Abstract. We obtain via Bäcklund transformation the Hamiltonian representation for a Lax type nonlinear dynamical system hierarchy on a dual space to the Lie algebra of super-integral-differential operators of one anticommuting variable, extended by evolutions of the corresponding spectral problem eigenfunctions and adjoint eigenfunctions, as well as for the hierarchies of their additional symmetries. The relation of these hierarchies with the integrable by Lax (2|1 + 1)-dimensional supersymmetric Davey–Stewartson system is investigated.

Key words: Lax type flows; “ghost” symmetries; the Davey–Stewartson system

1 Introduction

Since the paper of M. Adler [1] there was an understanding that Lax forms for a wide class of integrable nonlinear dynamical system hierarchies on functional manifolds [2] [3] [4] [5] and their supersymmetric analogs [6] [7] could be considered as Hamiltonian flows on dual spaces to the Lie algebra of integro-differential operators. Those flows are generated by the $\mathcal{R}$-deformed canonical Lie–Poisson bracket and Casimir functionals as Hamiltonian functions (see [1] [5] [6]). For a concrete integro-differential operator every Hamiltonian flow of such a type can be written as a compatibility condition for the corresponding isospectral problem in the case of an arbitrary eigenfunction and the suitable evolution of this function. Thus, the existence problem of a Hamiltonian representation for the Lax type hierarchy, extended by the evolutions of a finite set of eigenfunctions and appropriate adjoint eigenfunctions, arises. In [10] [11] [12] it was solved for the Lie algebra of integro-differential operators by use of the Casimir functionals’ invariant property under some Lie–Bäcklund transformation. Analogously we obtain in this paper the Hamiltonian representation of the extended Lax type system hierarchy for the Lie algebra of super-integro-differential operators of one anticommuting variable.

The hierarchies of additional or “ghost” symmetries [13] for the extended Lax type system are also proved to be Hamiltonian. It is established that every additional symmetry hierarchy is generated by the tensor product of the $\mathcal{R}$-deformed canonical Lie–Poisson bracket with the Poisson bracket on a finite-dimensional superspace, possessing an odd supersymplectic structure [14] [15], and all natural powers of one eigenvalue from the mentioned above finite set as Hamiltonian functions. The additional symmetry hierarchy is used for introducing one more commuting variable into (1|1 + 1)-dimensional supersymmetric nonlinear dynamical systems with preserving their integrability by Lax. By means of this approach a (2|1 + 1)-dimensional supersymmetric analog of the Davey–Stewartson system [5] [16] [17] and its triple linearization of a Lax type are found.
2 The general algebraic scheme

Let $G$ be a Lie algebra of scalar super-integral-differential operators of one anticommuting variable $\theta$ ($\theta^2 = 0$):

$$a := \partial^m + \sum_{j < 2m} a_j D^j_\theta, \quad m \in \mathbb{N},$$

where the symbol $\partial := \partial/\partial x$ designates differentiation with respect to the independent variable $x \in \mathbb{R}/2\pi\mathbb{Z} \simeq S^1$, $a_j := a_j(x, \theta) = a^0_j(x) + \theta a^1_j(x)$, $j \in \mathbb{Z}$, are smooth superfield functions (superfunctions), and the superderivative $D_\theta := \partial/\partial \theta + \theta \partial/\partial x$, for which $D^2_\theta = \partial$, satisfies the following relation for any smooth superfield functions $u$ and $v$:

$$D_\theta(uv) = (D_\theta u)v + (-1)^{p(u)}u(D_\theta v),$$

where $p(u)$ is a parity of an arbitrary superfunction $u$, which is equal to 0 for $u$, being even, and one for $u$, being odd.

The usual Lie commutator on $G$ is defined as

$$[a, b] := a \circ b - b \circ a$$

for all $a, b \in G$, where \(\circ\) is an associative product of super-integro-differential operators. On the Lie algebra $G$ there exists the $ad$-invariant nondegenerated symmetric bilinear form:

$$(a, b) := \int_0^{2\pi} \text{res}_{D_\theta}(a \circ b) \, dx,$$

where \(\text{res}_{D_\theta}\)-operation for all $a \in G$ is given by the expression:

$$\text{res}_{D_\theta} a := a_{-1}.$$

By means of the scalar product $\langle \cdot, \cdot \rangle$ the Lie algebra $G$ is transformed into a metrizable one. As a consequence, its dual linear space of scalar super-integro-differential operators $G^*$ is identified with the Lie algebra $G$, that is $G^* \simeq G$.

The linear subspaces $G_+ \subset G$ and $G_- \subset G$

$$G_+ := \left\{ a := \partial^m + \sum_{j = 0}^{2m-1} a_j D^j_\theta : j = 0, 2m - 1 \right\},$$

$$G_- := \left\{ b := \sum_{l > 0} b_l D^{-l}_\theta : l \in \mathbb{N} \right\},$$

where $a_j$ and $b_l$ are smooth superfunctions, forms Lie subalgebras in $G$ and $G = G_+ \oplus G_-$. Because of the splitting of $G$ into the direct sum of its Lie subalgebras one can construct a Lie–Poisson structure on $G^*$, using the special linear endomorphism $R$ of $G$:

$$R := (P_+ - P_-)/2, \quad P_\pm G := G_\pm, \quad P_\pm G_\mp = 0.$$

For any smooth by Frechet functionals $\gamma, \mu \in \mathcal{D}(G^*)$ the Lie–Poisson bracket on $G^*$ is given by the expression:

$$\{\gamma, \mu\}_R(l) = (l, [(\nabla \gamma(l), \nabla \mu(l))]_R),$$

(3)
where \( l \in G^* \) and for all \( a, b \in G \) the \( \mathcal{R} \)-deformed commutator has the form:

\[
[a, b]_{\mathcal{R}} := [\mathcal{R}a, b] + [a, \mathcal{R}b].
\]

(4)

The linear space \( G \) with the commutator \( [\mathcal{R}] \) also becomes a Lie algebra. The gradient \( \nabla_\gamma(l) \in G \) of some functional \( \gamma \in \mathcal{D}(G^*) \) at the point \( l \in G^* \) with respect to the scalar product \( \langle \rangle \) is defined as

\[
\delta \gamma(l) := (\nabla_\gamma(l), \delta l),
\]

where the linear space isomorphism \( G \cong G^* \) is taken into account.

Every Casimir functional \( \gamma \in I(G^*) \), being invariant with respect to \( \text{Ad}^* \)-action of the corresponding Lie group \( G \), obeys the following condition at the point \( l \in G^* \):

\[
[l, \nabla_\gamma(l)] = 0.
\]

(5)

The relationship \( [\mathcal{R}] \) is satisfied by the hierarchy of functionals \( \gamma_n \in I(G^*) \), \( n \in \mathbb{Z}_+ \), taking the forms:

\[
\gamma_n(l) = \frac{1}{n+1}(l^{1/m}, l^{n/m}).
\]

(6)

The Lie–Poisson bracket \( [\mathcal{R}] \) generates the hierarchy of Hamiltonian dynamical systems on \( G^* \):

\[
dl/dn := [\mathcal{R}\nabla_\gamma_n(l), l] = [\nabla_\gamma_n(l)_+, l],
\]

(7)

with the Casimir functionals \( [\mathcal{R}] \) as Hamiltonian functions.

The latter equation is equivalent to the usual commutator Lax type representation. It is easy to verify that for every \( n \in \mathbb{Z}_+ \) the relationship \( [\mathcal{R}] \) is a compatibility condition for such linear integral-differential equations:

\[
lf = \lambda f,
\]

(8)

and

\[
df/dn = (\nabla_\gamma_n(l))_+ f,
\]

(9)

where \( \lambda \in \mathbb{C} \) is a spectral parameter, \( f \in W^{1|0} := L_\infty(\mathbb{S}^1 \times \Lambda_1; \mathbb{C}^{1|0}) \) if \( f \) is an even superfunction and \( f \in W^{0|1} := L_\infty(\mathbb{S}^1 \times \Lambda_1; \mathbb{C}^{0|1}) \) if \( f \) is an odd one. Here \( \Lambda := \Lambda_0 \oplus \Lambda_1 \) is a Grassmann algebra over \( \mathbb{C} \), \( \Lambda_0 \supset \mathbb{R} \). The associated with \( [\mathcal{R}] \) dynamical system for the adjoint superfunction \( f^* \) takes the form:

\[
df^*/dn = -(\nabla_\gamma_n(l))_+ f^*,
\]

(10)

where \( (f, f^*)^T \in W^{1|1} := L_\infty(\mathbb{S}^1 \times \Lambda_1; \mathbb{C}^{1|1}) \) or \((f^*, f)^T \in W^{1|1} \) and superfunction \( f^* \) is a solution of the adjoint spectral problem:

\[
l^* f^* = \lambda f^*.
\]

The objects of further investigations are some algebraic properties of equation \( [\mathcal{R}] \) together with \( 2N \in \mathbb{N} \) copies of equation \( [\mathcal{R}] \):

\[
df_i/dn = (\nabla_\gamma_n(l))_+ f_i,
\]

\[
d\Phi_i/dn = (\nabla_\gamma_n(l))_+ \Phi_i,
\]

(11)

for even \( f_i \in W^{1|0} \) and odd \( \Phi_i \in W^{0|1} \) eigenfunctions of the spectral problem \( [\mathcal{R}] \), corresponding to the eigenvalues \( \lambda_i, i = 1, N \), and the same number of copies of equation \( [\mathcal{R}] \):

\[
df_i^*/dn = -(\nabla_\gamma_n(l))_+ f_i^*,
\]

\[
d\Phi_i^*/dn = -(\nabla_\gamma_n(l))_+ \Phi_i^*,
\]

(12)

for corresponding odd \( f_i^* \in W^{0|1} \) and even \( \Phi_i^* \in W^{1|0} \) adjoint eigenfunctions, as a coupled evolution system on the space \( G^* \oplus W^{2N|2N} \).
\[ \nabla_{\gamma}(\tilde{l}, \tilde{f}, \tilde{\Phi}^*_\gamma, \tilde{f}^*_\gamma, \tilde{\Phi}_\gamma^*) \triangleq \begin{pmatrix} \frac{\delta \gamma}{\delta l} & \frac{\delta \gamma}{\delta f_i} & \frac{\delta \gamma}{\delta \Phi_i} & \frac{\delta \gamma}{\delta f^*_i} & \frac{\delta \gamma}{\delta \Phi_i^*} \end{pmatrix}^T, \]

where \( i = 1, N \), at a point \((\tilde{l}, \tilde{f}_i, \tilde{\Phi}_i^*, \tilde{f}^*_i, \tilde{\Phi}_i) \in \mathcal{G}^* \oplus W^{2N|2N}\) for any smooth functional \( \gamma \in \mathcal{D}(\mathcal{G}^* \oplus W^{2N|2N}) \).

On the spaces \( \mathcal{G}^* \) and \( W^N \oplus W^*N \) there exist a Lie–Poisson structure \([1, 8, 9]\) and its Bäcklund transformation \([9]\), at a point \( \tilde{l} \in \mathcal{G}^* \) and the canonical Poisson structure \([14, 15]\) generates equation \([13]\) for any Casimir functional \( \gamma \in I(\mathcal{G}^*) \).

Thus, on the extended phase space \( \mathcal{G}^* \oplus W^{2N|2N} \) one can obtain a Poisson structure as the tensor product \( \mathcal{L} := \tilde{\Theta} \otimes \tilde{J} \) of \([13]\) and \([14]\).

Consider the following Bäcklund transformation:

\[ (\tilde{l}, \tilde{f}, \tilde{\Phi}^*_\gamma, \tilde{f}^*_\gamma, \tilde{\Phi}_\gamma^*)^T := \tilde{R}(\tilde{l}, \tilde{f}, \tilde{\Phi}^*_\gamma, \tilde{f}^*_\gamma, \tilde{\Phi}_\gamma^*) = \tilde{f}_i^*, \tilde{\Phi}_i^*, \tilde{f}^*_i, \tilde{\Phi}_i), \]

generating on \( \mathcal{G}^* \oplus W^{2N|2N} \) a Poisson structure \( \mathcal{L} \) with respect to variables \((l, f_i, \Phi_i^*, f^*_i, \Phi_i)\), \( i = 1, N \), of the coupled evolution equations \([17]\), \([11]\) and \([12]\). The main condition for the mapping \([15]\) is coincidence of the dynamical system

\[ (dl/dt, df_i/dt, d\Phi_i^*/dt, df^*_i/dt, d\Phi_i/dt)^T := -\mathcal{L} \nabla_{\gamma}(l, f_i, \Phi_i^*, f^*_i, \Phi_i) \]

with equations \([11]\), \([11]\) and \([12]\) in the case of \( \gamma_n \in I(\mathcal{G}^*), n \in \mathbb{Z}_+ \), i.e. when the functional \( \gamma_n \) is taken to be not dependent of variables \((f_i, \Phi_i^*, f^*_i, \Phi_i)^T \in W^{2N|2N}\). To satisfy that condition, one should find a variation of some Casimir functional \( \gamma_n \in I(\mathcal{G}^*), n \in \mathbb{Z}_+ \), at \( \delta l = 0 \), taking into account the evolutions \([11]\), \([12]\) and the Bäcklund transformation \([15]\):

\[ \delta \gamma_n(\tilde{l}, \tilde{f}_i, \tilde{\Phi}_i^*, \tilde{f}^*_i, \tilde{\Phi}_i^*) \bigg|_{\delta l = 0} = \sum_{i=1}^{N} \left( \langle \delta \tilde{f}_i, \delta \gamma_n \rangle + \langle \delta \Phi_i^*, \delta \gamma_n \rangle + \langle \delta \tilde{f}^*_i, \delta \gamma_n \rangle + \langle \delta \tilde{\Phi}_i^*, \delta \gamma_n \rangle \right) \]

\[ = \sum_{i=1}^{N} \left( \langle \delta \tilde{f}_i, -d\tilde{f}^*_i/dt_n \rangle + \langle \delta \tilde{\Phi}_i^*, -d\tilde{\Phi}^*_i/dt_n \rangle + \langle \delta \tilde{f}^*_i, d\tilde{f}_i/dt_n \rangle + \langle \delta \tilde{\Phi}_i^*, d\tilde{\Phi}_i/dt_n \rangle \right) \]

\[ = \sum_{i=1}^{N} \left( \langle \delta \tilde{f}_i, (\nabla \gamma_n(l))^* f_i^* \rangle + \langle \delta \tilde{\Phi}_i^*, (\nabla \gamma_n(l))^* \Phi_i^* \rangle + \langle \delta \tilde{f}^*_i, (\nabla \gamma_n(l))^* f_i \rangle \right. \]
Theorem 1. The dynamical system on $\mathcal{G}^* \oplus W^{2N|2N}$, being Hamiltonian with respect to the Poisson structure $\mathcal{L} : T^* (\mathcal{G}^* \oplus W^{2N|2N}) \to T (\mathcal{G}^* \oplus W^{2N|2N})$, in the form of the following evolution equations:

\[
\begin{align*}
\frac{d\tilde{l}}{dt_n} &= \left[ \frac{\delta \gamma_n}{\delta l} \right]_+ \tilde{l} - \left[ \frac{\delta \gamma_n}{\delta \tilde{l}} \right]_+ \tilde{l}, \\
\frac{d\tilde{f}_i}{dt_n} &= \frac{\delta \gamma_n}{\delta \tilde{f}_i}, \quad \frac{d\tilde{\Phi}_i^*}{dt_n} = -\frac{\delta \gamma_n}{\delta \tilde{\Phi}_i^*}, \quad \frac{df_i^*}{dt_n} = -\frac{\delta \gamma_n}{\delta f_i^*}, \quad \frac{d\Phi_i}{dt_n} = \frac{\delta \gamma_n}{\delta \Phi_i}.
\end{align*}
\]

where $i = 1, N$ and $\gamma_n \in I(\mathcal{G}^*)$, $n \in \mathbb{Z}_+$, is a Casimir functional at the point $l \in \mathcal{G}^*$, connected with $\tilde{l} \in \mathcal{G}^*$ by \[\text{(13)}, \text{ is equivalent to the system} \text{ (1)} \text{, (13) and (14)} \text{ via the Bäcklund transformation} \text{ (19)}.\]

By means of simple calculations via the formula:

\[\mathcal{L} = B^t \tilde{L} B^*;\]
where $B' : T(G^* \oplus W^{2N|2N}) \to T(G^* \oplus W^{2N|2N})$ is a Frechet derivative of \( \mathcal{L} \), one brings about the following form of the Poisson structure $\mathcal{L}$ on $G^* \oplus W^{2N|2N} \ni (l, f_i, \Phi_i, f_i^*, \Phi_i)^T$:

\[
\nabla \gamma(l, f_i, \Phi_i, f_i^*, \Phi_i) \xrightarrow{\mathcal{L}} \begin{pmatrix}
\left[\frac{\delta \gamma}{\delta l}\right] + \left[\frac{\delta \gamma}{\delta f_i}\right] + \frac{1}{\delta f_i} \sum_{i=1}^{N} \left( f_i D_{\theta}^{-1} \delta f_i - \delta \gamma \right) D_{\theta}^{-1} f_i^* + \Phi_i D_{\theta}^{-1} \delta \gamma \delta \Phi_i - \delta \gamma \delta \Phi_i D_{\theta}^{-1} \Phi_i^* \\
\delta \gamma \delta f_i^* - \delta \gamma \delta f_i \delta f_i^* + \delta \gamma \delta f_i \delta f_i^* - \delta \gamma \delta \Phi_i \delta \Phi_i^* - \delta \gamma \delta \Phi_i \delta \Phi_i^* \\
\delta \gamma \delta \Phi_i - \delta \gamma \delta \Phi_i \delta \Phi_i^* - \delta \gamma \delta \Phi_i \delta \Phi_i^* \\
\end{pmatrix},
\]

where $\gamma \in D(G^* \oplus W^{2N|2N})$ is an arbitrary smooth functional and $i = 1, \ldots, N$, that makes it possible to formulate the theorem.

**Theorem 2.** For every $n \in \mathbb{Z}_+$ the coupled dynamical system (7), (11) and (12) is Hamiltonian with respect to the Poisson structure $\mathcal{L}$ in the form (20) and the functional $\gamma_n \in I(G^*)$.

Using the expression (13) one can construct the hierarchy of Hamiltonian evolution equations, describing commutative flows, generated by involutive with respect to the Lie–Poisson bracket (3) Casimir invariants $\gamma_n \in I(G^*)$, $n \in \mathbb{Z}_+$, on the extended space $G^* \oplus W^{2N|2N}$ at a fixed element $l \in G^*$. For every $n \in \mathbb{Z}_+$ the equation of such a type is equivalent to the system (7), (11) and (12).

### 4 Hierarchies of additional symmetries

The evolution type hierarchy (7), (11) and (12) possesses another set of invariants, which includes all natural powers of the eigenvalues $\lambda_i$, $i = 1, \ldots, N$. They can be considered as smooth by Frechet functionals on the extended space $G^* \oplus W^{2N|2N}$ due to the representation:

\[
\lambda_k^s = \langle l^s f_k, f_k^s \rangle + \langle l^s \Phi_k, \Phi_k^s \rangle,
\]

where $s \in \mathbb{N}$, taking place for all $k = 1, \ldots, N$ under the normalizing condition:

\[
\langle f_k, f_k^s \rangle + \langle \Phi_k, \Phi_k^s \rangle = 1.
\]

In the case of

\[
l := l_+ + \sum_{i=1}^{N} (f_i D_{\theta}^{-1} f_i^* + \Phi_i D_{\theta}^{-1} \Phi_i^*)
\]

the formula (21) leads to the following variation of the functionals $\lambda_k^s \in \mathcal{D}(G^* \oplus W^{2N|2N})$,

\[
\delta \lambda_k^s = \langle (\delta l^s) f_k, f_k^s \rangle + \langle (\delta l^s) \Phi_k, \Phi_k^s \rangle + \langle l^s (\delta f_k), f_k^s \rangle + \langle l^s (\delta \Phi_k), \Phi_k^s \rangle + \langle l^s \Phi_k, (\delta \Phi_k)^s \rangle
\]
\[
\begin{align*}
= (\delta l_+, M^s_k) + \sum_{i=1}^{N} (\langle \delta f_i, (-M^s_k + \delta^i_k l^s)^* f_i^s \rangle + \langle \delta f_i^s, (-M^s_k + \delta^i_k l^s) f_i \rangle \\
+ \langle \delta \Phi_i, (-M^s_k + \delta^i_k l^s)^* \Phi_i^s \rangle + \langle \delta \Phi_i^s, (-M^s_k + \delta^i_k l^s) \Phi_i \rangle),
\end{align*}
\]
where \(\delta^i_k\) is a Kronecker symbol and the operator \(M^s_k\), \(s \in \mathbb{N}\), is determined as
\[
M^s_k := \sum_{p=0}^{s-1} ((l^p f_k)D_\theta^{-1}(l^{s-1-p} f_k^s) + (l^p \Phi_k)D_\theta^{-1}(l^{s-1-p} \Phi_k^s)) = \lambda^{s-1} M^1_k.
\]
Thus, one obtains the exact forms of gradients for the functionals \(\lambda^s_k \in \mathcal{D}(\hat{G}^s \oplus W^{2N}[2N])\), \(k = \overline{1,N}\):
\[
\nabla \lambda^s_k (l_+, f_i, \Phi^s_i, f^s_i, \Phi_i) = \begin{pmatrix} M^s_k \\ -M^s_k + \delta^i_k l^s f_i^s \\ -M^s_k + \delta^i_k l^s \Phi_i \\ -M^s_k + \delta^i_k l^s f_i \\
-\delta^i_k l^s \Phi_i^s \end{pmatrix},
\]
where \(i = \overline{1,N}\). By means of the expression (23) the tensor product \(\hat{\mathcal{L}}\) of Poisson structures (13) and (14) generates the hierarchy of coupled evolution equations on \(G^s \oplus W^{2N}[2N]\):
\[
\begin{align*}
dl_+/d\tau_{s,k} &= -[M^s_k, \hat{l}_+]_+, \\
df_i/d\tau_{s,k} &= (-M^s_k + \delta^i_k l^s) f_i, \quad df^s_i/d\tau_{s,k} = (M^s_k - \delta^i_k l^s)^* f_i^s, \\
d\Phi_i/d\tau_{s,k} &= (-M^s_k + \delta^i_k l^s) \Phi_i, \quad d\Phi^s_i/d\tau_{s,k} = (M^s_k - \delta^i_k l^s)^* \Phi^s_i,
\end{align*}
\]
where \(i = \overline{1,N}\), for every \(k = \overline{1,N}\). Because of the Bäcklund transformation (19) the equation (21) is equivalent to the commutator relationship:
\[
dl/d\tau_{s,k} = -[M^s_k, l] = -\lambda^{s-1}[M^1_k, l] = \lambda^{s-1} dl/d\tau_{1,k},
\]
and the following theorem takes place:

**Theorem 3.** For every \(k = \overline{1,N}\) and \(s \in \mathbb{N}\) the coupled dynamical system (21), (25) and (26) is Hamiltonian one with respect to the Poisson structure \(\hat{\mathcal{L}}\) in the form (10) and the functional \(\lambda^n_k \in \mathcal{D}(G^s \oplus W^{2N}[2N])\).

The coupled dynamical systems (21), (25) and (26) represent flows on \(G^s \oplus W^{2N}[2N]\), commuting one with each other.

**Theorem 4.** For \(k = \overline{1,N}\) the coupled evolution equations (21), (25) and (26) form a set of additional symmetry hierarchies for the coupled dynamical system (7), (11) and (12).

**Proof.** To prove the theorem it is sufficient to show that
\[
[d/dt_n, d/d\tau_{1,k}] = 0, \quad [d/d\tau_{1,k}, d/d\tau_{1,q}] = 0,
\]
where \(k, q = \overline{1,N}\) and \(n \in \mathbb{N}\). The first equality in the formula (28) follows from the identities:
\[
dd(\nabla \gamma_n(l))_+ / d\tau_{1,k} = [(\nabla \gamma_n(l))_+, M^1_k]_+, \quad dM^1_k / dt_n = [(\nabla \gamma_n(l))_+, M^1_k]_-,
\]
the second one being a consequence of the relationship:
\[
dM^k_1 / d\tau_{1,q} - dM^q_1 / d\tau_{1,k} = [M^1_k, M^1_q].
\]
When $N \geq 2$, a new class of nontrivial Hamiltonian flows $d/dT_{n,K} := d/dt_n + \sum_{k=1}^{K} d/dt_{n,k}$, $n \in \mathbb{N}$, $K = \mathbb{N} - 1$, in a Lax form on $G^* \oplus W^{2N}[2N]$ can be constructed by use of the set of additional symmetry hierarchies for the Lie algebra of super-integro-differential operators. Acting on the functions $f_i, f_i^*, \Phi_i, \Phi_i^*$, $i = 1, N$, these flows generate $((1 + K)(1+1))$-dimensional supersymmetric nonlinear dynamical systems.

For the first time the additional symmetries in the case of $N = 2$ were applied by E. Nissimov and S. Pacheva [13] to obtain a Lax integrable supersymmetric analog of the $(2 + 1)$-dimensional Davey–Stewartson system. If

$$l := \partial + f_1 D_\theta^{-1} f_1^* + f_2 D_\theta^{-1} f_2^* + \Phi_1 D_\theta^{-1} \Phi_2^* + \Phi_2 D_\theta^{-1} \Phi_1^* \in G^*,$$

where $(f_1, f_2, \Phi_1, \Phi_2, f_1^*, f_2^*, \Phi_1^*, \Phi_2^*)^T \in W^{4|4}$, the flows $\partial/\partial \tau := d/d\tau_{1,1}$ and $d/dT := d/d\tau_{2,1} = d/dt_2 + d/d\tau_{2,1}$ on $G^* \oplus W^{4|4}$, acting on the functions $f_i, f_i^*, \Phi_i, \Phi_i^*, i = 1, 2$, by the following way:

$$f_{1,\tau} = f_{1,x} + u_1 f_2 - \alpha_1 \Phi_2, \quad f_{2,\tau} = -\bar{u}_1 f_1 + \bar{\alpha}_1 \Phi_1,$$
$$f_{1,\tau}^* = f_{1,x}^* + \bar{u}_1 f_2^* - \bar{\alpha}_1 \Phi_2^*, \quad f_{2,\tau}^* = -u_1 f_1^* - \alpha_2 \Phi_1^*,\quad \Phi_{1,\tau} = \Phi_{1,x} - \alpha_2 f_2 + u_2 \Phi_2, \quad \Phi_{2,\tau} = -\bar{\alpha}_1 f_1 - \bar{u}_2 \Phi_1,$$
$$\Phi_{1,\tau}^* = \Phi_{1,x} - \bar{\alpha}_2 f_2^* - u_2 \Phi_2^*, \quad \Phi_{2,\tau}^* = \bar{\alpha}_1 f_1^* - \bar{u}_2 \Phi_1^*,$$

and

$$f_{1,T} = f_{1,xx} + f_{1,\tau \tau} + w_1 D \theta f_1 + w_0 f_1 + 2 v_1 f_1 - 2 \beta_1 \Phi_1,$$
$$f_{2,T} = f_{2,xx} + w_1 D \theta f_2 + w_0 f_2 - \bar{u}_1 f_{1,\tau} + \bar{\alpha}_1 \Phi_{1,\tau} + \bar{u}_1 \tau f_1 - \bar{\alpha}_2 \tau \Phi_{1,\tau},$$
$$f_{1,T}^* = -f_{1,x}^* - f_{1,\tau \tau}^* - D \theta (w_1 f_1^*) - w_0 f_1^* - 2 v_1 f_1^* + 2 \beta_1 \Phi_1^*,$$
$$f_{2,T}^* = -f_{2,x}^* - D \theta (w_1 f_2^*) - w_0 f_2^* + u_1 f_{1,\tau}^* + \alpha_2 \Phi_{1,\tau}^* - u_1 \tau f_1^* + \alpha_2 \Phi_{1,\tau}^*,$$
$$\Phi_{1,T} = \Phi_{1,xx} + \Phi_{1,\tau \tau} + w_1 D \theta \Phi_1 + w_0 \Phi_1 + 2 f_1 \beta_1 + 2 v_2 \Phi_1,$$
$$\Phi_{2,T} = \Phi_{2,xx} + w_1 D \theta \Phi_2 + w_0 \Phi_2 - \bar{\alpha}_1 f_{1,\tau} - \bar{u}_2 \Phi_{1,\tau} + \bar{\alpha}_1 \tau f_1 + \bar{u}_2 \tau \Phi_{1,\tau},$$
$$\Phi_{1,T}^* = -f_{1,x}^* - f_{1,\tau \tau} - D \theta (w_1 \Phi_1^*) - w_0 \Phi_1^* - 2 f_1^* \beta_1 - 2 v_2 \Phi_1^*,$$
$$\Phi_{2,T}^* = -f_{2,x}^* - D \theta (w_1 \Phi_2^*) - w_0 \Phi_2^* + \alpha_1 f_{1,\tau}^* + \alpha_1 \tau f_1^* + \alpha_2 \Phi_{1,\tau}^* - u_2 \Phi_{1,\tau},$$
$$D_\theta u_1 = f_1 f_2^*, \quad D_\theta u_2 = \Phi_1 \Phi_2^*, \quad D_\theta \bar{u}_1 = f_1^* f_2, \quad D_\theta \bar{u}_2 = \Phi_1^* \Phi_2,$$
$$D_\theta v_1 = f_1 f_2^*, \quad D_\theta v_2 = \Phi_1 \Phi_2^*, \quad D_\theta \alpha_1 = f_1 \Phi_2^*, \quad D_\theta \alpha_2 = \Phi_1 f_2^*,$$
$$D_\theta \bar{\alpha}_1 = f_1^* \Phi_2, \quad D_\theta \bar{\alpha}_2 = \Phi_1^* f_2, \quad D_\theta \beta = f_1 \Phi_2^*, \quad D_\theta \beta = \Phi_1^* f_2,$$

where $(\nabla \gamma_2(l))_+ := \partial^2 + w_1 D \theta + w_0$ represent $(2|1+1)$-dimensional supersymmetric nonlinear dynamical system. The system (29) and (30) possesses an infinite sequence of local conservation laws, which can be found by the formula (31), and a Lax representation, given by the spectral problem (32) and the evolution equations:

$$f_{\tau} = -M_1^1 f,$$
$$f_T = ((\nabla \gamma_2(l))_+ - M_1^2) f,$$

for an arbitrary eigenfunction $f \in W^{1|0}$ or $f \in W^{0|1}$. The relationships and (32) lead to additional nonlinear constraints such as

$$w_{0,\tau} = 2 w_1 (f_1 f_1^* - \Phi_1 \Phi_1^*) + 2 (f_1 (D \theta f_1^*) + \Phi_1 (D \theta \Phi_1^*)) x,$$
$$w_{1,\tau} = -2 (f_1 f_1^*) x + 2 (\Phi_1 \Phi_1^*) x.$$
When \( f_1 := \psi, \ f_1^* := \theta \psi^*, \ f_2 = f_2^* = 0 \) and \( \Phi_1 = \Phi_1^* = \Phi_2 = \Phi_2^* = 0 \), the equations and are reduced to the Lax integrable \((2 + 1)\)-dimensional Davey–Stewartson system \([5, 16, 17]\):

\[
\begin{align*}
\psi_{1,x} &= \psi_{1,xx} + \psi_{1,\tau \tau} + 2(S - 2\psi \psi^*)\psi, \\
\psi_{1,x}^* &= -\psi_{1,xx}^* - \psi_{1,\tau \tau}^* - 2(S - 2\psi \psi^*)\psi^*, \\
S &= (\partial/\partial x + \partial/\partial \tau)^2 \psi \psi^*,
\end{align*}
\]

where \( 2S := u_0^0 + 2v_0^0 + 4\psi \psi^*, \ u_0 := u_0^0, \ v_1 := v_1^0 \) and \( \psi, \ \psi^* \in L_\infty(S^1; \mathbb{C}) \).

The Lax representation \([10, 11] \) and \([82]\) for the \((2|1) + 1\)–dimensional supersymmetric nonlinear dynamical Davey–Stewartson system \([29, 11] \) and \([11]\) has equivalent matrix form:

\[
D_\theta F = \begin{pmatrix}
0 & 0 & 0 & 0 & 1 \\
\phi^*_1 & 0 & 0 & 0 & 0 \\
\phi^*_2 & 0 & 0 & 0 & 0 \\
\lambda & -f_1 & -f_1 & -\Phi_1 & -\Phi_2 & 0 \\
\end{pmatrix} F,
\]

\[
dF = \begin{pmatrix}
0 & -f_1 & 0 & -\Phi_1 & 0 & 0 \\
-\lambda & \bar{u}_1 & 0 & \bar{\alpha}_1 & -f_1^* \\
0 & -u_1 & 0 & \alpha_2 & 0 & 0 \\
0 & -\alpha_1 & 0 & -u_2 & 0 & 0 \\
\Phi_1 \Phi_1^* - f_1 f_1^* & -D_\theta f_1 & 0 & -D_\theta \Phi_1 & 0 & 0 \\
\end{pmatrix} F,
\]

\[
dF = CF,
\]

where \( F = (F^0 := f, F^2, F^4, F^1, F^3, F^5)^T \in W^{3|3}, \ C := (C_{mn}) \in \text{gl}(3|3), \ m, n = 1, 6, \) and

\[
\begin{align*}
C_{11} &= \lambda^2 + \frac{1}{2} w_0 + f_1 D_\theta f_1^* + \Phi_1 D_\theta \Phi_1, \quad C_{12} = -(2\lambda f_1 + f_1, x + f_1, \tau), \\
C_{13} &= -(\lambda f_2 + f_2, x) + \bar{u}_1 f_1 - \bar{\alpha}_2 \Phi_1, \quad C_{14} = -(2\lambda \Phi_1 + \Phi_1, x + \Phi_1, \tau), \\

C_{36} &= (-\lambda f_2^* + f_2^*, x) - u_1 f_1^* + \alpha_2 \Phi_1^*, \\
C_{41} &= -w_1 \Phi_1^* + 2D_\theta (-\Phi_1^* + \lambda \Phi_1^*) + \bar{u}_2 D_\theta \Phi_2^* - \bar{\alpha}_2 D_\theta f_2^*, \\
C_{42} &= -2D_\theta (f_1 \Phi_1^*) - u_1 \bar{\alpha}_2 - u_2 \alpha_1, \quad C_{43} = -D_\theta (f_2 \Phi_1^*) + \lambda \bar{\alpha}_2 - \bar{\alpha}_2, \tau, \\
C_{44} &= -\lambda^2 - 2D_\theta (\Phi_1 \Phi_1^*) - u_2 \bar{u}_2 - \alpha_2 \bar{\alpha}_2, \quad C_{45} = -D_\theta (\Phi_2 \Phi_1^*) + \lambda \bar{u}_2 - \bar{u}_2, \tau, \\
C_{46} &= 2(-\lambda \Phi_1^* + \Phi_1^*, x) + \bar{u}_2 \Phi_2^* + \bar{\alpha}_2 f_2^*, \\
C_{51} &= -\frac{1}{2} w_1 \Phi_2^* + D_\theta (-\Phi_2^* + \lambda \Phi_2^*) + \alpha_1 D_\theta f_1^* + u_2 D_\theta \Phi_1^*,
\end{align*}
\]
\[ C_{52} = -D_\theta(f_1 \Phi_2^*) - \lambda \alpha_1 - \alpha_{1,\tau}, \quad C_{53} = -D_\theta(f_2 \Phi_2^*) + \alpha_1 \bar{u}_1 - \bar{\alpha}_2 u_2, \]
\[ C_{54} = -D_\theta(f_1 \Phi_2^*) - \lambda u_2 - u_{2,\tau}, \quad C_{55} = -D_\theta(f_2 \Phi_2^*) + \alpha_1 \bar{\alpha}_1 + u_2 \bar{u}_2, \]
\[ C_{56} = (-\lambda \Phi_2^* + \Phi_2^*) - \alpha_1 f_1^* + u_2 \Phi_1^*, \]
\[ C_{61} = \frac{1}{2} D_\theta w_0 + (D_\theta f_1) D_\theta f_1^* + (D_\theta \Phi_1) D_\theta \Phi_1^* \]
\[- (f_{1,\tau} f_1^* + f_{2,\tau} f_2^* - \Phi_{1,\tau} \Phi_1^* - \Phi_{2,\tau} \Phi_2^*) + \bar{u}_1 f_1 f_2^* - \bar{\alpha}_1 f_1 \Phi_2^* + \bar{\alpha}_2 f_1 \Phi_2^* + \bar{u}_2 \Phi_1 \Phi_2^*, \]
\[ C_{62} = -D_\theta(2\lambda f_1 + f_{1,\tau} + f_{1,\tau}) + \frac{1}{2} w_1 f_1 + f_1(-f_1 f_1^* + \Phi_1 \Phi_1^*), \]
\[ C_{63} = -D_\theta(\lambda f_2 + f_{2,\tau} + \frac{1}{2} w_1 f_2 + \bar{u}_1 (D_\theta f_1) + \bar{\alpha}_2 (D_\theta \Phi_1), \]
\[ C_{64} = -D_\theta(2\lambda \Phi_1 + \Phi_{1,\tau} + \Phi_{1,\tau}) + \frac{1}{2} w_1 \Phi_1 - f_1 f_1^* \Phi_1, \]
\[ C_{65} = -D_\theta(\lambda \Phi_2 + \Phi_{2,\tau} + \frac{1}{2} w_1 \Phi_2 - \bar{u}_2 D_\theta \Phi_1 - \bar{\alpha}_1 D_\theta f_1, \]
\[ C_{66} = \lambda^2 + \frac{1}{2} w_0 + \frac{1}{2} D_\theta w_1 - (D_\theta f_1) f_1^* + (D_\theta \Phi_1) \Phi_1^*. \]

In fact, one has found a triple matrix linearization for a \((2|1+1)\)-dimensional dynamical system, that is important for the standard method of inverse scattering transformation \[3\] as well as for the reduction procedure \[18,19\] upon invariant subspaces of associated spectral problem eigenvalues.

The method of additional symmetries is effective for constructing a wide class of \((2|1+1)\)-dimensional supersymmetric nonlinear dynamical systems with a triple matrix linearization.

## 5 Conclusion

By now several regular Lie-algebraic approaches existed to constructing Lax integrable \((2 + 1)\)-dimensional nonlinear dynamical systems on functional manifolds, which were presented in \[12,20,21,22\]. In this paper a new Lie-algebraic method is devised for introducing one more commuting variable into \((1|1 + 1)\)-dimensional dynamical systems with preserving their integrability by Lax. It involves use of additional symmetries \[13\] for a Hamiltonian flow hierarchy on extended dual space to some operator Lie algebra.

Any integrable \((2|1+1)\)-dimensional supersymmetric nonlinear dynamical system obtained by means of the method possesses an infinite sequence of local conservation laws and a triple matrix linearization of a Lax type. These properties make it possible to apply the standard inverse scattering transformation \[4\] and the reduction procedure \[18,19\] upon invariant subspaces.

If \(N > 2\) in the representation \[22\], the hierarchies of additional symmetries can be used for constructing Lax integrable \(((1 + K)|1 + 1)\)-dimensional supersymmetric systems, where \(K = \frac{1}{2}N - 1\).

Analyzing the structure of the Bäcklund type transformation \[19\] as a key point of the method, one can observe that it strongly depends on an \(ad\)-invariant scalar product chosen for an operator Lie algebra \(G\) and a Lie algebra decomposition like \((2)\). Since there are other possibilities of choosing \(ad\)-invariant scalar products on \(G\) and such decompositions, they give rise naturally to other Bäcklund transformations.
