INTRODUCTION
Damages from free radicals at the cellular level cause cell inflammation, increasing the risk of damage from sunlight radiation, and related development of skin cancer. Antioxidants work by preventing onset of disorder at the cellular level. The first body protection that most simple and flexible is on the outside of the body, that cause more appearances of antioxidant products on the market as a cosmetic preparation. But currently, a large part of preparations that available using chemical antioxidants. The development of natural antioxidants is still continuing to be studied because it is difficult to maintain the antioxidant activity of material and its stability [1-3].

Waste of yellow banana peels is rich in flavonoids and another phenolic in addition to carbohydrates, cellulose, minerals such as potassium and sodium. Flavonoid and phenolic are bioactive compounds that useful as antioxidant [4-6]. According to Yunovan, the antioxidant activity of “Kepok” banana peel extract in ethanol has inhibitory concentration 50% (IC50) values of 156.67 part per million (ppm) [7]. White layer of watermelon rind that is not consumed contains citrulline. Citrulline is one of the antioxidants that are beneficial for skin health [8]. According to Damayanti et al. research, the antioxidant activity juice white layer of round watermelon rind has IC50 values 214.369 ppm and oval watermelon rind is 376.266 ppm [9]. Traditionally, watermelon that rich in water content and other fruits that rich in antioxidants such as banana can be used for skin detoxifying, providing essential nutrients to skin by moisturizing, brightening and protecting the outer layer of skin [10]. The objective of this research was to study antioxidant activity of banana peel, watermelon rind, and the combinations, also in lotion dosage form using antioxidant testing 2,2-diphenyl-1-picrylhydrazil (DPPH) to see the stability of extract antioxidant activity when formulated into lotion dosage form.

METHODS
Chemicals and equipment
Three months old “Kepok” banana peels from Jakarta - Indonesia, white layer of three months old watermelon rinds from Central Java - Indonesia, ethanol 70%, glycercyl monostearate (Mschen), cer alba (Xiamen Rengtone), tween 80 (Kao Corporation), glycercin (P&G Chemicals), paraffin liquid (Tudapelot), nipagin (Ueno Fine Chemicals), nipasol (Ueno Fine Chemicals), paraffin, water, methanol (Ajax Finechem), DPPH (Sigma-Aldrich), plate count agar (BD), potato dextrose agar (BD), semi-micro scales, blender (Philips), rotary evaporator (Buchi), freeze dryer (Telstar), ultra violet-visible (UV-Vis) spectrophotometer (Shimadzu 1240), viscometer (Brookfield type RV), pH meter (Mettler Toledo).

Manufacture of extract
Banana peel extract
Banana skin was macerated using ethanol 70% ratio 1:2 using a shaker for 24 h at room temperature, repeated 3 times and filtered. The filtrate was concentrated by rotary evaporator.

Watermelon rind extract
White layer of watermelon rind is refined using blender and filtered. The filtrate was powdered by freeze dryer.

Quality inspection of extract
Examinations involve in non-specific parameters are organoleptic, drying shrinkage, specific gravity, water content, total ash and acid content and other fruits that rich in antioxidants such as banana can be consumed contains citrulline. Citrulline is one of the antioxidants that are beneficial for skin health [8].
insoluble ash, solvent residues, pesticide residues, heavy metal contaminations, and microbial contaminations (total plate count and total yeast count). As well as specific parameters are phytochemical screening (alkaloids, saponins, tannins, phenolics, flavonoids, triterpenoids, steroids, glycosides, essential oils, quinones, coumarin) and total flavonoid content by spectrophotometric method [11,12].

Antioxidant activity test by DPPH method
Antioxidant activity was tested as a release of the stable DPPH radical. In the radical form, DPPH maximum absorption at λ 515 nm. The mixture reaction (5 ml) contain 1 ml of 0.4 mM DPPH (15.8 mg DPPH in 100 ml of methanol) and various concentrations of test solution dissolved in methanol. After incubation 30 minutes at 37°C in the dark room, absorbance was measured at λ 515 nm using UV-VIS spectrophotometer. Lower absorbance indicates higher restriction of free radical scavenging (% inhibition). Determination of IC50 value using linear regression between concentration and percent inhibition by replacing the percent inhibition to 50 [13-18].

% Inhibition=(Abs control−Abs sample)/Abs control×100%

Prepare a series of test solution with a concentration of 12.5; 25; 37.5; 50; and 62.5 mg/ml of banana peel extract, watermelon rind extract, combination banana peel, and watermelon rind extract.

Manufacture of antioxidant lotion dosage form
Cera alba that has been melted is poured into beaker glass containing paraffin liquid at the top of a hotplate temperature 40-60°C and stirrer at speed around 700 rpm. Then, add glyceryl monostearate, tween 80, watermelon rind extract, kombucha, and perfume as fragrances (Table 1) [19].

Evaluation of lotion dosage form
Organoleptic includes examination of color, odor, and sense when an application on the skin.

Homogeneity by applying the preparation on glass object, drops of methylene blue, and observed under a microscope.

pH tested using a pH meter.

Viscosity and rheology tested using a Brookfield viscometer type RV, spindle number 4 with three different speed (2.5, 4, and 5).

Microbiology tested of total plate count and total yeast mold with sample concentration 0.5 ml.

Acute dermal irritation test using albino rabbit (weight around 2 kg) with test dose 0.5 g. Response rating on 1, 24, 48, and 72 h after the opening of the patch. Ethical clearance approval from Airlangga University, Surabaya – Indonesia.

Table 1: Formulation of antioxidant lotion dosage form

| Formula materials       | Composition (%) |
|-------------------------|-----------------|
|                         | F1    | F2    | F3    | F4    |
| Banana peel extract     | -     | 12.81 mg | -     | 13.86 mg |
| Watermelon rind extract | -     | -     | 60.02 mg | 21.65 mg |
| Glycerol monostearate   | 2.8   | 2.8   | 2.8   | 2.8   |
| Cera alba               | 7.5   | 7.5   | 7.5   | 7.5   |
| Tween 80                | 4.7   | 4.7   | 4.7   | 4.7   |
| Glycerin                | 10    | 10    | 10    | 10    |
| Paraffin liquid         | 10    | 10    | 10    | 10    |
| Nipagin                 | 0.15  | 0.15  | 0.15  | 0.15  |
| Nipasol                 | 0.15  | 0.15  | 0.15  | 0.15  |
| Parfume                 | qs    | qs    | qs    | qs    |
| Water ad (ml)           | 100   | 100   | 100   | 100   |

Antioxidant activity test of preparation using DPPH method with test solution concentration 20, 40, 60, 80, and 100 μg/ml.

RESULTS
Table 2 shows examination results of extract. A study of antioxidant activity of banana peel extract, watermelon rind extract, and their combinations are shown in Table 3. The combination of banana peel and watermelon rind extract with three different combinations based on the comparison IC value of its single extract, which combination of banana peel:watermelon rind extract with a ratio of IC50:IC50, inhibitory concentration 75% (IC25), inhibitory concentration 25% (IC75), and IC50:IC50. Banana peel extract, watermelon rind extract, and the best combination of banana peel and watermelon rind extract (combination of banana peel:watermelon extract [75:25]) are formulated into lotion dosage form. Evaluation of lotion dosage form include organoleptic (Fig. 1 and Table 4), homogeneity (Table 5), pH (Table 6), viscosity (Table 7) and rheology (Fig. 2, microscope (Table 8), acute dermal irritation (Table 9), also antioxidant activity test of preparation (Table 10).

DISCUSSION
The result from organoleptic and homogeneity test between lotion formulas showed that there was no significant difference which is white-like milk color, typically weak odor, soft and non-sticky feel when applied to the skin, and the preparation is homogeneous with emulsion type O/W (oil in water). The soft feeling in lotion shows that glycerin as humectant and paraffin liquid as emollient is function properly. Non-sticky feeling is because the base of lotion is O/W (oil in water) with a composition ratio of water-oil around 80:20. pH of lotion between 5.0 and 5.5 which are in range pH of skin acid mantle (4.5-6.5) so expectantly the lotion will not damage the skin acid mantle layer. Test results show the viscosity of formula F1> F3> F2> F4. Formula F1 (base of lotion) resulted in the most viscous lotion. Extract of banana peel and watermelon rind are hydrophilic which causing an attractive force to water molecules with a base of lotion, so the viscosity becomes more aqueous. Rheology of lotion is plastic. Characteristic chart of plastic rheology...

is consistency curve for plastic material not passing through the point (0,0) but intersects the shearing stress axis (or will be cut off if the straight part of the curve is extrapolated to the axis) at a point known as yield value. The preparation will not flow until the shearing stress is achieved by yield value. This plastic rheology is characteristic of cera alba that used in the base of lotion, when idle and low temperatures, these materials tend to be a flocculation form. Microbiology test shows the growth of microorganisms <10 cfu/ml, so qualify according to “A Guidance Document on Microbiological Control of Cosmetic Products” that limit of microorganisms (bacteria, yeasts, and molds) in leave-on product should not more than 100 cfu/ml in 0.5 ml of product. This shows that nipagin and nipasol used in lotion worked effectively to keep the lotion from microorganism growth. Acute dermal irritation test shows the primary irritation index is zero, means no indication of erythema and edema, it can be categorized as very mild irritation response.

The best antioxidant activity of extract is banana peel extract with IC50 value 64.03 ppm. The results of antioxidant activity test of lotion, formula F1 is base of lotion do not have antioxidant activity so it conclusion that the base of lotion is not affecting antioxidant activity of extract in lotion dosage form. Antioxidant activity of formula F2, F3, and F4 decreased if compare with antioxidant activity of extract. Formula F2 using banana peel extract has decreased approximately 7.4. Formula F3 using watermelon rind extract and formula F4 is a combination of banana peel and watermelon rind extract have decreased approximately 1.7. Watermelon rind extract and combinations extract when formulated into a lotion dosage form are decreased smaller than banana peel extract. It can be concluded that the antioxidant activity of banana peel extract can be protected by watermelon rind extract of decomposition, so the combination of both extracts shows the highest antioxidant activity in lotion dosage form. The antioxidant activity of extract can not guarantee the stability of antioxidant activity when formulation into a dosage form.

CONCLUSION

Banana peel extract with the highest antioxidant activity when formulated into lotion has significant decrease of antioxidant activity, but when combined with watermelon rind extract has better antioxidant activity.
