Supplementary Figure S1. Kinetics of SARS-CoV-2 specific antibodies over time based on disease severity. OD values of S1- and N-specific IgG and IgM (S1-IgG, S1-IgM, N-IgG and N-IgM) and neutralizing titers (IC$_{50}$) are plotted against the days post disease onset. The line and the ribbon show the mean expected from a LOESS regression model with 95% confidence interval for each disease severity category. The colored circles indicate disease severity. OD = optical density.
Supplementary Figure S2. Relationship between S1 and N-specific IgG and IgM and neutralizing titer based on disease severity. (a) Pearson’s correlation between S1-IgG, N-IgG, S1-IgM and N-IgM and neutralizing titer based on disease severity. Scatter plots were generated using OD values (y-axis) versus IC_{50} (x-axis) from each individual serum sample with colored circles indicate disease severity. (b) Pearson’s correlation between IgG response against S1 and N proteins and IgM response against S1 and N proteins based on disease severity. Scatter plots were generated using anti-N OD values (y-axis) versus anti-S1 OD values (x-axis) from each individual serum sample with colored circles indicate disease severity. Pearson’s correlation between (c) IgG response against S1 and N proteins and (d) IgM response against S1 and N proteins based on neutralizing titer. Colored circles indicate neutralizing titers (IC_{50}). The dotted lines represent the cut-off of each assay. OD = optical density.
