GYY4137 and sodium hydrogen sulfide relaxations are inhibited by L-cysteine and Kv7 channel blockers in rat small mesenteric arteries

Silvijus Abramavicius¹,², Asbjørn G. Petersen¹, Nirthika S. Renaltan¹, Judit Prat-Duran¹, Roberta Torregrossa³, Edgaras Stankevicius¹, Matthew Whiteman³, Ulf Simonsen¹*

Supplementary Figure for review. ¹H-, ³¹P-NMR spectra five hours after mixing GYY4137 mixed with five equivalents of L-cysteine in water. The blue arrows show the formation of a new product. The results are preliminary and number of other approaches will be required to identify the product that is formed.
