**Supplementary Table S1** Verification primers for amplification of target region containing specific SNP

| Primer Name | Sequence 5’-> 3’ | Tm (°C) | Product size (bp) |
|-------------|------------------|---------|-------------------|
| rs11545078-FW | CATGTTTTCCAGCCTGTGTG | 54.5 | 508 |
| rs11545078-RV | GGATGGTCATTCACATCTTCAA | 52.9 | |
| rs1127354-FW | TACGGGTTTCTGGGAGCATTG | 54.6 | 548 |
| rs1127354-RV | CCTGGAAGCTACCTGGACAA | 56.6 | |
| rs10106-FW | AGGAAATCTACCACCCAGCA | 55.9 | 580 |
| rs10106-RV | CGTCTTCAGCTGCATTTCAAC | 54.5 | |
| rs2372536-FW | CACGACGACACCTGACATTT | 57.3 | 590 |
| rs2372536-RV | AGGTTGCAGTCAGCAGAAAAC | 56.3 | |
| rs4673993-FW | GCTGTCGAGTGCTGTCAT | 56.6 | 588 |
| rs4673993-RV | CCAGCAGCTGCATTTGACT | 56.1 | |
| rs3758149-FW | GTGCCGCCTTCAAAGTAGAC | 56.2 | 594 |
| rs3758149-RV | GCCCTATGGGAAATGCACT | 56.1 | |
Supplementary Fig. S1. Cellular pathway of MTX — uptake, transport, conversion to polyglutamate forms and downstream effects. MTX is absorbed through active transport mediated by reduced folate carrier (RFC1) or solute carrier family 19 member 1 (SLC19A1). Reversely, MTX is pumped out from the cell via the ATP Binding Cassette B1 (ABCB1). Inside the cell, MTX is converted to active methotrexate polyglutamates (MTX PGs) by folylpolyglutamate synthase (FPGS) and this process can be reversed by γ-glutamyl hydrolase (GGH). MTX PGs directly inhibit dihydrofolate reductase (DHFR), aminoimidazole-4-carboxamide ribonucleotide (AICAR) transformylase which is coded by ATIC and thymidylate synthetase (TYMS). Proteins highlighted in blue are encoded by the genes chosen for genotyping in this study. Red diamond (◆) indicates the inhibitory activity and black arrowhead (▼) indicates the directional flow of reaction.
Supplementary Fig. S2. Tertiary structure of AICAR transformylase complexed with antifolate (aminoimidazole 4-carboxamide ribonucleotide) was retrieved from Protein Data Bank (https://www.rcsb.org) (PDB ID: 5UZ0)\textsuperscript{49}. Thr116 (or T116) is in the MGS domain. The green arrowhead indicates the side-chain hydroxyl group of Thr116 that forms hydrogen bonds with the amide group from Val117 and Glu118. The blue arrowhead is where the main-chain carboxyl group of Thr116 forms hydrogen bond with the amide group of Glu119.
