =: TQ/G \). There is a well defined map \( \tau_{Q/G} : TQ/G \to Q/G \) induced by the tangent of the projection map \( \pi : Q \to Q/G \) and given by \([v_q]_G \mapsto [q]_G \). The vector bundle structure of \( TQ \) is inherited by this bundle.

(c) The rules

\[ [v_q]_G + [u_q]_G = [v_q + u_q]_G \quad \text{and} \quad \lambda [v_q]_G = [\lambda v_q]_G, \]

where \( \lambda \in \mathbb{R}, v_q, u_q \in T_q Q \), and \([v_q]_G \) and \([u_q]_G \) are their equivalence classes in the quotient \( TQ/G \), define a vector bundle structure on \( TQ/G \) having base \( Q/G \). The fiber \( (TQ/G)_x \) is isomorphic, as a vector space, to \( T_q Q \), for each \( x = [q]_G \).

(d) The map \( \alpha_A : TQ/G \to T(Q/G) \oplus \tilde{\mathfrak{g}} \) defined by

\[ \alpha_A([q, \dot{q}]_G) = T\pi(q, \dot{q}) \oplus [q, A(q, \dot{q})]_G \]

is a well defined vector bundle isomorphism. The inverse of \( \alpha_A \) is given by

\[ \alpha_A^{-1}(x, \dot{x}) \oplus [q, \xi]_G = [(x, \dot{x})^h_q + \xi q]_G. \]

An **action** \( \rho : G \times V \to V \) of a Lie group \( G \) on a vector bundle \( \tau : V \to Q \) with extra structure \( [ , ] \) (a Lie algebra structure on each fiber of \( V \), in such a way that \( V \) is a Lie algebra bundle), \( \omega \) (a \( V \)-valued 2-form on \( Q \)) and \( \nabla \) (a covariant derivative \( D/Dt \) for curves in \( V \) related in the standard way to a connection \( \nabla \) on \( V \)), is a vector bundle action such that, for each \( g \in G \), \( \rho_g : V \to V \) is a morphism that commutes with the structures given by \( [ , ] \), \( \omega \), \( \nabla \) in the vector bundles.
Definition 2.3. Let \( \tau : V \to Q \) be a vector bundle and let \( D/Dt \) be the covariant derivative along curves associated to a connection \( \nabla \) on \( V \). Let \( \rho : G \times V \to V \) be a vector bundle action covering the action \( \rho_0 : G \times Q \to Q \) which we assume that it is a principal bundle. Let \( A \) be a principal connection on the principal \( G \)-bundle \( Q \to Q/G \). Let \( v(t) \) be any curve in \( V \) and let \( q(t) = \tau(v(t)) \) for all \( t \). Choose \( t_0 \) and let \( q_0 = q(t_0) \). Let \( g_q(t) \) and \( g_h(t) \) be such that \( q(t) \) is a horizontal curve, \( q(t) = g_q(t)q_h(t) \), and \( g_q(t_0) = e \). Then we define

\[
\frac{D(A, H)v(t)}{Dt} \bigg|_{t=t_0} = \frac{Dv(t)}{Dt} \bigg|_{t=t_0} - \frac{D(A, H)v(t)}{Dt} \bigg|_{t=t_0},
\]

and

\[
\frac{D(A, V)v(t)}{Dt} \bigg|_{t=t_0} = \frac{Dv(t)}{Dt} \bigg|_{t=t_0}.
\]

We will call

\[
\frac{D(A, H)v(t)}{Dt}
\]

the \textit{A-horizontal covariant derivative} of \( v(t) \) and

\[
\frac{D(A, V)v(t)}{Dt}
\]

the \textit{A-vertical covariant derivative} of \( v(t) \). For \( X \in \mathfrak{X}^\infty(Q) \) and \( v \in \Gamma(V) \) we also define \( \nabla^{(A, H)}_X v \) and \( \nabla^{(A, V)}_X v \) by

\[
\nabla^{(A, H)}_X v(q_0) = \frac{D^{(A, H)}v(t)}{Dt} \bigg|_{t=t_0} v(t_0),
\]

and

\[
\nabla^{(A, V)}_X v(q_0) = \frac{D^{(A, V)}v(t)}{Dt} \bigg|_{t=t_0} v(t_0),
\]

where the covariant derivatives on the right hand side are taken along any smooth curve \( q(t) \) in \( Q \) satisfying \( q(t_0) = q_0, \dot{q}(t_0) = X(q_0) \), and \( v(t) = v(q(t)) \) for all \( t \). We will call \( \nabla^{(A, H)}_X \) the \textit{A-horizontal component} and \( \nabla^{(A, V)}_X \) the \textit{A-vertical component} of the connection \( \nabla \).

We see from this definitions that

\[
\nabla_X v(q_0) = \nabla^{(A, H)}_X v(q_0) + \nabla^{(A, V)}_X v(q_0).
\]

The following lemma gives, in particular, an alternative characterization of \( \nabla^{(A, H)}_X v \) and \( \nabla^{(A, V)}_X v \) for a \( G \)-invariant section \( v \) of \( V \). It also shows that, when restricted to invariant sections \( v \in \Gamma^G(V) \) and invariant functions on \( Q \), the operator \( \nabla^{(A, H)}_X \) has the formal properties of a connection.

If \( G \times V \to V \) is a vector bundle action on \( \tau : V \to Q \), a section \( s : Q \to V \) is called an \textit{invariant section} if for all \( g \in G \) and all \( q \in Q \) we have \( gs(q) = s(gq) \). The set \( \Gamma^G(V) \) of invariant sections of \( V \) is a subspace of \( \Gamma(V) \).

Lemma 2.4. (a) Let \( \text{Hor}^A(X) = X_H \) and \( \text{Ver}^A(X) = X_V \), the horizontal and the vertical components of the vector field \( X \), respectively. Then we have, for each \( q_0 \in Q \), each \( X \in \mathfrak{X}^\infty(Q) \) and each \( G \)-invariant section \( v \in \Gamma^G(V) \),

\[
\nabla^{(A, H)}_X v(q_0) = \nabla_{X_H} v(q_0)
\]

and
and
\[ \nabla^{(A,V)}_X v(q_0) = \nabla_{X} v(q_0). \]

(b) Let \( v \in \Gamma^G(V) \) and let \( q(t) \) be any curve in \( Q \) such that \( \dot{q}(t_0) = X(q_0) \). Define \( q_h(t) \) and \( q_{\bar{q}}(t) \) as in Definition 2.5. Then
\[
\nabla^{(A,H)}_{X} v(q_0) = \left. \frac{D}{Dt} g^{-1}_{q}(t)v(t) \right|_{t=t_0} = \left. \frac{D}{Dt} v(q_h(t)) \right|_{t=t_0}
\]
and
\[
\nabla^{(A,V)}_{X} v(q_0) = \left. \frac{D}{Dt} g_{q}(t)v(t) \right|_{t=t_0}.
\]

In particular, \( \nabla^{(A,V)}_{X} v(q_0) \) depends only on \( \xi_0 = \dot{g}_{q}(t_0) \) and \( v(q_0) = v(t_0) \).

(c) Let \( v \in \Gamma^G(V) \), \( q(t) \) a curve in \( Q \), and \( v(t) = v(q(t)) \) for all \( t \). Then
\[
\left. \frac{D}{Dt}^{(A,H)} v(t) \right|_{t=t_0} = \left. \frac{D}{Dt} g^{-1}_{q}(t)v(t) \right|_{t=t_0} = \left. \frac{D}{Dt} v(q_h(t)) \right|_{t=t_0}
\]
and
\[
\left. \frac{D}{Dt}^{(A,V)} v(t) \right|_{t=t_0} = \left. \frac{D}{Dt} g_{q}(t)v(t) \right|_{t=t_0}.
\]

Let \( \tau : V \to Q \) be a given vector bundle and let \( \rho : G \times V \to V \) denote a given \( G \)-action on \( V \). Then the quotient \( V/G \) carries a naturally defined vector bundle structure over the base \( Q/G \), say \( \tau/G : V/G \to Q/G \), where \( (\tau/G)([v]_G) \) is defined by \( (\tau/G)([v]_G) = [\tau v]_G \). The projection \( \pi_G(V) : V \to V/G \) is a surjective vector bundle homomorphism covering \( \pi \), and the restriction \( \pi_G(V)|_{\tau^{-1}(q)} : \tau^{-1}(q) \to (\tau/G)^{-1}([q]_G) \) is a linear isomorphism for each \( q \in Q \).

Let \( G \times V \to V \) be a vector bundle action and let \( \pi_G(V) : V \to V/G \) be the vector bundle homomorphism described above. Then \( (\pi_G(V))^* : \Gamma(V/G) \to \Gamma^G(V) \) is a linear isomorphism.

**Definition 2.5.** Let \([g_0, \xi_0]_G \in \mathfrak{g} \) with \( \hat{\pi}_G[g_0, \xi_0]_G = [g_0]_G \) and let \([v]_G \in \Gamma(V/G) \), where \( v \in \Gamma^G(V) \). Let \( I^V_G(TQ) \to Q/G \) be the **vertical invariant bundle** whose fiber is \( I^V_G(TQ)_x := \{ Y \in \mathfrak{X}^c(\tau^{-1}(x)) \} g^*Y = Y \).

Consider the horizontal invariant bundle, that is, the vector space of all horizontal invariant vector fields on \( Q \) along \( \tau^{-1}(x) \) given by \( I^H_G(TQ)_x := \{ X : \tau^{-1}(x) \to TQ : X(q) \in \text{Hor}T_qQ, \forall q \in Q, g^*X = X \} \).

Let \( Y_0 \in I^H_G(TQ)_x \) such that \( \beta_A(Y_0) = [g_0, \xi_0]_G \), where the map
\[
\beta_A : I^H_G(TQ) \to \hat{\mathfrak{g}}
\]
is the well defined Lie algebra isomorphism given by
\[
\beta_A(Y) = [q, A(Y(q))]_G,
\]
where \( Y \in I^H_G(TQ)_x, x \in Q/G, \) and \( q \in \tau^{-1}(x) \) is arbitrary.

Then

(a) The **quotient, or reduced, vertical connection** is defined by
\[
\nabla^{(A,V)}_{Y_0} v(x)_{G} = \left[ \nabla^{(A,V)}_{Y_0} v \right]_{G}.
\]

(b) Let \( \tilde{X}_0 \in T_{[g_0, \xi_0]_G}(Q/G) \), define \( X_0 = \tilde{X}_0^h \), so \( X_0 \in I^H_G(Q) \), and \( Z_0 = X_0 + Y_0 \).

The **quotient, or reduced, connection** is defined by the condition
\[
\left[ \nabla^{(A)}_{X_0 + Y_0 + Z_0} v \right]_{G} = \left[ \nabla_{Z_0} v \right]_{G}.
\]
or by the equivalent condition
\[
\left[\nabla^{(A)}\right]_{G, X_0}^{\left[q_0, \xi_0\right]} [v]_G = \left[\nabla^{(A,H)}\right]_{G, X_0} [v]_G + \left[\nabla^{(A,V)}\right]_{G, [q_0, \xi_0]} [v]_G.
\]

The following lemma establishes the link between the notions of quotient vertical covariant derivative (resp. quotient covariant derivative) and quotient vertical connection (resp. quotient connection).

**Lemma 2.6.** Let \([q_0, \xi_0]_G \in \tilde{q}\) and let \([v]_G \in \Gamma(V/G)\), where \(v \in \Gamma^G(V)\) as above. Let \([q]_G(t) = x(t)\) be any curve in \(Q/G\) such that \(\tilde{x}_G ([q_0, \xi_0]_G) = [q]_G(t_0)\) and let, with a convenient abuse of notation, \([v]_G(t) = [v]_G ([q]_G(t))\). Assume that \(D/Dt\) is \(G\)-invariant. Then we have
\[
\left. \frac{D^{(A,V)}}{Dt} \right|_{G, [q_0, \xi_0]} [v]_G(t) \bigg|_{t=t_0} = \left. \frac{Dg_0(t)v_0}{Dt} \right|_{t=t_0} [v]_G \left(\left[q\right]_G(t_0)\right),
\]
where \(v_0 = v(q_0)\) and \(g_0(t)\) is any curve on \(G\) such that \(g_0(t_0) = e\) and \(\dot{g}_0(t_0) = \xi_0\).

2.2. The Lagrange-d’Alembert-Poincarè equations. In this section we briefly review several definitions and results, stated and proved in [10].

**The Lagrange-d’Alembert principle.**

Let \(Q\) be a manifold and let \(\mathcal{D}\) be a distribution on \(Q\), that is, \(\mathcal{D}\) is a subbundle of \(TQ\) and let \(L : Q \to \mathbb{R}\) be a given Lagrangian. We can state the Lagrange-d’Alembert principle as follows:

A curve \(q(t), t \in [t_0, t_1]\), on \(Q\) is an actual motion of the system if and only if \(\dot{q}(t) \in \mathcal{D}_q(t)\) for all \(t\) and, besides, for any deformation \(q(t, \lambda)\) of \(q(t)\) such that the corresponding variation
\[
\delta q(t) = \left. \frac{\partial q(t, \lambda)}{\partial \lambda} \right|_{\lambda=0}
\]
satisfies \(\delta q(t) \in \mathcal{D}_q(t)\) for all \(t\), the following condition holds
\[
\delta \int_{t_0}^{t_1} L(q, \dot{q}) dt = 0.
\]

Here we use the standard notation in the calculus of variations, namely,
\[
\delta \int_{t_0}^{t_1} L(q, \dot{q}) dt = \left. \frac{\partial}{\partial \lambda} \right|_{\lambda=0} \int_{t_0}^{t_1} L(q(t, \lambda), \dot{q}(t, \lambda)) dt.
\]

Using the Lagrange-d’Alembert Principle, equations of motion, called *Lagrange-d’Alembert equations*, can be written in a local chart as follows
\[
\frac{\partial L}{\partial \dot{q}}(q, \dot{q}) - \frac{d}{dt} \frac{\partial L}{\partial \dot{q}}(q, \dot{q}) \in (\mathcal{D}_q)^0, \tag{2}
\]
\[
(q, \dot{q}) \in \mathcal{D}_q. \tag{3}
\]

The form of these equations is *independent* of the choice of coordinates, which is one of the great advantages of Lagrange-d’Alembert Principle.

**Nonholonomic Systems with Symmetry.** Now we shall assume that \(\pi : Q \to Q/G\) is a principal bundle with structure group \(G\) and we denote by \(\mathcal{V}\) the vertical distribution, that is, \(\mathcal{V}_q = T_q \left(\pi^{-1}([q]_G)\right)\), for each \(q \in Q\), which is obviously an integrable distribution whose integral manifolds are the group orbits \(\pi^{-1}([q]_G)\).
Following [6] let us consider the following condition, for simplicity:

(A1) DIMENSION ASSUMPTION. For each \( q \in Q \) we have the equality

\[
T_qQ = D_q + V_q.
\]  

(4)

It is easy to see that, under assumption (A1), the dimension of the space \( S_q = D_q \cap V_q \) does not depend on \( q \in Q \), and moreover, the collection of spaces \( S_q, q \in Q \), is a subbundle of \( D \), of \( V \), and of \( TQ \).

Also we consider the following condition:

(A2) INVARIANCE OF \( D \). The distribution \( D \) is \( G \)-invariant.

It follows immediately from (A1) and (A2) that \( S \) is a \( G \)-invariant distribution.

The Nonholonomic Connection. It is known, and easy to prove, that there is always a \( G \)-invariant metric on \( Q \). See, for example, [11]. In many important physical examples there is a natural way of choosing such a metric, representing, for instance, the inertia tensor of the system (see [6]).

Let us choose an invariant metric on \( Q \). Then, under condition (A1), we can define uniquely a principal connection form \( A : TQ \to \mathfrak{g} \) such that the horizontal distribution \( \text{Hor}_A TQ \) satisfies the condition that, for each \( q \), the space \( \text{Hor}_q T_qQ \) coincides with the orthogonal complement \( H_q \) of the space \( S_q \) in \( D_q \). This connection is called the nonholonomic connection.

For each \( q \in Q \), let us denote \( U_q \) the orthogonal complement of \( S_q \) in \( V_q \). Then it is easy to see that \( U \) is a distribution and we have the Whitney sum decomposition

\[
TQ = H \oplus S \oplus U.
\]

We obviously have \( D = H \oplus S \) and \( V = S \oplus U \).

Under the additional assumption (A2), all three distributions \( H, S \) and \( U \) are \( G \)-invariant, therefore we can write,

\[
TQ/G = H/G \oplus S/G \oplus U/G.
\]

The Geometry of the Reduced Bundles. Recall from [11] that there is a vector bundle isomorphism

\[
\alpha_A : TQ/G \to T(Q/G) \oplus \tilde{g},
\]

where \( \tilde{g} \) is the adjoint bundle of the principal bundle \( Q \) defined as follows

\[
\alpha_A[q, \dot{q}]_G = T\pi(q, \dot{q}) \oplus [q, A(q, \dot{q})]_G.
\]

Notice that the bundle \( T(Q/G) \oplus \tilde{g} \) does not depend on the connection \( A \), however the vector bundle isomorphism \( \alpha_A \) does depend on \( A \). It is easy to see that \( \alpha_A(H/G) = T(Q/G) \), and \( \alpha_A(V/G) = \tilde{g} \). Define the subbundles \( \tilde{s} \) and \( \tilde{u} \) of \( \tilde{g} \) by \( \tilde{s} = \alpha_A(S/G) \) and \( \tilde{u} = \alpha_A(U/G) \) respectively. Clearly, we have

\[
\tilde{g} = \tilde{s} \oplus \tilde{u}.
\]

Covariant derivatives on the bundle \( T(Q/G) \oplus \tilde{g} \).

Let \( l : T(Q/G) \oplus \tilde{g} \to \mathbb{R} \) be a given reduced Lagrangian. We will represent an element of \( T(Q/G) \oplus \tilde{g} \) using the notation \( (x, \dot{x}, \tilde{v}) \), where \( x \in Q/G \), \( (x, \dot{x}) \in T_x(Q/G) \) and \( \tilde{v} \in \tilde{g}_x \). Care should be exercised using this notation since the bundle \( T(Q/G) \oplus \tilde{g} \) is not necessarily trivial. However, we can still give a precise meaning to the partial derivatives

\[
\frac{\partial l}{\partial x}, \quad \frac{\partial l}{\partial \dot{x}} \quad \text{and} \quad \frac{\partial l}{\partial \tilde{v}},
\]
Upon the choice of an affine connection $\nabla$ on $Q/G$ and an affine connection $\nabla^A$ on the vector bundle $\tilde{g}$, which naturally gives an affine connection on $T(Q/G) \oplus \tilde{g}$, following [11]. First of all, since $\tilde{g}$ and $T(Q/G)$ are vector bundles we may interpret the last two derivatives as being fiber derivatives which are elements of the dual bundles $T^*(Q/G)$ and $\tilde{g}^*$, respectively, and for this, one does not need any extra structure other than the bundle structure. In other words, for given $(x_0, \dot{x}_0, \bar{v}_0)$ and $(x_0, x', \bar{v}')$ we define

$$\frac{\partial l(x_0, \dot{x}_0, \bar{v}_0) \cdot x'}{\partial x} = \frac{d}{ds} \bigg|_{s=0} l(x_0, \dot{x}_0 + sx', \bar{v}_0)$$

and

$$\frac{\partial l(x_0, \dot{x}_0, \bar{v}_0) \cdot \bar{v}'}{\partial \bar{v}_0} = \frac{d}{ds} \bigg|_{s=0} l(x_0, \dot{x}_0, \bar{v}_0 + s\bar{v}').$$

Now we shall define the derivative $\partial l/\partial x$. Let $(x_0, \dot{x}_0, \bar{v}_0)$ be a given element of $T(Q/G) \oplus \tilde{g}$. For any given curve $x(s)$ on $Q/G$, let $(x(s), \bar{v}(s))$ be the horizontal lift of $x(s)$ with respect to the connection $\nabla^A$ on $\tilde{g}$ such that $(x(0), \bar{v}(0)) = (x_0, \bar{v}_0)$, and let $(x(s), u(s))$ be the horizontal lift of $x(s)$ with respect to the connection $\nabla$ such that $(x(0), u(0)) = (x_0, \dot{x}_0)$. (Notice that in general, $(x(s), u(s))$ is not the tangent vector $(x(s), \dot{x}(s))$ to $x(s)$). Thus, $(x(s), u(s), \bar{v}(s))$ is a horizontal curve with respect to the connection $C = \nabla \oplus \nabla^A$ naturally defined on $T(Q/G) \oplus \tilde{g}$ in terms of the connection $\nabla$ on $T(Q/G)$ and the connection $\nabla^A$ on $\tilde{g}$.

**Definition 2.7.** The **covariant derivative** of $l$ with respect to $x$ at $(x(0), \dot{x}(0))$ in the direction of $(x(0), \dot{x}(0))$ is defined by

$$\frac{\partial^C l}{\partial x}(x_0, \dot{x}_0, \bar{v}_0)(x(0), \dot{x}(0)) = \frac{d}{ds} \bigg|_{s=0} l(x(s), u(s), \bar{v}(s)).$$

We shall often write

$$\frac{\partial^C l}{\partial x} = \frac{\partial l}{\partial x},$$

whenever there is no danger of confusion.

The covariant derivative on a given vector bundle, for instance $\tilde{g}$, induces a corresponding covariant derivative on the dual bundle, in our case $\tilde{g}^*$. More precisely, let $\alpha(t)$ be a curve in $\tilde{g}^*$. We define the covariant derivative of $\alpha(t)$ in such a way that for any curve $\bar{v}(t)$ on $\tilde{g}$ such that both $\alpha(t)$ and $\bar{v}(t)$ project on the same curve $x(t)$ on $Q/G$, we have

$$\frac{d}{dt} \langle \alpha(t), \bar{v}(t) \rangle = \left\langle \frac{D\alpha(t)}{Dt}, \bar{v}(t) \right\rangle + \left\langle \alpha(t), \frac{D\bar{v}(t)}{Dt} \right\rangle.$$

Likewise we can define the covariant derivative in the vector bundle $T^*(Q/G)$. Then we obtain a covariant derivative on the vector bundle $T^*(Q/G) \oplus \tilde{g}^*$.

It is in the sense of this definition that terms like

$$\frac{D}{Dt} \frac{\partial l}{\partial \bar{v}},$$

and

$$\frac{D}{Dt} \frac{\partial l}{\partial \bar{v}'}$$

should be interpreted. In the first case, $D/Dt$ means the covariant derivative in the bundle $T^*(Q/G)$ and, in the second case, $D/Dt$ is the covariant derivative in the bundle $\tilde{g}^*$.
Recall that the curvature $B = B^A$ of $\mathcal{A}$ is given by
\begin{equation}
B(q)(X_1(q), X_2(q)) = -\mathcal{A}([X_1^h, X_2^h])(q),
\end{equation}
where $X, Y$ are vector fields on $Q/G$ and $X^h_1, X^h_2$ are their horizontal lifts, respectively.

The curvature 2-form $B = B^A$ of the connection $\mathcal{A}$ induces a $\tilde{g}$-valued 2-form $\tilde{B} = \tilde{B}^A$ on $Q/G$ given by
\begin{equation}
\tilde{B}(x)(\delta x, \dot{x}) = [q, B(q)(\delta q, \dot{q})]_G,
\end{equation}
where for each $(x, \dot{x})$ and $(x, \delta x)$ in $T_x(Q/G)$, $(q, \dot{q})$ and $(q, \delta q)$ are any elements of $T_qQ$ such that $\pi(q) = x, T\pi(q, \dot{q}) = (x, \dot{x})$ and $T\pi(q, \delta q) = (x, \delta x)$ (see [11] for the proof).

The $\tilde{g}$-valued 2-form $\tilde{B}$ on $Q/G$ will be called the **reduced curvature form**.

In [10] and [11] the theory of Lagrange-Poincaré and Lagrange-d’Alembert-Poincaré equations has been developed. Here we recall the results that we use.

**Theorem 2.8.** Let $q(t)$ be a curve in $Q$ such that $(q(t), \dot{q}(t)) \in \mathcal{D}_{q(t)}$ for all $t$ and let $(x(t), \dot{x}(t), \ddot{v}(t)) = \alpha_A(q(t), \dot{q}(t)|G)$ be the corresponding curve in $T(Q/G) \oplus \tilde{g}$. The following conditions are equivalent:

(i) The **Lagrange-d’Alembert principle** holds:
\[
\delta \int_{t_0}^{t_1} L(q, \dot{q}) dt = 0
\]
for variations $\delta q$ of the curve $q$ such that $\delta q(t_i) = 0$, for $i = 0, 1$, and $\delta q(t) \in \mathcal{D}_{q(t)}$ for all $t$.

(ii) The **reduced Lagrange-d’Alembert principle** holds: The curve $x(t) \oplus \dot{v}(t)$ satisfies
\[
\delta \int_{t_0}^{t_1} l (x(t), \dot{x}(t), \ddot{v}(t)) dt = 0,
\]
for variations $\delta x \oplus \delta^A \ddot{v}$ of the curve $x(t) \oplus \dot{v}(t)$, where $\delta^A \ddot{v}$ has the form
\[
\delta^A \ddot{v} = \frac{D\ddot{v}}{Dt} + [\dddot{v}, \dot{\eta}] + \tilde{B}(\delta x, \dot{x}),
\]
with the boundary conditions $\delta x(t_i) = 0$ and $\dot{\eta}(t_i) = 0$, for $i = 0, 1$, and where $\dddot{v}(t) \in \tilde{g}x(t)$.

(iii) The following **vertical Lagrange-d’Alembert-Poincaré equations**, corresponding to vertical variations, hold:
\[
\frac{D}{Dt} \frac{\partial l}{\partial \ddot{v}} (x, \dot{x}, \dddot{v}) \bigg|_{\tilde{g}_x} = \text{ad}_x^* \frac{\partial l}{\partial \dot{v}} (x, \dot{x}, \dot{v}) \bigg|_{\tilde{g}_x},
\]
and the **horizontal Lagrange-d’Alembert-Poincaré equations**, corresponding to horizontal variations, hold:
\[
\frac{\partial^2 l}{\partial x} (x, \dot{x}, \dddot{v}) - \frac{D}{Dt} \frac{\partial l}{\partial \dddot{v}} (x, \dot{x}, \dddot{v}) = \left\langle \frac{\partial l}{\partial \dot{v}} (x, \dot{x}, \dot{v}), \mathbf{i}_x \tilde{B}(x) \right\rangle.
\]

In part (ii) of this theorem, if $\dddot{v} = [q, v]_G$ with $v = A(q, \dot{q})$ then $\dot{\eta}$ can be always written $\dddot{v} = [q, \dot{\eta}]_G$, and the condition $\dot{\eta}(t_i) = 0$ for $i = 0, 1$, is equivalent to the condition $\eta(t_i) = 0$ for $i = 0, 1$. Also, if $x(t) = [q]_G$ and $\dddot{v} = [q, v]_G$ where $v = A(q, \dot{q})$, then variations $\delta x \oplus \delta^A \ddot{v}$ such that
\[
\delta^A \ddot{v} = \frac{D\ddot{v}}{Dt} + [\dddot{v}, \dot{\eta}] \equiv \frac{D[q, \eta]_G}{Dt} + [q, [v, \eta]]_G
\]
with $\tilde{\eta}(t_i) = 0$ (or, equivalently, $\eta(t_i) = 0$) for $i = 0, 1$, and $\tilde{\eta}(t) \in \tilde{\mathfrak{s}}_x(t)$ correspond exactly to vertical variations $\delta q$ of the curve $q$ such that $\delta q(t_i) = 0$ for $i = 0, 1$, and $\delta q(t) \in S_{q(t)}$, while variations $\delta x \oplus \delta^A\bar{v}$ such that

$$\delta^A\bar{v} = \tilde{B}(\delta x, \dot{x})$$

with $\delta x(t_i) = 0$ for $i = 0, 1$, correspond exactly to horizontal variations $\delta q$ of the curve $q$ such that $\delta q(t_i) = 0$.

Remarks. a) Note that $\frac{D}{Dt} \frac{\partial l}{\partial v}(x, \dot{x}, \tau) \bigg|_{\tilde{s}_x}$ stands for $\left( \frac{D}{Dt} \frac{\partial l}{\partial v}(x, \dot{x}, \tau) \right)_{\tilde{s}_x}$.

b) In the case in which there is no restriction, then $\tilde{s} = \tilde{g}$, and the Lagrange-d’Alembert-Poincaré equations are exactly the Lagrange-Poincaré equations (see [10, 11]).

3. The Lie bracket by stages. In this section we calculate explicit expressions for the Lie bracket by several stages. For doing this, we need some background on reduced covariant derivatives and associated connections on associated bundles, as defined in [11] (see section 2). The formulas that we obtain are fundamental for writing reduced equations of motion by several stages, which is the main purpose of the paper.

3.1. An explicit formula for the Lie bracket by two stages. In this section we will rewrite the formula of the Lie bracket on sections of the Atiyah bundle that appears in [11] in a way that is adapted for our purposes in this paper. For this we need the Lie bracket of the Lie algebra of the symmetry group decomposed by stages. We will use results and notation from [11], see also section 2.1.

Let a given principal bundle $\pi : Q \rightarrow Q/G$ with structure group $G$, and choose a Riemannian invariant metric on $Q$. Let $N$ be a normal subgroup of $G$, then for each $q \in Q$ we have a decomposition of $TQ$ as an orthogonal direct sum $T_qQ = \text{Ver}^N(T_qQ) \oplus H_N(q)$, where $H_N(q)$ is the orthogonal complement of $\text{Ver}^N(T_qQ)$. Then, this collection of $H_N(q)$ defines a connection on the principal bundle $Q$ with structure group $N$. Let $A_N$ be the corresponding 1-form connection. From the definition of $A_N$ it follows easily that for each $g \in G$ and every $v_q \in T_qQ$ we have that $A_N(gv_q) = A_{dg}A_N(v_q)$.

Next, we use the notation and results on quotient horizontal and quotient vertical connections, summarized in section 2.1. Given $[g_0, \xi_0]_G \in \tilde{g}$, let $X_0$ be the $G$-invariant vertical vector field defined by $X_0(q_0) = \xi_0 g_0$, which we can prove that it is well defined, and satisfies $A(X_0(q_0)) = \xi_0$. Let $W \rightarrow Q$ be a vector bundle where $G$ acts by vector bundle isomorphisms and let $w \in \Gamma^G(W)$, which is identified with $[w]_G$. We define the quotient, or reduced, vertical connection $[\nabla^{(A,V)}]_{G,[g_0,\xi_0]_{\tilde{g}}} [w]_G$ by

$$[\nabla^{(A,V)}]_{G,[g_0,\xi_0]_{\tilde{g}}} [w]_G := [\nabla_{X_0} w]_G,$$

which, in the present context, is equivalent to the one given in [11] (see definition 2.5 in section 2.1).

One of the main results that we will use is Corollary 6.3.11 in [11]. Next, we shall explain all the concepts, notation and the main statements of that corollary. We will do that in full detail for the convenience of the reader. However, we will not provide the proofs, which are given in [11].
Consider a Lie group \( G, N \) a normal subgroup of \( G \) and \( K = G/N \). We sometimes think of \( G \) as a principal bundle \( \pi_N : G \to K \) with structure group \( N \) acting on the left, and also, as a principal bundle \( G \to G/G \equiv \{ [e_G]_G \} \), where \( e_G \) is the neutral element of \( G \), the base is a single point and the structure group \( G \) acts on the left by left translations. Similarly, we consider sometimes \( K \) as a principal bundle where the base is a single point and the structure group \( K \) acts on the left by left translations, \( K \to K/K \equiv \{ [e_K]_K \} \), where \( e_K \) is the neutral element of \( K \).

Let \( g, n \) and \( \mathfrak{t} \) be the Lie algebras of \( G, N \) and \( K \) respectively. We call \( e_N = e_G \) the neutral element of \( N \). The adjoint bundle \( \mathfrak{g} \to \{ [e_G]_G \} \) of \( G \to \{ [e_G]_G \} \), is naturally identified with \( g \), say \( g \equiv g_N \), by \( \xi \equiv [e_G, \xi]_G \). Likewise there is a natural identification \( \mathfrak{k} \equiv \mathfrak{t} \) given by \( \kappa \equiv [e_G, \kappa]_G \).

Let an arbitrary identification \( g \equiv \mathfrak{t} \oplus \mathfrak{n} \) as linear spaces. Choose a \( G \)-invariant Riemannian metric on \( G \), which is determined by its restriction to \( g \). Let \( A_N \) be the principal connection defined on the principal bundle \( G \to K \) with structure group \( N \) in the way described at the beginning of this section, which has the property that \( A_N(gvq) = Ad_p A_N(vq) \), for every \( g, q \in G, vq \in T_qG \). Then \( \mathfrak{g} = \mathfrak{t}^A_N \oplus \mathfrak{n} \) where \( \mathfrak{t}^A_N \) is the horizontal lift of \( \mathfrak{t} = T_eK \) in the bundle \( G \to K \), at the point \( e_G \in G \).

Note that, by definition, the subspaces \( \mathfrak{t}^A_N \) and \( \mathfrak{n} \) of \( \mathfrak{g} \) are orthogonal.

Then, for the given identification \( g \equiv \mathfrak{t} \oplus \mathfrak{n} \), the bracket on the Lie algebra \( \mathfrak{g} \) can be written in terms of the brackets on the Lie algebra \( \mathfrak{n} \) and the Lie algebra \( \mathfrak{t} \), and also in terms of \( \nabla(A_N,V) \) and \( B^A_N \) using the formula, given in [11],

\[
[k_1 \oplus \eta_1, k_2 \oplus \eta_2] = [k_1, k_2] \oplus [\nabla(A_N,V)]_{k_1 \eta_1 - [\nabla(A_N,V)]_{k_2 \eta_2}^}\]

\[
- [B^A_N]_{k_1, k_2} + [\eta_1, \eta_2].
\]  

Formula (8) should be interpreted as follows. By definition \( \tilde{n} \to K \) is a vector bundle on \( K \) which is a left principal bundle \( K \to \{ [e_K]_K \} \) with structure group \( K \) over a single point. We have an action of \( K \) on \( \tilde{n} \) covering the action of \( K \) on \( K \to \{ [e_K]_K \} \) defined by \( [g]_N [h, \eta]|_N = [gh, Ad_N \eta]|_N \).

For each \( \eta \in \mathfrak{n} \) there is a \( K \)-invariant section \( \sigma_\eta : K \to \tilde{n} \) defined by \( \sigma_\eta([g]_N) = [g, Ad_N \eta]|_N \). So, we can identify

\[
\sigma_\eta \equiv [\sigma_\eta]|_K \equiv \eta.
\]  

Then the right hand side of (8) should be interpreted as being

\[
[k_1 \oplus \eta_1, k_2 \oplus \eta_2] = [k_1, k_2] \oplus [\nabla(A_N,V)]_{k_1, k_1} \sigma_\eta_1 \sigma_\eta_2 \sigma_\eta, [\nabla(A_N,V)]_{k_2, k_2} \sigma_\eta_1 \sigma_\eta_2 \sigma_\eta, K
\]

\[
- [B^A_N]_{k_1, k_2} + [e_K, \eta_1]_{k_1, e_K, \eta_2]_{k_2} \sigma_\eta_1 \sigma_\eta_2} \sigma_\eta.
\]  

using the identifications \([\sigma_\eta_1, \sigma_\eta_2]|_K \equiv \sigma_\eta_1, \sigma_\eta_2, K \equiv \sigma_\eta_1, \sigma_\eta_2_2], K \equiv [\eta_1, \eta_2]. \) Now, according to the general definition given in [11] that we recall in formula (6) in section 2.2, \( B^A_N \) is a \( \tilde{n} \)-valued 2-form on \( K \) given by \( B^A_N(k)(\delta k) = [g, B(g)(\dot{\theta} g, \delta g)]|_N \),
where $k = [g]_N$, $\dot{k} = T\pi_N \dot{g}$ and $\delta k = T\pi_N \delta g$. It can be checked that $\bar{B}^A_N$ is $K$-invariant. Then

$$[\bar{B}^A_N]_K(k_1, k_2) := \left[ \bar{B}^A_N(e_K)(k_1, k_2) \right]_K$$

$$= \left[ [e_G, \bar{B}^A_N(e_G)(k_1^A_N(e_G), k_2^A_N(e_G))]_N \right]_K$$

$$= \bar{B}^A_N(e_G)(k_1^A_N(e_G), k_2^A_N(e_G)),$$

being $k_i^A_N(e_G) \in g$ the horizontal lift of $k_i$ at $e_G$ to $G$ for $i = 1, 2$.

In order to obtain a more explicit expression of the Lie bracket $[k_1 \oplus n_1, k_2 \oplus n_2]$ in terms of the decomposition $g = \mathfrak{k} \oplus n$, we shall see explicitly how to compute $[\bar{B}^A_N]_{G/N}(k_1, k_2)$ and $[\nabla^{(A_N, V)}]_{G/N, \kappa \eta}$ and identify them with elements of $n$, using the decomposition $g = \mathfrak{k} \oplus n$ and the identifications $\eta \leftrightarrow \sigma \eta$ and $\kappa \leftrightarrow [e_K, \kappa]_K$ as we have explained in the last proposition.

**Calculation of $[\bar{B}^A_N]_{G/N}(k_1, k_2)$**. For $k_i \in \mathfrak{k}$, $i \in \{1, 2\}$, we can define on $G$ a vector field associated to $k_i$ through the formula $X_{k_i}(g) = g_{\kappa_i}^A N(e_G)$. This field is a $G$-invariant horizontal field on the principal bundle $G \to K$ with principal connection $\mathcal{A}_N$. It follows that $[X_{k_1}, X_{k_2}]$ is $G$-invariant and we have $[X_{k_1}, X_{k_2}](g) = g([X_{k_1}, X_{k_2}](e_G)) = g([k_1^A_N(e_G), k_2^A_N(e_G)])$.

Using the general formula (5) in section 2.2 we have that

$$[\bar{B}^A_N]_K(k_1, k_2) = \left[ \bar{B}^A_N(e_G)(e_G, e_G)(k_1^A_N(e_G), k_2^A_N(e_G)) \right]_N$$

$$= \left[ [e_G, \bar{B}^A_N(e_G)(k_1^A_N(e_G), k_2^A_N(e_G))]_N \right]_K$$

$$= \left[ \left[ e_G, -\mathcal{A}_N \left( [k_1^A_N(e_G), k_2^A_N(e_G)] \right) \right]_N \right]_K$$

$$= \left[ \left[ e_G, -\mathcal{A}_N \left( k_1^A_N(e_G), k_2^A_N(e_G) \right) \right]_N \right]_K,$$

where we have used the definition of the bracket in $g$ and taken into account that the $X_{k_i}$ are left invariant vector fields on $G$ such that $X_{k_i}(e_G) = k_i^A_N(e_G)$, for $i = 1, 2$. Finally, using the identification (9) with $\eta \equiv -\mathcal{A}_N \left( [k_1^A_N(e_G), k_2^A_N(e_G)] \right)$ we obtain the identification

$$[\bar{B}^A_N]_K(k_1, k_2) \equiv -\mathcal{A}_N \left( k_1^A_N(e_G), k_2^A_N(e_G) \right). \quad (11)$$

In order to simplify the notation, we define the bilinear form $a_N : \mathfrak{k} \times \mathfrak{k} \to \mathfrak{n}/K \equiv n$ given by the following formula,

$$a_N(k, \pi) := -\mathcal{A}_N \left( k^A_N(e_G), \pi^A_N(e_G) \right) \quad (12)$$

and we can write

$$[\bar{B}^A_N]_K(k, \pi) \equiv a_N(k, \pi). \quad (13)$$

**Calculation of $[\nabla^{(A_N, V)}]_{G/N, \kappa \eta}$**. Using the definition of the quotient vertical connection we have

$$[\nabla^{(A_N, V)}]_{G/N, \kappa \eta} \equiv [\nabla^{(A_N, V)}]_{K, [e_K, \kappa]_K} \sigma \eta |_K = [\nabla_{X_0} \sigma \eta]_K,$$

where $X_0$ is the uniquely determined invariant vertical vector field on the principal bundle $K \to \{e_K\}$ with structure group $K$, such that $\mathcal{A}_K(X_0(e_K)) = \kappa$, where $\mathcal{A}_K$
is the uniquely determined principal connection on the principal bundle $K \to \{e_K\}$, see section 2.1.

**Notation.** For the rest of this paper we will often consider some horizontal lift with respect to some connection, at the neutral element $e = e_G$ of $G$, like, for instance, $\kappa^A_N(e_G)$. In those cases we will often avoid writing $e_G$, for simplicity.

We are going to use the following lemma.

**Lemma 3.1.** There is a natural identification
\[
[\nabla^{(A_N,V)}]_{G/N, \kappa, \eta} = [\kappa^{A_N}, \eta].
\]

**Proof.** Let $[q(s), \xi(s)]_G$ be any curve in $\tilde{g}$. Then we have (see definition 2.2 in section 2.1),
\[
\frac{D[q(s), \xi(s)]_G}{Ds} = \left[q(s), -[A(q(s), \dot{q}(s)), \xi(s)] + \dot{\xi}(s)\right]_G.
\]

Also we have
\[
\nabla_X^{(A_N,V)} v(q_0) = \left.\frac{D}{Dt} g_q(t)v(t_0)\right|_{t=t_0}
\]
with $v \in \Gamma^G(V)$, $q(t) \in Q$ such that $\dot{q}(t_0) = X(q_0)$, $\tau : V \to Q$, $v(t) \in V$ and $q(t) = \tau(v(t))$, with $q_0(t)$ horizontal such that $q(t) = g_q(t) q_0(t)$, $g_q(t_0) = e$.

So, considering the case $Q = G/N = K$, $V \equiv \tilde{n}$, $\tau = \tilde{n} \to K$, with $\sigma_q([g]_N) = [g]_N \cdot e_G, \eta]_N$, and $k(t) = [g(t)]_N$, $\dot{k}(t_0) = [\dot{g}(t_0)]_N = \kappa$, $v(t) = [g(t), \Ad_{g(t)} \eta]_N$, where $g(t_0) = e$, we can write $[\nabla^{(A_N,V)}]_{K, \kappa, \eta} = [\nabla_{Y_0 \sigma \eta}]_K = \left[D_t k(t) \sigma_q(e_K)\right|_{t=t_0}].$ So, we have
\[
[\nabla^{(A_N,V)}]_{G/N, \kappa, \eta} = \left[D_t k(t) \sigma_q(e_K)\right|_{t=t_0} = \left[D_t [g(t)]_N, \eta_N\right|_{t=t_0} = \left[D_t [g(t), \Ad_{g(t)} \eta]_N\right|_{t=t_0}
\]
where the last identity follows from the definition of the action of $K = G/N$ over $\tilde{n}$.

Now, applying the definition of covariant derivative in the adjoint bundle, we have
\[
\left[D_t [g(t), \Ad_{g(t)} \eta]_N\right|_{t=t_0} = \left([g(t), -[A_N g(t), \dot{g}(t)], \Ad_{g(t)} \eta] + (\Ad_{g(t)} \eta)|_{t=t_0}\right)_N.
\]

If we choose $g(t)$ horizontal with respect to $A_N$ such that $g(t_0) = e$, we obtain the formula
\[
[\nabla^{(A_N,V)}]_{G/N, \kappa, \eta} = \left[[e, [\kappa^{A_N}, \eta]]N\right]_K
\]
where $\kappa^{A_N}$ is the horizontal lift of $\kappa$ in $e_G$ to $G$.

Using (9) we obtain the identification $[\nabla^{(A_N,V)}]_{G/N, \kappa, \eta} = [\kappa^{A_N}, \eta].$

We define the bilinear form $b_N : \mathfrak{t} \times \mathfrak{n} \to \tilde{n}/K \equiv \mathfrak{n}$ given by
\[
b_N(\kappa, \eta) := [\kappa^{A_N}, \eta].
\]
Then we have an explicit formula for the Lie bracket
\[
[k + \eta, \pi + \overline{\eta}] = [k, \pi] + \left[ \frac{\nabla^{(A_{N_j}, V)}}{K, \kappa} \right] K, \kappa \overline{\eta} - \left[ \frac{\nabla^{(A_{N_j}, V)}}{K, \kappa} \right] K, \pi \eta - \left[ \frac{\bar{B}^{A_{N_j}}}{K}(k, \pi) + [\eta, \overline{\eta}] \right]
\]
\[= [k, \pi] + \left[ \frac{\nabla^{(A_{N_j}, V)}}{K} \right] K, \left[ e, [k^{A_{N_j}}, \eta] \right] + \left[ \frac{\nabla^{(A_{N_j}, V)}}{K} \right] K, \left[ e, [\pi^{A_{N_j}}, \eta] \right] + \left[ \frac{\nabla^{(A_{N_j}, V)}}{K} \right] K, \left[ e, [\bar{B}^{A_{N_j}}(k), \eta] \right] + [\eta, \overline{\eta}]
\]
\]
\[= \left[ e, [k_1^{A_{N_j}}(e_G), \pi_1^{A_{N_j}}(e_G)] \right] + [\eta, \overline{\eta}] + \left[ \frac{\nabla^{(A_{N_j}, V)}}{K} \right] K, \left[ e, [\bar{B}^{A_{N_j}}(k), \eta] \right] + [\eta, \overline{\eta}]
\]
\]
\[= \left[ e, [k_1^{A_{N_j}}(e_G), \pi_1^{A_{N_j}}(e_G)] \right] + [\eta, \overline{\eta}]
\]
(17)
or equivalently, using the defined bilinear forms,
\[
[k + \eta, \pi + \overline{\eta}] = [k, \pi] + b_N(k, \overline{\eta}) - b_N(\pi, \eta) - \eta(a_N(k, \pi) + [\eta, \overline{\eta}]].
\] (18)

3.2. The Lie bracket by several stages. Now we will obtain a formula that generalizes (18) for the case of several stages, in fact, we will show that it can be done by a repeated application of (18). This will be one of the main results of this paper. Another important result will be the application of this generalization for reducing a nonholonomic system by several stages.

**Theorem 3.2.** Let $G$ be a Lie group and let a chain of $n$ subgroups $N_j \triangleleft N_{j-1}$ for $1 \leq j \leq n+1$, where $N_0 = G$ and $N_{n+1} = \{e\}$. Denote $N_{j-1}/N_j$, $n_j$ the Lie algebra of the subgroup $N_j$, and $n_{(j-1,j)}$ the Lie algebra of $N_{(j-1,j)}$. Note that since $n_{n+1} = \{0\}$ we have $n_{(n,n+1)} = n_n$.

Consider a linear identification as vector spaces
\[
g = n_{(0,1)} \oplus n_{(1,2)} \oplus \cdots \oplus n_{(n-1,n)} \oplus n_{(n,n+1)}
\] (19)
such that $n_{j-1} = n_{(j-1,j)} \oplus n_j$ for all $1 \leq j \leq n+1$.

Let $\bigoplus_{i=0}^{n} \eta^{(i,i+1)}_{j}$ and $\bigoplus_{i=0}^{n} \eta^{(j,j+1)}_{i}$ be two elements of $g$, where $\eta^{(i,i+1)}_{j} \in n_{(i,i+1)}$, $\eta^{(j,j+1)}_{i} \in n_{(j,j+1)}$, for $i, j = 0, \ldots, n$.

For each $j = 1, \ldots, n+1$, consider the left principal bundle $N_{j-1} \rightarrow N_{(j-1,j)} = N_{j-1}/N_j$ with structure group $N_j$ and with connection $A_{N_j}$, defined in a similar way as it was done for the principal bundle $G \rightarrow G/N$ with structure group $N$ with connection $A_N$, at the beginning of section 3, using the same $G$-invariant metric, which will be, naturally, $N_{j-1}$-invariant.

Consider the map $b_{(N_{j-1},N_j)} : n_{(j-1,j)} \times n_j \rightarrow n_j$, $j = 1, \ldots, n+1$, defined by
\[
b_{(N_{j-1},N_j)}(\eta, \overline{\eta}) := \left[ \eta^{A_{N_j}}, \overline{\eta} \right] = \left[ e, [\eta^{A_{N_j}}, \overline{\eta}] \right]_{N_{(j-1,j)}}(\eta_{N_{j-1,j}}), \quad \text{where } \eta^{A_{N_j}} \text{ is the horizontal lift of } \eta \text{ in the bundle } N_{j-1} \rightarrow N_{(j-1,j)} \text{ at the neutral element. Note that } \eta^{A_{N_j}} \in n_{j-1} \text{ and } n_j \subseteq n_{j-1} \text{ while the Lie bracket } [\eta^{A_{N_j}}, \overline{\eta}] \text{ is the Lie bracket in } n_{j-1}.
\]

Similarly, we consider $a_{(N_{j-1},N_j)} : n_{(j-1,j)} \times n_{(j-1,j)} \rightarrow n_j$, $j = 1, \ldots, n+1$, defined by
\[
a_{(N_{j-1},N_j)}(\eta, \overline{\eta}) := -A_{N_j}(e) \left( [\eta^{A_{N_j}}, \overline{\eta}] \right)
\]
\[
= \left[ e, -A_{N_j}(e) \left( [\eta^{A_{N_j}}, \overline{\eta}] \right) \right]_{N_{(j-1,j)}}.
\]
The map $b_{(N_j-1,N_j)}$ is identified with a quotient vertical connection since
\[
\left[e, [\eta^{A_{N_j}}, \eta] \right]_{N_j} \equiv \left[\nabla^{V(N_j)} \right]_{N_j} \left[e, \eta \right].
\]

On the other hand, the map $a_{(N_j-1,N_j)}$ is related directly with the curvature of the connection $A_{N_j}$, as follows $-A_{N_j}(e) \left( [\eta^{A_{N_j}}, \eta^{A_{N_j}}] \right) = B^{A_{N_j}}(e)([\eta^{A_{N_j}}, \eta^{A_{N_j}}]).$

Then we have the following formula for the Lie bracket on $\mathfrak{g}$:
\[
\sum_{i=0}^{n} \eta_{(i^2+1)} \bigoplus \sum_{j=0}^{n} \eta_{(j^2+1)} = \sum_{i=0}^{n} \left( [\eta_{(i^2+1)}, \eta_{(i^2+1)}] + \sum_{j=0}^{i-1} \left( -a_{(N_j, N_{j+1})}(\eta_{(j^2+1)}, \eta_{(j^2+1)}) + b_{(N_j, N_{j+1})}(\eta_{(j^2+1)}, \eta_{(j^2+1)}) \right) \right)
\]
\[
+ b_{(N_j, N_{j+1})}(\eta_{(j^2+1)}, \eta_{(j^2+1)}) \right) \right)
\]
\[
- b_{(N_j, N_{j+1})}(\eta_{(j^2+1)}, \eta_{(j^2+1)}) \right) \right)
\]
(20)

where by definition, for $i = 0, ..., n$ and $j = 0, ..., n$, $b_{(N_j, N_{j+1})}$ and $a_{(N_j, N_{j+1})}$ are, respectively, the components of $b_{(N_j, N_{j+1})}$ and $a_{(N_j, N_{j+1})}$ on $n_{(i^2+1)}$.

Proof. We shall prove this formula by induction.

If $n = 1$ then formula (20) becomes
\[
[\eta_{(0,1)} \oplus \eta_{(1,2)}, \eta_{(0,1)} \oplus \eta_{(1,2)}] = [\eta_{(0,1)}, \eta_{(0,1)}] \oplus [\eta_{(1,2)}, \eta_{(1,2)}] - a_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)}) +
\]
\[
b_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(1,2)}) - b_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)}) - b_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)})
\]
and this expression coincides with equation (18) for the case $G = N_0, N_1 \equiv N$
\[
b_{(N_0, N_1)} \equiv b_N 	ext{ and } N_2 = \{e\}, \text{ where } b_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)}) = b_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)}) = a_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)}) = a_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)})
\]

Now, we shall suppose that formula (20) is valid in the case in which we have $n - 1$ normal subgroups and we shall see that the formula holds when the number of subgroups is $n$.

Using the formula (18) that we have obtained in the case of one normal subgroup, with $N_1 \lhd G$ whose Lie algebra can be written as $n_1 = \bigoplus_{i=0}^{1} n_{(i^2+1)}$, we have
\[
\sum_{i=0}^{n} \eta_{(i^2+1)} \bigoplus \sum_{j=0}^{n} \eta_{(j^2+1)} = [\eta_{(0,1)}, \eta_{(0,1)}] \oplus \left( \sum_{i=1}^{n} \eta_{(i^2+1)} \bigoplus \sum_{j=1}^{n} \eta_{(j^2+1)} \right)
\]
\[
+ b_{(N_0, N_1)}(\eta_{(0,1)}, \bigoplus_{j=1}^{n} \eta_{(j^2+1)})
\]
\[
- b_{(N_0, N_1)}(\bigoplus_{i=1}^{n} \eta_{(i^2+1)}, \eta_{(0,1)})
\]
\[
- a_{(N_0, N_1)}(\eta_{(0,1)}, \eta_{(0,1)})
\]
(21)
Replacing this expression in (21) and considering that

\[ \sum_{j=1}^{i-1} \left( -a_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \eta^{(j,j+1)}) + b_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \sum_{k=j+1}^{n} \eta^{(k,k+1)}) ight) 
- b_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)}) \right) \].

Replacing this expression in (21) and considering that

\[ b_{(N_0, N_1)} (\eta, \eta) = \bigoplus_{p=1}^{n} b_{(N_0, N_1)}^{(p,p+1)} (\eta, \eta) \]

and \( a_{(N_0, N_1)} (\eta, \eta) = \bigoplus_{p=1}^{n} a_{(N_0, N_1)}^{(p,p+1)} (\eta, \eta) \), we obtain

\[ \bigoplus_{i=0}^{n} \eta^{(i,i+1)}, \bigoplus_{j=0}^{n} \eta^{(j,j+1)} = [\eta^{(0,1)}, \eta^{(0,1)}] \bigoplus \bigoplus_{i=1}^{n} \left( [\eta^{(i,i+1)}, \eta^{(i,i+1)}] \right) \]

\[ + \sum_{j=1}^{i-1} \left( -a_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \eta^{(j,j+1)}) + b_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \sum_{k=j+1}^{n} \eta^{(k,k+1)}) ight) 
- b_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)}) \right) \]

Replacing the index \( p \) by \( i \) we can group terms together and we obtain

\[ \bigoplus_{i=0}^{n} \eta^{(i,i+1)}, \bigoplus_{j=0}^{n} \eta^{(j,j+1)} = [\eta^{(0,1)}, \eta^{(0,1)}] \bigoplus \bigoplus_{i=1}^{n} \left( [\eta^{(i,i+1)}, \eta^{(i,i+1)}] \right) \]

\[ + \sum_{j=1}^{i-1} \left( -a_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \eta^{(j,j+1)}) + b_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \sum_{k=j+1}^{n} \eta^{(k,k+1)}) ight) 
- b_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)}) \right) \]

\[ - b_{(N_j, N_j+1)} (\eta^{(j,j+1)}, \sum_{s=1}^{n} \eta^{(s,s+1)}) \right) \]
In other words, \[
\begin{align*}
\sum_{i=0}^{n-i-1} \left( \begin{array}{c}
\oplus_{j=0}^{i-i-1} \left( \begin{array}{c}
\eta^{(i,i+1)} + \eta^{(j,j+1)}
\end{array} \right)
\right) + \\
\sum_{j=0}^{i-i-1} \left( \begin{array}{c}
- a^{(i,i+1)}_{(N_j, N_{j+1})} (\eta^{(j,j+1)}, \eta^{(j,j+1)}) + b^{(i,i+1)}_{(N_j, N_{j+1})} (\eta^{(j,j+1)}, \sum_{k=j+1}^{n} \eta^{(k,k+1)})
\end{array} \right)
\right) = \\
\sum_{i=0}^{n} \left( \begin{array}{c}
[\eta^{(i,i+1)}, \eta^{(i,i+1)}] + \\
\oplus_{j=0}^{i-i-1} \left( \begin{array}{c}
\eta^{(j,j+1)} + \eta^{(j,j+1)}
\end{array} \right)
\right) + \\
\sum_{j=0}^{i-i-1} \left( \begin{array}{c}
- a^{(i,i+1)}_{(N_j, N_{j+1})} (\eta^{(j,j+1)}, \eta^{(j,j+1)}) + b^{(i,i+1)}_{(N_j, N_{j+1})} (\eta^{(j,j+1)}, \sum_{k=j+1}^{n} \eta^{(k,k+1)})
\end{array} \right)
\right).
\end{align*}
\]

In particular, for \( n = 2 \) and \( n = 3 \), we obtain the following expressions
\[
\left[ \eta^{(0,1)} \oplus \eta^{(1,2)} \oplus \eta^{(2,3)}, \eta^{(0,1)} \oplus \eta^{(1,2)} \oplus \eta^{(2,3)} \right] = \left[ \eta^{(0,1)}, \eta^{(0,1)} \right] \oplus \left[ \eta^{(1,2)}, \eta^{(1,2)} \right]
\]
and
\[
\left[ \eta^{(0,1)} \oplus \eta^{(1,2)} \oplus \eta^{(2,3)} \oplus \eta^{(3,4)}, \eta^{(0,1)} \oplus \eta^{(1,2)} \oplus \eta^{(2,3)} \oplus \eta^{(3,4)} \right] = \left[ \eta^{(0,1)}, \eta^{(0,1)} \right] \oplus \left[ \eta^{(1,2)}, \eta^{(1,2)} \right] + \left[ \eta^{(1,2)}, \eta^{(2,3)} \right] + \left[ \eta^{(1,2)}, \eta^{(3,4)} \right] - b^{(1,2)}_{(N_{12}, N_{12})} (\eta^{(1,2)}, \eta^{(1,2)}) - b^{(1,2)}_{(N_{12}, N_{12})} (\eta^{(3,4)}, \eta^{(3,4)}) - b^{(1,2)}_{(N_{12}, N_{12})} (\eta^{(1,2)}, \eta^{(3,4)}) - b^{(1,2)}_{(N_{12}, N_{12})} (\eta^{(3,4)}, \eta^{(3,4)})
\]
The Euler–Poincaré equations by several stages. For Euler–Poincaré equations and Euler–d’Alembert–Poincaré equations, see the introduction and section 2. These equations are the particular case of Lagrange–Poincaré equations and Lagrange–d’Alembert–Poincaré equations, respectively, for the case in which $Q = G$ is the trivial bundle whose base is a single point. In this section we are going to study the Euler–d’Alembert–Poincaré equations by several stages and in section 6 we will study the case of a trivial bundle $Q = X \times G$. From this, the case of a general bundle $Q$ will follow by glueing together principal bundle charts.

4.1. The Euler–Poincaré equations by several stages. In this section we first write down carefully all the ingredients to calculate Euler–Poincaré equations by using the expression of the Lie bracket developed in the previous section. In particular, we write down the expression of the variations of a curve in the Lie algebra. Using this we obtain the formulas for the Euler–Poincaré equations by stages.

Let $v(t) = \bigoplus_{i=0}^{n} \eta^{(i,i+1)}(t) \in g$ be a curve and consider a variation of this curve

$$\delta v(t) = \bigoplus_{i=0}^{n} \delta \eta^{(i,i+1)}(t).$$

In order to write Euler–Poincaré equations we need to calculate variations $\delta v(t)$ satisfying $\delta v(t) = \dot{\omega}(t) + [v(t), \omega(t)]$, where $\omega(t) \in g$ is a curve such that $\omega(t_0) = \omega(t_1) = 0$. Let us write

$$\omega(t) = \bigoplus_{j=0}^{n} \xi^{(j,j+1)}(t)$$

(22)

with $\xi^{(j,j+1)}(t) \in n_{(j,j+1)}$, such that $\xi^{(j,j+1)}(t_0) = \xi^{(j,j+1)}(t_1) = 0$, $\forall \ 0 \leq j \leq n$. Then,

$$\delta v(t) = \bigoplus_{i=0}^{n} \delta \eta^{(i,i+1)}(t) = \dot{\omega} + [v, \omega]$$
\( g \) represents an arbitrary curve on the Lie algebra

Using the decomposition of \( v \) the Euler-Poincaré equations by the condition

\[
\dot{\eta} = b_{(N_jN_{j+1})}^{(i,j+1)} \left( \eta^{(j,j+1)}, \sum_{k=j+1}^{n} \xi^{(k,k+1)} \right) - b_{(N_jN_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)} \right)
\]

Recall that the Euler-Poincaré equations \( \dot{\eta} = 0 \) with

\[
\dot{\xi} = \sum_{i=0}^{n-1} \eta^{(i,i+1)} \left( \xi^{(i,i+1)} \right)
\]

From the previous identities we can deduce the following equalities, for \( 0 \leq i \leq n \):

\[
\delta \eta^{(i,i+1)}(t) = \xi^{(i,i+1)}(t) + [\eta^{(i,i+1)}, \xi^{(i,i+1)}] + \sum_{j=0}^{i-1} \left( -a_{(N_jN_{j+1})}^{(i,i+1)} \eta^{(j,j+1)}, \xi^{(j,j+1)} \right)
\]

\[
+ b_{(N_jN_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)}, \sum_{k=j+1}^{n} \xi^{(k,k+1)} \right) - b_{(N_jN_{j+1})}^{(i,i+1)} \left( \xi^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)} \right)
\]

Since we are assuming that \( g = \bigoplus_{i=0}^{n} n_{(i,i+1)} \) we have \( g^* = \bigoplus_{j=1}^{n} n_{(j,j+1)}^* \).

As before, let \( v(t) \in g \) with \( v(t) = \bigoplus_{i=0}^{n} \eta^{(i,i+1)}(t) \), then \( \frac{\partial l}{\partial v}(t) \in g^* \). Let

\[
\beta(t) = \frac{\partial l}{\partial v}(t) = \bigoplus_{j=0}^{n} \frac{\partial l}{\partial \eta^{(j,j+1)}}(t) = \bigoplus_{j=0}^{n} \beta^{(j,j+1)}(t),
\]

where \( \beta^{(j,j+1)}(t) \in n_{(j,j+1)}^* \), for \( 0 \leq j \leq n \).

Recall that the Euler-Poincaré equations \( \dot{\beta} = ad^*_{v} \beta \) ( or, equivalently, \( \dot{\beta}(\xi) = \langle \beta, [v, \xi] \rangle \) are obtained from \( \delta \int_{t_0}^{t_1} l(v) dt = 0 \) with \( \delta v = \omega + [v, \omega] \), where \( \omega(t) \)

represents an arbitrary curve on the Lie algebra \( g \) satisfying \( \omega(t_0) = \omega(t_1) = 0 \). Using the decomposition of \( v(t) \), the expression (22) for \( \omega \) and (24) for \( \beta \), we obtain the Euler-Poincaré equations by the condition

\[
\left\langle \bigoplus_{j=0}^{n} \beta^{(j,j+1)}, \bigoplus_{k=0}^{n} \xi^{(k,k+1)} \right\rangle = \left\langle \bigoplus_{m=0}^{n} \beta^{(m,m+1)} \left[ \bigoplus_{i=0}^{n} \eta^{(i,i+1)}, \bigoplus_{k=0}^{n} \xi^{(k,k+1)} \right] \right\rangle
\]

for all \( \xi^{(j,j+1)} \in n_{(j,j+1)} \).
Now using the formula for the Lie bracket obtained in theorem 3.2 we have

\[
\sum_{j=0}^{n} \dot{\beta}_{(j,j+1)}(\xi^{(j,j+1)})
\]

\[
= \left( \bigoplus_{m=0}^{n} \dot{\beta}_{(m,m+1)} \bigoplus_{i=0}^{n} \left[ \eta^{(i,i+1)}, \xi^{(i,i+1)} \right] + \sum_{j=0}^{i-1} \left( -a_{(N_j, N_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)}, \xi^{(j,j+1)} \right) + b_{(N_j, N_{j+1})}^{(i,i+1)} \left( \xi^{(j,j+1)}, \sum_{k=j+1}^{n} \eta^{(k,k+1)} \right) - b_{(N_j, N_{j+1})}^{(i,i+1)} \left( \xi^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)} \right) \right) \right),
\]

for all \( \xi^{(j,j+1)} \in n_{(j,j+1)} \).

Then, the following equivalent condition is obtained

\[
\sum_{j=0}^{n} \dot{\beta}_{(j,j+1)}(\xi^{(j,j+1)}) = \sum_{i=0}^{n} \left( \beta_{(i,i+1)}(\eta^{(i,i+1)}, \xi^{(i,i+1)}) + \sum_{j=0}^{i-1} \left( -a_{(N_j, N_{j+1})}^{(i,i+1)} (\eta^{(j,j+1)}, \xi^{(j,j+1)}) + \sum_{k=j+1}^{n} \eta^{(k,k+1)} \right) - b_{(N_j, N_{j+1})}^{(i,i+1)} (\xi^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)}) \right) \right),
\]

for all \( \xi^{(j,j+1)} \in n_{(j,j+1)} \).

The terms \( a_{(N_j, N_{j+1})}^{(i,i+1)} (\eta^{(j,j+1)}, \xi^{(j,j+1)}) \) vanishes since \( \xi^{(j,j+1)} = 0 \) because \( j < i \).

Then we have the Euler-Poincaré equations by stages

\[
\begin{cases}
\dot{\beta}_{(i,i+1)} |_{n(i,i+1)} = \beta_{(i,i+1)} \left[ \eta^{(i,i+1)}, \right] + \sum_{j=0}^{i-1} b_{(N_j, N_{j+1})}^{(i,i+1)} (\eta^{(j,j+1)}, \cdot) \\
\beta_{(i,i+1)} = \frac{\partial l}{\partial \eta_{(i,i+1)}} (v)
\end{cases}
\]

for \( 0 \leq i \leq n \) and \( v \in g \), or equivalently,

\[
\begin{cases}
\dot{\beta}_{(i,i+1)} |_{n(i,i+1)} = \left( \text{ad}^{*}_{\eta^{(i,i+1)}} \beta_{(i,i+1)} \right) |_{n(i,i+1)} + \\
\beta_{(i,i+1)} \left( \sum_{j=0}^{i-1} b_{(N_j, N_{j+1})}^{(i,i+1)} (\eta^{(j,j+1)}, \cdot) \right) |_{n(i,i+1)} \\
\beta_{(i,i+1)} = \frac{\partial l}{\partial \eta_{(i,i+1)}}
\end{cases}
\]

(27)
where \( \eta^{(j,j+1)} \in \mathfrak{n}_{(j,j+1)} \).

**Example.** The simplest example of equations (27) occurs when \( G \) is a direct product \( G = N_{0,1} \times N_{(1,2)} \times \ldots \times N_{(n,n+1)} \). We choose our \( G \)-invariant metric on \( G \) as being a product of invariant metrics on each factor. Then each \( \mathcal{A}_{N_j} \) is the trivial connection in the product bundle \( N_{j-1} = N_{(j-1,j)} \times N_j \to N_{(j-1,j)} \). As we have noted in the definition of \( b_{(N_{j-1},N_j)} \), \( \eta^{A_{N_j}} \in \mathfrak{n}_{j-1} \) and \( \mathfrak{n}_j \subseteq \mathfrak{n}_{j-1} \) while the Lie bracket \( [\eta^{A_{N_j}},\eta] \) is the Lie bracket in \( \mathfrak{n}_{j-1} = \mathfrak{n}_{(j-1,j)} \times \mathfrak{n}_j \). The triviality of \( \mathcal{A}_{N_j} \) implies that the component of \( \eta^{A_{N_j}} \) corresponding to the factor \( \mathfrak{n}_j \) vanishes, so in the case of the present example \( b_{(N_{j-1},N_j)} = 0 \).

Then the Euler-Poincaré equations become \( \dot{\beta}_{(i,i+1)} \) \( |n(i,i+1) = \text{ad}^*_{\eta(i,i+1)} \beta_{(i,i+1)} \) \( n(i,i+1) \), with \( \beta_{(i,i+1)} = \frac{\partial}{\partial \eta^{(i,i+1)}} \).

In the particular case in which \( \{(\eta^{(0,1)},..,\eta^{(n,n+1)}) = l_0(\eta^{(0,1)}) + \ldots + l_n(\eta^{(n,n+1)}) \) \), where \( \eta^{(i,j)} \in \mathfrak{n}_{(i,j)}, i = 0,\ldots,n \), the previous system of equations (27) becomes uncoupled. If, in addition, some \( N_{(i,j)} \), for \( i = 0,\ldots,n \), is abelian then the corresponding quantity \( \beta_{(i,i+1)} \) is a constant of motion.

4.2. The Euler-d’Alembert-Poincaré equations by several stages. In this section we first write down carefully all the ingredients to calculate Euler-d’Alembert-Poincaré equations by using the expression of the Lie bracket developed in section 3.2. In particular, we write down a careful description of the nonholonomic distribution by stages. Using this and d’Alembert principle we finally write the equations.

In this section we are going to use some results and notation from [10]. Also, we are going to use the notation presented in section 2.2, for the particular case \( Q = G \).

Let \( \mathfrak{g} \equiv \mathfrak{n}_{(0,1)} \oplus \mathfrak{n}_{(1,2)} \oplus \ldots \oplus \mathfrak{n}_{(n-1,n)} \oplus \mathfrak{n}_{(n,n+1)} \) as before, and let \( \mathcal{D} \) be a left invariant distribution on \( G \), which represents the nonholonomic constraint. In particular, \( \mathcal{D} \subseteq \mathfrak{g} \). The vertical bundle \( \mathcal{V} \) is such that \( \mathcal{V} = T_e G \equiv \mathfrak{g} \). We shall also assume the dimension hypothesis (see equation (4) in section 2.2).

To write the Euler-d’Alembert-Poincaré equations by several stages we will consider an easy particular case first, and the general case later.

**Particular case.** We are going to assume that

\[
\mathcal{D} := \mathcal{D}_e \equiv \mathcal{D}_{(0,1)} \oplus \mathcal{D}_{(1,2)} \oplus \ldots \oplus \mathcal{D}_{(n-1,n)} \oplus \mathcal{D}_{(n,n+1)}
\]

where \( \mathcal{D}_{(i,i+1)} = \mathcal{D} \cap \mathfrak{n}_{(i,i+1)} \), with \( 0 \leq i \leq n \).

Since \( Q = G \) we have that \( \mathcal{S} = \mathcal{D} \) and, therefore,

\[
\mathcal{S} := \mathcal{S}_e \equiv \mathcal{S}_{(0,1)} \oplus \mathcal{S}_{(1,2)} \oplus \ldots \oplus \mathcal{S}_{(n-1,n)} \oplus \mathcal{S}_{(n,n+1)}
\]

(28)

where \( \mathcal{S}_{(i,i+1)} = \mathcal{S} \cap \mathfrak{n}_{(i,i+1)} = \mathcal{D}_{(i,i+1)} \), for \( 0 \leq i \leq n \).

The Euler-d’Alembert-Poincaré equations are obtained in the following way:

Let us consider a curve

\[
v(t) = \bigoplus_{i=0}^n \eta^{(i,i+1)}(t) \in \mathcal{S},
\]

(29)

such that \( \eta^{(i,i+1)}(t) \in \mathcal{S}_{(i,i+1)} \). Let \( \delta v(t) = \bigoplus_{i=0}^n \delta \eta^{(i,i+1)}(t) \in \mathfrak{g} \) be an allowed variation, that is, \( \delta v(t) = \dot{\omega}(t) + [v(t),\omega(t)] \) with \( \omega(t) \in \mathcal{S} \) such that \( \omega(t_0) = \text{constant} \).
\( \omega(t_1) = 0 \). Then we can write \( \omega(t) = \bigoplus_{j=0}^{n} \xi^{(j,j+1)}(t) \) where \( \xi^{(j,j+1)}(t) \in S_{(j,j+1)} \), being \( \xi^{(j,j+1)}(t_0) = \xi^{(j,j+1)}(t_1) = 0 \), for \( 0 \leq j \leq n \).

Then, as before, we have

\[
\delta v(t) = \bigoplus_{i=0}^{n} \delta \eta^{(i,i+1)}(t) = \hat{\omega} + [v, \omega]
\]

\[
= \left( \bigoplus_{j=0}^{n} \xi^{(j,j+1)}(t) \right) + \left[ \bigoplus_{i=0}^{n} \eta^{(i,i+1)}(t), \bigoplus_{j=0}^{n} \xi^{(j,j+1)}(t) \right]
\]

\[
= \bigoplus_{i=0}^{n} \left( \xi^{(i,i+1)}(t) + [\eta^{(i,i+1)}, \xi^{(i,i+1)}] + \sum_{j=0}^{i-1} \left( -a^{(i,i+1)}(N_j, N_{j+1}) \xi^{(j,j+1)}(t) + b^{(i,i+1)}(N_j, N_{j+1}) \left( \eta^{(j,j+1)}, \sum_{k=j+1}^{n} \xi^{(k,k+1)}(t) \right) - b^{(i,i+1)}(N_j, N_{j+1}) \left( \xi^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)}(t) \right) \right) \right),
\]

where \( \xi^{(j,j+1)}(t) \in S_{(j,j+1)} \), for \( 0 \leq j \leq n \). It follows that

\[
\delta \eta^{(i,i+1)}(t) = \xi^{(i,i+1)}(t) + [\eta^{(i,i+1)}, \xi^{(i,i+1)}] + \sum_{j=0}^{i-1} \left( -a^{(i,i+1)}(N_j, N_{j+1}) \eta^{(j,j+1)}(t) + b^{(i,i+1)}(N_j, N_{j+1}) \left( \eta^{(j,j+1)}, \sum_{k=j+1}^{n} \xi^{(k,k+1)}(t) \right) - b^{(i,i+1)}(N_j, N_{j+1}) \left( \xi^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)}(t) \right) \right),
\]

for \( \xi^{(j,j+1)}(t) \in S_{(j,j+1)} \), \( 0 \leq j \leq n \).

If \( \mu = \frac{\partial \mathcal{L}}{\partial v} = \bigoplus_{j=0}^{n} \beta^{(j,j+1)}(t) \in \mathfrak{g}^* \) and \( \xi = \bigoplus_{k=0}^{n} \xi^{(k,k+1)} \in \mathfrak{g} \), then the Euler-Poincarè equations \( \mu(\xi) = \langle \mu, [v, \xi] \rangle \) are equivalent to the fact that the equality

\[
\sum_{j=0}^{n} \beta^{(j,j+1)}(t) \xi^{(j,j+1)}(t) = \sum_{i=0}^{n} \left( \beta^{(i,i+1)}(t) \xi^{(i,i+1)}(t) + \sum_{j=0}^{i-1} \left( -a^{(i,i+1)}(N_j, N_{j+1}) \eta^{(j,j+1)}(t) + b^{(i,i+1)}(N_j, N_{j+1}) \left( \eta^{(j,j+1)}, \sum_{k=j+1}^{n} \xi^{(k,k+1)}(t) \right) - b^{(i,i+1)}(N_j, N_{j+1}) \left( \xi^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)}(t) \right) \right) \right),
\]

for \( \xi^{(j,j+1)}(t) \in S_{(j,j+1)} \), \( 0 \leq j \leq n \).

\[
(30)
\]

\[
(31)
\]
are satisfied for all curves $\varepsilon^{(j,j+1)}(t) \in S_{(j,j+1)}, \ 0 \leq j \leq n$.

Finally, for this particular case, we obtain the following \textit{Euler-d'Alembert-Poincaré equations by $n$ stages}, which are obtained taking for each $i = 0, \ldots, n$, $\varepsilon^{(i,i+1)}$ arbitrary, while $\varepsilon^{(j,j+1)} = 0$, for $i \neq j$,

$$
\beta_{(i,i+1)} = \left( \text{ad}^*_{\theta_{(i,i+1)}} \beta_{(i,i+1)} \right) |_{S(i,i+1)}
+ \beta_{(i,i+1)} \left( \sum_{j=0}^{i-1} b_{(j,j+1)}(\eta^{(j,j+1)}, \cdot) \right) |_{S(i,i+1)}
$$

\textbf{General case.} Now suppose that $D = S \subseteq g = n_{(0,1)} \oplus n_{(1,2)} \oplus \ldots \oplus n_{(n-1,n)} \oplus n_{(n,n+1)}$ is an arbitrary subspace. Let $m = \dim(g)$ and $d_i = \dim(n(i,i+1))$, for $0 \leq i \leq n$. Consider a base $\{\tau_1, \ldots, \tau_m\}$ of $g$ adapted to the previous decomposition of $g$. Namely, consider $\{\tau_1, \ldots, \tau_m\}$ such that the first $d_0$ vectors of the base belong to $n_{(0,1)}$, the following $d_1$ vectors belong to $n_{(1,2)}$, the following $d_2$ to $n_{(2,3)}$ and so on up to the last $d_n$ vectors which should belong to $n_{(n,n+1)}$.

Let $(z^1, z^2, \ldots, z^m)$ be the coordinate system in $g$ associated to the base $\{\tau_1, \ldots, \tau_m\}$. Then, if $\xi \in g$, we have $\xi = \sum_{i=1}^{m} z^i \tau_i$. In this case we will write

$$\xi \equiv (z^1, \ldots, z^{d_0}, z^{d_0+1}, \ldots, z^{d_0+d_1}, z^{d_0+d_1+1}, \ldots, z^{d_0+d_1+d_2}, \ldots, z^{m-d_0}, \ldots, z^m).$$

On the other hand, we can define the arbitrary subspace $S \subseteq g$ as being the kernel of a linear function $f : g \to \mathbb{R}^{m - \dim(S)}$. In coordinates we have that points $(z^1, z^2, \ldots, z^m)$ belonging to $S$ are those which satisfy the system of equations

$$f^j(z^1, z^2, \ldots, z^m) = 0,$$

for $j = 1, \ldots, m - \dim(S)$.

From this system we can obtain $m - \dim(S)$ coordinates in terms of the rest $\dim(S)$ independent coordinates. More precisely, we can represent (not necessarily in a unique way) $S$ as being the graph of a linear map, as follows. We can choose a set of indexes $A \subseteq \{1, \ldots, m\}$, with $\dim(S)$ elements, and linear functionals $\varphi_j(\langle z^i \rangle)$, $i \in A$, $j \in \{1, \ldots, m\} - A$ (32) such that points of $S$ are precisely $(z^i, \varphi_j(\langle z^i \rangle))$, with $i \in A$ and $j \in \{1, \ldots, m\} - A$, where $z^i$ with $i \in A$ are independent coordinates.

We are going to denote $\{z_{r_0}^0\} = \{z^1_0, \ldots, z^0_{r_0}\} = \{z^1_0, \ldots, z^{d_0}\} \cap \{z^i : i \in A\}$, where $r_0 = 1, \ldots, s_0$ and $s_0$ is the dimension of $S_{(0,1)}$.

The set $\{h_{r_0+1}^0, \ldots, h_{d_0-s_0}^0\}$ is defined by

$$\{h_{r_0+1}^0, \ldots, h_{d_0-s_0}^0\} = \{z^1_0, \ldots, z^{d_0}\} - \{z^0_1, \ldots, z^0_{s_0}\}.$$
being \( s_2 \) the number of independent variables in \((z^{d_0 + d_1 + 1}, \ldots, z^{d_0 + d_1 + d_2})\). Then, we define \( \{h_{l_2}^2\} \), for \( s_2 + 1 \leq l_2 \leq d_0 + d_1 + d_2 \), by \( \{h_{l_2 + 1}^2, \ldots, h_{d_0 + d_1 + d_2}^2\} = \{z^{d_0 + d_1 + 1}, \ldots, z^{d_0 + d_1 + d_2}\} - \{\varepsilon_1^2, \ldots, \varepsilon_{s_2}^2\} \).

We continue this procedure to obtain \( \{\varepsilon_i^2\} \), for \( 0 \leq i \leq n \). In particular, \( \{\varepsilon_n^2\} = \{z^{m-d_0}, \ldots, z^m\} \cap \{z^i : i \in A\} \), for \( 1 \leq r_n \leq s_n \) being \( s_n \) the number of independent variables in \( (z^{m-d_0}, \ldots, z^m) \). Besides, \( \{h_{l_n}^n\} \) for \( s_n + 1 \leq l_n \leq m \), \( \{h_{s_{n+1}}^n, \ldots, h_{d_{m-s_n}}^n\} = \{z^{m-n}, \ldots, z^m\} - \{\varepsilon_n^1, \ldots, \varepsilon_{s_n}^n\} \).

Then we can write, equivalently, the linear dependence \( \varphi \) as follows:

\[
h_{l_i}^i = h_{l_i}^i(\varepsilon_{r_i}^0, \ldots, \varepsilon_{r_n}^n),
\]

where \( 1 \leq r_p \leq s_p \), for \( 0 \leq p \leq n \), and \( s_i + 1 \leq l_i \leq d_i - s_i \), for \( 0 \leq i \leq n \).

Then a generic element \( \xi \equiv (z^1, \ldots, z^n) \) belonging to \( S \), after a reordering, can be represented as follows

\[
\xi = (\varepsilon_1^1, \ldots, \varepsilon_n^1, h_{s_0 + 1}^0, \ldots, h_{d_{m-s_0}}^0, \varepsilon_1^2, \ldots, \varepsilon_{s_1}^2, h_{s_1 + 1}^1, \ldots, h_{d_{m-s_1}}^1, \varepsilon_1^3, \ldots, \varepsilon_{s_2}^3, \ldots, h_{s_{n+1}}^n, \ldots, h_{d_{m-s_n}}^n).
\]

For simplicity, we shall introduce the following notation. We denote \( (\varepsilon_1^i, \ldots, \varepsilon_{s_i}^i) = \varepsilon^i \) and \( (h_{s_i+1}^i, \ldots, h_{d_i-s_i}^i) = h^i \), for \( i = 0, \ldots, n \). We will define the subspaces \( S_i \), for \( i = 0, \ldots, n \), as follows

\[
S_0 = \{(\varepsilon^0, h^0(0, \varepsilon^1, \ldots, 0), 0, h^1(\varepsilon^0, 0, \varepsilon^1, \ldots, 0), 0, h^n(\varepsilon^0, 0, \varepsilon^1, \ldots, 0))\},
\]
\[
S_1 = \{(0, h^0(0, \varepsilon^1, \ldots, 0), \varepsilon^1, h^1(0, \varepsilon^1, \ldots, 0), 0, h^n(0, \varepsilon^1, \ldots, 0))\},
\]
\[
\ldots
\]
\[
S_n = \{(0, h^0(0, \varepsilon^n, \ldots, 0), 0, h^1(0, \varepsilon^n, \ldots, 0), \varepsilon^n, h^n(0, \varepsilon^n, \ldots, 0))\}.
\]

Then we have that \( S = S_0 \oplus S_1 \oplus \ldots \oplus S_n \). Therefore we obtain the following decomposition of the Euler-d’Alembert-Poincaré equations:

\[
\begin{align*}
\mu_i & = \bigoplus_{j,p} \left( \text{ad}_{v_j}^* \mu_p \right) \big|_{S_i} \\
\mu_i & = \frac{\partial l}{\partial v_i}(v) \\
v_j & \in S_j
\end{align*}
\]

where \( i, j, p = 0, \ldots, n \), which is, as usual, a differential-algebraic equation.

Then using the previous decomposition 34 for \( \psi \) with \( v \equiv \psi \), in coordinates we have

\[
\mu_0 = \frac{\partial l}{\partial v_0}(v) = \left( \frac{\partial l}{\partial z_1}, \ldots, \frac{\partial l}{\partial z_0} \right)(v) = \left( \frac{\partial l}{\partial z_1}(z^1, \ldots, z^m), \ldots, \frac{\partial l}{\partial z_0}(z^1, \ldots, z^m) \right) = (\mu_{0,1}, \ldots, \mu_{0,d_0})
\]
Then, the differential-algebraic system (36) can be written as follows,

\[
\mu_1 = \frac{\partial l}{\partial v_1}(v) = \left( \frac{\partial l}{\partial z_{d_0+1}}, \ldots, \frac{\partial l}{\partial z_{d_1}} \right)(v) = \left( \mu_{d_0+1}, \ldots, \mu_{d_1} \right),
\]

\[
\vdots
\]

\[
\mu_n = \frac{\partial l}{\partial v_n}(v) = \left( \frac{\partial l}{\partial z_{m-d_0}}, \ldots, \frac{\partial l}{\partial z_m} \right)(v) = \left( \mu_{m-d_0}, \ldots, \mu_{m} \right).
\]

Here, \( v(t) = \bigoplus_{i=0}^{n} \eta^{(i,1)}(t) \in S \) as in (29).

In order to obtain a system of implicit scalar differential equations in terms of \( \mu_{ij} \), \( \mu_{ij} \), and \( \varepsilon_{ij} \), which will be linear in \( \mu_{ij} \), one may proceed as follows.

Taking advantage of the fact that the variables \( \varepsilon_{rij} \), for \( 1 \leq r_i \leq s_i \), \( 0 \leq i \leq n \), are independent, we can choose their values arbitrarily. Then to obtain differential (implicit) equations of motion we only need to fix the value of each one of them to be arbitrary while the rest are fixed to be 0 in system (37). Moreover, since the dependence of the \( \varepsilon_{rij} \) is linear we may simply fix the value of each one of them to be 1 while the rest are fixed to be 0.

For example, in the system (37) we replace \( \varepsilon_{ij} = 1, \varepsilon_0 = 0, \ldots, \varepsilon_{s_0} = 0, \varepsilon_1 = 0, \ldots, \varepsilon_{s_1} = 0, \ldots, \varepsilon_{s_n} = 0, \) which gives some more equations. We
continue in this way until the last replacement \( \varepsilon^0_1 = 0, \varepsilon^0_2 = 0, \ldots, \varepsilon^0_s = 0, \varepsilon^1_1 = 0, \ldots, \varepsilon^1_s = 0, \varepsilon^2_1 = 0, \ldots, \varepsilon^2_s = 0, \ldots, \varepsilon^1_1 = 0, \ldots, \varepsilon^s_1 = 1. \)

To the system of implicit differential equations so obtained we should add the algebraic restrictions \( \partial l / \partial v_i = \mu_i. \) This gives the Euler–d’Alembert–Poincaré equations in coordinates.

**Remark.** The particular case \( S = S^{(0,1)} + S^{(1,2)} + \ldots + S^{(n-1,n)} + S^{(n,n+1)} \) corresponds to the case in which all the variables are independent, that is, there are no variables \( h_i. \)

### 5. Lagrange-Poincaré equations by several stages

Our strategy for writing the Lagrange-Poincaré equations by several stages consists in writing down their local expressions in a trivial principal bundle \( X \times G \) with a principal connection \( \mathcal{A} \) and an affine connection \( \nabla \) on the base \( X, \) as in reference [11]. Since those expressions are written in terms of \( \mathcal{A} \) and \( \nabla \) they have, in fact, a global character.

In subsection 5.1 we deal with the case of one stage and in subsection 5.2, using the results of subsection 4.1, we obtain the case of several stages.

#### 5.1. Case of one stage

Let \( G \) be a Lie group and \( Q = X \times G \) a trivial principal bundle with structure group \( G \) acting on the left by \( g(x, h) := (x, gh), \forall g, h \in G, \forall x \in X, \) where the projection \( \pi_G : X \times G \to X \) is given by \( \pi_G(x, g) = x, \) for all \((x, g) \in Q.\)

Let a principal connection \( \mathcal{A} : TQ \to g, \) then
\[
\mathcal{A}(x, g, \dot{x}, \dot{g}) = \mathcal{A}(x, g, \dot{x}, 0) + \mathcal{A}(x, g, 0, \dot{g}) \]
\[
= g\mathcal{A}(x, e, \dot{x}, 0)g^{-1} + g\mathcal{A}(x, e, 0, g^{-1}\dot{g})g^{-1} = g\mathcal{A}(x)(\dot{x}g^{-1} + \dot{g}g^{-1}),
\]
where \( \mathcal{A}(x)\dot{x} = \mathcal{A}(x, e, \dot{x}, 0) \) by definition. Then we can deduce that \( (x, e, \dot{x}, \xi) \) belongs to \( T_{(x,e)}(X \times G) \) is a horizontal vector if and only if \( \mathcal{A}(x)\dot{x} + \xi = 0. \)

On the other hand, the Cartan’s structure equation says that the curvature \( B \) is given by \( B(X, Y) = d\mathcal{A}(X, Y) - [\mathcal{A}(X), \mathcal{A}(Y)], \forall X, Y \in \mathfrak{X}(Q). \)

If \( X \) and \( Y \) are horizontal fields, then \( B(X, Y) = -\mathcal{A}([X, Y]). \)

According to section 2.2 we have an isomorphism \( \alpha_{\mathcal{A}} : TQ/G \to T(Q/G) \oplus \tilde{g} \)
given by \( \alpha_{\mathcal{A}}(g, q) = (\dot{x}, \dot{q}) + [q, \mathcal{A}(x, \dot{x})]_{G}, \) where \( (x, \dot{x}) = T\pi(q, \dot{q}), \tilde{g} = (Q \times g)/G \)
with the action of \( G \) over \( Q \times g \) given by \( g(q, \xi) = (qg, \text{Ad}_q \xi). \)

In the local case \( Q = X \times G, \) we have \( \tilde{g} \equiv X \times g \) through the identification \( [(x, e), \xi]_G = (x, \text{Ad}_\xi \xi), \) in particular we have \([(x, e), \xi]_G = (x, \xi).\) Then the isomorphism \( \alpha_{\mathcal{A}} \) is given by
\[
\alpha_{\mathcal{A}}(g, q) = (\dot{x}, \dot{q}) + (\mathcal{A}(x)\dot{x} + g^{-1}\dot{q}).
\]

Now let us calculate the \( \tilde{g} \)-valued two form \( \tilde{B}. \) By definition,
\[
\tilde{B}(x, \delta x) = [q, B(q)(\dot{x}^h_q, \delta x^h_q)]_G
\]
being \( \dot{x}^h \) the horizontal lifts of \( \dot{x} \) at the point \( q \in \pi^{-1}(x). \) Of course, \( \dot{x}^h, \delta x^h \) can be replaced by any pair of elements \( \dot{q}, \delta q \) that satisfies the conditions \( T\pi\dot{q} = \dot{x} \) and \( T\pi\delta q = \delta x. \)

Since \( Q = X \times G, \) we have
\[
\tilde{B}(x, \delta x) = [(x, e), B(x, e)((\dot{x}, 0), (\delta x, 0))]_G = (x, B(x, e)((\dot{x}, 0), (\delta x, 0))).
\]

Using the Cartan’s structure equation, we obtain \( B(x, e)((\dot{x}, 0), (\delta x, 0)) = d\mathcal{A}(x)((\dot{x}, \delta x) - [\mathcal{A}(x)\dot{x}, \mathcal{A}(x)\delta x].) \)
\[
\tilde{B}(x, \delta x) = (x, d\mathcal{A}(x)((\dot{x}, \delta x) - [\mathcal{A}(x)\dot{x}, \mathcal{A}(x)\delta x]).\)
Now we need to calculate the covariant derivatives on the vector bundles $\tilde{g}$ and $\tilde{g}^*$:

We have the formula $\frac{D}{Dt}[q, \xi]_G = [q, -[\mathcal{A}(q, \dot{q}), \xi] + \dot{\xi}]_G$ (see section 2.1).

In the local case, after the identification $\mathcal{L}(x, e) \equiv (x, \xi)$, we have

$$\frac{D}{Dt} (x, \xi) = (x, -[\mathcal{A}(x, \dot{x}), \xi] + \dot{\xi}) = (x, \dot{\xi} - \text{ad}_{\mathcal{A}(x, \dot{x})} \xi). \quad (38)$$

Let $\overline{\alpha}(t) = (x(t), \alpha(t)) \in \tilde{g}^*$ with the identification $\tilde{g}^* \equiv X \times g^*$ given by $[(x, e), \alpha]_G \equiv (x, \alpha)$.

For any curve $\xi(t) = (x(t), \xi(t)) \in \tilde{g}$, we have

$$\frac{d}{dt} \langle \overline{\alpha}(t), \xi(t) \rangle = \dot{\alpha}(t) \xi(t) + \alpha(t) \dot{\xi}(t) = \left\langle \frac{D\overline{\alpha}}{Dt}, \dot{\xi}(t) \right\rangle + \left\langle \overline{\alpha}(t), \frac{D\xi(t)}{Dt} \right\rangle.$$ 

But using the identity (38), we obtain that

$$\left\langle \overline{\alpha}(t), \frac{D\xi(t)}{Dt} \right\rangle = \left\langle \alpha(t), -[\mathcal{A}(x, \dot{x}) \xi(t)] + \dot{\xi}(t) \right\rangle = \left\langle \alpha(t), \dot{\xi}(t) - \text{ad}_{\mathcal{A}(x, \dot{x})} \xi(t) \right\rangle. \quad (39)$$

Then

$$\frac{D(x, \alpha)}{Dt} = (x, \dot{\alpha} + \text{ad}_{\mathcal{A}(x, \dot{x})} \alpha).$$

**The vertical Lagrange-Poincaré equation.**

As in section 2.2 for a reduced Lagrangian $l : T(Q/G) \oplus \tilde{g} \to \mathbb{R}$, we have the vertical Lagrange-Poincaré equations

$$\frac{D}{Dt} \frac{\partial l}{\partial \overline{\alpha}} = \text{ad}_{\overline{\alpha}}^* \frac{\partial l}{\partial \overline{\alpha}} \quad (40)$$

In the local case, we denote $l(x, \dot{x}, [e, \xi]_G) \equiv l(x, \dot{x}, (x, \xi))$ and we can identify $\partial l/\partial \overline{\alpha} \equiv \partial l/\partial \xi$. Then, using the formula (38), we obtain

$$\frac{D}{Dt} \frac{\partial l}{\partial \overline{\alpha}} = \frac{D}{Dt} \frac{\partial l}{\partial \xi} = \frac{d}{dt} \frac{\partial l}{\partial \xi} + \text{ad}_{\mathcal{A}(x, \dot{x})}^* \frac{\partial l}{\partial \xi}.$$ 

Then the vertical Lagrange-Poincaré equation becomes

$$\frac{d}{dt} \frac{\partial l}{\partial \xi} = \text{ad}_{\xi}^* \frac{\partial l}{\partial \xi} - \text{ad}_{\mathcal{A}(x, \dot{x})}^* \frac{\partial l}{\partial \xi}. \quad (41)$$

**The horizontal Lagrange-Poincaré equations.**

In the general case we have

$$\frac{\partial A}{\partial x} \delta x - \frac{D}{Dt} \frac{\partial l}{\partial \overline{\alpha}} \delta x = \frac{\partial l}{\partial \overline{\alpha}} \dot{B}(x) \delta x \quad (42)$$

Now we need to calculate this in the local case. For this we proceed as in section 2.2.

Now let $\overline{\alpha}(t, s)$ be a horizontal deformation of the curve $\overline{\alpha}(t)$ such that $\overline{\alpha}(t, 0) = \overline{\alpha}(t)$, and let $x(t, s)$ be the base point of $\overline{\alpha}(t, s)$, then $x(t, 0) = x(t)$.

In the local case, we have $\overline{\alpha}(t, s) = (x(t, s), \xi(t, s))$. Let $\delta x = \frac{\partial x}{\partial s} \bigg|_{s=0}^t$.

By definition,

$$\frac{\partial A}{\partial x} \delta x = \frac{d}{ds} \bigg|_{s=0}^t \frac{dl}{dx}(x(t, s), \dot{x}(t), (x, \xi)(t, s)).$$
Note: \( \dot{x}(t) \) has been constant.

Since \((x(t), \xi(t, s)) \) is horizontal for each \( t \), using the formula (38) we have

\[
\frac{\partial \xi}{\partial s} \bigg|_{s=0} = [A(x) \delta x, \xi] = \text{Ad}_{A(x)} \delta x
\]

then,

\[
\frac{\partial A^I}{\partial x} \delta x = \frac{\partial l}{\partial x} \delta x + \frac{\partial l}{\partial \xi} [A(x) \delta x, \xi] = \frac{\partial l}{\partial x} \delta x + \frac{\partial l}{\partial \xi} \text{Ad}_{A(x)} \delta x, \xi.
\]

Finally the horizontal Lagrange-Poincaré equations are

\[
\frac{\partial l}{\partial x} \delta x - \frac{d}{d t} \frac{\partial l}{\partial \dot{x}} \delta x = \frac{\partial l}{\partial \xi} \tilde{B}(x)(\dot{x}, \delta x) - \frac{\partial l}{\partial \xi} [A(x) \delta x, \xi].
\]

(43)

So, the Lagrange-Poincaré system of vertical and horizontal equations is

\[
\begin{cases}
\frac{d}{dt} \frac{\partial l}{\partial \xi} = \text{ad}_{\xi}^* \frac{\partial l}{\partial \xi} - \text{ad}_{A(x)} \frac{\partial l}{\partial \xi} \\
\frac{\partial l}{\partial x} \delta x - \frac{d}{dt} \frac{\partial l}{\partial \dot{x}} \delta x = \frac{\partial l}{\partial \xi} \tilde{B}(x)(\dot{x}, \delta x) - \frac{\partial l}{\partial \xi} [A(x) \delta x, \xi]
\end{cases}
\]

(44)

5.2. Case of several stages. Consider \( Q = X \times G \) and the identification \( \tilde{g} \equiv X \times g \) given by \([(x, e), \xi]_G \equiv (x, \xi) \) and \([(x, g), \xi]_G \equiv (x, e, \text{Ad}_{g^{-1}} \xi) \).

We have \( g = n(0,1) \oplus n(1,2) \oplus \ldots \oplus n(n,n+1) \) and \( g^* = \bigoplus_{i=0}^n n^*_{(i,i+1)} \), where we are using the same notation as in previous sections. Let \( \xi \in \tilde{g} \), namely

\[
\xi = \bigoplus_{i=0}^n \eta^{(i,i+1)},
\]

then \( \partial l/\partial \eta \equiv \partial l/\partial \xi \in g^* \) and

\[
\frac{\partial l}{\partial \xi} = \bigoplus_{j=0}^n \frac{\partial l}{\partial \eta^{(j,j+1)}} = \bigoplus_{j=0}^n \beta^{(j,j+1)},
\]

(46)

where \( \beta^{(j,j+1)} \in n_{(j,j+1)}^* \), for \( 0 \leq j \leq n \).

On the other hand, \( A(x) \dot{x} \in g \) and, so, it can be decomposed as \( A(x) \dot{x} = \bigoplus_{i=0}^n A^{(i,i+1)}(x, \dot{x}) \) with \( A^{(i,i+1)}(x, \dot{x}) \in n_{(i,i+1)} \), \( 0 \leq i \leq n \).

**Vertical Lagrange-Poincaré equations by several stages**

For a given arbitrary element \( \rho = \bigoplus_{i=0}^n \nu^{(i,i+1)} \in \tilde{g} \) the vertical Lagrange-Poincaré equations (44) at this point \( \rho \) are:

\[
\begin{align*}
\left\langle \bigoplus_{j=0}^n \dot{\beta}^{(j,j+1)}, \bigoplus_{i=0}^n \nu^{(i,i+1)} \right\rangle &= \left\langle \bigoplus_{l=0}^n \beta^{(l,l+1)}, \left[ \bigoplus_{j=0}^n \eta^{(j,j+1)}, \bigoplus_{i=0}^n \nu^{(i,i+1)} \right] \right\rangle
\end{align*}
\]
\[-\left\langle \bigoplus_{l=0}^{n} \beta_{(l,l+1)}, \left[ \bigoplus_{k=0}^{n} A^{(k,k+1)}(x, \dot{x}), \bigoplus_{j=0}^{n} \nu^{(j,j+1)} \right] \right\rangle.

So, we obtain

\[
\bigoplus_{j=0}^{n} \hat{\beta}_{(j,j+1)}(\nu^{(j,j+1)}) = \left\langle \bigoplus_{l=0}^{n} \beta_{(l,l+1)}, \bigoplus_{i=0}^{n} \left[ \eta^{(i,i+1)}, \nu^{(i,i+1)} \right] \right\rangle - \left[ A^{(i,i+1)}(x, \dot{x}), \nu^{(i,i+1)} \right] + \sum_{j=0}^{i-1} \left( \right.
\]

\[
- a_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)}, \nu^{(j,j+1)} \right)
+ b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)}, \sum_{k=j+1}^{n} \nu^{(k,k+1)} \right)
- b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \nu^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)} \right)
+ a_{(N_{j},N_{j+1})}^{(i,i+1)} \left( A^{(j,j+1)}(x, \dot{x}), \nu^{(j,j+1)} \right)
- b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( A^{(j,j+1)}(x, \dot{x}), \sum_{k=j+1}^{n} \nu^{(k,k+1)} \right)
\left. \right) + b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \nu^{(j,j+1)}, \sum_{l=j+1}^{n} A^{(l,l+1)}(x, \dot{x}) \right) \right) \right\rangle.
\]

Then we have

\[
\sum_{j=0}^{n} \hat{\beta}_{(j,j+1)}(\nu^{(j,j+1)}) = \sum_{i=0}^{n} \left\langle \beta_{(i,i+1)}, \left[ \eta^{(i,i+1)}, \nu^{(i,i+1)} \right] \right\rangle - \left[ A^{(i,i+1)}(x, \dot{x}), \nu^{(i,i+1)} \right] + \sum_{j=0}^{i-1} \left( \right.
\]

\[
- a_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)}, \nu^{(j,j+1)} \right)
+ b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)}, \sum_{k=j+1}^{n} \nu^{(k,k+1)} \right)
- b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \nu^{(j,j+1)}, \sum_{l=j+1}^{n} \eta^{(l,l+1)} \right)
+ a_{(N_{j},N_{j+1})}^{(i,i+1)} \left( A^{(j,j+1)}(x, \dot{x}), \nu^{(j,j+1)} \right)
- b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( A^{(j,j+1)}(x, \dot{x}), \sum_{k=j+1}^{n} \nu^{(k,k+1)} \right)
\left. \right) + b_{(N_{j},N_{j+1})}^{(i,i+1)} \left( \nu^{(j,j+1)}, \sum_{l=j+1}^{n} A^{(l,l+1)}(x, \dot{x}) \right) \right) \right\rangle.
\]

\[\text{(47)}\]

\[
\text{(48)}
\]
Since \( \eta^{(i,i+1)} \in \mathfrak{n}_{(i,i+1)} \) for \( 0 \leq i \leq n \), are arbitrary, we have the vertical Lagrange-Poincaré equations by stages:

\[
\dot{\beta}_{(i,i+1)} \bigg|_{\mathfrak{n}_{(i,i+1)}} = \left( \beta_{(i,i+1)} \right) \left[ \eta^{(i,i+1)} - \mathcal{A}^{(i,i+1)}(x, \dot{x}), \right]_{\mathfrak{n}_{(i,i+1)}} + \sum_{j=0}^{i-1} b_{(N_j, N_{j+1})}^{(i,i+1)}(\eta^{(j,j+1)} - \mathcal{A}^{(j,j+1)}(x, \dot{x}), \right)_{\mathfrak{n}_{(i,i+1)}},
\]

being \( \eta^{(i,i+1)} \in \mathfrak{n}_{(i,i+1)}, \) \( \dot{\beta}_{(i,i+1)} = \frac{\partial l}{\partial \eta^{(i,i+1)}} \in \mathfrak{n}_{(i,i+1)}, \) for \( 0 \leq i \leq n; \) and \( \mathcal{A}(x)\dot{x} = \bigoplus_{k=0}^{n} \mathcal{A}^{(k,k+1)}(x, \dot{x}), \) with \( \mathcal{A}^{(k,k+1)} \in \mathfrak{n}_{(k,k+1)}, \) for \( 0 \leq k \leq n. \)

This equations coincide with the Euler-Poincaré equations (27) if \( Q = G. \)

In the case in which the number of stages is two, these vertical equations by stages are:

\[
\dot{\beta}_{(0,1)} \bigg|_{\mathfrak{n}_{(0,1)}} = \left( \beta_{(0,1)} \right) \left[ \eta^{(0,1)} - \mathcal{A}^{(0,1)}(x, \dot{x}), \right]_{\mathfrak{n}_{(0,1)}} = \left( \frac{\partial l}{\partial \eta^{(0,1)}} - \mathcal{A}^{(0,1)}(x, \dot{x}) \right)_{\mathfrak{n}_{(0,1)}},
\]

\[
\dot{\beta}_{(1,2)} \bigg|_{\mathfrak{n}_{(1,2)}} = \left( \beta_{(1,2)} \right) \left[ \eta^{(1,2)} - \mathcal{A}^{(1,2)}(x, \dot{x}), \right]_{\mathfrak{n}_{(1,2)}} = \left( \frac{\partial l}{\partial \eta^{(1,2)}} - \mathcal{A}^{(1,2)}(x, \dot{x}) \right)_{\mathfrak{n}_{(1,2)}},
\]

\[
\dot{\beta}_{(2,3)} \bigg|_{\mathfrak{n}_{(2,3)}} = \left( \beta_{(2,3)} \right) \left[ \eta^{(2,3)} - \mathcal{A}^{(2,3)}(x, \dot{x}), \right]_{\mathfrak{n}_{(2,3)}} = \left( \frac{\partial l}{\partial \eta^{(2,3)}} - \mathcal{A}^{(2,3)}(x, \dot{x}) \right)_{\mathfrak{n}_{(2,3)}},
\]

Horizontal Lagrange-Poincaré equations by several stages.

Recall that the horizontal Lagrange-Poincaré equations are

\[
\frac{\partial l}{\partial \delta x} - \frac{d}{dt} \frac{\partial l}{\partial \delta x} = \frac{\partial l}{\partial \xi} \tilde{B}(x, \delta x) - \frac{\partial l}{\partial \xi} \mathcal{A}(x)\delta x, \xi).
\]

(49)

Let \( \xi \in \mathfrak{g} \) such that \( \xi = \bigoplus_{i=1}^{n} \eta^{(i,i+1)} \) and \( \frac{\partial l}{\partial \xi} = \bigoplus_{j=0}^{n} \beta_{(j,j+1)}, \) as in (45) and (46). Let \( \mathcal{A}(x)\delta x \in \mathfrak{g} \) such that \( \mathcal{A}(x)\delta x = \bigoplus_{j=0}^{n} \mathcal{A}^{(j,j+1)}(x, \delta x). \) Also consider

\[
B(x, e)((\dot{x}, 0), (\delta x, 0)) = \bigoplus_{k=0}^{n} \varphi^{(k,k+1)}, \text{ where } \varphi^{(k,k+1)} \in \mathfrak{n}_{(k,k+1)}, k = 0, ..., n.
\]
Then, since $\dot{B}(x) = (x, B(x, e)((\dot{x}, 0), (\delta x, 0))) = B(x, e)((\dot{x}, 0), (\delta x, 0))$, we can write the right hand side of the equation (49) as

$$
\begin{align*}
\frac{\partial l}{\partial x} & \delta x - \frac{d}{dt} \frac{\partial l}{\partial \dot{x}} \delta x = \sum_{i=0}^{n} \left( \beta_{(i+1),1} \varphi^{(i+1)} - \left[ A^{(i+1)}_{(x, \delta x)}, \eta^{(i+1)} \right] \right) \\
& + \sum_{j=0}^{i-1} \left( - a_{(N_j, N_{j+1})}^{(i+1)} \left[ A^{(j+1)}_{(x, \delta x)}, \eta^{(j+1)} \right] \right) \\
& + b_{(N_j, N_{j+1})}^{(i+1)} \left( A^{(j+1)}_{(x, \delta x)}, \sum_{k=j+1}^{n} \eta^{(k+1)} \right) \\
& - b_{(N_j, N_{j+1})}^{(i+1)} \left( \eta^{(j+1)}, \sum_{l=j+1}^{n} A^{(l+1)}_{(x, \delta x)} \right).
\end{align*}
$$

Then we have the horizontal Lagrange-Poincaré equations by stages:

$$
\begin{align*}
\frac{\partial l}{\partial x} & \delta x - \frac{d}{dt} \frac{\partial l}{\partial \dot{x}} \delta x = \sum_{i=0}^{n} \left( \beta_{(i+1),1} \varphi^{(i+1)} - \left[ A^{(i+1)}_{(x, \delta x)}, \eta^{(i+1)} \right] \right) \\
& + \sum_{j=0}^{i-1} \left( - a_{(N_j, N_{j+1})}^{(i+1)} \left[ A^{(j+1)}_{(x, \delta x)}, \eta^{(j+1)} \right] \right) \\
& + b_{(N_j, N_{j+1})}^{(i+1)} \left( A^{(j+1)}_{(x, \delta x)}, \sum_{k=j+1}^{n} \eta^{k+1} \right) \\
& - b_{(N_j, N_{j+1})}^{(i+1)} \left( \eta^{(j+1)}, \sum_{l=j+1}^{n} A^{(l+1)}_{(x, \delta x)} \right).
\end{align*}
$$

being $\beta_{(i+1),1} = \frac{\partial l}{\partial \eta^{(i+1)}} \in n^{*}_{(i+1)}$, for $0 \leq i \leq n$.

In the particular case in which we have two stages, the horizontal equations are:

$$
\begin{align*}
\frac{\partial l}{\partial x} & \delta x - \frac{d}{dt} \frac{\partial l}{\partial \dot{x}} \delta x = \left( \beta_{(0,1)}, \varphi^{(0,1)} - \left[ A^{(0,1)}_{(x, \delta x)}, \eta^{(0,1)} \right] \right) + \left( \beta_{(1,2)}, \varphi^{(1,2)} \right) \\
& - \left[ A^{(1,2)}_{(x, \delta x)}, \eta^{(1,2)} \right] - \left( - a_{(N_0, N_1)}^{(1,2)} \left[ A^{(0,1)}_{(x, \delta x)}, \eta^{(0,1)} \right] \right) \\
& + b_{(N_0, N_1)}^{(1,2)} \left( A^{(0,1)}_{(x, \delta x)}, \eta^{(1,2)} + \eta^{(2,3)} \right) \\
& - b_{(0,1)}^{(1,2)} \left( \eta^{(0,1)} + A^{(1,2)}_{(x, \delta x)} + A^{(2,3)}_{(x, \delta x)} \right) \\
& - \left[ A^{(2,3)}_{(x, \delta x)}, \eta^{(2,3)} \right] - \left( - a_{(N_0, N_1)}^{(2,3)} \left( A^{(0,1)}_{(x, \delta x)}, \eta^{(0,1)} \right) \right) \\
& + b_{(N_0, N_1)}^{(2,3)} \left( A^{(0,1)}_{(x, \delta x)}, \eta^{(1,2)} + \eta^{(2,3)} \right) \\
& - b_{(0,1)}^{(2,3)} \left( \eta^{(0,1)} + A^{(1,2)}_{(x, \delta x)} + A^{(2,3)}_{(x, \delta x)} \right) \\
& - \left( - a_{(N_1, N_2)}^{(1,2)} \left( A^{(1,2)}_{(x, \delta x)}, \eta^{(1,2)} \right) \right) \\
& + b_{(N_1, N_2)}^{(1,2)} \left( A^{(1,2)}_{(x, \delta x)}, \eta^{(1,2)} + \eta^{(2,3)} \right) \\
& - b_{(0,1)}^{(2,3)} \left( \eta^{(0,1)} + A^{(1,2)}_{(x, \delta x)} + A^{(2,3)}_{(x, \delta x)} \right). \tag{52}
\end{align*}
$$
6. Lagrange-d’Alembert-Poincaré equations by several stages. In this section we will write the Lagrange-d’Alembert-Poincaré equations by several stages using the results of section 5 and also section 4.2. We shall consider first a particular case and then the general case, as we did in section 4.2.

Particular case. Suppose, as in section 4.2, that \( S \) can be decomposed as \( S := S_e \oplus S_{(1,2)} \oplus ... \oplus S_{(n,n+1)} \) being \( S_{(i,i+1)} = S \cap n_{(i,i+1)} \), for \( 0 \leq i \leq n \).

Then, the Lagrange-d’Alembert-Poincaré equations in several stages are:

\[
\dot{\beta}_{(i,i+1)}(\nu^{(i,i+1)}) = \left\{ \dot{\beta}_{(i,i+1)}, \left[ \eta^{(i,i+1)} - A^{(i,i+1)}(x, \dot{x}), \nu^{(i,i+1)} \right] \right\} + \sum_{j=0}^{i-1} b_{(N_j,N_{j+1})}^{(i,i+1)} \left( \eta^{(j,j+1)} - A^{(j,j+1)}(x, \dot{x}), \nu^{(i,i+1)} \right),
\]

\[
\frac{\partial l}{\partial x} \delta x - \frac{d}{dt} \frac{\partial l}{\partial \dot{x}} \delta x = \sum_{i=0}^{n} \left( \dot{\beta}_{(i,i+1)}, \varphi^{(i,i+1)} - \left[ A^{(i,i+1)}(x, \delta x), \eta^{(i,i+1)} \right] \right) - \sum_{j=0}^{i-1} \left( a_{(N_j,N_{j+1})}^{(i,i+1)} \left( A^{(j,j+1)}(x, \delta x), \eta^{(j,j+1)} \right) + b_{(N_j,N_{j+1})}^{(i,i+1)} \left( \eta^{(j+1,j+1)}, \sum_{l=j+1}^{n} A^{(l,l+1)}(x, \delta x) \right) \right);
\]

(53)

for all \( \delta x \in T_x(Q/G) \) and \( \nu^{(i,i+1)} \in S_{(i,i+1)} \), \( i = 0, ..., n \); being \( \eta^{(i,i+1)} \in n_{(i,i+1)} \),

\[ \dot{\beta}_{(i,i+1)} = \frac{\partial l}{\partial \eta^{(i,i+1)}} \in n^{(i,i+1)} \text{ and } A(x) \dot{x} = \bigoplus_{k=0}^{n} A^{(k,k+1)}(x, \dot{x}) \in \mathfrak{g}. \]

General case. Consider again the case in which \( S \) cannot be written as \( S := S_e \oplus S_{(1,2)} \oplus ... \oplus S_{(n,n+1)} \) being \( S_{(i,i+1)} = S \cap n_{(i,i+1)} \), for \( 0 \leq i \leq n \).

Then, using the same notation in page 26, if \( \xi \) is a generic element of \( S \), it has the following form

\[ \xi = (\varepsilon^0_1, ..., \varepsilon^0_n, h^0_{s_0+1}, ..., h^0_{s_0-s_0}, \varepsilon^1_1, ..., \varepsilon^1_{s_1}, h^1_{s_1+1}, ..., h^1_{s_1-s_1}, ..., \varepsilon^n_n, h^n_{s_n+1}, ..., h^n_{s_n-s_n}). \]

Then, if \( \xi \in S \), the Lagrange-d’Alembert-Poincaré equations by \( n \) stages in this case are:

\[
\sum_{j=0}^{n} \mu_j(\varepsilon^j_1, ..., \varepsilon^j_{s_j}, h^j_{s_j+1}, ..., h^j_{d_j-s_j}) = \sum_{i=0}^{n} \left( \mu_i, \left[ \eta^{(i,i+1)}(\varepsilon^i_1, ..., \varepsilon^i_s, h^i_{s+1}, ..., h^i_{d-s}) \right] \right) - \left[ A^{(i,i+1)}(x, \dot{\xi}), (\varepsilon^i_1, ..., \varepsilon^i_s, h^i_{s+1}, ..., h^i_{d-s}) \right] + \sum_{j=0}^{i-1} \left( -a_{(N_j,N_{j+1})}^{(i,i+1)}(\eta^{(j+1,j+1)}(\nu_j, (\varepsilon^j_1, ..., \varepsilon^j_s, h^j_{s+1}, ..., h^j_{d-s}))) \right) \]

(54)
shall apply different methods.

We will use the description and notation of reference [9], however here we exclude the horizontal and vertical positions of the disk is excluded from the configuration space. We proceed as before in the general case in section 4.2 to obtain the equations of motion.

Let us consider an Euler’s disk of radius \( r \) and thickness \( r e \) rolling on a rough horizontal plane and having only one point of contact with it, in other words, the horizontal and vertical positions of the disk is excluded from the configuration space. We will use the description and notation of reference [9], however here we shall apply different methods.

The configuration space for Euler’s disk is

\[
Q = \left( 0, \frac{\pi}{2} \right) \times S^1 \times S^1 \times \mathbb{R}^2,
\]

for all \( \delta x \in T_q(Q/G) \) and \( \varepsilon_{r_i} \in S_{(i,i+1)} \), for \( i = 0, ..., n \).

We proceed as before in the general case in section 4.2 to obtain the equations of motion.
and a point \( q \in Q \) is written as \( q = (\theta, \varphi, \psi, x) \). Let denote \( A \) an orthogonal \( 3 \times 3 \) matrix representing the instantaneous orientation of the disk, therefore \( Ae_3 \) has \( e_3 \) component belonging to \((0, 1)\). The angle \( \theta \) is the angle from the axis \( e_3 \) to the vector \( z = Ae_3 \). The vector \( y \) is the unit vector directed from the point of contact with the plane to the origin of the system \((Ae_1, Ae_2, Ae_3)\). The vector \( u \) is defined by \( u = z \times y \) being tangent to the disk at the point of contact \( x \) and having the direction of the motion of this point on the plane. The unit vector \( u \) has the expression \( u = (-\cos \varphi, -\sin \varphi, 0) \) which defines the angle \( \varphi \). The angle \( \psi \) is the angle from the vector \(-y\) to the vector \( Ae_1 \) where the positive sense for measuring the angle \( \psi \) on the plane of the disk is the counterclockwise sense, as viewed from \( z \).

The nonholonomic constraint is given by the distribution

\[
D_{(\theta, \varphi, \psi, x)} = \left\{ (\theta, \varphi, \psi, x, \dot{\theta}, \dot{\varphi}, \dot{\psi}, \dot{x}) \mid \dot{x} = \dot{\psi}ru \right\}. \tag{56}
\]

The symmetry group that we are going to consider is \( G = SO(2) \times \mathbb{R}^2 \equiv S^1 \times \mathbb{R}^2 \). Since the group is abelian, we can consider that the group \( G \) acts on the left on the configuration space \( Q \) by the action

\[
(\alpha, a)(\theta, \varphi, \psi, x) = (\theta, \varphi, \psi + \alpha, x + a).
\]

With this action \( Q \) is a left principal bundle with structure group \( G = S^1 \times \mathbb{R} \). The map \( \pi : Q \rightarrow Q/G \equiv (0, \pi/2) \times S^1 \), given by \( \pi(\theta, \varphi, \psi, x) = (\theta, \varphi) \), is a submersion and we have \([[(\theta, \varphi, \psi, x)]_{S^1 \times \mathbb{R}^2} = (\theta, \varphi)\).

The vertical distribution \( V \) is given by

\[
V_{(\theta, \varphi, \psi, x)} = \{ (\theta, \varphi, \psi, x, \dot{\theta}, \dot{\varphi}, \dot{\psi}, \dot{x}) \mid \dot{x} = 0, \dot{\psi} = 0 \}, \tag{57}
\]

and the vector bundle \( S = D \cap V \) is

\[
S_{(\theta, \varphi, \psi, x)} = \{ (\theta, \varphi, \psi, x, 0, 0, \xi, \xi ru) \}. \tag{58}
\]

Since \( \dim D_{(\theta, \varphi, \psi, x)} = 3, \dim V_{(\theta, \varphi, \psi, x)} = 3 \) and \( \dim S_{(\theta, \varphi, \psi, x)} = 1 \), we have \( D_{(\theta, \varphi, \psi, x)} + V_{(\theta, \varphi, \psi, x)} = T_{(\theta, \varphi, \psi, x)}Q \), that is, the dimension assumption is satisfied.

We choose the horizontal spaces

\[
H_{(\theta, \varphi, \psi, x)} = \{ (\theta, \varphi, \psi, x, \alpha, \beta, 0, 0) \}
\]

satisfying \( H_{(\theta, \varphi, \psi, x)} \oplus S_{(\theta, \varphi, \psi, x)} = D_{(\theta, \varphi, \psi, x)} \). So the distribution \( H \) is \( G \)-invariant.

The connection 1-form \( A \) whose horizontal spaces are \( H_{(\theta, \varphi, \psi, x)} \) is

\[
A(\theta, \varphi, \psi, x, \dot{\theta}, \dot{\varphi}, \dot{\psi}, \dot{x}) = (\dot{\psi}, \dot{x}). \tag{59}
\]

In this context, we are going to apply the techniques of reduction by stages to the example of Euler’s disk. We shall write the Lagrange-d’Alembert-Poincaré equations by stages for this example.

We choose \( N_1 = \mathbb{R}^2 \) as a normal subgroup of the symmetry group \( G = S^1 \times \mathbb{R}^2 \), and \( N_2 = \{ e \} \) as a normal subgroup of \( N_1 \).

So, following the notation of the theorem 3.2 in page 16, we have \( N_{(0,1)} = N_0/N_1 = G/N_1 = S^1 \) and \( N_{(1,2)} = N_1/N_2 = \mathbb{R}^2 \). Then we can write the chain of subgroups as follows

\[
N_2 = \{ e \} \leq N_1 = \mathbb{R}^2 \leq N_0 = G = S^1 \times \mathbb{R}^2. \tag{60}
\]

We note \( g, n_1 \) and \( n_2 \) the Lie algebras of the groups \( G, N_1 \) and \( N_2 \) respectively. And \( n_{(0,1)}, n_{(1,2)} \) denote the Lie algebras of the groups \( N_{(0,1)} \) and \( N_{(1,2)} \).
We consider the identification of the Lie algebra of the symmetry group \( G \), as in (19),

\[
g \equiv n_{(0,1)} \oplus n_{(1,2)} = s^1 \oplus \mathbb{R}^2.
\] (61)

So \( m = \dim(g) = 3 \), \( d_0 = \dim(n_{(0,1)}) = 1 \) and \( d_1 = \dim(n_{(1,2)}) = 2 \).

In this case, \( S_{(\theta, \varphi, \psi, x)} = \{ (\theta, \varphi, x, 0, 0, \xi, \xi_r u) \} \) cannot be decomposed in \( S_{(0,1)} \oplus S_{(1,2)} \), being \( S_{(0,1)} = S \cap n_{(0,1)} \) and \( S_{(1,2)} = S \cap n_{(1,2)} \). Then we have the general case considered in section 6.

Then a generic element \( \mu \in S_{(\theta, \varphi, \psi, x)} \) has the form \( \mu = (\varepsilon_1^0, h_1^1(x_1), h_2^2(x_1)) \), where \( \varepsilon_1^0 = \xi, h_1^1(x_1) = -\xi \), and \( h_2^2(x_1) = -\xi \).

And the Lagrange-d’Alembert-Poincaré equations by stages (see formula (6)) for Euler’s disk are:

\[
\mu_0(\xi) + \dot{\mu}_1(-\xi \cos \varphi, -\xi \sin \varphi) = \left\langle \mu_0, \left[ \eta^{(0,1)} - A^{(0,1)}(\theta, \varphi, \dot{\theta}, \dot{\varphi}) \xi \right] \right\rangle + \left\langle \mu_1, \left[ \eta^{(1,2)} - A^{(1,2)}(\theta, \varphi, \dot{\theta}, \dot{\varphi}), (-\xi \cos \varphi, -\xi \sin \varphi) \right] - b^{(1,2)}_{(N_0, N_1)} \right\rangle - A^{(0,1)}(\theta, \varphi, \dot{\theta}, \dot{\varphi}) \xi \right\rangle
\]

\[
\frac{\partial l}{\partial \theta} \delta \theta - \frac{d}{dt} \frac{\partial l}{\partial \theta} \delta \theta = \left\langle \mu_0, B^{(0,1)}(\theta, 0, 0, 0) \left( \dot{\theta}, 0, 0, 0, (\delta \theta, 0, 0, 0) \right) \right\rangle
\]

\[
- \left[ A^{(0,1)}(\theta, 0, 0, 0, \eta^{(0,1)}) \right] \right\rangle
\]

\[
+ \left\langle \mu_1, B^{(1,2)}(\theta, 0, 0, 0) \left( \dot{\theta}, 0, 0, 0, (\delta \theta, 0, 0, 0) \right) \right\rangle
\]

\[
- \left[ A^{(1,2)}(\theta, 0, 0, 0, \eta^{(1,2)}) - b^{(1,2)}_{(N_0, N_1)} \right] \left[ A^{(0,1)}(\theta, 0, 0, 0, \eta^{(1,2)}) \right] \right\rangle
\]

\[
- b^{(1,2)}_{(N_0, N_1)} \left[ \eta^{(0,1)}, A^{(1,2)}(\theta, 0, 0, 0) \right] \right\rangle ,
\]

\[
\frac{\partial l}{\partial \varphi} \delta \varphi - \frac{d}{dt} \frac{\partial l}{\partial \varphi} \delta \varphi = \left\langle \mu_0, B^{(0,1)}(0, \varphi, 0, 0) \left( 0, \dot{\varphi}, 0, 0, (\delta \varphi, 0, 0) \right) \right\rangle
\]

\[
- \left[ A^{(0,1)}(0, \varphi, 0, 0, \eta^{(0,1)}) \right] \right\rangle
\]

\[
+ \left\langle \mu_1, B^{(1,2)}(0, \varphi, 0, 0) \left( 0, \dot{\varphi}, 0, 0, (\delta \varphi, 0, 0) \right) \right\rangle
\]

\[
- \left[ A^{(1,2)}(0, \varphi, 0, 0, \eta^{(1,2)}) \right] \right\rangle
\]

\[
- b^{(1,2)}_{(N_0, N_1)} \left[ \eta^{(0,1)}, A^{(1,2)}(0, \varphi, 0, 0) \right] \right\rangle ,
\]
where

\[ \mu_0 = \frac{\partial}{\partial \eta^{(0,1)}}(\eta^{(0,1)} \oplus \eta^{(1,2)}) , \]

\[ \mu_1 = \frac{\partial}{\partial \eta^{(1,2)}}(\eta^{(0,1)} \oplus \eta^{(1,2)}) , \]

\[ A(\theta, \varphi, \psi, x) = A^{(0,1)}(\theta, \varphi, \psi, x) \oplus A^{(1,2)}(\theta, \varphi, \psi, x) , \]

\[ B(\theta, \varphi, \psi, x)(\dot{\theta}, \dot{\varphi}, 0, 0, (\delta \theta, \delta \varphi, 0, 0)) = B^{(0,1)}(\theta, \varphi, \psi, x) \left( \dot{\theta}, \dot{\varphi}, 0, 0, (\delta \theta, \delta \varphi, 0, 0) \right) \]

\[ \oplus B^{(1,2)}(\theta, \varphi, \psi, x) \left( \dot{\theta}, \dot{\varphi}, 0, 0, (\delta \theta, \delta \varphi, 0, 0) \right) . \]

with \( \eta^{(0,1)} \oplus \eta^{(1,2)} \in \mathcal{S}(\theta, \varphi, \psi, x) . \)

Since \( A(\dot{\theta}, \dot{\varphi}) = (0, 0) \) (see equation (59)), we have \( A^{(0,1)}(\theta, \varphi, \dot{\theta}, \dot{\varphi}) = A^{(1,2)}(\theta, \varphi, \dot{\theta}, \dot{\varphi}) = 0 \) and \( B(\theta, \varphi, 0, 0) \left( \dot{\theta}, \dot{\varphi}, 0, 0, (\delta \theta, \delta \varphi, 0, 0) \right) = dA(\theta, \varphi)(\dot{\theta}, \dot{\varphi}, \delta \theta, \delta \varphi) - \left[ A(\theta, \varphi)(\dot{\theta}, \dot{\varphi}), A(\theta, \varphi)(\delta \theta, \delta \varphi) \right] = 0 . \)

Then, the equations that we obtain are

\[ \mu_0(\xi) + \mu_1(\xi ru) = \left\langle \mu_0, [\eta^{(0,1)}, \xi] \right\rangle + \left\langle \mu_1, [\eta^{(1,2)}, \xi ru] \right\rangle + b^{(1,2)}(\eta^{(0,1)}, \xi ru) - b^{(1,2)}(\eta^{(0,1)}, \xi ru) , \]

\[ \frac{\partial}{\partial \theta} \delta \theta - \frac{d}{d t} \frac{\partial}{\partial \theta} \delta \theta = \left\langle \mu_0, 0 \right\rangle + \left\langle \mu_1, b^{(1,2)}(\eta^{(0,1)}, \xi ru) - b^{(1,2)}(\eta^{(0,1)}, \xi ru) \right\rangle , \]

\[ \frac{\partial}{\partial \varphi} \delta \varphi - \frac{d}{d t} \frac{\partial}{\partial \varphi} \delta \varphi = \left\langle \mu_0, 0 \right\rangle + \left\langle \mu_1, -b^{(1,2)}(\eta^{(0,1)}, \xi ru) - b^{(1,2)}(\eta^{(0,1)}, \xi ru) \right\rangle , \]

\[ \mu_0 = \frac{\partial}{\partial \eta^{(0,1)}}(\eta^{(0,1)}, \eta^{(1,2)}) , \]

\[ \mu_1 = \frac{\partial}{\partial \eta^{(1,2)}}(\eta^{(0,1)}, \eta^{(1,2)}) , \] with \( \eta^{(1,2)} = \eta^{(0,1)} ru . \)

On the other hand, using the fact that the groups \( N_{(0,1)} = S^1 \) and \( N_{(1,2)} = \mathbb{R}^2 \) are abelian, we can write the equations as follows

\[ \mu_0(\xi) + \mu_1(\xi ru) = \left\langle \mu_1, b^{(1,2)}(\eta^{(0,1)}, \xi ru) - b^{(1,2)}(\eta^{(0,1)}, \xi ru) \right\rangle , \]

\[ \frac{\partial}{\partial \theta} \delta \theta - \frac{d}{d t} \frac{\partial}{\partial \theta} \delta \theta = - \left\langle \mu_1, b^{(1,2)}(\eta^{(0,1)}, \xi ru) + b^{(1,2)}(\eta^{(0,1)}, \xi ru) \right\rangle , \]

\[ \mu_0 = \frac{\partial}{\partial \eta^{(0,1)}}(\eta^{(0,1)}, \eta^{(1,2)}) , \]

\[ \mu_1 = \frac{\partial}{\partial \eta^{(1,2)}}(\eta^{(0,1)}, \eta^{(1,2)}) . \]

According to the definitions of the bilinear forms \( b \) and \( a \) given in theorem 3.2, we have that \( b_{(N_{(0,1)})}(\kappa, \eta) = \left[ [e, [\kappa^A N_1, \eta]]_{N_{(0,1)}} \right]_{N_{(0,1)}} \) and \( a_{(N_{(0,1)})}(\kappa, \xi) = \left[ [e, -A_{N_1}(\xi) \left( [\kappa^A N_1, \xi^{A N_1}] \right)]_{N_{(0,1)}} \right]_{N_{(0,1)}} . \)
In this case, the corresponding $G$-invariant 1-form connection $\mathcal{A}_n : T_QG \to \mathfrak{n}_1$ over the principal bundle $Q$ with structure group $N_1$ (see the first paragraph of the section 3.1), is given by $\mathcal{A}_n(\psi, x, \dot{x}) = \dot{x}$.

So, we obtain $b_{\mathcal{A}_n}(\kappa, \eta) = ([e, ([\kappa, 0], (0, \eta))]_{N(0,1)} = 0$ and $a_{\mathcal{A}_n}(\kappa, \xi) = ([e, -\mathcal{A}_n(e) ([[(\kappa, 0), (\xi, 0)])])_{N(0,1)} = 0$.

Then, the expression of the Lagrange-d'Alembert-Poincaré equations by stages is

$$d \frac{\partial l}{\partial \eta^{(0,1)}} (\xi) + d \frac{\partial l}{\partial \eta^{(1,2)}} (\xi r) = 0,$$

$$\frac{\partial l}{\partial \theta} \delta \theta - d \frac{\partial l}{\partial \theta} = 0,$$

$$\frac{\partial l}{\partial \varphi} \delta \varphi - d \frac{\partial l}{\partial \varphi} = 0.$$

for all $\xi$, $\theta$, $\varphi \in \mathbb{R}$.

The reduced Lagrangian for Euler’s disk is given by $\ell(\theta, \varphi, \dot{\theta}, \dot{\varphi}, \eta^{(0,1)}, \eta^{(1,2)}) = -Mr \sin \theta + \frac{1}{2} \left[ I_1 + \frac{1}{4} Mr^2 \dot{\varphi}^2 \sin^2 \theta + \frac{1}{2} M \eta^{(1,2)} \right]^2 + \frac{1}{2} M r^2 \dot{\varphi}^2 \cos^2 \theta + Mr \eta^{(1,2)}(\dot{\theta} \sin \theta \varphi - \dot{\varphi} \cos \theta \cos \varphi - Mr \eta^{(2,1)}(\dot{\theta} \cos \varphi \sin \theta + \dot{\varphi} \cos \theta \sin \varphi) + \frac{1}{2} I_3(\dot{\varphi} \cos \theta + \eta^{(0,1)})^2 + \frac{1}{2} Mr \left[ \eta^{(1,2)}(\dot{\varphi} \cos \varphi \sin \theta + \dot{\theta} \sin \varphi \cos \theta) + \eta^{(2,2)}(\dot{\varphi} \sin \varphi \sin \theta - \dot{\theta} \cos \varphi) - r \cos \theta \sin \varphi \right] - \frac{1}{2} Mr r \cos \theta$, with $\eta^{(1,2)} = \left( \eta^{(1,2)}_1, \eta^{(1,2)}_2 \right) \in \mathbb{R}^2$.

So we can write the Lagrange-d'Alembert-Poincaré equations by stages (equations (63)) for Euler’s disk as follows

$$r I_3(\eta^{(0,1)}_1 + \dot{\varphi} \cos \varphi - \dot{\theta} \sin \varphi) + Mr(\eta^{(1,2)}_1, u) + Mr^2(\dot{\varphi} \cos \varphi - 2 \dot{\theta} \sin \varphi \sin \theta) - \frac{1}{2} Mr^2(\dot{\varphi} \sin \theta + 2 \dot{\theta} \dot{\varphi} \cos \varphi) = 0,$$

$$2(Mr^2 + I_3 - I_1) \dot{\varphi} \sin \theta \cos \varphi - (I_1 \sin^2 \theta + (I_3 + Mr^2) \cos^2 \varphi) \dot{\varphi} + Mr \cos \theta \eta^{(1,2)} \cos \varphi + \eta^{(1,2)}_2 \sin \varphi + I_3(\dot{\theta} \eta^{(0,1)} \sin \varphi - \dot{\varphi} \cos \theta) - \frac{1}{2} Mr \left[ 2 \cos^2 \theta - 2 \cos \varphi \cos \phi \sin \varphi \right] + 2r \dot{\varphi}(\sin \theta \cos \varphi - \cos \theta) - 2r \sin \varphi \cos \theta = 0,$$

$$I_1 - I_3 - Mr^2) \dot{\varphi}^2 \sin \theta \cos \theta - I_1 \eta^{(0,1)} \dot{\varphi} \sin \theta - (I_1 + Mr^2) \dot{\varphi} + Mr \sin \theta(\eta^{(1,2)}_2 \cos \varphi - \eta^{(1,2)}_1 \sin \varphi) - Mr \cos \theta + \frac{1}{2} Mr \left[ 2 \cos^2 \theta - 2 \cos \varphi \cos \phi \sin \varphi \right] + r \dot{\varphi}^2(\sin \theta \cos \varphi - \cos \theta) + \frac{1}{2} r \sin \varphi \cos \theta = 0,$$

where the last equation is equivalent to the condition $(\eta^{(0,1)}, \eta^{(1,2)}) \in \mathcal{S}(\theta, \varphi, \psi, x)$.

This system of equations is the same that we have obtained in [9], where we developed reduction in one stage.

Acknowledgments. The authors would like to thank the referees and the editor for the useful remarks and recommendations which helped to improve the paper. Besides, the authors wish to thank the following institutions for making our
work on this article possible: Universidad Nacional del Sur (projects PGI 24/L075, PGI 24/ZL06, PGI 24/L086 and PGI 24/L098); Agencia Nacional de Promoción Científica y Tecnológica, Argentina (projects PICT 2006-2219, PICT 2010-2746 and PICT 2013-1302); CONICET, Argentina (project PIP 2010-2012 11220090101018 and PIP 2013-2016 11220090101018); European Community, FP7 (project IRSES “GEOMECH” 240981). The authors also thank the hospitality of the ICMAT where part of this research has been carried out.
