Citation: Liu W, Yang S-F, Peng X-J (2016) Two new species of Yaginumaella, Prószyński 1976 from Yunnan, China (Araneae, Salticidae). ZooKeys 620: 57–66. doi: 10.3897/zookeys.620.7895

Abstract

The present paper deals with two new species of Yaginumaella, Yaginumaella lushuiensis sp. n. (female and male) and Yaginumaella pseudoflexa sp. n. (female and male). The male of Y. lushuiensis sp. n. differs from the related species Y. flexa Song & Chai, 1992 in ventral view of palpal organ. The female of Y. lushuiensis sp. n. differs from the related species Y. urbanii Žabka, 1981 by: 1) hoods locate at the anterior area of epigynum and far away from the copulatory openings; 2) epigynum about circular; 3) copulatory openings transverse. The male of Y. pseudoflexa sp. n. differs from the related species Y. bulbosa Peng, Tang & Li, 2008 in ventral view of palpal organ: 1) basal portion of embolus touches the margin of genital bulb. 2) distal portion of tibial apophysis covers the posterior margin of cymbium and far away from the margin of genital bulb. The female of Y. pseudoflexa sp. n. differs from the related species Y. urbanii Žabka, 1981 by: epigynum about as long as wide; hoods locate at the anterior area of the epigynum, above the outside area of the copulatory openings and far away from the copulatory openings. Photos of body and copulatory organs, line drawings of copulatory organs, as well as the locality map are provided. Descriptions of morphology are given.

Introduction

_Yaginumaella_ was established by Prószyński in 1979 with the type species _Y. ususudi_. A total of 42 species have been described mainly from subtropical Himalayan and Eastern Palaearctic areas (World Spider Catalog 2016). Żabka (1980, 1981) revised the diagnosis of the genus and described 27 new species. Up to now, 14 species have been recorded from China (Prószyn’ski 1979; Żabka 1980; Żabka 1981; Song and Chai 1992; Xie and Peng 1995; Yang et al. 1997; Peng et al. 2002; Zhu et al. 2005; Zhang and Zhu 2007).

While examining the specimens collected in the Gaoligong Mountains (Yunnan Province, Southwest China) by the Sino-American Expeditions (1998–2008), two new species of the genus _Yaginumaella_ are found and described in this paper.

Material and methods

All specimens were kept in 75% ethanol, examined, measured, and drawn with an Olympus SZX16 stereomicroscope and an Olympus BX53 compound microscope. Photos were taken with a digital camera Canon PowerShot G12 mounted on an Olympus SZX16. Compound focus images were generated using Helicon Focus software (3.10).

All measurements are given in millimeters. Leg measurements are given as: total length (femur, patella + tibia, metatarsus, tarsus). The abbreviations used in text include:

- **AER** anterior eye row;
- **ALE** anterior lateral eyes;
- **AME** anterior median eyes;
- **CD** copulatory ducts;
- **CO** copulatory openings;
- **E** embolus;
- **EFL** length of eye;
- **H** hood;
- **MOA** median ocular area;
- **PER** posterior eye row;
- **PLE** posterior lateral eyes;
- **PME** posterior median eyes;
- **S** spermatheca;
- **TA** tibial apophysis.
Taxonomy

**Yaginumaella Prószyński, 1976**

Females in *Yaginumaella* have sclerotized blind hoods on epigyne, which are far away from the posterior edge, and differ in size and location. Copulatory ducts are of different length, with an internal ridge in the majority of species. The shape and size of spermathecae differ in various species.

Palpal organ in males rather simple, with end of embolus lying in a special groove on the ventral surface of cymbium usually more or less expanded laterally. Seminal receptacle thick. Cymbium densely covered with setae. Tibial apophysis robust and heavily sclerotized. Species differ in length and shape of embolus, bulb, and cymbium.

**Yaginumaella lushuiensis** sp. n.

**Type material.** **Holotype:** ♂, China: Yunnan: Lushui County: Pianma Township, 25.99363°N, 98.66651°E, 2470 m, 14 May 2005, C. Griswold. **Paratypes:** 1♂, 4♀, the same data as holotype.

**Etymology.** The specific name refers to the type locality, Lushui County.

**Diagnosis.** The male of the new species can be distinguished from all known congeneric species in ventral view of palpal organ by: embolus short, spatuliform; genital bulb without distinct posterior lobe; tibial apophysis extends to the top of genital bulb; embolus about 1/2 length of genital bulb. The female of the new species can be distinguished from all known congeneric species by: epigynum about circular; copulatory openings transverse.

**Description. Male (holotype):** Total length 4.60. Cephalothorax 2.15 long, 1.75 wide. Abdomen 2.35 long, 1.50 wide. Clypeus height 0.10. Carapace black-brown, with black margin, basal area of each eye, anterior and lateral margins of ocular area black. Thoracic region with two longitudinal dark bands. Marginal areas of carapace, anterior and lateral margins of ocular area densely covered with white hair; ocular area with thick dark brown hair; fovea short, longitudinal and black; cervical groove indistinct, radial groove dark brown. Sternum oval, covered with short brown hair, central area bulged, light yellow with gray edge. Clypeus narrow, height less than the radius of AME, light brown, promargin with white hair. Chelicerae dark brown, with brown hair, two promarginal and one retromarginal teeth (Fig. 6). Labium brown with brown hair, terminal area lightly colored. Palp and legs brown, legs with clear dark brown annuli. Eye sizes and interdistances: AER 1.50, PER 1.40, ALE 0.25, PLE 0.15, AME 0.50, EFL 1.00. Measurements of legs: I 5.00 (1.50, 2.00, 1.00, 0.50), II 3.75 (1.00, 1.50, 0.75, 0.50),
Figures 1–3. Yaginumaella lushuiensis sp. n. 1 male body, dorsal view 2 male palp, retrolateral view 3 male palp, ventral view. Scale bars: (1) 0.5 mm; (2, 3) 0.1 mm.

Figures 4–6. Yaginumaella lushuiensis sp. n. 4 male palp ventral view 5 male palp, retrolateral view 6 left chelicera, posterior view. Scale bars: 0.1 mm.

III 4.50 (1.50, 1.50, 1.00, 0.50), IV 4.25 (1.25, 1.50, 1.00, 0.50). Leg formula: 1342. Abdomen long oval, black to yellow brown, cardiac pattern long bar-shaped, muscular impressions clearly visible, posterior area of abdomen with six arc-shaped darker bands.

Figures 7–9. *Yaginumaella lushuiensis* sp. n. 7 female body, dorsal view 8 epigyne, ventral view 9 vulva, dorsal view. Scale bars: (7) 0.5 mm; (8, 9) 0.1 mm.

Figures 10–12. *Yaginumaella lushuiensis* sp. n. 10 vulva, dorsal view 11 epigynum, ventral view 12 left chelicera, posterior view. Scale bars: 0.1 mm.
Abdominal ventral: anterior area light brown, median area with one black longitudinal stripe, lateral areas with scattered grayish-black patches. Spinnerets brown.

Male palp (Figs 2–3, 4–5): tibia longer than wide in ventral view, with several long prolateral macrosetae in retrolateral view. Genital bulb with membrane structure. Embolus slender and about 1/2 length of genital bulb, originates from the position of 10:00 o’clock, its tip reaches to the position of 13:00 o’clock in ventral view. Bulb squat, median portion widest. Sperm ducts obvious, its diameter about 1/6 width of bulb.

**Female:** Total length 5.00. Cephalothorax 2.40 long, 2.00 wide. Abdomen 2.60 long, 2.10 wide. Clypeus 0.15 high. Eye sizes and interdistances: AME 0.50, ALE 0.25, PLE 0.15, AER 1.60, PER 1.40, EL1.00. Legs yellow. Leg spinnation the same as male. Measurements of legs: I 4.85 (1.50, 1.85, 0.75, 0.75), II 3.85 (1.30, 1.30, 0.75, 0.50), III 4.75 (1.75, 1.3, 1.00, 0.75), IV 4.5 (1.25, 1.75, 1.00, 0.50). Leg formula: 1342. Other morphological characteristics the same as male except more pale in color.

Epigyne (Figs 8–9, 10–11) longer than wide, with two distinct anterior hoods. Copulatory openings almost u-shaped, far away from the hoods. Copulatory ducts indistinct. Spermathecae big, squat, close to each other.

**Variation.** The male length 4.60–4.80 (n = 2) and the female length 4.80–5.60 (n = 4).

**Distribution.** China (Yunnan).

**Type material.** **Holotype:** ♂, China: Yunnan: Lushui County: Pianma Township, 25.99363°N, 98.61704°E, 1780 m, along the road in town 15 May 2005, G. Tang. **Paratypes:** 1♂, 3♀, the same data as holotype.

**Etymology.** The specific name is the combination of the Latin prefix “pseudo” and “flexa”, referring to the similarity of the new species to *Y. flexa* Song and Chai, 1992.

**Diagnosis.** The male of this new species can be separated from all known congeneric species in ventral view of palpal organ by: basal portion of embolus touches the margin of genital bulb; distal portion of tibial apophysis covers the posterior margin of cymbium and far away from the margin of genital bulb. The female of this new species can be separated from all known congeneric species by: epigynum about as long as wide; copulatory openings almost parentheses-shaped; hoods locate above the outside area of the copulatory openings.

**Description. Male (Holotype):** Total length 5.40. Cephalothorax 2.60 long, 1.90 wide; Abdomen 2.80 long, 1.70 wide. Clypeus 0.15 high. Carapace brown, with black margin, basal area of each eye, anterior and lateral margins of ocular area black; Marginal areas of carapace and thoracic region with one longitudinal yellow brown band. Marginal areas of carapace, anterior margin of ocular area densely covered with white hair, sparsely covered with brown hairs; fovea short, longitudinal and reddish-

FIGURES 25. Localities of new Yaginumaella species from China.

Male palp (Figs 14–15, 16–17): tibia longer than wide in ventral view, with several long prolateral macrosetae in retrolateral view. Genital bulb with membrane structure. Embolus slender and sinuous, nearly as long as genital bulb, originates from the position of 9:00 o’clock, its tip reaches to the position of 14:00 o’clock in ventral view. Bulb squat, median portion widest. Sperm ducts obvious, its diameter about 1/3 width of bulb.

Female: Total length 5.40, Cephalothorax 2.40 long, 1.85 wide. Abdomen 3.00 long, 1.90 wide. Clypeus 0.15 high. Eye sizes and interdistances: AME 0.50, ALE 0.30, PLE 0.25, AER 1.65, PER 1.55, EFL 1.00. Measurements of legs: I 4.30 (1.40, 1.70, 0.70, 0.50), II 3.90 (1.30, 1.05, 0.06, 0.50), III 4.80 (1.40, 1.70, 0.90, 0.80), IV 5.20 (1.60, 1.90, 1.00, 0.70). Leg formula: 4312. Other morphological characteristics the same as male, but lightly colored.

Epigyne (Figs 20–21, 22–23) as long as wide, with two distinct anterior hoods. Copulatory openings almost parentheses-shaped, far away from the hoods. Copulatory ducts thick and sinuous. Spermathecae big, squat, close to each other.

Variation. The male length 4.30–5.40 (n = 2) and the female length 4.80–5.80. (n = 3).

Distribution. China (Yunnan).
